simple, yet bold and warlike tribes, who inhabited the valleys of the Appennines, and the feeble and luxurious cultivators of the marshes of Verona, or the plains of Campania, that it does not appear at all surprising that the natives themselves should have been led to believe, that characters so dissimilar could not be descended from the same common ancestors. But so entirely does this diversity seem to have been owing to the influence of climate, that when the warlike Umbrians themselves became by conquest masters of the plains, we find them infected by the same degeneracy, and obliged to submit to the Etruscans, who, in their turn, suffered no less in their national character by this pernicious acquisition.

The form of government which most prevailed, seems to have been a sort of federal republic, or defensive league, by which all the tribes of the same original stock were bound together. And as the colonies, which some from convenience, and others, in consequence of a religious observance, frequently sent out, were often removed to a great distance, this family compact had the effect of connecting nations, otherwise remote from each other. Thus, from the ancient stock of the Osce or Aenunci, were derived the Sabines, and from them, in consequence of a religious vow, the Samnites and the Lucanians.

The limits prescribed in a work of this nature, prevent us from entering at large into the ancient history of the Italian nations, a field of research far from interesting: there is, however, one state which has left behind it so many memorials of its grandeur and advancement in the arts of civilized life, that it requires from us a more particular attention.

The people called by the Romans, Etruscans or Tuscan, and by the Greeks Tirreni, a corruption of the word Traseni, which probably was their original appellation, inhabited the district lying betwixt the Arno and the Tiber. By their victories over the Umbri, Osce, and Veneti, they extended their power to the other side of Italy, and there founded the flourishing colonies of Adria and Bologna. Having, however, at an early period of their empire, had the wisdom to renounce all wars of conquest, they devoted their chief attention to commerce and the arts of peace. The result of their commerce was a decided naval superiority, in consequence of which they became masters, by means of their colonies, of the islands of Sardinia, Corsica, and Elba. The last acquisition, by its inexhaustible mines of iron, for the manufacture of which the Tuscan forests afforded ample materials, was of immense importance, not only in constructing a navy, but also as an article of commerce. By the possession of these mines, and the art of fabricating tools of iron, the Tuscan were enabled to construct those prolixigous citadels and fortifications, which have acquired for them the reputation of being the inventors of military architecture, and the lively idea of which remain at this day the splendid and indescribable monuments of the grandeur of their founders. And though many succeeding ages of war and slavery and oppression, have converted into pestilential deserts, much of the once highly cultivated territory of Etruria, yet even there the ruins of harbours and cities, and the consequently numerous population which must have been maintained, attest their progress in the science of agriculture.

The form of government was that of a federal republic, divided into twelve states, over each of which presided a civil magistrate, called Lucumon. In times of war, the office of commander in chief was conferred on one of the Lucumones, with the title of king, and very considerable powers. This authority, however, was by no means absolute, as it appears that he was subject to the control of the general assembly of the deputies of the twelve states held in the temple of Volturna, and liable even to capital punishment, if found guilty of the crimes laid to his charge. That their system of laws was just and equitable, and admirably adapted to the form of their society, appears from the concurrence of historians, and the abridgment of its principles itself, the foundation of the prudence of the Romans; for which, as well as their religious establishment, they were indebted to their Etrurian neighbours.

Their manners were in no small degree humanized; domestic slavery, which at that period prevailed in almost every other nation in the world, did not exist among them; and their progress in the arts of polished life, is attested by those exquisite remains, which even in our own times, have been considered as models worthy of imitation.

These new arts, however, and the foreign ideas introduced by abundance and wealth, against which the most virtuous education can make but a feeble opposition, were adding the Etrurian of the requisites to the relaxation of morals which marks inevitably the epoch of its decay. The seducing influence of corruption, damped by degrees the ardour of liberty. The colonies lost their affection for the mother country, and degenerated into cold and uninterested allies, and the republic itself, divided by domestic contentions, fell, one state after another, under the dominion of the Romans. The history of that nation becomes, from this period, that of Italy; and for an account of its various revolutions, while under our power, we must refer to the article Rome.

Towards the close of the 5th century, when the empire of the west, surrounded by numberless hordes of barbarians impelled by ambition and famine, was every day deprived by their conquests of some valuable province or territory, Italy alone for some time preserved the appearance and name of the Roman empire. Under the feeble sway, however, of the later emperors, and the tyrannical misrule of their favourites, such was the miserable situation of the country, that the circumstances even of the provinces conquered by the barbarians, were envied by the wretched Italians. Civil liberty was almost annihilated, the laws were disregarded, the nobles harassed and impoverished by the exactions of the imperial tax-gatherers, and the poor, exposed to the oppression of the soldiery, and reduced to a state of famine by the bands of robbers which overran the country, were indifferent into the hands of what master they fell, and were rather willing to enjoy personal freedom under the name of slaves to the Goths, than remain in a state of actual slavery with the semblance of Roman liberty. At this period, the army of the emperor consisted of three tribes of barbarians, the Heruli, the Rugi, and the Turcelling. These soldiers having for some time received no pay, demanded that in lieu of it a certain portion of land should be assigned them. This request being refused by Orestes, the guardian of the Emperor Augustulus, they offered to transfer their allegiance to Odoacer, his principal general; and on his promising to accede to their demands, deposed the emperor, and acknowledged him as their king. The new monarch wisely abstained...

Basilusius recalled and banished.

depended on success, was unable to make any effective opposition to the victorious Totila; and although Basilusius recovered the city of Rome, almost all the rest of Italy again fell under the dominion of the Goths. In this situation of affairs, Basilusius was again recalled, and the machinations of his enemies succeeded in banishing him from the court. (See Basilusius.) The management of the Gothic war was committed to Narses, one of the eunuchs of the palace, whose vigorous understanding and enterprising genius had already raised him to important situations in the court of Justinian. Aware, however, of the causes of the failure of the last expedition, Narses would not accept of the command without an army and resources sufficient for the enterprise. In obtaining these, he succeeded; and led to Italy not only the flower of the Grecian army, but an immense number of young noblemen in the character of volunteers, who were desirous of making court to the Emperor, by serving their first campaign under his favourite. The most complete success attended the arms of Narses, for notwithstanding the most valiant and obstinate resistance of Totila, he was defeated and slain; and the same fate having overtaken his successor Teia, the great body of the Goths surrendered to the Imperial army, and Italy was again, for a short time, re-annexed as a province to the empire. Narses continued for 14 years to govern Italy with wisdom equal to the bravery with which he had conquered it; but, on the death of Justinian, he was recalled from his situation by the Emperor Justin II, or rather by the Empress Sophia, who governed her husband and the empire; and only survived his master two years.

The death of Narses, whose name alone had intimidated the barbarians, left Italy again exposed to their invasions. In the year 568, the Lombards, a nation of German or Scandinavian origin, first established themselves on the banks of the Po, and occupied that part of the north of Italy which still bears their name. They were then governed by Alboinus, a chief who had already distinguished himself in his wars with the Gepidae, whose king, Cunemund, he had defeated and slain. This prince having made himself master of Milan, was then crowned king of Italy with the title of Teia, given to his father; but he was not, however, till three years after, that he made himself master of Pavia, at that time considered the principal seat of the monarchy. This important acquisition was the last victory of Alboinus, who was murdered at a festival by his wife Rosamund, whom he had brutally compelled to drink from a cup made of the skull of her father Cunemund, king of the Gepidae. Alboinus was succeeded by Clephix, who continued to lead the Lombards to victory, but whose cruelty and other vices were the cause of his murder after a reign of three years. The death of Clephix was followed by an interregnum of 10 years, which might rather be termed an anarchy, as the government was in the hands of no less than 85 dukes or military governors of the provinces, who acted as regents during the minority of the children of the late king. The terror of a threatened invasion by Childerich, king of the Franks, at length determined the Lombards to raise Autharla (the son of Clephix) to the throne, who, by his prudence and valor, soon restored tranquillity to the kingdom, and frustrated the attempts of the Franks to gain a footing in Italy. The dynasty of the Lombard princes continued to reign in the northern provinces of Italy for the space of 160 years, still prosecuting with various success their schemes of conquest, but without ever attaining to the principal object of their ambition, the entire subjection of Italy. To enter particularly into the history of these monarchs seems unnecessary in this work, especially as the annals are peculiarly perplexed by the constant internal commotions which the feudal government of the Lombards naturally gave rise to.

The situation of those provinces, which, under the name of the exarchate of Ravenna, still retained their allegiance to the Grecian empire, was still more deplorable than that of the subjects of the Lombards. Continually exposed to the vexatious exactions of the rapacious exarchs of Ravenna, from which their spiritual fathers, the bishops of Rome, had alone power to protect them, their affections were gradually transferred to them, and every tie which connected them with the empire became loosened. The people were sunk in profound ignorance; their spirit was broken by oppression; and it was only in a few trading towns, where, fostered by the spirit of commerce, a few sparks of liberty still remained. At length, however, the exarchs, having exhausted the resources of the people, made an attempt to extend their depredations to the property of the church; and the pontiffs, exasperated by this sacrilege, and weary of a government at once tyrannical and feeble, began to look out for a more powerful protection against the daily increasing power of the Lombards.

Charles, king of the Franks, better known by the appellation of Charlemagne, excited by the intrigues of Pope Adrian, whose territories had been invaded by Desiderius, king of the Lombards, prepared to pass the Alps at the head of a formidable army. On his approach, the Lombard troops, though advantageously posted, were seized with a sudden panic, and fled; and although Desiderius and Adelchis his son continued their resistance for a few months, the capture of the former in Pavia put an end to the struggle; and with him ceased the power and monarchy of the Lombards. The pontiff and his successor received a grant from Charlemagne of the territories formerly governed by the exarch of Ravenna, and Pepin, the second son of the conqueror, was crowned king of Italy, the administration of the imperial dignity being left to the Pope. The remainder of the Lombards, still, however, kept their ground in the south, under the Duke of Benevento, but were at length obliged to submit to the superior force of Charlemagne. The prudent administration of this prince had, not less than his military glory, attached to him the affections of the Italians; and when hailed by the Pope Leo III. as Emperor of the West, his election was sanctioned by the united assent of all orders of the people. The reign of Pepin over Italy was short, and he died before his father in his 34th year, at a time when the highest expectations were entertained from his prudence and wisdom. He was succeeded by his son Bernard; but this young prince having become an object of jealousy to his uncle Louis, king of France and Emperor of the West, was tempted to join in a rebellion against him; and being defeated, and after his defeat persuaded to throw himself on the Emperor's mercy, was by him sentenced to lose his eyes. The sentence was executed in so cruel a manner, that he died in consequence of the operation; and the kingdom of Italy, with the title of king, was conferred upon Lothaire, the emperor's eldest son. The reign of this prince was consumed in unsuccessful wars with his brothers, the kings of France and Aquitaine; and at his death, having bestowed on his second son Lothaire the
The reign of Louis II. lasted 20 years, during which Italy regained that peace and prosperity which it had lost during the struggles of his ancestors; and for a short period knew the advantages of a mild and well-regulated government. On the death of Louis, without issue, the succession was again contested by his uncles Charles the Bald, King of France, and Louis King of Germany. By the assistance of Pope John VIII. the former was successful, and was crowned at Rome Emperor and King of Italy. Louis of Germany and his son Carloman still, however, continued to carry on war against him; and four of the Dukes of Italy, Lambert of Spoleto, Berenger of Friouli, Bezen of Provence and Lombardy, and Aripert of Tuscany, took advantage of this contest to add to their territories, and establish their independence. The Pope also was able not only to confirm his temporal and spiritual dominion over the Roman states, but considerably to extend his influence over the French church.

Charles the Bald did not long survive his elevation, being poisoned on his return over the Mount Cenis from an unsuccessful expedition into Italy. He was succeeded by Carloman, who only reigned two years; and had for his successor his brother Charles the Fat. The weakness and unpopularity of this prince consummated the ruin of the French dynasty. The Italian barons everywhere asserted their independence; and the unfortunate descendant of Charlemagne, having in vain attempted to secure the succession to his natural son Bernard, was himself expelled from the throne, and during the short remainder of his life reduced to actual beggary. On his demise, the principal competitors for the crown were Berenger of Friouli, and Guido of Spoleto. The latter was at first successful, and Berenger was obliged to fly to Germany, and throw himself under the protection of King Arnulph, the natural son of Carloman, King of Italy, and who himself aspired to that crown.

It was no difficult task to persuade Arnulph to undertake the conquest of Italy. The death of Guido, who was succeeded as emperor by his son Lambert, a very young man, favoured his designs; and after a series of victories, he succeeded in making himself master of Rome, where he was crowned Emperor by Pope Formosus. He then marched against the Empress Angelstrude, widow of Guido, who is said to have contrived to administer to Arnulph a slow poison, which so injured his health that he was obliged to return to Germany. Italy was for a short time divided between Lambert, Berenger, and Adelbert, Marquess of Tuscany; but the ambition of the last soon occupied his ruin, and Lambert having been murdered by one of his courtiers, the chief authority devolved to Berenger, who was also at this period freed from another rival, by the death of Arnulph. A formidable invasion by the Hungarians, however, in repelling which Berenger was unsuccessful, together with his despotism and insolent behaviour, induced several Italian princes to offer the kingdom of Italy to Louis, King of Provence. This prince made several attempts to gain possession of it; and having in one of his invasions reached Rome, was crowned Emperor by Pope Benedict IV.; but being surprised in Verona by Berenger, was by him deprived of his eyes, and sent back to Provence. The latter having at length made himself sole master of Italy, continued to reign undisturbed for 20 years. Having assisted the Pope John X. against the Saracens, he was by him crowned Emperor. A very formidable conspiracy soon was formed against Berenger, headed by the Marquess of Yvrée. Italy was again invaded by the Hungarians, who destroyed Pavia, and most of the principal cities; and Rodolph, King of Burgundy, was elected King of Italy by the conspirators, in which the treacherous murder of Berenger soon left him without a rival. The intriguing of Hugues II., Marchioness of Yvrée, who had been the author of the last revolution, did not leave Rodolph long in quiet, and her arts soon succeeded in expelling him from Italy, and substituting in his room Hugh, Count of Provence, who was crowned at Pavia, A.D. 927. Having married Marozia, a Roman lady of infamous character, but great influence over her countrymen, he, for some time, enjoyed the sovereignty of that city; but having insulted Alberie, the son of Marozia by a Roman marquess, the latter persuaded the Romans to reassert their liberty, and was elected by them consul. Hugh, however, obtained some victories over his foreign opponents, regained the friendship of Alberie, by giving him his daughter in marriage. Hugh’s reign lasted 20 years, in part of which his son, Lothaire II., was associated with him in the government. But his name never appears to have been popular; and, in 947, Berenger, Marquess of Yvrée succeeded in expelling both father and son from the throne. Hugh retired into Burgundy, and on the death of Lothaire, in 950, Berenger II. was acknowledged King of Italy. The commencement of the new reign was marked by calamities. Italy was first invaded by Henry Duke of Bavaria, who took and plundered Aquileia, but retired without making farther progress. After him the Hungarians overran the greatest part of Italy, and were only persuaded to depart by an enormous bribe, which was raised as a tax from the people. To add to their misfortunes, Berenger was oppressive and tyrannical. Having made himself master of Pavia, in which Adelaide, the widow of Lothaire, resided, he imprisoned her in a dungeon, and treated her with the greatest cruelty. From this confinement, however, she contrived, in the most extraordinary manner, to make
The reign of Henry III. is also remarkable for the first appearance, in history, of the Norman princes in Apulia, who were afterwards the founders of the kingdoms of Naples and Sicily; and for the first alliance of the emperor with the republic of Venice; which had now ceased to pay its former homage to the Byzantine emperor, and had already risen to a great degree of wealth and power, having, with its rivals, the Pisani, Genoese, and the republic of Amalfi, engrossed all the commerce of Europe.

The reign of Henry IV. is distinguished by his long and violent contests with the pontiffs. During a long reign, the young emperor was entrusted to the guardianship of the pope, whose power and ambition so much increased, that they openly aimed at universal dominion, and from the subjects, became the masters of the secular princes; and, for 70 years, the history of Italy presents little else but a series of struggles between weak and vicious monarchs, and ambitious and unprincipled priests. The history of the humiliating submission of Henry IV. to Pope Gregory VII. the haughty Hildebrand, is well known; and the unnatural wars which the pope occasioned, by exciting Henry's sons to rebel against their father, excite more disgust than interest.

About this period a new cause of disagreement arose between the emperors and the papal see. The Countess Matilda, widow of Guelph, duke of Bavaria, having died, bequeathed all her immense possessions to the see of Rome. These consisted of the greater part of Tuscany, of Mantua, Parma, Piacenza, Ferrara, Modena, Verona, Viterbo, and Orvieto, part of Umbria, Spoleto, and the marquisate of Ancona. As it was not considered lawful for a female to alienate the seigniory of the empire, the Emperor Henry V. disregarding this bequest, seized on the succession; and, although by the convention at Worms, a temporary agreement was entered into by the Pope Pascal; yet, as we shall see afterwards, the validity of the bequest was long maintained by the church and its supporters, which occasioned much jealousy and contention between the emperor and his Italian vassals.

During the reigns of the emperors of the house of Saxony, the political state of Italy had undergone a remarkable change. About a century before, Otho I. had allowed to most of the Italian cities a regular municipal government, and had left to themselves the choice of a particular form. In the exercise of this power they seem generally to have selected as a model the Roman republic or its colonies, as far as least as their limited acquaintance with history would permit. At the head of their administration were placed two consuls, elected annually by the suffrages of the people. These magistrates, as judges, were entrusted with the care of administering justice to their fellow
citizens; and, as generals, they commanded the military force of the city, when called out by order of the emperor. A third duty of the consuls was to preside in the councils of the city. Of these there were commonly two, besides the general assembly of the people. The first was called the council "de credenza," or privy-council. It consisted of few persons, and was entrusted with the administration of the finances, and all the foreign relations of the community. The other council, consisting of 100 or more members, was styled the senate, or special council; and in it were arranged the resolutions or measures, which were afterwards submitted to the deliberations of the people in their general assembly, held in the market place, or public square, which was termed a parliament. This assembly was sovereign; but in most cities there was a law, which allowed no subject to be laid before the parliament until it had first been considered by the council "de credenza" and the senate. Each city was divided into four or six divisions, each provided with different organized military bodies, with different standards.

The imperfection of the general administration of justice under the feudal system, rendered this regular military organization more necessary, and afforded constant occasion for keeping alive a warlike spirit. As each member of the empire was supposed to be entitled to refuse a partial judge and appeal to his sword; the first wars of the Italian cities with each other, or against the powerful nobles of their vicinity, were not considered as acts of rebellion, but merely as those measures for self-defence, which it was competent for them to adopt in common with the other vassals of the empire. The cities of Milan and Pavia were the first whose private wars attract attention. Their first open rupture arose from their espousing opposite sides, on the double election of Henry II. and Ardoine.

At a subsequent period, the city of Milan ventured, in defence of the church, to declare war on the emperor Conrad, who, in an attack on that city, was repulsed with loss. It was during this war that Erbert, archbishop of Milan, invented the "carroccio," a device which was immediately adopted by all the Italian cities. This was a kind of four-wheeled waggon, painted red, and drawn by four pair of oxen, completely covered with housings of red cloth. In the middle of the car there was a very long pole, surmounted with a gilded globe, under which was displayed the banner of the city, and still lower an image of Christ on the cross, with its hands extended, appearing to bless the army. Behind, was a stage occupied by a band of musicians, and before, another, where some chosen soldiers were placed to defend the sacred car. As the loss of the "carroccio," like the ark of the covenant of the Israelites, was regarded most fatal and disgraceful, no expedient could have been better devised for giving to the half-trained infantry of the cities, that solidity which alone could enable them to withstand the shock of the heavy armed cavalry of that age. Crowded around the palladium of their liberties, they presented on every side an impenetrable mass to their assailants; and, if obliged to retreat, the slow motion of the "carroccio" prevented that movement from degenerating into a disorderly flight.

Under a constitution that thus at once kept alive the flame of civil liberty and military glory, the cities of Lombardy had gradually attained to independence. Those nobles who had formerly exercised over them no small degree of authority, and to whom they had been accustomed to look up as their defenders, now in their turn began to consider it not only honourable, but prudent to be enrolled among their citizens.

The already flourishing commerce of the commercial cities of Pisa, Venice, and Genoa, afforded a ready market for the products of the soil; and even this species of traffic was the mean of diffusing a considerable degree of wealth among the inland cities.

The long continued struggles between the Saxon princes and the popes, confirmed the independence of the Lombard cities; as the former, in order to secure their attachment, added considerably to their privileges, while the latter inculcated the spirit of resistance against a foreign ruler. Accustomed, too, during this period of anarchy, to trust to their own resources alone, the ties which connected them with the empire were insensibly weakened, and the Italian citizen's feelings of patriotism were confined within those walls which afforded him the protection which his German sovereign could not now secure.

During the years that intervened between the peace of Worms and the death of Henry V. little occurred to interrupt the tranquillity of Italy; and the only warlike events recorded, are the conquest of Lodi and Como by the Milanese, and their long contest with the city of Cremona.

The death of the emperor without issue, however, gave rise to a contest of greater general interest, and more lasting effects. The partisans of the four last emperors in Germany had been denominated Ghibelines, from Ghibelina, or Ghibelina, a castle among the mountains of Hertfeld, which had been the ancient seat of their family. Their opponents received the name of Guelphs, from the appellation of the dukes of Bavaria, the most powerful rival of the reigning family.

As, however, the Bavarian family had always protected the popes during their contests with the two last emperors in Italy, the names Guelph and Ghibeline soon came to denote the different parties of the pope and the emperor. On the death of the Emperor Henry V. his nephew Frederic, duke of Suabia, aspired to the crown. The diet, however, influenced by the archbishop of Mentz, the enemy of the Ghibelines, elected Lothaire duke of Saxony, who was intimately connected with the Guelphs. Frederic immediately took up arms; and his brother Conrad, duke of Franconia, having returned from the Holy Land, assumed the title of king, with the consent of his brother, and immediately proceeded to Milan, where he was crowned king of Italy.

But the Pope Honorius having declared in favour of Lothaire, and having engaged the cities of Pavia and Cremona, with their allies, in his cause, the Milanese and Parmesans, on whom Conrad depended for assistance, were obliged to defend themselves; and, on the arrival of Lothaire with a very small army in Italy, he was forced to retire into Germany.

The emperor having proceeded to Rome, was crowned in the church of the Lateran by Pope Innocent II. as the Vatican, however, was occupied by the troops of Roger I. king of Sicily, who espoused the cause of the antipope Anacleto, and the family of the Frangipani, in Rome, Lothaire was soon obliged to leave that city, and return to his own country, where, having defeated his two rivals, Conrad resigned his pretensions to the crown, and was appointed commander of an army, sent into Italy to assist the pope against Roger, king of Sicily. These troops were at first successful, with the help of the Pisan fleet, in forcing Roger to
raise the siege of Naples; but, on their departure, innocent having fallen into Roger's hands, was compelled to acknowledge his right to the kingdom of Sicily, and to grant him (what he had no power to give) the city and territories of Naples. The Neapolitans, perceiving that resistance was vain, surrendered to the Norman prince; and their republic, which had existed for several centuries, was incorporated with the kingdom of Sicily. These schisms in the church and the empire, tended still more to strengthen the cause of the Lombard republics; and even the inhabitants of Rome, weary of the crimes of rival popes, and incited by the preaching of Arnold of Brescia, a monk, who inculcated the principles of theocracy, elected a senate, and placed the executive powers, formerly belonging to the pope's prefect, in the hands of an officer styled the patronian; and even put to death Pope Lucius II. who ventured to resist the authority of the senate. On the death of the Emperor Lothaire, in 1137, his former competitor, Conrad III. was elected his successor. His reign lasted fourteen years; but during the early part of it, he had to contend with the Guelf princes of Bavaria and Saxony; and in 1147, he had, with Lewis VII. of France, been persuaded by St. Bernard to lead a powerful army of crusaders into the East. The expedition was unsuccessful; and on his return, he died while meditating a visit to Italy to receive the imperial crown.

By the election of his nephew, Frederic of Suabia, surnamed Barbarossa, who was equally related to the Guelf and Chibeline families, the animosity of these factions was for a time laid to rest; and the whole military forces of Germany, rendered more formidable by the civil wars in which they had been so long engaged, were united under the standard of a prince, not more distinguished for his valour, than for the high and unbending severity of his character. The new emperor was immediately solicited to march into Italy, by Robert, prince of Capua, who had been deprived of his states by Roger, King of Naples and Sicily; by Pope Eugene IV., whose authority he promised to re-establish in Rome; and by the Lodesans, whose city and territory had been conquered by the Milanese. In answer to the complaints of the citizens of Lodi, Frederic dispatched without delay a special messenger to Milan, commanding peremptorily the immediate restitution of the rights of the Lodesans. This message, when communicated by the consuls to the people of Milan, was received with universal indignation, and treated with contempt, while the envoy of the emperor or difficulty escaped from the fury of the multitude.

They, however, transmitted to their new sovereign the usual presents; but prepared, by their arms, to take vengeance on the cities of Pavia and Cremona, who had joined with the Lodesans in arraigning their conduct before Barbarossa.

In 1154, Frederic entered Italy at the head of a very powerful army, and encamping on the plains of Roncaglia, convened there a meeting of his Italian feudatories.

Already prepossessed against the free cities of Lombardy, he appears to have willingly listened to the complaints made against them. To the Marquess of Montferrat, and the Bishop of Asti, who accused the inhabitants of Asti and Chieri, he promised to exercise exemplary vengeance on those republics.

Having heard the complaint of Pavia and its allies against the Milanese, he ordered the contending parties to cease their hostilities, and await his decision at Novara, whither he commanded the Milanese consuls to conduct him. The route by which he marched, however, had already been laid waste in the war between Milan and Pavia, and Frederic, enraged at not finding the necessary supplies for his army, dismissed the consuls, and began to lay waste the Milanese territory. The citizens of that republic having in vain attempted to appease his wrath by the offer of a tribute, proceeded to repair their fortifications, and put them in a posture of defence, sending at the same time embassies to solicit earnestly the assistance of their ancient allies. In the mean time, Frederic put in execution his threat against Chiari and Asti; which, being deserted by the inhabitants on his approach, were pillaged and burnt by his soldiery. The city of Tortona having refused to renounce its league with Milan, was put under the ban of the empire; and, after sustaining a siege of two months, with the greatest valour and fortitude, its citizens were obliged to capitulate, on the condition of evacuating the town immediately, being allowed to take away only what they could carry on their shoulders.

The fate of Tortona only filled the Milanese with admiration for their brave defenders, and animated them to resistance. Frederic having been crowned king of Italy at Pavia, now proceeded to Rome, in order to receive from the pope the imperial diadem. Before approaching that city, he was met by three cardinals, sent by Pope Adrian IV. requesting his assistance in subduing the Romans. To shew his willingness to comply with the pope's desires, Frederic, having got possession of the person of Arnold of Brescia, delivered him up to Adrian, by whom he was cruelly put to death. To the deputies of the senate Frederic paid no attention, nor did he enter the city but on the day of coronation; and even on that day, there was a skirmish of some consequence between his soldiers and the citizens. The emperor next marched into the duchy of Spoleto; and the inhabitants of the city of that name having had the misfortune to excite his indignation, the town was given up to pillage. Frederic next proposed to enter Apulia, where Robert of Capua had succeeded in raising an insurrection in his favour against William the Bad, son of Roger I.; but his troops were impatient to return home, and their ranks were already thinned by fatigue and disease. He was, therefore, obliged to disband his army at Ancône, and return to Germany. The unfortunate prince of Capua, was betrayed by one of his adherents into the hands of William, who put out his eyes; and he shortly afterwards died in prison at Palermo. Sarcely had the army of Frederic quitted Italy, when the Milanese proceeded to rebuild the walls of Tortona at the public expense; and so general was the desire to testify their gratitude to allies who had suffered on their behalf, that for three weeks half of the citizens of Milan, of every rank and profession, was employed either in personally labouring at the houses and fortifications of Tortona, or in repelling the assaults of the Pisans, who took every opportunity of interrupting the work.

Not content with re-establishing Tortona, the Milanese turned their arms against the allies of the emperor, and were successful. Pavia was forced to accept of a dishonourable peace, the Marquess of Montferrat defeated, and the inhabitants of Lodi again reduced to submission.

The example of Milan was imitated by her allies, and all Lombardy appeared in hostilities against Frederic. The pope, too, alarmed by the success of William, had
granting him the kingdom of Sicily and Naples; and in his letters to the emperor, had assumed a degree of haughtiness, which offended him so much, that he ordered the legates to depart from Germany. Perceiving the necessity of returning to Italy, he convoked a meeting of the princes of the empire, with their vassals, at Ulm, for the express purpose of punishing the defection of the Milanese. The army, which now entered Italy, was still greater and better organized than the former one. After having obliged the Brescians to atone for their short opposition to his arms by a heavy fine, Frederic summoned a sort of diet in his camp, where some military regulations were enacted, and the deputies from Milan were heard in their defence. Their professed tribute, and excuses for their conduct however, were not accepted; the diet declared Milan under the ban of the empire; and the army was ordered to prepare for the siege of that city.

Having accepted the submission of most of the Italian nobility, and of the smaller towns, Frederic proceeded to lay waste the Milanese territory; and having raised entrenchments round the city, attempted to reduce it by famine. The distress occasioned by this measure, soon induced the majority of the people to listen to the advice of the Count de Blandrata, to submit to the emperor. A treaty was accordingly concluded, by which Frederic engaged to evacuate the Milanese territory, and that of their allies of Tortona and Crema, on condition of their restoring their liberty to the towns of Como and Lodli, and renouncing the other sovereign rights they had assumed; and besides building the emperor a palace, it was stipulated, that a considerable annual tribute should be paid to him.

Soon after concluding this treaty, a general diet of the kingdom of Italy was held at Roncaglia. Its resolutions evidently mark the terror which the success of the German army had inspired. The ancient feudal prerogatives of the emperor were acknowledged, and his exactions submitted to; and the right of appointing consuls and judges declared to reside in his person. A new measure was also approved of, which, in its consequences, proved most fatal to the liberties of the Italian cities. This was the appointment of a new magistrate in each town for the administration of justice, who was styled a podesta. The right of nomination was vested in the emperor; but it was enacted, that the podesta should in no case be a native of the city over which he presided. Another enactment, no less injurious to the privileges of the cities, was that which deprived them, together with the independent nobles, of the right of making war and peace, which they had so long enjoyed. Having inquired, also, into the cause of the dispute between Cremona and Piacenza, Frederic decided against the latter, which was allied to Milan, and commanded its fortifications to be demolished. Encouraged by the general obedience of the diet, Barbarossa did not deem it necessary to adhere to his agreement with the Milanese, and not only seized on part of their territory, but ordered the fortifications of Crema, their ally, to be destroyed. The indignation of the people, already excited by these insults, at length burst into open insurrection, on the attempt to substitute the podesta for the consuls; and the inhabitants of Milan and Crema once more set the emperor at defiance.

Frederic having again laid waste the Milanese territory, proceeded to lay siege to Crema, whose hostages he caused to be executed in sight of the walls. The citizens, however, undismayed, continued for six months to defend themselves with persevering valour, till at length worn out with famine, they were forced to surrender, and leave their city, which was razed to the ground.

The death of Pope Adrian IV, which took place a few months before, occasioned a change in the affairs of Italy by no means favourable to the emperor. The college of cardinals, unable to agree in their choice of a successor, had nominated two popes: the one, Alexander III, was generally recognised by the church; while the other, Victor III, had on his side the scurvy and people of Rome, with whom Frederic, having lately concluded a treaty, was inclined to concur. He, however, summoned a council at Pavia, which ordered the rival popes to await his decision. Alexander refused to obey, asserting that the pope was neither subject to emperors or councils. The decision was accordingly in favour of Victor, who excommunicated his rival; who, in return, excommunicated Frederic, and discharged his subjects from their oath of allegiance.

In the mean time, being obliged to send back to Germany the greater part of his army, he was obliged to carry on his hostilities with Milan on a small scale; and at Cassano, was defeated by the forces of the republic. The Milanese had the same advantage at Bul-chignano; but an army of 100,000 Germans having, in the course of the summer, joined the emperor, their city was again invested, and all supplies of provisions completely cut off from the besieged. The people at length, unable any longer to sustain their privations, compelled the consuls to surrender at discretion. The keys of the city, and the carocci, were, at the emperor's command, reluctantly delivered up to him; and, after ten days of painful suspense, the whole inhabitants were ordered to quit the city. The unfortunate exiles having taken refuge in the neighbouring towns and villages, the army of the emperor, assisted by the inhabitants of Lodli, Cremona, and Pavia, and other enemies of the Milanese, proceeded to put in execution the sentence of destruction; and, in six days, the city of Milan was completely demolished.

This act of severity spread an universal terror through the Italian states; the authority of Frederic was every where acknowledged; and even the more independent maritime republics of Pisa and Genoa submitted to his sovereign decision their mutual disputes. Having disbanded his army, he took up his residence with his court at Pavia; while his ministers and podestas exercised, without control, the most tyrannical authority, and, by their cruelty and extortions, rendered the imperial sway as much detested as it was dreaded.

The inhabitants of Verona, and other cities, which had as yet sided with the emperor, attempted at first to represent these grievances to him; but receiving no redress, and finding their complaints overlooked, they determined to recover their rights by force, and to confine the power of Barbarossa within the same bounds as that of his predecessors. The league at first consisted of Verona, Vicenza, Padua, and Treviso; and being joined by the Venetians, who had long been jealous of the power of Frederic, they proceeded to open hostilities, and expelled his German officers from their territories. On hearing of this revolt, the emperor collected the troops of his Lombard dependants, and marched against the Veronese. He soon, however, perceived that his troops were not to be trusted; and was obliged to leave his camp in a precipitate manner, and shortly after to depart from Italy, where he found it was now unsafe for him to remain without a Germ
army. On his return home, finding that a civil war had arisen, he was compelled to remain in Germany for two years, and thus allow the Lombard cities time to prepare for a vigorous resistance. In the mean time, the antipope Victor died, and his party appointed as his successor Pascal III. who, being acknowledged by none of the European princes, began to be despised even by his own adherents in Rome. The friends of Alexander in Rome, took advantage of this to propose his return; and it was at length determined in the senate, to invite him to leave France, and take up his residence among them. He was accordingly received with great joy, notwithstanding the opposition of the emperor's lieutenant, Christian, archbishop of Mentz, whose attempts against Rome were frustrated by the troops of William, king of Naples. This prince died soon after, leaving a son in his minority, afterwards called William the Good. In the end of this year, the emperor again crossed the Alps, and, without taking any decisive step against the Venetian, marched into the south of Italy. The confederates, however, lost no time in preparing for defence. Having called a general council at Puntido, near Milan, they were joined by the deputies from Cremona, Bergamo, Brescia, Mantua, and Ferrara; a general plan of resistance was organized, and an oath agreed on, to be taken by all the members of the confederation, which now assumed the title of the League of Lombardy. Their first measure was to rebuild the walls of Milan; for which purpose, each city of the League sent a large body of men, and so eager were the Milanese to secure their independence, that, till the fortifications were completed, no attempt was made to repair their ruined habitations. The city of Lodoli was forced into the confederacy, which was soon after joined by Placentia, Parma, Modena, and Bologna, and now consisted of fifteen of the principal cities in Italy. Frederic having in vain assaulted Ancona, which was garrisoned by the troops of the Grecian emperor, Manuel Comnenus, proceeded to besiege Rome, which soon yielded to him; and the pope was obliged to retire for safety to Benevento. In the mean time, the German troops were attacked by the pestilential fever of the "Maremme," which, in less than two months, carried off all the principal officers, more than 2000 gentlemen, and a proportionable number of common soldiers. Such was the weakness of the German army after this loss, that Frederic, finding himself unable to make any attack on the Lombards, privately recrossed the Alps. On his departure, all those states whom the terror of his arms had formerly kept back, hastened to join the League, which now consisted of all Lombardy, except the city of Pavia, and William, Marquis of Montferrat. To prevent any junction between these allies, the League determined to build a city between them, and having fixed on a spot at the confluence of the river Tanaio and Bormida, whose situation rendered it almost impregnable, the whole armies of the League laboured at the work with such assiduity, that, in a few months, the walls, and a competent number of houses, were finished, and the inhabitants of five neighbouring villages transported to it, and authorised to constitute a free and republican government. This city, destined to be a monument of their alliance, and of their zeal for liberty and the church, was named Alexandria, after the pope, the head of the League; and so rapid was the increase of its population, that in the course of one year after its foundation, the inhabitants of Alexandria were able to send to the field a body of 15,000 armed troops.

In the mean time, the emperor attempted, by all the means in his power, to throw the seeds of dissension among the confederates; sometimes endeavouring to treat with the pope, with the king of Sicily, or with the cities singly; but without effect. He then sent the archbishop of Mentz, with a considerable body of troops, into Tuscany; who, taking advantage of the war between Pisa, and its allies the Florentines, with the Genoese, for the sovereignty of Sardinia, pretended to observe a neutrality, and was chosen arbiter by the contending parties. No sooner, however, had the magistrates of Pisa and Florence appeared at the place appointed, than the archbishop, irritated at their having concluded an alliance with the Grecian emperor, ordered them to be thrown into a dungeon. Putting himself then, at the head of the armies of Sienna, Pistoia, and Lucca, with the nobility of Tuscany, Umbria, and Romagna, he proceeded to invade the Florentine territory. But the Pisans having succeeded in making a diversion by attacking Lucca, Christian was twice defeated, and obliged to give up his designs against Florence. He now, notwithstanding, had contrived to collect a considerable army, with which, early in the following year, he began to lay siege against Ancona. In this he was assisted by the fleet of the Venetians, who were jealous of the inhabitants of that city becoming their rivals in the commerce of the Levant. The situation of Ancona is naturally strong; and the attempts to assault it by land or sea, were unavailing. The wooden towers of the archbishop were burnt by the citizens, led on by a courageous and patriotic female; and of the Venetian squadron, seven vessels were destroyed and stranded, by divers cutting their cables under water, during a violent gale. The town, however, contained 12,000 inhabitants; and the preceding harvest having been bad, and all supplies completely cut off, it soon began to suffer all the miseries of famine. An offer to capitulate being refused by the archbishop, they still continued, with unparalleled fortitude, their resistance, although their remanning stock of provisions consisted only of 15 sacks of corn, and one dozen of eggs; and the poorer part of the inhabitants were reduced to feed on the most nauseous and unwholesome substances. At length, the Guelph nobles of Ferrara contrived, by an ingenious stratagem, to raise the siege. Having collected a few hundred cavalry, they contrived to pass through the imperial rear-guard; and, led on by William Marcheselli, who commanded the vassals of the Countess Bertinoro, the zealous friend of Ancona, they encamped on the top of the mountain of Paleogora. At midnight, each horseman fastening several torches to the end of his lance, the whole body proceeded down the mountain, in line, to attack the imperial camp. Christian, alarmed by the formidable appearance, gave orders to retreat; and the provisions of his camp were carried to the famishing inhabitants of Ancona by the Ferrarese troops. The retreat of the archbishop was followed, next day, by the departure of the Venetian fleet. It is satisfactory to add, that the conduct of Marcheselli was magnificently rewarded by the eastern emperor.

In the end of the year, Frederic again entered Italy by the way of Mount Cenis. Having accepted the surrender of Asti, whose citizens were alarmed at the strength of his army, he sat down before Alexandria, which, after some ineffectual attempts to storm, he de-
The pope having arrived at Venice, after much difficulty, a truce was agreed on; the duration of which was to be fifteen years with the king of Naples, and six with the Lombard League. The years of the truce were spent by the emperor in endeavouring to disunite the League: but in this he was unsuccessful; and the only towns that joined him were Tortona and Alexandria, to the latter of which, the name of Cesarea was given. In the year 1183, a general diet of the empire was held at Constance, where the emperor's son, Henry VI., was associated with him in the government; and the deputies of the Lombard cities having attended it, a definitive truce was at length concluded, in which the emperor acknowledged and restored the rights of the free states; and Italy at length enjoyed peace. The calm which followed the treaty of Constance was not of long duration. The tranquility of the free Italian states was soon disturbed by petty wars with their neighbours and the nobility, or by the usurpation of ambitious individuals or families, and the fury of contending factions among themselves. To enter particu-
of the German troops, with the assistance of the Saracens settled in Sicily, maintained the Ghibelline party there; but they were equally unfortunate. But it was in only alone that Innocent met with opposition; in Hungary, Denmark, France, Portugal, Arragon, and Poland, his rescripts were implicitly obeyed; and in England, his excommunication of King John, and that prince's surrender of his crown, are familiar to every British reader.

In the mean time, a new pretender to the crown of Naples appeared, Walter, count of Brienne, the son-in-law of the late King Tancred; but this nobleman, who, (it is supposed) at the instigation of Innocent, invaded Naples with a small army, soon fell in a skirmish with the German troops of Margovald. Soon after this, a period was put to the German dissensions, by the death of Philip of Suabia, who was murdered by a private enemy; and Otho, having married his daughter, and thus united the rival families, was unanimously acknowledged king of Germany and the Romans at Alberstadt.

Early in the following year, Otho entered Italy to receive the imperial crown, with which Innocent had promised to invest him. His first task was to reconcile Azzo of Este (now acknowledged lord of Ferrara) with Eccelinno Romano. This was at first difficult, the marquess having challenged his rival in Otho's presence; but he at last succeeded in effecting a temporary agreement. To secure them both, he confirmed to Azzo his title of marquess of Ancona, which had been conferred on him by the pope, reserving, however, the rights of the empire; while to Eccelinno he gave the office of podesta of Vicenza, imposing on it, at the same time, a very considerable fine, as having been guilty of rebellion.

Otho then proceeded to Rome, where he was crowned emperor by the pope; but as the latter soon found that the Ghelph prince was not so obedient as he could wish, and especially refused to resign his claims to the inheritance of the Countess Matilda, they soon parted equally discontented with each other, to seek allies in their approaching war. The emperor secured in his interest the Pisans, the German army in Naples, the Milanese, Parmarans, and Bolognese, Eccelinno, and Salagueria. On the other side, the party of the pope was warmly embraced by Azzo of Este, the cities of Genoa, Pavia, and Cremona, and the Marquess of Montferrat. Innocent having likewise negotiated a marriage between the young Frederic of Naples and Constance, daughter of the king of Arragon, entered into a treaty with the King of France and several German princes, to elect him to the crown of Germany; of which he represented him unjustly dispossessed.

On hearing of this, Otho immediately declared war against Frederic; and, marching into his kingdom, made himself master of Capua, Salerno, and Naples; but was interrupted in the midst of his victories by the intelligence, that he had been excommunicated by Siffredi, archbishop of Mentz, and the imperial dignity declared vacant, and that the league against him had been joined by the king of Bohemia, the duke of Bavaria, and many others of the princes of the empire. He therefore quitted Italy without delay, and proceeded into Germany, whither he was soon followed by Frederic. This prince, setting out from Genoa, marched through Lombardy, where many attempts were made by the Ghelph states to intercept him, which he escaped by the assistance of the Marquess of Este, and arrived in safety at Coblentz, in the country of the Graisons, where he was met by his German allies,
History. 

A.D. 1214. who conveyed him to Aix-la-chapelle, and there crowned him king of the Romans. Otho, in the meantime, had been defeated by the King of France at Bouvines, with a loss of 30,000 men; by which his power was so much weakened, that he never afterwards was able to make head against his competitor.

A.D. 1215. It was about this period that the dissensions of the Bourdelmonti and the Uberti first broke out in Florence; which kept that city in a state of civil war for more than 30 years, and prepared its citizens for taking the distinguished part which they afterwards did in the wars of Italy. (See Florence.)

The following year is marked by the death of Innocent III., whose intrigues had so much raised the papal authority, and occasioned so many wars in Europe. Besides his unprincipled political conduct, his character was stained by his cruel persecutions of the Albigeneses, and the encouragement for that purpose given to the Spaniard Dominic and his followers, so distinguished in after times for their hostility against religious liberty. Innocent died at Perugia, on his way to Tuscany, for the purpose of restoring peace between the Pisans and Genoese, in order to combine their forces for the defence of Palestine.

Our attention should now naturally be directed to the magnificent conquests of the Venetians and Genoese during the 4th crusade; but as these transactions, and the naval victories of these two republics, deserve to be narrated in a more connected manner, their history will fall more properly to be considered under the article Venice.

The contest between Otho and Frederic armed the cities of Italy against each other. The Milanese remained constant in their attachment to the cause of Otho; and were joined by Thomas, count of Savoy, and Crema, Placentia, Alexandria, &c. On the other side, Pavia, Cremona, Parma, Modena, &c. embraced the cause of Frederic, and were styled the Ghibeline League. The city of Pavia, however, after several defeats, was forced to join the opposite party. Notwithstanding these wars, the wealth of the Lombard cities was daily increasing; and, even at this early period, the opulence among them had begun to lend money on interest to their foreign neighbours—a trade which they afterwards monopolized to such a degree, that, in most European countries, the name Lombard became synonymous with that of banker. The progress of science, too, such as it existed in these ages, attested their prosperity. The university of Bologna, originally dedicated to the study of the civil and canon laws, now possessed teachers of every branch of liberal science; and the number of students, and the many rival establishments in other cities, demonstrated the zeal of the Italians for those acquirements, which had been unknown to their ancestors.

The death of Otho having now put an end to the competition for the empire, the Pope Honorious III. agreed to invest the King of Naples with the imperial dignity, upon condition of his immediately taking the cross, and proceeding to the Holy Land. Frederic, whose education at the papal court had taught dissimulation to a character otherwise resembling his ancestors, readily accepted the condition. He, however, remained in Germany for two years, until he had obtained the coronation of his son Henry (then only ten years old) as king of the Romans. He then entered Italy at the head of a considerable army, and proceeding directly to Rome, received from Honorious the imperial crown, renewing at the same time his promise of proceding to Palestine. But the affairs of his hereditary kingdoms first demanded his attention; and he found them in such a state of anarchy and insubordination, that for several years they continued his sole object of attention, notwithstanding the entreaties and menaces of the pontiff. His zeal in the cause of the crusaders was at length roused, by his second marriage with Yolanta, the heiress of the kingdom of Jerusalem. He sent some reinforcements to the East, and began to make preparations for embarking at Brindisi, where he collected his army. A pestilential fever, which raged among the troops, and attacked the emperor himself, obliged him, for another year, to defer his voyage. But on the death of Pope Honorius, Gregory IX., who succeeded him, excommunicated the emperor for not performing his promise, accusing him at the same time of feigning disease, for the purpose of evading it. Frederic, however, ordering his bishops to disregard the papal sentence; and, appealing to the European princes, determined by his actions to prove his sincerity, and embarked the following autumn for the Holy Land.

But this measure did not appease the indignation of the pope; and not contented with exciting his subjects to rebellion, and sending an army of crusaders, headed by Frederic's own father-in-law, to lay waste his territories, he even interdicted the Christians in Palestine from giving obedience to his orders. Notwithstanding these difficulties, the emperor succeeded in making an honourable peace with the sultan of Egypt, and Jerusalem was restored to the Christians; though such was the veneration of the patriarch for the papal mandates, that he refused to assist at Frederic's coronation; and the new king of Jerusalem was obliged, with his own hands, to invest himself with the ensigns of royalty. His rapid return to Italy, soon disconcerted the plans of his enemies; the army, which had invaded Naples, was disbanded; and the pope, alarmed for his safety, hastened to conclude a treaty.

In this peace, the cities of the League of Lombardy were included, at the desire of Gregory, who knew the value of their assistance; and their independence was thus for the second time publicly recognized.

The emperor had now to contend with a new enemy in his own family. His son Henry, king of the Romans, whose ambition, it is said, was excited by the secret intrigues of the pope, appeared in Germany in open rebellion against his father; and the Milanese had promised to crown him king of Italy, an honour which they had constantly refused to Frederic. In public, however, Gregory affected the utmost horror at this rebellion, and exhorted the German prelates not to lend their aid in so disgraceful a course. But on the approach of the emperor, the young prince was deserted by all his partisans, and obliged to throw himself on the mercy of his father. Frederic having deprived him of the crown of Germany, sent him into Apulia, where, after a confinement for many years, he died a prisoner. He now returned into Lombardy to punish the defection of the Milanese. To this he was incited by Eccelino III., (commonly called the cruel) who had for 10 years governed Verona, as podesta, with absolute authority, and who, also, as chief of the Ghibeline faction, had considerable influence in Cremona, Parma, and Modena, which were zealously attached to that party.

Frederic's first exploit was the surprise of Vicenza, which having been taken by storm, was pillaged by the
Germans. Padua, the defence of which had been committed to 16 of the principal inhabitants, was treachery-surely surrendered by them to Azzo, 7th Marquis of Este, who, in his turn, was obliged to deliver it up to Eccelino.

The emperor having collected an army near Verona, marched into the territory of Brescia; and having come up with the Milanese army at "Corso Nuova," completely defeated it, and carried off the carroccio as a trophy of his victory. After the battle many of the fugitives were cast to pieces by the inhabitants of Bergamo, but the greater number were protected by Paganino della Torre, lord of Valesassina, whose family afterwards acquired so much power in Milan. The imperial army then marched into Piedmont, where the terror it occasioned detached, for a time, the cities from the Guelph league; and Milan, Brescia, Placentia, and Bologna, were left alone in their resistance to Frederic. The latter laid siege to Brescia, and continued for some months before it, but with so little success, that he was obliged to raise the siege.

The long-dissembled enmity of the pope at length burst forth in a regular sentence of excommunication against Frederic; his subjects were released from their allegiance, and every place that received him was placed under an interdict. The first effects produced by this was the defection of Azzo of Este, and Alberico Romano, brother of Eccelino. The emperor retired to winter at Pisa, where he still had a powerful party, who were called Conti, in opposition to the Visconti, a noble Pisan family of the Guelph faction. Henzio, the natural son of the emperor, having married the widow of Ubaldo Visconti, chief of the Visconti colony in Sardinia, was invested by his father, with consent of the republic, with the title of king of Sardinia. The barbarous Eccelino was, in the meantime, exercising the most dreadful cruelties on the unhappy Guelphs and friends of the house of Este at Padua, and every day adding to the unpopularity of the Ghibelines. Frederic now marched towards Rome; but a crusade was preached against him by Gregory, the people every where took up arms, and he was forced to abandon his design, and retire into Apulia. The Guelphs then besieged, and took Ferrara, from whence Saluzzoer had expelled the Marquess of Este, and imprisoned the former nobleman at Venice, where, after a confinement of five years, he died at the age of 80. But the papal party received a check by the defeat and capture of the Genoese fleet, by the Pisans and Neapolitans; and two cardinals, and several French pretenses, who were in the former squadron, fell into the hands of Frederic.

The aged pope, overwhelmed by this disaster, died a few months after, and his death was followed, in three weeks, by that of Celestine IV, his successor. The concile, after very long discussions, came to the resolution of electing Cardinal Sinibaldo Fiesco, of the Lavagna family at Genoa, who had always been friendly to the emperor. But the new pontiff, who assumed the name of Innocent IV, soon showed that his former attachments were lost in the interests of his new office. Frederic having in vain attempted to gain him over by negotiations, determined to seize on his person; but Innocent, being apprized of this, secreted himself, and, embarking on board the Genoese fleet at Civita Vecchia, arrived in safety at Genoa, where he was received with enthusiasm by his compatriots. He then travelled to Alexandria and Asti, which cities were persuaded again to join the Guelph league, and from thence to Lyons; where, under the protection of Louis IX. of France, (commonly called St. Louis), he summoned a general council of the church.

The melancholy state of the Christians in the east Council of Council first engrossed the attention of the council, and the council French King was persuaded to undertake his expedition to Egypt, which afterwards proved so disastrous. At the second meeting of the council, the emperor was summoned to answer the charges of the pope. His defence was ably pleaded by Taddeo of Suessa; but the council found him guilty, and solemn sentence of excommunication was pronounced, the throne of the empire declared vacant, and the kingdoms of Sicily placed under the control of the pontiff. On being informed of this sentence, Frederic at first held it in derision, and wrote to all the princes of Europe, appealing against the arrogance of the church; but the domestic treasons which he soon discovered, the election of Henry, landgrave of Thuringia, as king of the Romans, and his subsequent victory over Frederic's son Conrad, soon showed him the fatal effects of the enmity of the pope; and he made every effort in his power, to reconcile himself with the church, but in vain. He had even determined to submit to the humiliation of a personal confession of his offenses to the pope; and for that purpose was on his way to Turin, the residence of Innocent, when he was informed of the revolt of Parma, which had always been attached to his family—a revolution effected by the personal relations of the pope in that city. The emperor's indignation at this event put an end to all ideas of accommodation; and, collecting some reinforcements from the cities of Piedmont, which remained attached to him, he hastened to join the army of his son Henzio, and lay siege to Parma. This army was increased by the addition of the troops of Padua, Vicenza, and Verona, under the command of Eccelino; but the garrison of Parma had also been powerfully reinforced by Azzo of Este, who had collected from every quarter the adherents of the Guelphs, and the entire army of Ferrara, at the risk of leaving his own territories exposed to the ravages of Eccelino. The number of its defenders soon occasioned a scarcity of provisions in Parma, and the emperor attempted to increase the popular discontent occasioned by this by an act of most atrocious cruelty. Having conducted, in sight of the walls, eight Parmaian prisoners, four of high rank, he ordered them to be beheaded, assuring the besieged, that they should witness the same spectacle every day till his prisoners (1000 in number) were finished. But this bloody spectacle was not repeated. The troops of Pavia declared that they came to serve as soldiers, not as executioners; and the emperor consented, lest this enormity should prove more fatal to himself than his enemies. In the mean time, certain of ultimate success, he employed his armies, during the winter, in building a new city, called Vittoria, into which, when he had reduced Parma, he proposed to remove its inhabitants. But the besieging having received a supply of provisions from Mantua and Ferrara, took advantage of the emperor's absence on a hunting excursion; and suddenly making a sally, and assaulting the ramparts of Vittoria, carried the place. The imperialists were put to flight with great loss, and Frederic, returning from the chase, joined them in their retreat to Cremona. The whole imperial treasure and jewels fell into the hands of the victors, and the new city was burnt and rased to the ground. Notwithstanding this mis-

28

A. D. 1247.

The aged pope, overwhelmed by this disaster, died a few months after, and his death was followed, in three weeks, by that of Celestine IV, his successor. The concile, after very long discussions, came to the resolution of electing Cardinal Sinibaldo Fiesco, of the Lavagna family at Genoa, who had always been friendly to the emperor. But the new pontiff, who assumed the name of Innocent IV, soon showed that his former attachments were lost in the interests of his new office. Frederic having in vain attempted to gain him over by negotiations, determined to seize on his person; but Innocent, being apprized of this, secreted himself, and, embarking on board the Genoese fleet at Civita Vecchia, arrived in safety at Genoa, where he was received with enthusiasm by his compatriots. He then travelled to Alexandria and Asti, which cities were
forty, and the defeat of his son Conrad in Germany, the spirit of the emperor remained undaunted. Even the intercession of St. Louis had failed in mitigating the rancour of Innocent; and, aware that no reconciliation could now be effected, Frederic continued the war with unabated vigour. Having sent his son, Frederic of Antioch, to the assistance of the Ghibelines at Florence, the Guelphs were at length expelled from the city, and many of their captains in the country were compelled to surrender. In Romagna, success attended the opposite party. The Bolognese, under the command of Ubaldini, the papal legate, succeeded in reducing obedience to the principal cities; and at length ventured to attack the imperial army under Henzius, king of Sardinia, at Fossalta, a place two miles from Modena. The battle was carried on, during the day, with equal success; but, at night, the Bolognese renewing their attack, the Ghibeline army was thrown into confusion, and Henzius himself taken prisoner. All the attempts of the emperor to prevail on the Bolognese to accept a ransom for his son were unavailing; and Henzius remained at Bologna in a state of honourable captivity till his death in the year 1271.

The consequence of the victory at Fossalta was the accession of Medici to the Guelph alliance. On the other hand, at Verona, and Padua, and the surrounding territory, Ecclesino, as chief of the Ghibelines, exercised a power now almost independent of the emperor; and the annals of these cities, during his long reign of blood, exhibit only scenes of diabolical cruelty, into the details of which we rejoice that the limits of this historical sketch preclude us from entering. Frederic had now retired into Apulia, from whence he sent considerable supplies to the army of St. Louis, then in the isle of Cyprus, and made a last and unavailing attempt to reconcile himself to the pope. On the 1st of Dec., he died of a dysentery at Florenzio, aged 56; having reigned 31 years as emperor, 38 as king of Germany, and 32 as king of the Sicilies.

The death of Frederic was followed by an entire change of the state of affairs in Italy. The crown of Germany, after the death of his son Conrad, was contested, for more than 20 years, by many princes of different families; and when Rudolph of Hapsburg (ancestor of the house of Austria), was at length elected, neither that prince, nor his successors, Adolphus of Nassau, and Albert of Austria, felt themselves sufficiently masters of their German dominions to interfere in the affairs of Italy. Sixty years, therefore, elapsed after the death of Frederic I. before the imperial dignity was conferred on any individual; while the tie, which had so long connected the Italian states with the empire, were almost completely broken, and the authority of the German Cesar no longer either dreaded or revered.

The pope, now released from his apprehensions, returned through Genoa and Lombardy to Perugia, being received with the greatest respect, even by the Ghibeline cities; while, at Milan and other states attached to his party, his return resembled a triumphal procession. But Innocent's ungrateful behaviour to the people of Milan soon alienated their affections; and their choice of the Marquess Lancia of Montferrat, a zealous Ghibeline, for their captain-general, proved their indifference for the papal party. Indeed, though the names of the factions continued the same, the interest of the pope, or the emperor, was but little considered by either side. The real contest was between the nobles and the people; and where the former were of the one party, the latter inclined to the other. At Milan, for example, the people were Guelph, the nobles Ghibeline—at Placentia the reverse; and the state inclined to one side or other, as either party of the community acquired the preponderance. This circumstance serves to explain the sudden and otherwise unaccountable changes in the policy of the Italian republics.

In the meantime, Conrad, king of the Ilomans, the emperor's eldest surviving son, had entered Apulia, which had now been governed by his natural brother Manfred, prince of Tarento, where his authority was acknowledged, except in Naples and Capua, which had been excited to rebellion by the pope. These cities, however, were soon forced to surrender, and Conrad remained master of the kingdom; which he did not long enjoy, being suddenly cut off by a fever at Lavello, in the 26th year of his age, leaving his infant son, Conradin, to the care of Manfred, and the regency to Berthold, margrave of Hoenburg, general of the German troops. The first act of these guardians was to solicit the protection of Innocent for their ward, who was innocent of the offences committed by his ancestors, and whose helpless condition ought to recommend him to the papal compassion. But the pontiff, who had forgiven the house of Suabia, and, in the lifetime of Conrad, had endeavoured to raise competitors against him, now demanded, in his own name, the immediate surrender of the kingdom, promising, at the same time, to bestow on Conradin when he arrived at the years of puberty, if he could shew any title to it. To these terms, Manfred and Berthold found themselves obliged to submit; and the pope, at the head of an army, and accompanied by the Guelph nobles, whom he had expelled by Frederic, entered Apulia. His first act was to deprive Manfred of part of his domains, which he bestowed on Borello d'Anglone, his personal enemy, who immediately set out to take possession. In his way, however, he was accidentally met by Manfred; and a skirmish having ensued, Borello was slain. Innocent immediately cited him to appear and stand trial for this murder; and Manfred, finding that Berthold and his friends were unable or unwilling to protect him, after a long flight through a country entirely occupied by the troops of his enemies, at length was received by the Saracen troops at Luceria, who, notwithstanding the opposition of the governor, were determined to shew their respect and affection to the son of their deceased commander. Putting himself at the head of these troops, he immediately attacked the army of the pope, commanded by Cardinal William Fiesco, his nephew; and, having been successful in a skirmish, inspired them with such a panic, that they fled with precipitation. But Manfred derived still greater advantages from the death of Innocent IV., which was followed by repeated defeats of his troops; and, in less than two years, Manfred recovered the whole kingdom, which he continued to govern as regent for Conradin.

In the mean time, considerable changes had also taken place in the Tuscan states. At Florence, the people attached to the Guelph party, had revolted against the Ghibeline nobles, to whom Frederic II. had entrusted the government, and recalled the exiles of the opposite faction. Not content with this domestic victory, they proceeded to attack their Ghibeline neighbours, the Pisans, and their allies. Their endeavours were crowned with success; Pistoia first submitted, and received a Florentine garrison; Sienna was next compelled to join their league; Volterra, one of the
strongest cities in Tuscany, was taken; and the Pisans, after repeated defeats, obliged to beg a peace.

During the sixteenth century, Innocent IV. was succeeded in the pontificate by Alexander IV., who, although of a more moral and religious character than his predecessor, was by no means equal to him in talents. His first public act was to preach a crusade against Eccelino Romano; this was entrusted to Philip, archbishop of Ravenna, who proceeded to Venice, and there collected the Paduans and other exiles who had fled from the tyranny of Eccelino. He also received considerable assistance from the Venetians, and was joined by the Marquess Azzo of Este, and the Ferrarese, the republic of Bologna, Count Louis de San Bonifazio, lord of Mantua, and the citizens of Trent, who had revolted against Eccelino. On the other hand, the tyrant was master of Verona, Vicenza, Padua, Feltria, and Belluna; he had secretly reconciled himself with his brother Alberico, who governed Treviso; and had made an alliance with the Marquess Oberto Pelleavicino, and Buoso da Doara, the alternate podestas of Cremona. The crusaders were at first victorious; and having defeated the governor of Padua, they entered that city with the fugitives, took possession of it, and laying open the dungeons, delivered nearly 1000 victims of the cruelty of Eccelino. But the unfortunate citizens of Padua, who were serving in his army, felt the weight of his vengeance, and of 11,000 men scarcely 200 escaped alive. In the mean time, Alberico Romano arrived with an army, and, offering his aid, wished to be admitted into Padua; but he begged, believing that he attempted to raise a mutiny among his troops, wisely rejected his assistance.

The troops of Eccelino, and his Cremonese allies, had now made themselves masters of Brescia; but the latter, indignant at being defrauded of their share of the conquest, deserted the former, and soon after joined themselves with the papal army. The last victory of Eccelino was the capture of the castle of Friola in the territory of Vicenza. The unfortunate garrison had their eyes torn out, and their noses and legs cut off; nor were the women, the children, or the priests exempted from the most dreadful mutilations. But the victors had now filled up the measure of his crimes, and the hour of vengeance, so long delayed, was at hand. Having marched into the Milanese, he was met at the bridge of Cassano, over the Adula, by Azzo of Este, with the troops of Ferrara, Mantua, and Cremona. Deserted during the battle by the Brescian cavalry, his army was thrown into confusion. His German soldiers, indeed, still made a desperate resistance; but Eccelino, being severely wounded by a brother of one of his mutilated captives, was taken prisoner, and a total route ensued. The captive tyrant maintained a galling silence, and, fixing his ferocious looks on the ground, seemed insensible to the shouts of joy of his conquerors. Refusing food and medical assistance, he tore open his wounds, and died at Sosino 11 days after his defeat. He was in his 60th year, and his reign of blood had lasted 34 years.

The papal army was immediately admitted into the cities under his power; Vicenza received a podesta from Padua; and Verona elected to that office Martino della Scala, who afterwards became their sovereign lord. Alberico Romano, expelled from Treviso, took refuge in the castle of San Zeno, among the Euganean mountains, but the Guelphs determined utterly to extirpate a family so justly detested, and commanded by the marquess of Este, besieged the fortress. Alberico was reduced by famine to surrender, imploring the compassion of Este for his six sons and two daughters, one of whom was the widow of Rinaldo of Este, his brother, but in vain; the whole family were put to death, and their mangled limbs sent to the cities which had endured the tyranny of Eccelino. The extinction of the family of Romano, and the fall of the tyrant, which occasioned universal exultation, were followed by a general peace in Lombardy; and the attention of the pope was turned solely to the affairs of the kingdom of Naples.

Manfred, in the midst of his victories, was informed of the death of his nephew Conradin in Germany; made king immediately, and, at the desire of the Sicilian nobility, assumed the title, and was crowned king of the two Sicilies. The arrival of dispatches from Conradin soon proved the falsehood of the report; but Manfred informed the messengers that, having now accepted the crown, he could not surrender it, but declared that Conradin should be his heir, and invited him to reside at his court. At this period, the Ghibeline nobility had been, by the increasing influence of the democratic party, banished from Florence; and, taking refuge at Sienna, easily obtained the protection of that republic. The Florentines immediately declared war against Sienna, and that state was obliged to beg assistance from King Manfred. The reinforcement granted by him was so small, that, in his first combat with the Florentines, the German troops were cut to pieces, and the standard of the king of Naples conveyed in triumph to Florence. Indignant at this disgrace, and excited by Farinata Uberti, the able chief of the Florentine exiles, Manfred immediately sent to Sienna a considerable body of cavalry under the command of Count Giordano d'Anglone, who, joined by their Tuscan auxiliaries, awaited the approach of the Florentines. Uberti had, in the meantime, carried on a secret correspondence with those of the Ghibelines, who still remained in Florence, and persuaded them, on the first opportunity, to desert the standard of their country. He had contrived to persuade the anziani, or chief magistrates, that, on their appearance before the gates of Sienna, it would be immediately surrendered. His stratagem was successful; the anziani conducted the army reinforced by the troops of Bologna, and all the forces of Lucca, and the other Tuscan cities, to the plain of Arbìa, five miles from Sienna, and there awaited the promised surrender.

On a sudden the gates of the city were thrown open, and the Neapolitan cavalry, followed by the Siennese and the Ghibeline exiles, made a desperate charge on the main body of the Florentines. While the astonished magistrates attempted to rally their disordered troops, the Ghibeline gentlemen in the army seized the opportunity, and, cutting down the standard-bearer, carried off the Florentine colours, and deserted to the enemy. This act of treachery decided the battle; the Guelph army was totally defeated; and 10,000 of the Florentines and their allies were left dead on the field. Such was the terror occasioned by this defeat, that the whole Guelph population deserted Florence and retired to Lucca; and this example was followed by all the cities and towns of Tuscany. Guido Novello, count of Casentino, was appointed podesta of Florence, and the Neapolitan troops were ordered to be paid out of its revenues. Such was the inveteracy of the Pisans and Siennese, that, at a diet of the Ghibeline cities, they even urged the demolition and total destruction of Florence. This proposition had even met with the concurrence of the Assembly; but the patriotic firmness of some
Alexander IV. was now dead, and Urban IV. his successor, a man of talents, began, with zeal, to carry into effect the designs of Innocent IV. against Manfred and the holy See. He first attempted, but without success, to put a stop to the marriage of Countess Manfred with Peter, son of James, king of Arragon. Having then persuaded Edmund, son of Henry III. of England, to renounce the investiture of Naples, formerly bestowed on him by Innocent, he immediately offered the crown to Charles count of Anjou and Provence, brother to St. Louis. This prince, whose talents and courage eminently qualified him for such an undertaking, accepted the gift, and prepared to collect an army to attack Manfred. His power was greatly increased by the alliance of Philip della Torre, and an army of Tuscan exiles of the Guelph party, who kept in check the Ghibelines in Lombardy. During these warlike preparations Urban IV. died, and his successor, Clement IV., who was a Frenchman, was even now devoted to the interests of the court of Anjou, and gave immediate proof of his attachment by appointing him senator of Rome. Charles immediately proceeded by sea, and escaping the fleet of Manfred with difficulty, arrived at Rome; and, taking an oath to obey the conditions, and pay the tribute imposed by the pontiff, was solemnly invested with the crown of the two Sicilies. In the mean time, his army, under the command of his wife Beatrice of Provence, his nephew Robert de Bethune, and Count Guy de Montfort, son of the famous Simon Earl of Leicester, crossed Mount Cenis, and passing through the Milanese, conducted by Napoleon della Torre, was received into the territories of Mantua and Ferrara by the Count San Bonifazio and Obizzo, grandsons of the last Azzo of Este; having defeated the troops of the Marquess Pelavicino at Capriolo. At Ferrara they were joined by 400 Florentine exiles and 4000 Bolognese; and Charles putting himself at their head, entered Apulia by the way of Ferr entino. He was met near Benevento by the army of Manfred; but the degenerate Apulians were Death of unable to stand the repeated and impetuous charges of Manfred. The French, and even the Germans having given way, a total route ensued, and Manfred himself was slain while 26th Feb. in vain endeavouring to rally his troops. The conqueror refused to allow to his body the Christian rites of sepulchre; but the French soldiers, more generous than their leader, having buried him near the bridge of Benevento, raised a rude pile over his grave, to which each soldier carried a stone, a monument, equally honourable to the dead and the living. But the cruelty of Charles was not confined to this insult; on his entry into Benevento, he put to death Count Giordano Lanzi, Peter Uberti, and many other adherents of the late king; and, a few days after, having seized Queen Sybilla, and the two children of Manfred, with his sister, while attempting to escape into Greece, they, too, became victims to his barbarity, and were murdered in prison. Such was the commencement of the reign of Charles of Anjou. Every corner of the kingdom was subjected to the rapine and cruelty of the French, and the extortions of the king, and even the papal party regretted the exchange they had made of the mild and paternal sceptre of Manfred, for the bloody sword of Charles.

The French victories in the south of Italy, proved of essential advantage to the Guelph party in Tuscany. Count Guido Novello, who commanded the troops of Manfred in Florence, was at last obliged to evacuate that city; and the Guelphs having chosen Charles of
Anjou as their lord, and having received from him a troop of 800 French horse, under the command of Guey de Montfort, once more expelled the Ghibelines, who were forced to take refuge at Pisa and Sienna. Florence immediately declared war against these two republics; and, joined by the army of the king of Naples commanded by himself, laid siege to the castle of Poggibonsi near Sienna, which, after holding out for four months, was at length compelled to surrender. Charles then marched into the territory of Pisa, and made himself master of several fortresses belonging to that state. In the mean time, the Neapolitans and Sicilians, longing for deliverance from the yoke of the French, had sent a deputation into Germany to solicit Conradin to reclaim the inheritance of his ancestors. The ambassadors of Pisa and Sienna recorded these solicitations; and Martino della Scala at Verona, and Oberto Pelavicino at Pavia, promising to assist him with their troops, the young prince entered Italy, accompanied by Frederic duke of Austria, and attended as far as Verona by the duke of Bavaria, his uncle, and the count of Tyrol, his step-father, with their troops. From Verona he proceeded to Pavia, and at the head of 8000 cavalry, passed through Lombardy without opposition. Lucina had now revolted from Charles; Henry of Castile, senator of Rome, had declared in favour of Conradin; and the pope, beginning to be alarmed, recalled Charles from Tuscany to defend his own kingdom. While that prince laid siege to Luceria, Conradin repaired to Pisa, and having there received considerable reinforcements, attacked and defeated William de Belleville, Charles' lieutenant in Tuscany. From thence he proceeded to Rome, and, regardless of the anathemas of Clement, who had retired to Viterbo, converted to his own use, such of the treasures of the church as he could get possession of. His army now amounted to 5000 cavalry, at the head of which he entered Abrazzo, and encamped in the plain of Tagliacozzo. He was there attacked by the army of Charles, which only consisted of 3000 men, 800 of whom he placed in ambush under the command of Alard de St. Valery. The first charge of Conradin was successful, and the French were put to flight; but the Germans having found the body of prince Henry of Coenzenza, and taking it for that of the king of Naples, imagined that their victory was complete, and leaving their ranks, proceeded to plunder. In this state of disorder, they were charged by St. Valery's reserve with complete success, and Conradin and his barons, after a short resistance, obliged to betake themselves to flight. Having arrived at Astura, 45 miles from the field of battle, he embarked in a boat, with the intention of landing in Sicily; but being pursued by Frangipani lord of Astura, was by him taken prisoner and delivered up to Charles. The king, determined to get rid of his unfortunate competitor, summoned him before him as a traitor. The result of this mock trial was, (as might be expected,) the condemnation of Conradin; and the last male representative of the house of Swabia perished on the scaffold. This execution took place in the presence of Charles, and was followed by that of the duke of Austria, the two Lancis, the counts Donoratico of Pisa, and many others of the adherents of Conradin. The inhabitants of Augusta in Sicily were put to the sword, and in every city of the kingdom the unfortunate Ghibelines were inhumanly massacred. Two months after the execution of Conradin, the pope, Clement IV. died; and as for nearly three years, the conclave could not agree in electing a successor, the states of the church remained, during the interval, under the power of Charles. That ambitious prince now aimed at making himself master of all Italy. His attempts had at first every prospect of success. The power of the Ghibeline lords in Lombardy was now much weakened; and at a general diet of the Guelph cities at Cremona, the king of Naples was declared head of their confederation, and was, by many of them, acknowledged as their lord. His attention, however, was now for a time diverted from the affairs of Italy by the last crusade of his brother St. Louis.

On the death of this zealous defender of the faith of the plague near Tunis, Charles assumed the command; but no sooner had he defeated the Bey of Tunis, and compelled him to acknowledge himself a vassal of the crown of Sicily, than he returned home; and his example was followed by the other crusaders, except Edward of England, who alone proceeded to the Holy Land.

The cardinals at length elected Tebaldo Visconti, then in Palestine, who, on his return, assumed the name of Gregory X. His first attempt was to reconcile the Guelph and Ghibeline states; but which purpose he travelled into Tuscany; and at Florence, Pisa, and Sienna, was successful in recalling the Ghibeline exiles. But the king of Naples, who considered this pacification as not at all conducive to his interest, contrived, in a very short time, to force them again to emigrate. The pope, fully aware of his ambitious designs, attempted to give a head to the empire, who might serve as a check to him; and having persuaded the other competitors to withdraw their claims, Rudolph of Hapsburg was elected king of the Romans. He next succeeded in reconciling to the Western church the Grecian emperor, Michael Paleologus; and still retaining that zeal against the infidels, which had carried him in his youth to Palestine, was preparing to lead another army of crusaders to that country, when his plans were interrupted by death. The reigns of his three immediate successors, Innocent V. Adrian V. and John XXI. together only lasted one year; but Nicholas III. the next elected pontiff, exerted all his great personal talents, and the interest of his family, (the Orsini at Rome,) to carry into effect the schemes of Gregory X. Having conciliated the friendship of the German monarch, he contrived completely to shake off the yoke of Charles of Anjou; and had afterwards the honour of acting as mediator between these two princes. The latter was obliged to give up the office of senator of Rome, and head of the Tuscan League; and the former granted the long denied charter, which entirely separated the territories of the See of Rome from the domains of the empire. Having appointed his brother, Bertoldo Orsino, count of Romagna, he nominated seven new cardinals of his family and connections, and thus secured a majority in the sacred college. His last act was to bring about, by means of his legate cardinal Latino, a peace at Bologna, between the Gierimei and Lambertazzi, two powerful families, whose dissensions had involved their fellow citizens in war; and at Florence, between the Guelphs and Ghibelines. These transactions were soon followed by the death of Nicholas, whose reign had been thus useful to the church, and advantageous to his own family.

An important revolution had in the mean time taken place at Milan. The archbishop, Giacomo Visconti, with the powerful houses of Donzolo and Visconti, having imprisoned Napoleon della Torre; and the Milanese having expelled the remaining branches of the family, con-
ferrèd the sovereignty on Visconti; who thus became the founder of a dynasty of princes, whose sway, at an after period, extended over all Lombardy.

On the death of the late pope, the cardinals, influenced by the threats and violence of the king of Naples, elected as his successor Martin IV.; who, entirely devoted to the interest of Charles, depriving the Orsini family of the government of Romagna, filled Italy with its exiles, and the Neapolitan treasury, from the confiscation of their property. The pontiff also, to second Charles' designs against the Grecian emperor, communicated him for relapsing into heresy, and dignified with the title of a crusade the expedition against Constantinople, for which Charles was making preparations. But it was destined that a check should now be given to the ambition of the King of Naples, and a bloody sacrifice affixed to the shades of Manfred and Conradin. John de Proceda, a nobleman of Salerno, the physician and friend of Frederic II. and Manfred, had, on the death of Conradin, taken refuge at the court of Peter and Constance of Arragon, and was by them honourably recompensed for his attachment to the house of Suabia. But his ardent spirit could not enjoy repose, while his country was enslaved by the murderer of her princes. Having, therefore, excited Constance and Peter to undertake the defence of the oppressed Sicilians, whom he visited, and whose spirit he kept alive, he proceeded to Constantinople, where he obtained pecuniary assistance from the emperor, and to Rome, where he received a promise of aid from Nicholas III. The death of that pope seemed at first to impede his designs; but his successor having insulted the Arragonian ambassadors, Peter at length made serious preparations for invading Sicily, concealing, however, his intentions, by an expedition to the coast of Africa. Proceda in the mean time repaired to Sicily, to await a favourable opportunity for insurrection.

This very soon occurred. The brutal insolence of a French officer to a female, roused the indignation of the inhabitants of Palermo, and a general massacre of the French was the consequence. The example of Palermo was followed by the other cities of Sicily; and long before the fleet of the king of Arragon reached its shores, the French had been either exterminated, or expelled from the island; Peter and Constance acknowledged as king and queen of Sicily; and sent to Charles, whose fleet now besieged Messina, a solemn defiance and challenge. In the mean time, a scarcity of provisions obliged the latter monarch to re-land his troops in Italy; and his whole fleet and transports were destroyed by Roger de Loria, the Arragonian admiral. Charles then determined to accept of the challenge of his rival; and it was agreed, that the next year a private and judicial combat should take place at Bourdeaux, under the auspices of the king of England, between 100 knights on each side, which was to decide the fate not only of Naples and Sicily, but of the hereditary dominions of each party. The preparations for this combat left the south of Italy for a short time in a state of tranquillity. But the pope opposed this mode of decision, and in the meantime passed sentence of excommunication against Frederic, and, as king Edward I. of England refused to guarantee the place of battle, the king of Arragon did not appear on the day appointed, although waited for by his antagonist. Martin now conferred the title of king of Arragon on Charles of Valois, second son of Philip the Hardy, king of France; and the king of Naples set out by sea from Provence, on his return to Italy.

Before his arrival, however, his son Charles, prince of Salerno, had been provoked to hazard an engagement with the Arragonian and Sicilian fleet. The superior skill and valour of Roger de Loria decided the day; and the prince of Salerno, and his principal officers, fell into the hands of the Spanish admiral. Charles of Anjou seemed at first unmoved by this misfortune, and continued to make preparations to invade Sicily; but his disguised distress and anxiety produced a fatal effect on his health, and occasioned his death at Foggia, in the 69th year of his age, and 5th of his reign. His death was soon followed by that of Martin IV., who was succeeded by Honorius IV., a man of talents, but aged and infirm. The kings of France and Arragon also died this year, both in consequence of wounds received in a battle, in which the former was defeated by the latter. Peter was succeeded in Sicily by his second son James; and as Charles of Salerno still continued a prisoner, the kingdom of Naples was administered by Robert count d'Artois, his cousin. The division of the Sicilian kingdoms, and the captivity of the king of Naples, tended considerably to alter the state of Italy; and the republic of Florence, which had lately adopted the democratical form of government, which it continued to retain, was now generally looked up to as the head of the Guelph confederation.

The object of chief interest in the north of Italy, had for some years been the naval war between the states of Pisa and Genoa for the possession of Corsica, in which the fleets of the former were repeatedly defeated. The Guelph cities taking advantage of this, formed a league against Pisa. In this extremity, the Pisani appointed Count Ugolino de la Gherardesca their general. This nobleman was successful in his negotiations to dissolve the league; and, having obtained peace, continued to retain his authority. His tyranny soon became odious to the Pisani; and at length having, in a fit of passion, slain the nephew of Roger Ubaldini, archbishop of Pisa, that prelate headed an insurrection against him. Ugolino was defeated and taken, and, by order of the archbishop, thrown with his sons into a dungeon, where they were left to die of hunger.

Soon after this event, Honorius IV. died, and Nicholas IV. was elected his successor. This pontiff raised the Colonna family in Rome to that power and eminence which enabled them to rival the Orsini. He also obtained the deliverance of Charles II. king of Naples; but no sooner was that prince set at liberty, than he released him from the obligation of his oath; and the king and pope set themselves to attack the house of Arragon both in Spain and Sicily. On the death of Nicholas, the papal see continued for two years vacant; and was at length filled up by Peter Morone, a hermit, who assumed the name of Celestine V. and entirely submissive to Charles II. took up his residence at Naples. The unfortunate anchorite soon shewed his incapacity for reigning; and even Charles found him utterly useless in promoting his designs. He was easily persuaded to resign, and Boniface VIII. was elected; but the latter, jealous of his feeble predecessor, shut him up in a tower in Campania, where he did not long survive.

James of Sicily having now succeeded his brother Alphonsino of Arragon, Frederic, the youngest of the family, was left to govern Sicily. But James soon after entered into a treaty with Charles of Naples: Having married his daughter Blanche, and given up Sicily, the pope bestowed on him Sardinia and Corsica, although these belonged to the Pisans and Genoese. But the
History.

Sicilians, indignant at this treaty, crowned Frederick as their king. In Tuscany, the rivalry of the factions of the Bianchi and Neri at Pistoia had spread to Florence and Lucca. In Florence, the Bianchi were headed by Vieri Cerchi, and the Neri by Corso Donati, and the cities presented the same scene of confusion as during the contests of the Guelphs and Ghibelines. By the intervention of Pope Boniface, the chiefs of both parties were exiled from Florence; but the Bianchi returning immediately, took possession of the city, and oppressed their antagonists. At Lucca, the Neri were more powerful, and expelled the Bianchi, among whom was Costanzo Castiglione, who retiring to England, entered into the army of that country. The pope now invited to the assistance of the King of Naples against Sicily, Charles of Valois, on whom he conferred the title of Count of Romagna. On entering Tuscany, he was received into Florence on condition of not interfering with the politics of the state; but no sooner was he admitted, than he recalled the exiles; and having arrested the Bianchi, plundered their houses, and banished their chief leaders. Among the latter, was the poet Dante, and the father of Petrarch. Valois then left Florence to carry on the war in Sicily; but the prudence and valour of Frederick overcame all the attacks made upon him, and a peace was at length concluded, when his title was acknowledged by the pope, and his marriage with Eleonora, daughter of Charles II. of Naples, united the interests of the rival families.

The pride and violence of Boniface had now raised against him powerful enemies in the Colonna family, whom he had excommunicated, and in Philip the Fair, King of France, whom he had offended by interfering with the rights of the Gallican church. At length William de Nagaret, a French gentleman, incensed by his insolence, having collected a few soldiers, surprised Boniface in Anagni, and made himself master of his person and treasure. He was however rescued by the people of Anagni, and returning to Rome, put himself under the protection of the Orsini. But indignation at the late insult offered him, had aggravated the violent passions of the pope. He soon took offence at his protector and was pressing for leave to leave the court of Charles VII., threatened by the Orsini, and confined to his apartment. Boniface was now raised to a pitch of insanity; he refused all sustenance, and the following morning was found dead in his chamber, having repeatedly dashed his head against the wall.

Into the transactions of Lombardy at this period, it is impossible for us to enter at large, from the intricacy of its revolutions, and the rapid changes in the government of its cities; it was at present engaged in ineffectual struggles against its tyrants. The king of the Romans, Albert of Austria, fully occupied in combating his German rivals, could take no interest in the affairs of Italy, and the king of France alone possessed any influence. Benedict XI., who succeeded Boniface, having retired to Rome, where his power was thwarted by the cardinals of the Orsini and Colonna families, took up his residence at Perugia, where his first act was to excommunicate those concerned in the outrages offered to his predecessor. But Philip, who supposed himself included in this sentence, and dreaded more decided opposition, contrived to have a poison

D. 1304. administered to Benedict, which occasioned his death in a few days.

The contest in the conclave lasted nearly a year, but at length the archbishops of Philip prevailed, and the new pope, Clement V., took up his residence in France, and shewed himself completely devoted to the interests of the king. At his request the Emperor Andronicus was excommunicated, and the order of the Knights Templars, whose riches had excited the cupidity of Philip, were cruelly proscribed.

The party of the Neri, now triumphant at Florence, A.D. 1306, had, after a long siege, made themselves masters of Pistoia, and dispersed an army, led by Cardinal Orsini against them. In Lombardy, Matthew Visconti had been expelled from Milan, and most of the other cities were distracted by internal commotions; and the death of Azzo VIII. had involved his states in a war between his natural and legitimate children. Charles II. of Naples was also dead, and was succeeded by his second son Robert, by the decision of the pope, who set aside the right of Caribert, king of Hungary, the son of Robert's elder brother.

On the assassination of Albert of Austria by his nephew, Henry count of Luxemburg was nominated king of the Romans; and having secured for his son John the kingdom of Bohemia, prepared to pass into Italy. He first endeavoured to conciliate the friendship of the pope, by confirming the grants of his predecessors to the church.

Having then proceeded to Lausanne, he was met by Henry I., the deputies of most of the Italian states, who visited Italy, each other in their professions of attachment; and the Pisans, especially, having laid at his feet 60,000 florins, urged him immediately to visit Tuscany. The only powers who did not send deputies, were the king of Naples, and the republics of Florence, Lucca, Sienna, and Bologna. These feared, lest, by publicly acknowledging his authority, they should afford him a pretext for interfering with their affairs, and recalling the exiles. Henry then arrived at Asti, where he was joined by the Lombard lords; and from thence to Milan, the gates of which were, after some hesitation, opened to him by Guido della Torre. At Milan he received the iron crown of Lombardy; and, having received the oath of fidelity from the states, succeeded in most of them in pacifying the factions. But a sedition was soon excited at Milan, by a demand of a considerable contribution, which the poverty of the king rendered necessary; and although it was quelled by the expulsion of Guido della Torre and his family, yet it spread to the other towns; and Henry was obliged to reduce Lodoli, Como, and Cremona. But Brescia resisted him, and only capitulated after a tedious siege.

Genoa was next visited by Henry, where he met a similar reception; loyal at first, but they, too, were disgusted by his rapacious exaction. In the mean time, the king of Naples and the Florentines prepared for war; and it was only by means of Count Guido, and the Ghibelines of Tuscany, that Henry escaped the Florentines, while on his way to Pisa. At that city his pecuniary wants were supplied; and, after being treated with the greatest respect for two months, he proceeded to Rome, at the head of an army of exiles of the Ghibeline and Bianchi factions. The troops of Naples had, however, taken possession of the Vatican; and the ceremony of his coronation was performed, in the church of the Lateran, by three cardinals appointed by Clement for that purpose. A.D. 1319. He then returned to Tuscany, and sat down before Florence; but, although that state had received considerable reinforcements, it did not venture to attack him. Having thus defied Florence, the emperor encamped at Poggibonzi, where he solemnly pronounced sentence against the king of Naples; and the Florentines, who had now entered into a solemn treaty with
Robert, and acknowledged him as their protector and lord, were included in the same condemnation. The emperor having now formed an alliance with Frederick, king of Sicily, and received an additional body of German troops, and the promise of aid from the Pisan and Genoese fleets, proceeded to invade the kingdom of Naples. But these preparations were rendered nugatory, by the sudden death of Henry, while on his march to Bonconvento, near Sienna; and this unexpected event occasioned the immediate dispersion of his army. The body of the deceased emperor was magnificently entombed at Pisa; and that republic, justly alarmed for its safety, took into pay about 1000 German soldiers, under the command of Ugucione della Fagggiuola, on whom they conferred the lordship of their city.

This general proceeded to attack Lucca, which he surprised, and gave up to pilg rage. He next laid siege to the castle of Montecatini, but was attacked by the Florentines, under the command of Philip, prince of Tarento, brother to Robert of Naples. But the Pisan troops were victorious; and after a severe engagement, in which Peter, prince of Naples, and Charles, son of Philip of Tarento, were slain, the Florentines were put to flight, with the loss of 2000 killed, and 1500 prisoners.

But the tyranny of Ugucione, after this victory, soon occasioned his downfall. The people of Lucca, indignant at the arrest of their brave countryman Castracani, were the first to revolt; and while Ugucione marched with his troops against that city, its example was followed by Pisa; and thus excluded from both states, he was forced to take refuge at the court of Cane Grande della Scala, at Verona. His retreat was followed by a general peace in Tuscany.

In Lombardy, the prince of Verona had made himself master of Vicenza, then under the government of Padua, the only remaining free state of Lombardy; and obliged the latter state to accede to an unfavourable treaty. But the Paduans having infringed the treaty, were so powerfully attacked, that, feeling the want of a leader, they were obliged to confer the sovereignty on James of Carrara, in whose family it long continued. Not long after, Cremona was taken by Galeazzo Visconti, and added to the territory of Milan. When the Lombards lost their liberties, they lost with them their former enterprising spirit of commerce, which was transferred to the still flourishing republics of Tuscany; and, although encouragement was given to poetry and the arts, at the courts of the petty sovereigns of Lombardy, it is remarkable that the objects of it were generally natives of other states.

At this period, the succession to the empire was contested by Louis of Bavaria, supported by John, king of Bohemia, son of the late emperor; and Frederic of Austria.

Pope Clement V. having died at Avignon, was succeeded by John XXII., who directed his chief attention to raise again the Guelph party in Lombardy, and humble the rising power of the Visconti, but without success; for Galeazzo, son of Matthew Visconti, retained the power of his father, and was assisted by Louis of Bavaria, who had defeated his rival. The pope, indignant at this protection, given by Louis, notwithstanding his protestations, proceeded to depose and excommunicate him. Louis had, however, now acquired an adherent, whose victories made more impression than the papal anathemas. This was Castruccio Castracani of Lucca, who had made himself master of Pisato; and, assisted by Visconti, had completely defeated the Florentine army, and taken their general Raymond de Cardone prisoner, whom he conducted in triumph to Lucca, after insulting the Florentines by encamping under the walls of the city, and actually celebrating games there. The Florentines now had recourse to the king of Naples, on whose son, Charles, duke of Calabria, they conferred, for ten years, the military government. In the mean time, Louis arrived at Trent, where, at a meeting of the Ghibeline deputies, he openly accused the pope of heresy. At Milan he received the iron crown; but jealous of Visconti, who had so eminently served him, he expelled him from the city, and imprisoned his adherents. He next forced Pisa to open her gates to him; and, accompanied by Castruccio, whom he created duke of Lucca and Pistoia, proceeded to Rome, where he was invested with the imperial crown, without the authority of the pope. In the mean time, the duke of Calabria having taken Pistoia, Castruccio returned to Tuscany, and was successful in recovering it; but died, in consequence of the fatigue he underwent, aged 47. Galeazzo Visconti, who served in his army, fell also a victim to fatigue; and their deaths were soon followed by that of the duke of Calabria; and the republic of Florence was released at once from the dread of a powerful antagonist, and a foreign lord.

The conduct of the emperor now rendered him hated and despised in Italy. Having deprived the children of Castruccio of Lucca, he actually set it up to sale, and disposed of it to a Genoese nobleman; and his conduct to his other allies was no less disgraceful. Milan was regained by Azzo Visconti, who refused admittance to Louis; and that prince, still farther weakened by the death of Cane della Scala of Verona, retired to Bavaria, to defend himself against the attacks of the Austrian family. On the retreat of Louis, John, king of Bohemia, son of the emperor Henry VII. entered Lombardy, and in one year made himself lord of many of the principal cities. His success was but transient; the king of Naples, and the republic of Florence, first attacked him, and were even joined by their ancient antagonists, the Ghibeline princes of Lombardy, and the emperor; and the king of Bohemia, unable to withstand such a confederacy, retired to Paris, having first sold the sovereignty of the states which had submitted to him.

During the pontificate of Benedict XII., the successor of John XXII., the rising power of Florence is the chief object worthy attention. Having obtained, in addition to their former allies, the assistance of the republic of Venice, they succeeded in humbling Mastino della Scala of Verona, who had made himself master of Lucca; and soon after purchased from him that city, of which, however, the Pisans contrived to gain possession, and defeated the Florentines. Walter de Brienne, titular duke of Athens, the general of the troops of Florence, had, by his intrigues, persuaded the people to appoint him lord of the city; and, desirous to make himself completely sovereign, betrayed the interests of the state, by making peace with the Pisans, and giving up all claims on Lucca. His power, however, was not of long continuance; the citizens rose in a body, and, having put to death the ministers who had been the tools of his tyranny, forced him to take refuge in his palace; from which he fled privately on the 26th July, 1343: a day, whose anniversary continued to be held sacred at Florence.

The expulsion of the duke of Athens, was followed 1

**I T A L Y.**
by an attempt of the nobles, to obtain a share in the government, but without success. In the mean time, the rest of Tuscany was annoyed by a body of 2000 disbanded mercenaries, which had been in the service of Pisa, who, headed by a German, styling himself duke Guarini, laid waste and plundered the whole country. The smaller states were glad to get rid of this "great company," as it was called, by the payment of a contribution; and at last, having pillaged the most fertile parts of Romagna and Lombardy, they retired to Germany loaded with booty. The impiety with which these banditti escaped, held out encouragement to similar adventurers, whom we shall afterwards find acting a considerable part in the affairs of Italy.

The kingdom of Naples was now destined again to be the scene of war. On the death of king Robert, who had arrived at the advanced age of eighty, he was succeeded by his grand-daughter Jane, or Joan, who was married to her cousin Andrew, second son of Caribert, king of Hungary. But the criminal passion of the queen for her cousin Louis, prince of Tarento, on the one side, and the jealousy, violent temper, and ambition of Andrew, on the other, rendered this union unhappy. At length the party attached to Jane, determined to dispute the king; and, with the knowledge and participation of the queen, soon carried their designs into execution in a very barbarous manner. This atrocious act, which could not be concealed, excited general indignation in the kingdom; and the pope, Clement VI., immediately insisted on the punishment of the principal conspirators; and Louis, king of Hungary, brother to the deceased, openly accused Jane as his accomplice, and asserting his own rights to the kingdom, prepared to maintain them by a powerful army. At this period, the emperor, Louis of Bavaria, died, and was succeeded by Charles IV. son of John, king of Bohemia, who had been slain at the battle of Crécy: a prince whom the pope had set up in opposition to Louis some time before his death. This year was also distinguished by the short-lived revolution at Rome, under Cola de Rienzo; and by a general famine throughout Europe, which was followed by pestilence, which, first appearing in Turkey, spread in the course of the three following years through every country of the continent, from whence it passed to Britain, and even to Ireland. In Italy its ravages were tremendous. In the city and territory of Florence alone, Boccace estimates the number of deaths at 100,000; and at Pisa, out of every ten persons, seven fell victims to the contagion. This dreadful scourge occasioned a temporary cessation of war in the north of Italy. In the south, it compelled the king of Hungary to evacuate the kingdom of Naples, from which queen Jane and her second husband, Louis of Tarento, had fled to Provence. His retreat enabled them to return; and, on his second invasion, Jane, having obtained from him a truce, agreed to have her conduct investigated by the pope. The decision of the court of Avignon was in her favour: the pope acknowledged Louis of Tarento king of Naples, but ordained 300,000 florins to be paid to the king of Hungary, to defray the expenses of the war. But that monarch declared, that he did not make war for money, but to avenge the death of his brother; and suffered the queen to be reinstated, without demanding the subsidy.

The picture which Italy presents, for a series of years after this period, is truly deplorable. In Lombardy, all the smaller states were falling, one by one, a prey to the tyranny of the Visconti. That family was now represented by Barnabas and Galeazzo, who, having poisoned their elder brother Matthew, divided between them their dominions; and exercised throughout Lombardy; on their subjects and their enemies, cruelties equal to, if not surpassing, those of Eccelino Romano. In Tuscany, the rivalry of Florence and Pisa, of Sienna and Perugia, kept alive constant warfare; and the bands of adventurers employed in their wars, spent the short intervals of tranquility in oppressing the smaller states, and plundering the peasantry. Naples was overrun by bands of the same description whose depredations, the feeble and distant government of that kingdom was unable to repress. In Romagna, the troops of Innocent VI. had succeeded in executing the designs of his predecessors, and subjected to his immediate sway all the free cities and independent nobles. Bologna was the last that surrendered, being also attacked by the army of Barnabas Visconti. That lord immediately declared war against the pope, but was at first repulsed by the troops of the king of Hungary, his ally. Barnabas, however, having joined the Pisans, engaged in his service a band of English adventurers, commanded by John Hawkwood, and proceeded against Florence. His new auxiliaries had introduced with them what was more fatal than the arms of Visconti, the plague, which again commenced its ravages in Florence, and obliged its citizens to remain spectators of the devastations occasioned by the combined armies, with whom their general Malatesta had a treasonable connection. At length, the Visconti having concluded a separate treaty with the pope, the example was followed by Pisa and Florence, and a few years of tranquility were given to Tuscany.

On the death of pope Innocent, Urban V. had returned to Rome, aware that his presence was necessary in Italy to check the power of the Visconti; who, being now allied by marriage to the kings of France and England, set no bounds to their ambition. For this purpose, at his desire, the emperor Charles IV. entered Italy with a powerful army; but the Visconti, aware of his avarice, procured a peace by the advance of a sum of money. His other transactions in Italy were of a similar nature: for money he granted a peace to the Pisans and Florentines; and, for a similar reason, liberty to the city of Lucca. Having attempted to interfere in the affairs of Sienna, his troops were defeated, and he himself obliged to secure his safety by flight. His return to Germany was soon followed by that of the pope to Avignon, after venting his wrath by excommunicating Barnabas Visconti: a sentence which, that tyrant so much disregarded, that he forced the legates actually to swallow the bulls which they had presented to him. On the death of Urban, Gregory XI. recommended war; but the Florentines, distrusting him, concluded an alliance with Visconti. The states of the church again rebelled, and Gregory was obliged to visit Italy, having first condemned the Florentines. But those republicans, despising the interdict, continued the war, having engaged in their service Hawkwood and the English condottieri. At length, Bologna having detached itself from the league, and made a separate treaty with the pope, a congress met at Sarzana to negotiate a general peace. It was, however, suddenly dissolved by the death of Gregory—an event which provoked important changes in the state of Italy.

As there was a majority of Limousin cardinals in the
conclave, the election fell on the archbishop of Bari, who took the name of Urban VI. A person entirely devoted to the views of the other cardinals; and, as his character soon showed itself in his imprudent and violent conduct, his enemies in the college having assembled, declared the election illegal, and nominated Robert of Geneva, who took the name of Clement VII. To him, Spain, France, and Naples adhered; while Urban was acknowledged in Italy, Germany, England, Hungary, and Portugal. This schism almost completely destroyed the papal authority; for neither the one nor the other pontiff could, from their individual character, command the respect of the Christian world.

The schism in the church was followed by general revolutions in Italy. At Florence, the family of the Albizzi having endeavoured to expel their political rivals from the city by force of arms, were successfully opposed by Salvestro di Medici and Benedetto Alberti; but during these commotions, the Ciompi, or lowest class of artisans, having taken arms, defeated the magistrates and officers of justice, effected a temporary change in the government; but this new administration was (as might be supposed) of no long duration; and, after a few weeks, the Alberti and Medici families acquired the ascendancy.

The same year, Galeazzo Visconti died at Milan, and was succeeded by John Galeazzo, his son. The death of the emperor Charles IV, soon followed, and Wenzelslas, his son, was elected king of the Romans. The antipope Clement, hitherto protected by queen Jane, was forced, by the machinations of Urban, to take refuge at Avignon. The pope also raised up a rival against the queen, in the person of Charles Durazzo, her nephew, the legitimate heir of the crown; although Jane had adopted, as her son and successor, Louis of Anjou, brother of king Charles V. of France.

The army of Charles, consisting chiefly of adventurers, and a few Hungarians, passing through Tuscany, made a conquest of Arezzo. At Rome, Charles received the investiture of the kingdom, and took the title of Charles III. and then made himself master of Naples, without opposition. The queen having surrendered the crown, was smothered to death by his orders.

Louis of Anjou immediately asserted his rights, and invaded Naples with a powerful army; but his death at Bari dispersed his troops, and left Charles, for a time, without a competitor. He, however, only survived one year, being murdered in Hungary, (whether he was called by the barons of that country,) by order of the widow and daughter of king Louis. His son Ladislaus, only ten years old, was left under the care of his mother Margaret; but a powerful party in the kingdom proclaimed Louis II. of Anjou, also a minor; and Naples, torn by the contests of the rival factions, remained in a state of anarchy.

In the mean time, John Galeazzo Visconti having poisoned his uncle Barnabas, and being now sole master of Milan and its conquests, aimed at the domination of all Lombardy. The Venetians had invited Antonio della Scala of Verona to make war against Francisco Carrara of Padua, who had formerly assisted the king of Hungary against them; but Visconti, having allied himself with the latter prince, made himself master of Vicenza and Verona, and obliged della Scala to take refuge at Venice. In order to evade his promise of giving up Vicenza to Carrara, he next agreed with the Venetians to divide the Paduan territories, and made war on his former ally. On this formidable league being formed against him, the elder Carrara abdicated in favour of his son Francisco Novello, and retired to Treviso.

That prince, however, unable to defend himself, was, with his father, obliged to surrender; but the treacherous Visconti immediately threw them into prison. Having thus overcome his two principal rivals, he might now be considered as master of Lombardy, as the families of Savoy, Monferrat, Guazaga, and Esté, were his allies, or rather dependants. The character of this new disturber of Italy differed greatly from those of his predecessors. Incapable of heading an army, and of a timid and suspicious nature, his plans as a statesman were bold and enterprising: trusting to others the execution of his designs, his measures were taken with promptitude and decision; while no feelings of justice or humanity, of shame or remorse, ever impeded his unprincipled ambition.

His views were now directed to Tuscany, where he attempted (though without success) to make himself master of Pisa. He next endeavoured to excite the jealousy of the other states against the Florentines, whom he justly regarded as his most formidable opponents; but they, aware of his designs, prepared, in conjunction with the Bolognese, to defend themselves against his attacks. In the mean time, Francisco Novello Visconti, having discovered that Visconti intended to put him to death, escaped with his family from his place of confinement, and, after a series of interesting adventures, at length succeeded in reaching Florence, where he left his wife and children. He then proceeded to Bologna, and, receiving from that republic promises of support, repaired to Bavaria, and persuaded the duke to lead his army into Italy in behalf of the Florentines. While he was thus employed, the army of Visconti, and his allies, amounting to 15,000 horse, and 6000 infantry, proceeded into Tuscany. The united army of Florence and Bologna was far inferior in number; but its commander, Hawkwood, was greatly superior to the Milanese generals. But, before any action could take place, Carrara, at the head of a few hundred men, had, without waiting for the Bavarians, passed through the Venetian into the Paduan territory. His former subjects received him with enthusiasm; and having, during the night, entered the city by the bed of the Brenta, he easily overpowered John Galeazzo's soldiers, and once more became lord of Padua. But the Florentines were not so fortunate in all their allies. The duke of Bavaria, who soon after reached Padua, being prevailed on, by the intrigues of Visconti, to desert the league, John, count of Armagnac, who also brought his troops to their assistance, was defeated by James del Verme, near Andrea, and died soon after of his wounds. His defeat exposed Hawkwood and the Florentine army, who had advanced towards Milan, to the most imminent danger, the Milanese general having cut the dikes of the Adige, and inundated the valley of Verona, where they were encamped; but Hawkwood, leaving his camp, to deceive the enemy, marched during the night through the inundated plain, and, after much fatigue and danger, at length arrived in Tuscany. A short peace followed, but was soon disturbed by the machinations of Visconti; and the next ten years contained nothing but events of the same nature. The emperor Wenceslaus having in vain attempted to obtain money, by offering his assistance against Visconti, at length concluded an alliance with him, and erected his dominions into a regular fief of the empire, with the title of...
History.

The year 1400. The first campaigns of the Italian states against the empire were carried on by the Florentines and Siennese. The Florentines assisted the emperor in his war against Ladislaus, who had invaded Tuscany, but were put to flight and compelled to make peace with him. The Siennese, under the leadership of Catharine Colonna, a woman of great enlightened and noble spirit, carried on a war against the emperor's ally, Ladislaus, but were defeated at Rocca-secca. The Florentines, assisted by Louis II. of Anjou, carried the war into the states of the church, and made themselves masters of Rome. But Alexander V. did not live to enter that city, having died at Bologna. A.D. 1410. His death was generally ascribed to the effects of poison, administered to him by Cardinal Cossa, who was elected his successor, under the name of John XXIII.

Louis of Anjou, after two unsuccessful campaigns, at length defeated Ladislaus at Rocca-secca; but, unable to improve his victory, was again forced to return to France, and interfere no more with the affairs of Italy. The pope was forced to leave Rome, and take refuge at Florence; and that state, menaced by the Neapolitan troops, commanded by Sforza, were on the point of concluding a treaty with him, when Ladislaus was attacked by a disease, said to have been occasioned by his excesses, which soon terminated in his death.

In Lombardy, John Maria Visconti, Duke of Milan, and Facino Cane, his principal general, were murdered by Hector, a natural son of Barnabas Visconti; but Philip Maria, the second son of John Galeazzo, having married the widow of Cane, (aged 40, while he was only 20), was followed by the soldiery, and soon regained the city of Milan.

The death of the emperor Rupert was followed by the election of Sigismund, king of Hungary, who, anxious to put an end to the schism in the church, prevailed on John XXIII. to call another general council at Constance. The proceedings of this celebrated assembly, it is impossible to dwell here. After long deliberations, John XXIII., and his two rivals, Gregory IX. and Benedict XII., were deposed; the abuses in the church, and the vices of the clergy, were exposed without any steps being taken for their reformation; while their zeal against reformers was shewn, by the cruel execution of John Huss, and his disciple Jerome of Prague, although the former had received a guarantee of safety from the emperor. At length a new head was given to the church, in the person of Martin V. of the Colonna family, and his first act was to dissolve the council, and reserve to himself the farther reformation of the clergy.

At Naples, Jane II. the sister and successor of Ladislaus, had married James of Bourbon, Count de la Marche; but that prince, irritated by the irregularities of his wife, treated her so ill, that the people of Naples revolted against him; and, the pope, having declared in favour of the queen, he returned to France, where he soon after died in a convent. But Louis III. of Anjou, having asserted his claims to Naples, succeeded in obtaining the concurrence of Martin, and the assistance of Sforza. On the other hand, Jane had recourse to the alliance of Alphonso of Arragon, to whose family the crown of Sicily had again returned, whom she adopted as her heir. She also engaged in her service, Braccio Montone, who had now established himself in the principality of Perugia, his native city. This war was terminated in two years, by the intervention of the pope, and Louis again retired to Provence. But Alphonso, jealous of the influence of Caraccioli, the queen's favourite, caused him to be arrested, and attempted to seize the queen, who had recourse to the protection of Sforza, who defeated Alphonso, but was obliged to retreat to Aversa. Jane now chose Louis as her successor, and was assisted by the armies of the Duke of Milan, and Francis Sforza,

...menced the war by the invasion of Tuscany, but his projects were thwarted by the military skill of Montone; while the Florentines, assisted by Louis II. of Anjou, who had received the investiture of Naples, carried the war into the states of the church, and made himself masters of Rome. But Alexander V. did not live to enter that city, having died at Bologna. A.D. 1410. His death was generally ascribed to the effects of poison, administered to him by Cardinal Cossa, who was elected his successor, under the name of John XXIII. Louis of Anjou, after two unsuccessful campaigns, at length defeated Ladislaus at Rocca-secca; but, unable to improve his victory, was again forced to return to France, and interfere no more with the affairs of Italy. The pope was forced to leave Rome, and take refuge at Florence; and that state, menaced by the Neapolitan troops, commanded by Sforza, were on the point of concluding a treaty with him, when Ladislaus was attacked by a disease, said to have been occasioned by his excesses, which soon terminated in his death.

In Lombardy, John Maria Visconti, Duke of Milan, and Facino Cane, his principal general, were murdered by Hector, a natural son of Barnabas Visconti; but Philip Maria, the second son of John Galeazzo, having married the widow of Cane, (aged 40, while he was only 20), was followed by the soldiery, and soon regained the city of Milan.

The proceedings of this celebrated assembly, it is impossible to dwell here. After long deliberations, John XXIII., and his two rivals, Gregory IX. and Benedict XII., were deposed; the abuses in the church, and the vices of the clergy, were exposed without any steps being taken for their reformation; while their zeal against reformers was shewn, by the cruel execution of John Huss, and his disciple Jerome of Prague, although the former had received a guarantee of safety from the emperor. At length a new head was given to the church, in the person of Martin V. of the Colonna family, and his first act was to dissolve the council, and reserve to himself the farther reformation of the clergy.

At Naples, Jane II. the sister and successor of Ladislaus, had married James of Bourbon, Count de la Marche; but that prince, irritated by the irregularities of his wife, treated her so ill, that the people of Naples revolted against him; and, the pope, having declared in favour of the queen, he returned to France, where he soon after died in a convent. But Louis III. of Anjou, having asserted his claims to Naples, succeeded in obtaining the concurrence of Martin, and the assistance of Sforza. On the other hand, Jane had recourse to the alliance of Alphonso of Arragon, to whose family the crown of Sicily had again returned, whom she adopted as her heir. She also engaged in her service, Braccio Montone, who had now established himself in the principality of Perugia, his native city. This war was terminated in two years, by the intervention of the pope, and Louis again retired to Provence. But Alphonso, jealous of the influence of Caraccioli, the queen's favourite, caused him to be arrested, and attempted to seize the queen, who had recourse to the protection of Sforza, who defeated Alphonso, but was obliged to retreat to Aversa. Jane now chose Louis as her successor, and was assisted by the armies of the Duke of Milan, and Francis Sforza,
the successor to the command of the troops of his father, who was drowned in crossing the river Pescara.

The party of Jano was successful. Don Pedro, brother to Alphonzo, was obliged to yield Naples, and shut himself up in a fortress; and the queen was completely re-established in her authority, by the decisive battle of Aquila, and the death of Montone. The remains of his band of adventurers, entered into the Florentine service, under the command of Nicholas Piccinino. Martin V. resumed the territories wrested from the church; and of all the principality of Braccio, nothing was left to his son Count Oddo, but the castle of Montone.

At this period, the chief influence at Florence was possessed by Nicholas d'Uzzano, of the same party and policy as Maso Albizzi; but, notwithstanding his power, the Medici, at the head of the democratic party, were gradually increasing in wealth and authority, and John di Medici, (father of the great Cosmo), now attained to the office of gonfalonier of justice.

A treaty had been concluded with Philip Visconti; but the ambitious spirit of that prince soon excited new wars and revolutions. Francis Carmagnola, his general, had succeeded in the conquest of Genoa, which was in a state of anarchy from its intestine discord. This was followed by the acquisition of Parma and Bergamo; and Brrescia and Crema were surrendered to his arms. Bellinzona, Duomo d'Ossola, and the Levantine Valley, were next wrested from the Swiss: but 3000 of that gallant nation having crossed Mount St. Gothard, attacked the army of Carmagnola, which, although consisting of 24,000, was with difficulty able to keep its ground, and the Swiss were permitted to retire unmolested.

The interference of Visconti, in the affairs of Romagna, after the death of Montone, was considered by the Florentines as an infraction of the treaty, and war was immediately commenced; but the republicans were defeated in six successive battles, and obliged to apply for aid to the senate of Venice. In the meantime, Carmagnola, having incurred the jealousy of Philip, had fled to Venice, where, eager for an opportunity of revenge, he zealously pleaded the cause of Florence; and the senate, roused by his exhortations, placed him at the head of their troops. Brrescia soon submitted; and the duke, alarmed, acceded to a peace with the republicans, allowing them to retain their conquest. But the Milanese, dissatisfied with the terms of the peace, prevailed on Philip immediately to break the treaty, and invade Mantua. Their troops were at first victorious; the event of a second battle was doubtful; but in the third, which was fought at Macalo, on the Oglio, Charles Malatesti was completely defeated, and, with 8000 men, was taken prisoner by Carmagnola. The latter, however, released next day, by the generosity of that leader and his soldiers; but this act excited the suspicions of the supreme council of Venice, and afterwards occasioned his ruin.

This defeat occasioned a second peace between Philip and the republics. But the attempts of Florence against Lucca, being frustrated by Sforza and Piccinini, now in the pay of the duke, the war was again renewed, but with less favourable auspices. The Venetian fleet on the Po, was almost entirely destroyed by the Milanese, and the army of Carmagnola surprised and routed near Soncino by Sforza, while in Tuscany, Piccinino made demonstrations against Pisa, and laid waste the Florentine territory. After his defeat, Carmagnola continued for some time in a state of inaction, which increasing the suspicions of the Venetian council, he was invited to Venice, to give his advice on the state of affairs; but no sooner had he arrived, than he was thrown into prison, and after a secret trial, where he suffered the torture of the rack, was publicly beheaded, in St. Mark's place. His trial was never made public, but throughout Italy he was generally considered as a victim rather to the jealousy, than the revenge of the Venetians.

In the meantime, Martin V. had been succeeded in the pontificate, by Gabriel Condolmieri, a Venetian, who embraced the cause of the republics and of the Orsini at Rome. But this pope, who took the name of Eugene IV. was hasty and passionate, and his whole reign exhibits a series of contests with the Columna; the Hussites in Bohemia; the council at Basle for the reformation of the church; and his own vassals in Romagna.

The emperor Sigismond now entered Italy, and at Visit of the Milan received the iron crown, but without obtaining an interview with the duke. He then succeeded in restoring peace between the republics and Philip; and, repairing to Rome, was invested with the imperial crown, from whence, after attempting in vain to act as mediator between the pope and the council of Basle, he returned to Germany, convinced by experience, that it was in vain for an emperor, without an army, to interfere in the affairs of Italy.

The death of queen Jane II. of Naples, now rekindled the war in that country. The Neapolitans the crown embraced the party of Rene of Anjou, son of Louis of Naples III., while the duke of Suessa, the prince of Tarento, and the Count of Fondi, declared in favour of Alphonzo of Arragon. The latter prince, whose actions entitled him to the apppellation of the magnanimous, having engaged the Genoese fleet near Gata, was defeated, and with his brothers made a prisoner, and conveyed, by order of Visconti, from Genoa to Milan. Here his brilliant talents and amiable manners were more effectual than his arms; and the duke, persuaded by his arguments, renounced his connection with the French, and allied himself to his captive, whom he immediately set at liberty. But the Genoese, on receiving Visconti's orders to reconvey Alphonzo to Naples, determined no longer to be the submissive slaves of his caprice; and expelling the Milanese governor, and the garrisons of Genoa and Savona, reassured their liberty, and leagued themselves with the Venetians and Florentines. The ruling party in the latter state was now that of the Medici. Two years before, the death of Nicholas d'Uzzano, who had kept in order the rival factions, had thrown the chief power into the hands of Rinaldo Albizzi, who having brought Cosmo di Medici to trial, obtained his banishment to France. Not content with the exile of his rival, Rinaldo proposed to attack those magistrates who opposed his measures; but in this his friends refused their aid. The magistrates soon after having cited him to appear, to give an account of his conduct, on his resistance, exiled him and his principal adherents, and recalled Cosmo di Medici. Rinaldo, who took refuge at Milan, incited Visconti again to make war on Florence, and Piccinino again invaded Tuscany. This war, which continued for five years, with various success, is more interesting from the military achievements of Sforza and Piccinino, than the importance of its results to the parties concerned. It was at length terminated by Visconti, who submitted Peace of the terms of the treaty to the arbitration of Sforza, the Capitana, commander of the republican troops, whose interest A.D. 1435.
he attempted to conciliate, by conferring upon him the hand of Bianca Visconti, his natural daughter, with Cremona and Pontremoli as a dowry.

In the meantime, Eugene IV. had been declared contumaciously by the council of Basle, which elected, as his successor, Amadeus VIII. of Savoy, who resigning his temporal dominions to his son, took the name of Felix V. On the other hand, Eugene called a rival council at Ferrara, which afterwards removed to Florence, where the emperor John Palavoglova VI. and the deputies of the Greek church met, in order, if possible, to effect a union between the churches.

Three years before this period, Rene of Anjou had entered Naples, but, notwithstanding the assistance of Pope Eugene, his influence daily declined; and Alphonzo having defeated the lieutenants, and taken possession of the siefs of Sforza in Abbruzzo, proceeded to besiege Naples.

Sforza prepared to march to the assistance of Ilen, but Visconti, jealous of his son-in-law, hinted to Eugene that this was now the time to recover the marquisate of Ancona from Sforza; and sent Piccinino to command his army. But during these transactions, Alphonzo succeeded in surprising Naples, and Rene was forced, like his ancestors, to retire to his hereditary states.

Sforza was now attacked by the pope, the king of Naples, and the duke of Milan; and at the end of four years was reduced to the greatest extremity, when he was joined by the Venetians and Florentines, through the influence of Cosimo di Medici, who was his personal friend. Their combined efforts were successful, Sforza was re-established at Ancona, and the war was even carried to the gates of Milan, when Visconti again made offers of accommodation to his son-in-law, which Sforza, by the secret advice of Cosimo, accepted, and leaving the marquisate of Ancona to Pope Nicholas V. who had a short time before succeeded Eugene, proceeded to march to the assistance of the duke against V. On the duke's death being known to his council, it was debated whether the sovereignty should be offered to Sforza, or Alphonzo of Aragon. The latter party had the majority, and the first intimation which the citizens of Milan received of the death of Visconti, was the hearing of the Arragonian banns on the castle. Four distinguished citizens, however, Trivulzio, Bossi, Lampugnani, and Cotti, having barricaded the streets, and cut off the communication with the castle, called a meeting of the deputies of the people, who, asserting the independence of the republic, established a constitution similar to Florence. The example of Milan was followed by Pavia and Parma, which established independent governments, but most of the other cities agreed to follow the fate of Milan.

The Venetians having refused to enter into a treaty with the new republic, the war still continued; and Sforza being invited by the Milanese to become their general, found it prudent to become the servant of those whom he had hoped to govern.

The senate of Milan had soon occasion to distrust their new general, on whom the Pavisans conferred the sovereignty of their city; as, desirous of continuing in his command, he contrived to defeat all negotiations for peace: At last the Venetians having suffered a total defeat at Ceravaggio, and having disco-
submitted to his authority. Soon after this event, followed the death of Cosmo di Medici, whose talents and virtues well deserved the title conferred on him by his fellow-citizens, of father of his country. Pope Pius II. having died at Ancona, where he had repaired to join the crusade of the Venetians against the Turks, was succeeded by Paul II., who refused to pay the contribution agreed to by his predecessor for the crusade, and the expedition did not take place. Sforza having now concluded an alliance with Louis XI. sent his son Galeazzo to his aid, in the civil war in which he was then engaged.

This was the last act of that great statesman and warrior, whose character, though tinged with the vices of the age, stands deservedly high in the history of his country. He died of a dropsy at Milan, on the 8th March, 1466, and his son Galeazzo was, without opposition, acknowledged his successor. The death of Sforza occasioned an attempt, by the independent party at Florence, to throw off the yoke of Peter di Medici, but without success; and the struggle ended in the banishment of Acciaioli, Soderini, and other friends of liberty. By their influence the Venetians declared war on Florence; but the war had no decisive results, and peace was concluded by the intervention of Paul II. and Borso of Este, duke of Ferrara and Modena. The power of the Medici was now completely established in Florence; and, on the death of Peter, his sons Lorenzo and Julio, the eldest of whom was only 22, were acknowledged chiefs of the republic. But the actual government of the state continued for some time in the hands of the same persons who, during the illness of Peter di Medici, had, as his friends, been possessed of the administration.

A dangerous enemy, however, was soon raised up to the Medici in the person of Sixtus IV., the successor of Paul II. This pope, who was said to have arrived by no very honourable means at that high office, devoted his whole influence to the advancement of his nephews; some of whom, whose characters but ill qualified them for such situations, were elevated to the highest stations in the church, while the others were invested with temporal principalities, and connected, by marriage, with the most illustrious families of Italy. Jerome Riasio, one of these favoured relatives, had become intimate with Francisco Pazzi, a Florentine gentleman, whose family, having incurred the jealousy of Lorenzo di Medici, had retired to Rome. In him Sixtus found a proper instrument for the destruction of the Medici. It was agreed, that assassination was the only manner by which their measures could be effectual; and Salviati, archbishop of Pisa, Jacob Pazzi, uncle of Francesco, and other enemies of the Medici, were added to the number of the conspirators. The time chosen for their purpose was during the festivities on the visit of Cardinal Riario at Florence; and the two brothers were attacked in the church during the celebration of mass. Juliano was murdered; but Lorenzo defending himself, was surrounded by his friends, and escapes to his house. In the meantime, the archbishop having attempted to make himself master of the palace of justice, was seized, and hanged, in his priestly dress, from the windows of the palace. Of the conspirators, a similar fate attended the first; the others were massacred by the people; and Bandini, the actual murderer of Juliano, who had taken refuge at Constantinople, was delivered up, a year after, by Mahomet II. to the vengeance of Lorenzo. The pope, aware that his connection with the conspiracy was discovered, immediately interdicted Florence, on account of the death of the archbishop; and, without dissembling his participation in the crime, declared war against the republic.

About the same period, Milan was the scene of a similar catastrophe. Galeazzo, duke of Milan, the unworthy son of Francisco Sforza, had become, by his princely and licentiousness, detested by the Milanese. Having at last grossly injured Jerome Olgiati, that gentleman, assisted by Carlo Visconti and John Lampugnani, determined to revenge himself by the assassination of the tyrant. Their plan was successful, and Sforza fell a victim, in the church of St. Ambrose, to their resentment, or patriotism. Visconti and Lampugnani were immediately put to death by the guards; but Olgiati suffered, with heroic fortitude, a more cruel death by the hands of the executioner. The duke was succeeded by his son John Galeazzo, under the tutelage of his mother, Bona of Savoy. This guardianship was disputed by the brothers of the late duke, who endeavoured to excite an insurrection; which was suppressed by the prime minister Cecco Simonetta. Octavian Sforza was drowned in crossing the river Adda, and his brothers banished to different cities.

In the war between the pope and his ally, Ferdinand of Naples, against Florence, the latter state sustained the loss of many of their strongest fortresses, by the supineness, or the treachery, of Hercules, duke of Ferrara, their general, and was obliged to apply for aid to the duchess of Milan and the Venetians; but the former was occupied by the revolt of the Genoese; and the latter, exhausted by their Turkish war, were unable to afford any assistance. At this period Rene, second duke of Lorraine, began to assert his claim to the throne of Naples, as representative of the house of Anjou; and Ferdinand, alarmed lest support should be afforded to him by the Florentines, began to shew himself inclined towards peace. Lorenzo di Medici, whose affairs were now reduced to the greatest extremity, taking advantage of this inclination, determined to have a personal conference with the king, and proceeded to Naples, contrary to the advice of his friends, who dreaded the notorious treachery of Ferdinand's character. His enterprise, however, succeeded; and Ferdinand, convinced that the friendship of Florence was his best protection against the French, concluded a treaty; and Lorenzo returned to Florence, where his authority was now implicitly acknowledged, and his power strengthened by that liberality and generosity, which acquired to him the title of the Magnificent. The capture of Otranto by the Turks, now terrified Sixtus into a peace with Florence, and the fortresses taken during the war were restored.

The last transaction of any consequence during his reign, was his war, in conjunction with the king of Naples, the duke of Milan, (now under the direction of his uncle Ludovico, commonly called the Moor,) and the Florentines, against the Venetians, whom he excommunicated. In a short time, however, the league of the pope, that it threw the gout into his head, and occasioned his death.

The suffrages of the cardinals were in favour of Bap- tista Cybo. This pope, who took the name of Inno- cent VIII., was no less lavish of the honours and treasures of the church to his natural sons, than Sixtus had been to his nephews; and besides this scandal, his indulgence of temper permitted the most undeserved licentiousness and venality in his court. His hostility to the king of Naples was soon evinced, by his interrup-
tion of the commerce formerly carried on; and the barons, incensed by the tyranny of Alphonzo, duke of Calabria, having revolted, were assisted by Innocent. But Ferdinand, having secured the friendship of Lorenzo di Medici and Ludovico Sforza, sent his son against Rome. The papal troops were defeated, and a peace was granted to the pope, by the intercession of Ferdinand and Isabella of Arragon and Castile. The Neapolitan barons, though concluded in the treaty, fell victims to the perfidy of Ferdinand.

Innocent now courted the favour of Lorenzo, on whose son John, (afterwards Leo X.) he conferred a cardinal's hat, though at that time only eight years old. The reign of this pontiff presents little more that is interesting, except the greatness of Lorenzo di Medici, for which we must refer our readers to the interesting work of Mr. Irosco. That illustrious statesman died in his 44th year, beloved and lamented by his countrymen. His death was followed by that of Innocent, who, on his death-bed, permitted his son to plunder the public treasury. His vices, however, were made to appear venial, when compared with the atrocities of Rodrigo Borgia, who succeeded him by the name of Alexander VI. This pontiff united in his own person all the vices of which former popes either were accused or were guilty; and the elevation of Borgia continues, to our own days, a lasting stain on the Romish church. The authority of Ludovico Sforza still continued paramount at Milan, notwithstanding the majority and marriage of his nephew; but his ambition was still unsatisfied. The strict union which subsisted between Peter, son of Lorenzo di Medici, and Ferdinand of Naples, thwarted his views; and this feeling, heightened by his jealousy of Isabella, duchess of Milan, his niece, who was the daughter of Alphonzo, duke of Calabria, urged him to the desperate step of inviting Charles VIII. of France to assert his claims to the crown of Naples. This young and ambitious prince eagerly embraced the opportunity afforded him, and, entering Italy by the Alps of Savoy, arrived at Arta, where he was seized with the small-pox, and remained for a month in extreme danger. Having then proceeded into the Milanese, he was joined by Ludovico Sforza, who engaged him for a few days for the Duke of Milan on the death of the duke, his nephew: an event ascribed to poison administered by Ludovico; whose conduct, in imprisoning the duchess and her infant son, and immediately assuming the title of duke, certainly gives probability to the suspicion.

On the entry of Charles into Tuscany, Peter di Medici in vain attempted to reconcile himself to him; and the Florentines, incited by the opposite party, issued a decree of banishment against the Medici; and the king of France entered Florence with the pomp of a conqueror. His entry into Rome was no less triumphant; and Alexander, who at first shut himself up in the castle of St. Angelo, was forced to accede to a treaty dictated by Charles. A considerable change had now taken place at Naples. A few months before the invasion of Charles, Ferdinand, now in his seventieth year, died, and was succeeded by Alphonzo II.; but that prince, whom the approach of the French affected with a degree of terror approaching to frenzy, resigned his crown in favour of his son Ferdinand, and retired to a monastery at Messina, where he did not long survive. The young king made an attempt to defend Naples; but Charles (who now, for the first time, was obliged to draw his sword,) easily overpowered him, and forced him to retire to the Isle of Sicilia, and Naples received the French monarch. The example of the capital was speedily followed; and, of all the cities in the kingdom, Brindisi alone retained its allegiance to Ferdinand. Such were the results of the expedition of Charles, and all this was achieved with astonishing rapidity. It was in the end of summer 1494 that the French army marched from Lyons, and on the 25th February following, Charles made his entry into Naples, and in a few weeks after completed the conquest of the kingdom. No sooner were the Italian potentates recovered from the surprise and panic occasioned by this rapid conquest, than a league was formed by the Venetians, the pope, and the duke of Ferrara, against Charles. This alliance was also joined by the perfidious Sforza, who began to fear that Charles would support the claims of the duke of Orleans to the duchy of Milan, in right of his grandmother Valentina Visconti.

On receiving the accounts of this confederation, to which of which were also joined the emperor Maximilian, his Charles son the archduke Philip, and Ferdinand of Spain, Charles recrossed the Alps with equal rapidity, and the troops left by him at Naples were soon expelled by Ferdinand II.; whose return the Neapolitans, heartily weary even of the short rule of the French, hailed with acclamations. The death of this young prince soon followed, and his uncle Frederic became his successor. In the mean time, Sforza, by his pride and ambition, had excited the hatred of all the neighbouring states, and especially of the Venetians and Florentines, and the duke of Orleans now openly asserted his rights. But the declining health of the king of France, for a while delayed any active measures; and on the death of that monarch, the duke of Orleans, who succeeded him by the name of Louis XII. was for some time too much engaged by his domestic concerns to engage in Italian affairs. At length, an army of 30,000 French, led by Louis of Luxembourg, James Trivulzio, and Robert Stuart, Lord d'Aubigny, entered the Milanese, and, being joined by the Venetians, were joyfully received at Milan, where Louis for three months resided, and was acknowledged duke of Milan. On his return to France, however, Sforza, who had retired into Tyrol, again recrossed Milan at the head of 15,000 Swis; but these soldiers, when opposed, at the siege of Novarra, to their countrymen in the French service, were persuaded by the latter to desert the service of a traitor and assassin; and Ludovico Sforza, attempting to escape in disguise, was taken and delivered to Louis, by whose Ludovico order he was confined in the castle of Loches, in Tou. Sforza raine, where he remained till his death, ten years after. In the meantime, Caesar Borgia, by a series of the most detestable perfidies, had made himself master of Romagna, and had now turned his views to the conquest of Florence; when a considerable check was given to the career of his ambition by the death of his father Alexander VI., whose infamous conduct had alienated the minds of the Christian world from the head of the church.

Pius III. his successor, only lived twenty-six days; and Juliano della Renciere, one of the nephews of Sixtus IV. was raised to the pontificate by the name of Julius II. At the same time, the archduke Philip concluded with Louis, in the name of his father-in-law Ferdinand of Spain, by which it was agreed, that the kingdom of Naples should be divided between them; as Frederic of Naples had already abdicated, and received a pecuniary compensation, and a retreat in Anjou, from Louis. The treacherous Ferdinand, however,
only waited till the arrival of the troops sent by the emperor to his assistance; and his general Gonsalvo de Cordova then attacked the French troops of the duke of Nemours at Cerignola, and completely defeated and expelled them from Naples. Louis' declining health put a stop to his plans of invading Spain in revenge; and the Spaniards, on the conclusion of a peace, remained in possession of Naples. Louis, however, conferred on Francis, count of Angoulême, the hand of his daughter Claude, which had before been promised to Charles prince of Spain, son of the late archduke Philip of Austria; and a foundation was thus laid for the personal hostility of these distinguished princes. The pope having now succeeded in overthrowing the power of Borghini in Romagna, still found a check to his ambition, in the cities possessed in that country by the Venetians. The wealth and ambition of that republic, had been long objects of jealousy to the other states of Europe; the emperor Maximilian was actually engaged in a war with it; and the intrigues of the pope soon produced the League of Cambrai, in which the kings of France and Spain joined themselves to the confederacy. The duke of Ferrara, and the marquess of Mantua, embraced with eagerness the opportunity of throwing off the yoke; and, after considerable delay, Charles VIII. duke of Savoy, also joined the alliance. The first conflict was decisive, and the defeat at Ghiana d'Adda placed the Venetians at the mercy of the confederates; but, for the time, the seeds of discord were already sown among these ill-assorted allies. Julius especially, having now recovered the whole of Romagna, and whose ambition now embraced a wider field, exerted himself to bring about a peace; and the Venetian republic, though strip of its conquests, was left inviolate.

The pope, thwarted in his projects against Ferrara by the interference of Louis, now set on foot an alliance, termed the Holy League, for the purpose of expelling the French from Italy. The new confederates were Ferdinand of Spain, the Venetians, and the Swiss. Powerful as were these antagonists, the army of France, commanded by Gaston de Foix, duke of Nemours, succeeded in raising the sieges of Brescia and Bologna, and at Ravenna completely routed the troops of the League; but this last victory was dearly bought, by the loss of their gallant general, who fell in a skirmish, after the battle, in his 21st year. The death of Foix was fatal to the French interest; dissensions arose in the army; Milan was seized by the Swiss, who reinstated the family of Sforza, in the person of Maximilian, son of Ludovico; and France, invaded by the emperor and Henry VIII. of England, became now the theatre of the war; when the death of Julius, whose restless spirit had animated the contest, gave a promise of repose to the nations. John di Medici, who assumed the name Leo X. now ascended the papal chair. The death of his brother Peter, in 1505, had left him the representative of his family; and a revolution in Florence, had raised him to the influence enjoyed by his ancestors in that state. On his accession to the pontificate, the French had gained considerable successes in the Milanese; but the exertions of the Swiss again replaced Sforza at Milan, and once more expelled the French from Italy. The League, however, was weakened by the defection of the king of England, who bestowed on Louis, now a widower, the hand of his young and beautiful sister. The aged monarch did not long survive this connection. His successor, Francis I. eager to recover Milan, and wipe off the stain on the glory of the French arms, soon crossed the Alps, and advanced against the Swiss troops of Sforza, posted at Morignano, a few miles from Milan. The Swiss defended them with obstinate valor for two days, and at length retreated in good order, although weakened by the loss of 10,000 men. The French loss amounted to 6000; but their victory was decisive; Maximilian Sforza surrendered Milan, and, accepting a pecuniary consideration, resigned his claim to the duchy, and retired to France. The pope, alarmed at the progress of Francis, hastened to reconcile himself to him; and at a personal interview, contrived, by his flattery, to gain over to his own plans the unsuspecting generosity of the king.

Soon after his return to France, the emperor Maximilian invaded the Milanese with a large army, and laid siege to Milan; but was repulsed by Charles of Bourbon, constable of France, and obliged to return to Germany, where he died. The king of France immediately declared himself a candidate for the imperial crown; but the electors, partial to the house of Austria, preferred Charles V. now by the death of his grand- father Ferdinand king of Spain and Naples, in his own right, duke of Austria and lord of the Netherlands, and enriched by the spoils of the new world. Francis, jealous of his fortunate rival, soon found a pretext for a war, which was in the end to be attended with consequences so fatal to himself: and the power and influence of the combatants soon involved all Europe in the quarrel. For the general history of this important struggle, see the article France, Vol. IX. p. 557, where it is related at such length, as to render it unnecessary for us to give any more than a short sketch of the transactions in Italy. Leo X. who had formerly favoured Francis, chiefly in order to use his influence for the aggrandizement of his nephew Lorenzo, duke of Urbino, had now his hopes of raising his family blasted by his death. Lorenzo left only one daughter, the celebrated Catherine, and an illegitimate son Alexander. The chief aim of the pope was now to obtain Parma and Placentia, which were held by the French. He therefore entered into an alliance with Charles, who proceeded to invade Lombardy. The troops of Francis were engaged in other quarters; and the Swiss, to whom the emperor had trusted the Milanese, being ill paid, were easily gained over by Prosper Colonna, the papal general; and the short struggle was ended by the complete expulsion of the French. Francis Maria Sforza, brother to Maximilian, was invested with the dukedom of Milan. Parma and Placentia had already been surrendered to Leo; but that pontiff had not long survived the success of his intrigues, having died at Rome in the end of the year 1521. He was succeeded by Adrian VI, a Fleming, who had been preceptor to Charles V. and regent of Spain.

The undecided character and unpopular manners of Adrian formed an unfavourable contrast with the polished urbanity of his predecessor, and he died at the end of the year very little regretted by the Italians. After a long contest, the cardinals united in favour of Julio di Medici, natural son to Juliano, who was murdered by the Pazzi. This pope, who took the name of Clement VII. had acted as prime minister to Leo X. but his conduct as a sovereign disappointed the hopes entertained from his success in a lower situation. The defection of Charles of Bourbon, who fled to Italy, was a severe blow to Francis; and the misconduct of Bonnivet, to whom he entrusted the invasion of the Milanese, ruined his affairs in Italy: and his army, com-
manded by Bajard, was completely routed by the imperialists under Bourbon, and their gallant general slain. Irritated by these reverses, the king of France again entered Italy, where he was joined by the pope and the Florentines, and laid siege to Pavia. On the advance of the imperial army to relieve it, Francis was so infatuated as to listen to the advice of Bonnivet, and leave an advantageous position to give them battle. The result was fatal to the French; and the captivity of their monarch left the emperor apparently undisputed master of Italy. But a conspiracy was now formed by Clement, Francis duke of Milan, and the Venetians, to throw off his yoke; and they attempted to gain over to their interest Ferdinand, marquess of Pescara, the imperial general, by the offer of the crown of Naples. The marquess remaining faithful to his master, immediately seized on the Milanese, and besieged the duke in his citadel, who was forced to surrender; and Charles of Bourbon, on whom the emperor conferred the investiture, remained master of the duchy, and, at the head of an army of 20,000, laid siege to Rome, and prepared for an assault. On the first attack, Bourbon was killed by a musket-shot; but his troops, commanded by Phillibert of Chalons, prince of Orange, made themselves masters of Rome, and the holy city was left a prey to the cruelty and rapacity of the soldiery. Clement retired to the castle of St. Angelo, but was soon obliged, by famine, to surrender, and was retained in the same place a prisoner and a witness of the calamities of his unfortunate subjects.

The confinement of Clement gave the last impulse in the favour of liberty to the republic of Florence; the adherents of the Medici were expelled, and the statues of Leo and Clement destroyed. At the head of this revolution was Philip Strozzi, the husband of Clarice, daughter of the unfortunate Peter di Medici, who herself contributed in no small degree to the success of the revolution. The newly emancipated republic embraced the cause of Francis, and were joined by the Venetians; while Lautrec, the French general, invaded Italy. Their cause was at first successful. By the assistance of Andrew Doria, Genoa again acknowledged the French dominion, Pavia and Alexander surrendered to Lautrec, who now marched towards Naples; and Clement, during a negotiation for ransoming himself, contrived to escape from his confinement. These apparent advantages, however, were soon frustrated. The pope, who saw no opportunity of regaining his ascendancy at Florence, through Francis, the ally of the republic, began to treat secretly with Charles. The army of Lautrec was weakened by pestilence, and its valiant leader fell a victim to its ravages; and Doria, indignant at the overbearing insolence of the French, deserted the service of Francis, and assisted his fellow-citizens in asserting the liberties of their country. Another attempt of Francis on the Milanese failed by the skill of De Leyva, the Spanish general, and the Count de St. Pol was defeated and taken prisoner.

These reverses at length obliged the king of France to listen to terms of accommodation; and the peace of Cambrai was concluded, by which he renounced all claims to Milan, Genoa, and Naples; and, what was still more degrading, left his Italian allies to the mercy of the emperor. But the formidable invasion of the Turks made that prince unwilling to excite fresh wars by any severity; and his proceedings during his visit to Italy, were in general conciliating. Francis Sforza was reinstated at Milan, and united to the niece of the emperor; the duke of Ferrara’s dominions were, notwithstanding the remonstrances of the pope, left inviolate; and an equitable treaty granted to the republic of Venice. Florence, however, with a fortitude worthy of its better days, resisted, for several months, the imperial armies; but its efforts were unavailing; and, on its surrender, Alexander di Medici, who assumed the title of duke of Florence, was confirmed by the sanction of the emperor. On the death of the marquess of Montierat without issue, the inheritance, disputed by the duke of Savoy, the marquess of Saluces, and the marquess of Mantua, was decided by Charles in favour of the last claimant. From this period the affairs of Italy became comparatively of little interest; the petty intrigues, and crooked policy of its tributary chiefs, are unworthy the attention of the historian; and its annals in future, only contain the alternate victories and defeats of those potentates who contended for its dominion, while the natives themselves remained the passive and obedient slaves of him who gained the victory.

The attention of the emperor was now chiefly occupied by the progress of the reformers in Germany, and, anxious to bring to a conclusion the divisions in the church, he repeatedly urged Clement to call a general council, but without effect. Francis, aware that the importance with which this measure was demanded, was extremely disagreeable to the pope, now again endeavoured to detach him from the emperor. In this he completely succeeded, by the marriage of his son, Henry duke of Orleans, to Catherine di Medici, his grand-niece. Clement, however, still appeared devoted to Charles; but his unfortunate reign now drew near a close. The defection of Henry of England, and the complete emancipation of that kingdom from the papal dominion, an event, to which the intertemporal violence of the Iloman court had in no small degree contributed, deeply affected Clement’s mind, and at length injured his health to such a degree, as to occasion his death. He was immediately succeeded by Alexander Farnese, who assumed the name of Paul III. whose prudent government maintained, for some time longer, peace in Europe.

At length Sforza, duke of Milan, having put to death one of Francis’ emissaries, the impatient spirit of the monarch could contain no longer, and though unable to gain a single ally, he marched with his troops into Italy. His first attempt was against the duke of Savoy, who, not receiving assistance from Charles, then engaged in the siege of Tunis, was expelled from Savoy, and obliged to take refuge in Piedmont. Francis now prepared to turn his arms against Sforza, but his plans were altered by the sudden death of that prince, whose duchy, as he left no heirs, was seized by Charles as a vacant fief of the empire.

Francis in vades Italy, A. D. 1535.

Francis now lost his time in making out legal claims to the succession, while Charles, now arrived in Italy, and at the head of a powerful army, carried the war into France. This war, which was carried on with great exertions on both sides, was terminated by the conclusion of a truce for ten years, through the mediation of Paul III. This was signed at Nice, in June 1538.

In the meantime, an attempt was made to excite a revolution at Florence, Alexander di Medici had ren.
dered himself justly detested by the tyranny of his government, and the brutality of his vices. The death of pope Clement, whose influence had in some degree restrained his excesses, left him completely at liberty. The conduct became so odious, that his cousin Lorenzo di Medici, himself an associate in his debaucheries, intending perhaps to become his successor, took an opportunity of assassinating him. But Lorenzino's designs were frustrated; and although he was well received by Strozzi and the exiles, the principal inhabitants of Florence placed at the head of the government Cosmo di Medici, a youth of 18, the only remaining legitimate descendant of the great Cosmo, and their choice was ratified by Charles, who confirmed Cosmo in the dukedom. The emperor bestowed the hand of his natural daughter, Margaret of Austria, the widow of Alexander, on Octavio Farnese, the nephew of the pope.

War renewed, A.D. 1542.

The war in Italy was again renewed, by the refusal of Charles to bestow on Francis' son, Charles duke of Orleans, the investiture of Milan, of which he had given a promise, at one of his interviews with Francis during the truce. On this occasion the dominions of Charles were invaded by no less than five French armies. That in Piedmont was commanded by Ambant, while the count of Enghien, aided by the fleet of the corsair Hayradin Barbarossa, besieged Nice, the residence of the duke of Savoy. The arrival of the imperial troops, under the Marquess of Guasto, however, obliged these extraordinary confederates to raise the siege.

The following year was distinguished by the decisive victory of the count d'Enghien over Guasto and the imperialists, with a very inferior force, at Cersoles in Piedmont. But Francis was too much weakened to follow up the victory; and its only result was the capture of a few towns in Piedmont. A treaty was at length concluded at Crespy; by which, among other things, it was agreed, that Charles should confer on the duke of Orleans the Milanese, and the hand of his niece, the daughter of Ferdinand king of the Romans. But the premature death of Charles of Orleans prevented the marriage, and gave the emperor an opportunity of evading the fulfilment of the condition. In the meantime, all hopes of reconciling the Protestants being at an end, their tenets were condemned, and their persons excommunicated, by the Council of Trent; and their armies defeated by the allied troops of the emperor and the pope. But the latter, alarmed at the accession of power acquired by Charles by the defeat of the reform-ed princes, soon withdrew his troops, and devoted his endeavours to the aggrandisement of his own family. He first obtained for Octavio Farnese the city of Sienna, after having in vain attempted to get for him the duchy of Milan. He next prevailed on the college of cardinals to erect into a duchy the territories of Parma and Placentia, which he conferred on his son Peter Ludovico Farnese, a monster of vice and tyranny. But the indignation of the Placentians soon roused them to resistance, and this wretch was assassinated in the fortress of Placentia, which the conspirators immediately seized in the name of the emperor.

The same year was remarkable, by the failure of the conspiracy of Fiesco, count of Lavagna, against Andrew Doria at Genoa; an event which it would be presumptuous to relate in other words than those of Robertson, and for which we refer our readers to the page of that elegant historian. The death of Paul III. followed soon after that of his son. Sensible, probably, of the mistake he had been guilty of, his last act was to give Parma to the states of the church. He was succeeded by cardinal Dumont, a person of an effeminate and voluptuous character, equally desirous with the late pope to advance his family; but Paul had bestowed principalities,—Julius III. confined his donations to estates and offices. The death of Francis I., occasioned a similar Death of change in the court of France; for Henry II. thought like his father ambitious and warlike, could be satisfied with the pre-eminence in martial exercises, and feed his ambition with the mimic victories of the tournament.

An event soon occurred, however, which drew the French monarch into hostilities of a more serious nature. Octavio Farnese had, notwithstanding the decree of his dying uncle, made himself master of Parma, with the connivance of Julius, who was willing that at least it should be saved from falling into the emperor's hands; but Charles, desirous of recovering this fief of the empire, having bestowed the investiture on Gonzaga, governor of Milan, and Farnese having in vain requested assistance from the pope, had recourse to the king of France, who embraced his cause, and commenced a war, which, however, produced no effect of consequence, and the attention of both Charles and Henry were diverted for some time, to revolutions of greater interest, and wars of more vital importance. In the mean time, the power of Cosmo di Medici was daily increasing; the possession of Florence and Leghorn gave him the key of what are called the fettors of Tuscany; he had also received the principality of Piombino; and his ambition was now turned to the acquisition of Sienna. This ancient republic still retained its liberty, and, although torn by factions during the late war, successfully defended itself against the imperial troops. The aid afforded by Henry II. to the Siennese during this contest, had raised a powerful party in favour of the French in that city,—a circumstance which excited the jealousy of Charles and the alarms of Cosmo, who was besides desirous to extinguish, in a state so near him, the last sparks of that liberty, whose flame he had suppressed at Florence. The emperor, willing to create a diversion to the arms of Henry, now victorious in the Netherlands, permitted Cosmo to undertake the conquest of Sienna. His army was commanded by John James Medichino, marquess of Marignano, a soldier of fortune and of low birth, whom Cosmo flattered, by allowing him to bear the arms of the Medici, and acknowledging him a relation of the family. The French and Siennese had, as their leader, Peter Strozzi, the son of Philip, and Clarice di Medici, who maintained his hereditary tone of liberty, and thorough detestation of the enslavers of his country. The armies encountered near Marciano; but the valour and impetuosity of Strozzi were foiled by the superior military science of Medichino; and the former, weakened by a dangerous wound, was forced to retreat with the feeble remains of his troops, while his antagonist immediately laid siege to the city of Sienna. The Siennese, encouraged by Monle, commander of the French garrison, defended themselves with determined valour for two months, and at length capitulated on honourable terms.

These were not adhered to by Cosmo, who proceeded to new-model the government of the state, with-
ITALY.

out any regard whatever to its former policy. Many of the citizens, however, retired to a small town called Montelabate, which they established a government similar to that of Sienna, and consoled themselves with this shadow of their ancient liberty. The pope, overjoyed by the re-union of England, under Mary, to the Roman church, now attempted, by his intrigues, at the diet of Augsburg, if possible to disunite the Protestants in Germany; but his designs were interrupted by death. His successor, the virtuous Marcellus II. died on the 20th day of his pontificate, while meditating plans for the reformation of the church. The tiara was now conferred on John Peter Caraffa, who took the name of Paul IV.

This pope was of an intolerant and severe disposition, and filled with extravagant notions of the power and authority of the Roman see. He soon displayed this, in his insolent treatment of the imperial ambassador, who informed him of the pacification of the diet of Augsburg, an event so unpleasing to his bigotted mind, that he openly inveighed against Charles and Ferdinand. His nephews, whom the duke of Guise had gained over to the French interest, encouraged this temper, and at last induced him to conclude a treaty with Henry. But the emperor, having now abdicated his hereditary dominions in favor of his son Philip II. consecrated the last months of his political existence to the negocitation of a peace with Henry; and a truce for five years being concluded, the pope was left exposed to the vengeance of Philip. Paul, alarmed for his safety, now had recourse to intrigues; and having sent his nephew cardinal Caraffa to Paris, succeeded, by the united influence of the Loraine family, the queen, and Diana of Poitiers, Henry's mistress, in persuading him to violate the league, and again renew the war. Emboldened by his success, the pope, in the king of Spain at defiance, and proceeded to harass the Colonna family, and other adherents of the house of Austria. Philip at first was prevented by religious scruples from openly attacking the pontiff; and it was with extreme reluctance, that, having in vain attempted pacific measures, he ordered the duke of Alva to invade the papal territory. The rapid progress of that general reduced Paul to his old intrigues; and, under pretense of expecting a truce from Henry of France, he attempted to gain time, till the arrival of the French troops, and a considerable sum of money, again enabled him to set the duke at defiance. The French army was commanded by the duke of Guise, who, after relieving Rome, marched towards Naples, and endeavored to force Alva to give him battle. But that experienced leader declined an engagement, and remained within his entrenchments, while the allied army was wasted by sickness, and weakened by the dissensions of its commanders.

But, in the mean time, the Spanish army in the Netherlands, commanded by Emmanuel Philibert, duke of Savoy, completely routed the French under constable Montmorency at St. Quintin; and Henry was forced to rescind the duke of Guise for the defence of France. The pope now hastened to appease Philip, which the superstitious veneration of that prince for the holy See rendered no difficult task; and the duke of Alva was even obliged to solicit his knees, the forgiveness of the pontiff for invading the sacred territory. At the same period, Philip, desirous to ingratitude himself with the Italian princes, of whose influence he intended to make use to counterbalance the authority of the pope, conferred on Octavio Farnese the city and territory of Placentia; and, having acknowledged him as duke of Parma, succeeded in detaching him from the French alliance. In the mean time, influenced also by the intrigues of Cosimo di Medici, he conferred on him the investiture of Sienna, in consideration of the sums due to him by his father, and on condition of his furnishing a body of auxiliary troops, in case of any attack on Naples and Milan.

This acquisition secured to Cosmo, who had assumed the title of Grand Duke of Tuscany, the complete dominion of that country. Two years after this, the peace of Chateau-Cambresis restored peace to Europe. The principal articles regarding Italy, were the restoration of Savoy to Emanuel Philibert, who was also united in marriage to Margaret of Valois, sister to Henry II. Elizabeth, daughter of that monarch, became queen of Spain, although her hand had previously been promised to the unfortunate Don Carlos, Philip's eldest son. Henry's troops evacuated Italy; Montferrat was restored to the duke of Mantua, and Corsica to the Genoese, whose independence was now acknowledged. The conditions of the treaty were observed with punctuality and fidelity: a circumstance to which, in Italy, the death of Paul IV. contributed in no small degree. This pontiff is said to have died from the distress occasioned by his nephew, the duke of Palermo, having in a fit of jealousy assassinated his wife, and murdered her suspected lover. His successor, Pius IV. instigated probably by the court of Spain, a few months after his accession, ordered this affair to be investigated; and the result of the inquiry was, the execution of the duke of Palermo, his brother cardinal Charles Caraffa, and other two noblemen, their accomplices.

The return of the duke of Savoy to his hereditary states, was an event no less agreeable to his subjects, than fortunate to the other states of Italy. This prince, though from his infancy accustomed to war, had learned to estimate the value of peace; and, aware of the misfortunes which his country had suffered from being the theatre of war, exerted himself, in concert with the Venetians, in defending the frontiers of Italy, and preventing it from again being exposed to the devastation of foreign armies. The general state of Italy had improved under the conduct of Pius IV., and his successors Pius V. and Gregory XIII. also contributed, in a no small degree, to the tranquillity of Italy. These pontiffs, instructed by the example of their predecessors, in the pernicious effects resulting from their attempts to aggrandise their families, devoted their attention to the affairs of the church, and rescued it from the scandal occasioned by former popes and their nephews, of which even the warmest of its defenders could not but feel sensible.

The contest at Genoa between the old and new nobility in the grand dukedom of Tuscany

Death of Paul IV. Aug. 1565.
ality, and the subsequent insurrection of the people against their divided lords, was fortunately terminated by the mediation of the pope, the emperor, and the king of Spain; and Genoa remained, till our days, undisturbed by any more intestine revolutions. Not long after this, the last Marquess of Saluces died in France, having previously ceded his dominions to Charles IX. whose troops immediately took possession of it, notwithstanding the remonstrances of the duke of Savoy, who claimed it as an ancient dependency of his duchy. The latter prince, unable to accomplish his object by pacific measures, and unwilling to have recourse to war, was forced, during the remainder of his reign, to acquiesce; and the French remained possessors of Saluces. After his death, however, his son Charles Emanuel, taking advantage of the difficulties in which Henry III. was involved, made himself master of Saluces, whose cruel persecution of the Protestants has made his name odious in the annals of the reformed churches, while it acquired him, at Rome, the reputation of the active and zealous defender of the Catholic faith.

In Tuscany, the grand duke Francis (son of Cosmo di Medici) and his duchess, the celebrated Bianca Capella, died at Florence in the course of the same night; and as he only left two daughters by his first wife, Jane of Austria, the dukedom descended to his brother cardinal Ferdinand di Medici, who, laying aside the purple, assumed the government of Tuscany.

Soon after the peaceable establishment of Henry IV. on the throne of France, having at length obtained the consent of the pope to his divorce of Margaret of Valois, he was married to Mary di Medici, the youngest daughter of the grand duke Francis; and the Tuscian family was thus honoured by a second alliance with the royal family of France. Henry now turned his arms against the duke of Savoy, desirous to recover Saluces, and punish that prince for his interference in the wars of the league. In one campaign, he made himself master of most of the duke's strongest fortresses; but the war was put an end to by the intervention of Pope Clement VIII. and the King of Spain. Saluces was left under the dominion of Savoy; but the country of Bresse was ceded to France, and 100,000 crowns were paid by the duke to defray the expences of the war.

Much about this period, Alphonso II. of Esté, duke of Ferrara and Modena, died, and was succeeded by his son Caesar; but Clement VIII. took advantage of this conjunction, to assert the ancient claims of the church to the city of Ferrara, which was immediately seized by his troops. Caesar, unable to contend with the pope, retired to Modena; and Ferrara was united to the papal territories. These changes, however, but little affected the general peace of Italy, which continued for upwards of twenty years; a period, doubtless, of great advantage to that country, but of little interest to the historian.

A.D. 1612. The succession to the dukedom of Mantua occasioned a contest, which once more laid Italy open to foreign invasion. Francis IV. duke of Mantua, left only a daughter, and was succeeded by his brothers Paul and Vincent II.; but neither leaving any children, the dukedom was claimed by Charles Gonzaga, duke of Nevers, the heir-male of the family, and whose son was also married to Maria, daughter of duke Francis. The emperor Ferdinand II. unwilling that so valuable a principality should fall into the hands of a subject of France, conferred Mantua on the duke of Guastalla; while Charles Emanuel of Savoy annexed the old claims of his family to the marquisate of Montferrat, and obtained the support of the Spaniards. The duke of Nevers, unable to contend against such powerful rivals, applied for assistance to Louis XIII. of France, and was seconded by the Venetians, who dreaded the consequences of Mantua falling under the dominion of the Spaniards. The cardinal de Richelieu having, by the capture of La Roche, succeeded in subduing the Protestants, was not unwilling to enter into a war which might conduct to the great end he had now in view, the humiliation of the house of Austria. The French accordingly, commanded by Louis in person, crossed the Alps, and, without receiving opposition from the duke of Savoy, (whose prudence, or perhaps indecision, prevented him from taking any active part in the war,) proceeded to the relief of Casal, then besieged by the Spanish troops. The news of the insurrection in Gascony, of the Protestants under the duke of Rohan, obliged Louis to return to France; and the duke of Savoy, imagining all danger from the French at an end, united his forces with the besiegers of Casal. But the duke was soon taught the impolicy of his conduct, by the speedy return of the French army under the command of Richelieu; which, after menacing Turin, and forcing the duke to concentrate his troops for its defence, laid siege to the fortress of Pignerol, a post commanding the passes of Italy, and reduced it in a few days.

In the mean time, Louis returned and entered Savoy, which soon submitted to his arms; and the duke, overwhelmed with the weight of these sudden calamities, died at Turin, in the sixtieth year of his age. His son, Victor Amadeus I. instructed by the example of his father, hastened to conclude a treaty with Louis; whose troops now proceeded to Casal, which still continued to hold out. In Lombardy, however, the cause of the imperialists had been successful; the Venetian and French troops, commanded by Marshal d'Estrees, were defeated, and the city of Mantua taken by assault by Count Colalto, the imperial general. But the active mediation of Pope Urban VIII. or rather of his agent Julio Mazarine, succeeded in procuring a suspension of arms; and, at the dict of Ratisbon, the intrigues of Richelieu procured the acknowledgment of the duke of Nevers' right to Mantua, which was delivered up to him; while the duke of Savoy received a few towns in Montferrat; and the Gonzagas of Guastalla a pecuniary indemnification; and Pignerol, Luza, and two other fortresses, remained in the hands of the French, as securities for the performance of the treaty. The subsequent treaty of Querquesa secured to the French the entire possession of Pignerol, and thus left them an easy entrance into Italy.

Three years after, war broke out anew. Richelieu secured on his side Odourd Farnese, duke of Parma, in Italy, and the dukes of Mantua and Savoy. The two brothers of the latter, however, Cardinal Maurice, and Thomas, entered into the imperial service. The death of Victor Amadeus left his dominions, and the care of his infant successor, in the hands of Louis. The Marquis of Gonzaga, in Italy, was not at first successful; and although the duke de Crequi afterwards defeated the duke of Modena and the Spaniards, the state of the contending parties remained, at the end of two
years, much the same. At this period, the male line of the Rovere, dukes of Urbino, became extinct. The duchy was claimed by Ferdinand, grand duke of Tuscany, who married Victoria, grand-daughter of the late duke; but Urban VIII. had already seized it as a vacant fief of the papal see; and Ferdinand, unwilling to contend with the pope, was satisfied with the inheritance of the private property of the Rovere. The Barberini, nephews of Urban, finding him firm in his refusal to grant them the investiture of Urbino, turned their attention to the acquisition of the duchy of Castro, near Rome, the property of the duke of Parma, which they persuaded the pope to invade. That prince having allied himself with Ferdinand II. grand duke of Tuscany, and Francis I. of Este, duke of Modena, marched at the head of 5000 men to the attack of the papal army near Bologna, commanded by Taddeo Barberini, though consisting of 20,000. This daring enterprise was successful: Barberini was forced to take refuge in Ferrara, and Farnese entered into and laid waste Romagna. The armies of Modena and Tuscany were equally successful, and the pope at length concluded a treaty with the dukes. This event was soon followed by the death of Urban VIII.

France continued the friendship of Cardinal Richelieu and Louis XIII. The government was left in the hands of Cardinal Mazarine, who acted as prime minister to Queen Anne of Austria, regent during the minority of her son, Louis XIV. Mazarine, who entered warmly into the affairs of Italy, displeased by the election of Innocent X. who was his personal enemy, used all his interest to gain over the Italian princes. Thomas of Savoy, now in the French service, was successful in gaining over the dukes of Parma; and that prince, repairing to Paris, concerted with the cardinal the plan of the war. Hostilities were commenced by the French army under the command of the Duke de Brie and Thomas of Savoy, which landed near Orbetello, and commenced the siege. But the fleet was in the mean time defeated by the viceregy of Naples, the duke of Brie killed, and the troops forced to reembark and return to France. The second expedition was more fortunate, and the isle of Elba and the principality of Piombino surrendered to the French arms.

In the mean time, the kingdoms of Naples and Sicily were groaning under the oppression of the Spaniards, the chief object of each successive viceregy was to rival his predecessor in the raising of levies and taxes. The resources and the patience of the Neapolitans were at length exhausted; the ministers of Philip IV. had, by their misconduct, occasioned the revolt of Catalonia and Portugal; and these misfortunes, of too great magnitude to be long concealed from the people even in the most remote territories of Spain, awakened in the Sicilies the spirit of insurrection. The first explosion was at Palermo, where the crown of Sicily was offered to Francis of Vintimilla, Marquess of Gierace; but that nobleman, with great prudence, resisted this dangerous promotion, and succeeded in calming, for a time, the indignation of his countrymen. But the misjudged severity of the viceregy again excited the Sicilians; and the Spanish troops were forced to withdraw from Palermo. The severity of the duke of Arcos at Naples, roused in that city a rebellion, no less formidable. Headed by Thomas Aniello, (commonly called Masiello,) a fisherman, the lower classes made themselves masters of the palace and the viceregy, commited numberless excesses, and sacrificed to their vengeance the most obnoxious instruments of the tyranny to which they were subjected. Their leader assumed the title of lieutenant-general of the king of Spain, and for ten days exercised the most unlimited authority; but at length, becoming intoxicated by a success so unexpected, he grew suspicious and cruel, and his whole conduct exhibited evident marks of insanity. He was assassinated on the 11th day of his short and extraordinary reign; but the Neapolitans still continued in arms, and assuming a republican government, chose as their commander Francis Toraldo, prince of Massa.

The insurrection at Palermo had, in the mean time, been quelled by Cardinal Trivulzio, whose influence as a churchman and an Italian, at length restored tranquillity. The Neapolitans, however, determined to throw off the yoke of Spain, now began to deliberate to whom they should make offer of the crown; and actually entertained the pope, as their suzerain, to confer it on some prince of French extraction.

At this period, Henry, duke of Guise, happened to be at Rome. This nobleman, whose character resembled that of the ancient heroes of chivalric romance, being immediately excited by the ambition of making himself master of Naples; and without waiting for assistance, proceeded immediately to that city, and offered his services to the republic. He was received with enthusiasm by the people, and immediately appointed their general, with the title of duke, or doge. The civil administration still remained in the hands of Gennaro Annese, one of the original insurgents; but the duke, after the conquest of Capua and Aversa, openly assuming an authority and state which showed his intention of aiming at the crown, Annese contrived to excite the jealousy of the people against him, and, in concurrence with the archbishop, carried on a secret negotiation with Don Juan of Austria, and the Spanish troops in the citadel. At length having, by a false report of an attack on Nisites, contrived to remove the duke and his troops from the city, the Spaniards, issuing from the fortress, were received without resistance; and Guise, after some unavailing attempts to force his way back, retreated towards Rome, but on his march was seized by treachery, and sent to Spain, where he remained a prisoner for five years. The Spaniards, again masters of Naples, punished the revolt with the greatest cruelty; and even Gennaro Annese, whose treachery had restored the Spaniards, perished on the scaffold.

The wars of the Fronde, which now raged in France, completely withdrew the attention of Mazarine from Italy; and in the course of a few years, the Spaniards recovered Elba, Piombino, and Casal; but no sooner was the cardinal reinstated in his power, than he again attempted to invade Naples, allowing the expedition to appear, however, as if solely the work of the duke of Guise, now delivered from prison. The capture of Castelmare was all that the duke could effect; and, meeting with no encouragement from the Neapolitans, he was obliged to return to France. Nothing farther of any importance was attempted in Italy during this war; which was put an end to by the peace of the Pyrenees.

From this period, there follows about twenty years of profound repose in Italy, which can scarcely be said to be interrupted by the contest of the Venetians with
the Turks, commonly called the war of Candia, in which Pope Innocent X. in vain endeavoured to procure the assistance of the other Catholic potentates. During the pontificate of Alexander VII. a dispute which arose between him and Louis XIV. occasioned a mutual dismissal of ambassadors; and preparations for war were made on both sides: but the pope soon becoming convinced of his inability to oppose so powerful an antagonist, hastened to appease Louis, whose pardon he only obtained by the most humiliating concessions.

The king of France was now engaged in his wars in Flanders, and for some years interested himself but little in Italian affairs: the oppressive government of the Spaniards at length gave him an opportunity.

The city of Messina, in Sicily, had, from a very early period, enjoyed the privilege of being governed by its own senate, a right which its citizens had, defended against the aggressions of several monarchs of the different dynasties which had in their turn been oppressors in Sicily. The Spanish ministers, jealous of this last remnant of independence, made an attempt to deprive the senate of its jurisdiction, and put to death two of the magistrates who ventured to defend its rights. The remonstrances of the people on this atrocious outrage, were considered by the court of Madrid as acts of rebellion, and the governor of Messina endeavoured to secure the persons of the senators as its instigators. But the people, alarmed for the fate of their magistrates, flew to arms, and the garrison were forced to take refuge in the citadel, which they were soon compelled to evacuate. The armies of the viceroys of Naples and Sicily now prepared to besiege the city, and the Messenians had recourse to the duke d’Estrees, French ambassador at Rome.

Louis, on receiving this intelligence, immediately sent a body of troops to Messina, to the great joy of the inhabitants, who hoisted the standard of France, and proclaimed Louis as their sovereign. In the course of the following year, the Spanish fleet being defeated by the French: the siege was raised, and the generals of Louis entertained hopes of conquering the whole island. But the lapse of 400 years had not effaced the recollection of the tyranny of Charles of Anjou: and however averse the Sicilians might be to the Spanish government, they exhibited still greater antipathy to the dominion of the French, and the conquests of the latter were confined to a few inconsiderable towns. At last Louis, weary probably of the expense of the contest, suddenly sent a peremptory order to his general, Feuillade, to evacuate Messina. The senate and nobles having in vain remonstrated against this cruel desolation, were forced to surrender to the Spaniards, but more than one half of the inhabitants removed to France: an emigration which, with the loss during the war, and the subsequent oppression of the Spaniards, so much weakened Messina, that half a century elapsed before it regained its former prosperity.

Not long ago after this, Louis acquired the important city of Casal, in Montferrat, by a treaty with Guerrieri, prime minister to Ferdinand Charles, duke of Mantua, by which, on the payment of 500,000 livres, the city was delivered up to Louis, and immediately occupied by 19,000 French, under Boufflers and Catignat. This dishonourable transaction excited so great indignation among the Italian states against the duke of Mantua, that he disavowed any knowledge of the transaction. The French, however, retained possession, and the extravagance and thoughtlessness of the duke, who was devoted to the passion of gaming, rendered his participation in the treaty not at all improbable.

The republic of Genoa now incurred the displeasure of Louis, by the steady attachment it continued to maintain to the Spanish interest. Under pretence of their fitting out a fleet for the service of Spain, the Genoese were attacked by a powerful French squadron, and on their refusal to surrender the ships, Genoa was bombarded, and part of the city reduced to ashes; and the doge, and four of the principal senators, obliged to proceed to Paris, and there humble themselves before the haughty Louis.

In his conduct to Pope Innocent XI. the French monarch displayed 'the same overbearing insolence, nor can his obstinate opposition to the pope’s wise restrictions on the right of sanctuary enjoyed within the premises of foreign ambassadors, be otherwise accounted for, than from his desire to shew to Europe that he had now arrived at such a height of power, as to despise the laws by which other civilized states were regulated in their mutual intercourse.

The indignation of Europe at length burst forth. League of Augsburg against Louis. The first commencement of the war in Italy was by Battle of the allies. The troops of Victor Amadeus II. were defeated at Staffarda, by Mareschal Catignat, and Savoy, with the greater part of Piedmont, fell into the hands of the French. The activity of prince Eugen of Savoy saved Turin; and in the following years these allies invaded Dauphiny, in order to divide the attention of Catignat. The success of their campaign was, however, interrupted by the illness of the duke, and his generals were forced to retreat. Casal was then invested by the combined troops of Spain and Savoy, and on its surrender was restored to the duke of Mantua, in consequence of a secret agreement between Louis and the duke of Savoy, who was now weary of the war, and determined to desert the cause of the allies. In fact he concluded a treaty the next year, after sustaining a mock siege in Turin, by Catignat.

By this pacification, which was termed the neutrality of Italy, the duke received back Savoy, with all the other places occupied by France, and Adelaide, his eldest daughter, was betrothed to the duke of Burgundy, grandson of the French monarch. The defection of Victor Amadeus was soon followed by the general peace of Ryswick, terminating a war, which though it had not humbled the French king, had at least exhausted his resources to such a degree, as to render his ambition less formidable to his neighbours.

The commencement of the 18th century was marked by a new cause of contention, and a war still more important in its results. Charles II. the last king of Spain, of the house of Austria, dying without issue, bequeathed his dominions to the duke of Anjou, grandson to Louis XIV. who, repairing to Madrid,
was immediately acknowledged as king, by the name of Philip V. The emperor Leopold, who claimed the succession in behalf of the archduke Charles, his second son, finding it vain to make attempts on Spain, marched a considerable army into Italy, under the command of prince Eugene. The Venetians observing a strict neutrality, he met with little or no opposition, till he attempted to enter the Milanese, when he was attacked near Chiaia, by the united troops of the duke of Savoy and Marechal Villeroi, whom he completely defeated. Cremona also was surprised and occupied by the Germans, and Villeroi taken prisoner; and a revolt at Naples, in favour of Charles III. was with difficulty quelled by the Spanish viceroy. Eugene then laid siege to Mantua, but the arrival of the duke of Vendome, with considerable reinforcements from France, forced him to give up the undertaking.

In the meantime, the duke of Savoy, offended that the sole management of the war was not committed to him, notwithstanding his connection with Philip, who had married his daughter, left the French party, and accepted the grand-duchy of Sardina, consisting of the emperor king William III. the states of Holland, and the kingdom of Portugal. The affairs of these great leagues, however prosperous elsewhere, was unsuccessful in Italy. Savoy was immediately invaded by the French armies, under Vendome and Feuillade; and the duke at length, after the doubtful action at Cassinato, forced to take refuge in Turin, where he was closely besieged by Feuillade. But the archduke was now master of great part of Spain, and the decisive victory by Marlborough at Blenheim, having expelled the French from Germany, prince Eugene hastened to the relief of Turin. The French army had been reinforced by the troops under the duke of Orleans and Marechal Marsin, and was superior in numbers to that of Eugene; but the latter, attacking them with vigour in their camp, carried the entrenchments, and defeated them with great loss. Marsin was killed, and the duke of Orleans wounded, and the remains of the army fled with great precipitation. The effects of this victory were decisive of the fate of Italy, and the duchy of Milan and kingdom of Naples were occupied by the imperial troops.

During the course of the four following years, France was reduced to the greatest extremities, and Louis made several attempts to negotiate; but with no success, and peace seemed still far distant, when two unexpected events, which took place much about the same time, contributed to accelerate its approach. The one was the death of the emperor Joseph I. who leaving no heirs, was succeeded by his only brother the archduke Charles, who, under the title of Charles III. was in possession of part of Spain, with the kingdom of Naples, and who was named Charles VI. The dismissal of the Whig ministry in England, and the consequent recall of the duke of Marlborough, tended still farther to prepare the way for the peace which was at length concluded at Utrecht, by the kings of France and Spain, with the queen of England and duke of Savoy, the emperor still persisting in carrying on hostilities. The articles relating to Italy, were the acknowledgment of the duke of Savoy's right of succession to the dukedom of Spain, in default of issue of Philip V. and his acquisition of the island of Sicily with the title of king. Charles VI. thus deserted by his allies, also made peace the following year. By this treaty, which was concluded at Rastadt, Philip V. was acknowledged king of Spain, while the kingdom of Naples, and duchy of Milan, were left in the possession of the emperor.

But the peace was not destined to be of long endurance in Italy. On the death of his first wife, Philip V. espoused Elizabeth Farmese, grand-daughter of Francis duke of Parma. This princess soon acquired great influence with Philip, while she in her turn was ruled by the intriguing and ambitious Alberoni. The first attempt of this celebrated statesman, was the sudden invasion of Sicily, which was so successful, that only two small towns were left in the possession of the Spaniards. In the year 1717, Victor Amadeus, this sudden aggression allied the emperor with the regent Orleans and the courts of Britain and Savoy against Spain. Sardina, with the title of king, was bestowed on Victor Amadeus, in lieu of Sicily, which was ceded to the emperor. At length, Philip, alarmed at the number of his enemies, dismissed Alberoni, and peace was again restored.

The question of the right of succession to the duchies of Tuscany and Parma, now excited considerable interest; and by an agreement, concluded by the emperor and Philip V. it had been settled, that on the demise of the two dukes, neither of whom had any issue, the infant Don Carlos should receive the investitures, and on the death of Antonio Farmese, he was accordingly acknowledged duke of Parma. But the contest for the crown of Poland again divided the European powers; War of the Polish succession. The result was fatal to the German interest in Italy; Naples and Sicily fell again into the hands of France, and Milan, with many other cities in Lombardy, were taken by Villars. In the mean time, John Gaston di Medici, grand duke of Tuscany, died, and the investiture was conferred by the emperor on Francis Stephen of Lorraine, his son-in-law, the Spaniards, however, remaining in actual possession. A peace was then concluded, by which Don Carlos was to remain king of Naples. Milan and Parma were to be restored to the emperor, and Tuscany to Francis of Lorraine. But this treaty was never executed, and the death of Charles VI. rekindled with double vigour the flames of the emperor's war. His daughter Maria Theresa, queen of Hungary, VI. and her husband Francis of Tuscany, were attacked by the French, Prussians, and Saxons; and Charles, elector of Bavaria, was crowned emperor by the name of war.

Charles VII. in Italy, the queen was assisted by Charles Emmanuel, king of Sardinia, while considerable British subsidies aided her in carrying on the war. But the troops of the infant Don Philip and the prince of Conti, made themselves masters of all Savoy, and most of Piedmont.

The empress queen having now expelled Charles VII. from his hereditary states, and concluded a peace with the king of Prussia, was now able to assist her ally; and Charles Emmanuel re-entered his dominions. The imperial troops then entered Genoa, but were soon after expelled by the people, who admitted a French garrison, and repelled the repeated attacks of the imperialists.

War at length was terminated by the peace of Aix-la-Chapelle, by which the states of Italy were distributed Aix-la-Cha- among the way in which they remained till our own times, pelle. The king of Sardinia, and the duke of Modena, (who
had also been expelled) were reinstated in their dominions. Charles remained king of Naples and Sicily; but it was secured, that these crowns should not be united with that of Spain; Don Philip was left duke of Parma and Placentia; while Milan was restored to Austria, and the archduke Leopold, second son of the empress, became grand duke of Tuscany.

Between this period and the French Revolution, an era of profound peace intervenes, diversified by few events of general interest, if we except the gradual expulsion of the order of Jesuits from the different states, and their final abolition by the papal bull of Clement XIV. See Jesuits.

Under the government of the well-meaning, though injudicious emperor Joseph II. and his benevolent and liberal brother Leopold of Tuscany, abuses were reformed, the situation of the people ameliorated, agriculture improved; and the progress of science, and the arts, at Milan and Florence, attest their encouragement of philosophy and literature. Nor were these improvements confined to the Austrian dominions; at Rome, science equally flourished under the philosophic Clement XIV. and agriculture and the arts under the polished Pius VII. Turin, amid all the bigotry of the Sardinian court, produced the brilliant talents of Alfieri, and even Naples could boast of a Filangieri, and Caraccioli.

The dreadful earthquake, which in 1791 laid waste the country, and destroyed the cities in Sicily and Calabria, would in a less enlightened age have been considered as the omen and precursor of the tremendous convulsion which was about to agitate the political world.

The eyes of Europe were now turned on France, and it was not to be supposed, that the Italian potentates connected by blood with the unfortunate Louis XVI. and Maria Antoinette, could be indifferent spectators of their death, or regard without alarm the military spirit and conquests of the republic. In consequence, the king of Sardinia and the other Italian states joined in the league with the Austrians, Prussians, and British, and declared war.

The campaign of 1794, in Piedmont, was uniformly successful on the part of the French, and the defeat of the Sardinians near Milan, made them masters of that city. Corsica, however, surrendered to the British, and acknowledged George III. as its sovereign. The following year the Austrian and Sardinian troops were successful in some battles, and checked for a short period the progress of the republicans. But the events of 1796 decided the fate of Italy. The history of the celebrated campaign of Bonaparte, and the rest of the war in Italy, has already been related in the article France, and we must only slightly enumerate its results. The defeat of the king of Sardinia was followed by a peace, by which he surrendered Savoy and Nice. The battle of Lodi forced the pope and the dukes of Parma and Modena, and the king of Naples, to accede to the ignominious terms dictated by the victor; Florence and Milan fell before his arms, and Mantua alone remained in the hand of the Austrians.

The next years were no less disastrous: the revolution at Venice ended in the abolition of that state; the signal defeat of the Austrians occasioned the surrender of Mantua and Verona, and the emperor was at length compelled, by the treaty of Campo Formio, to acknowledge the Cisalpine republic, consisting of Milan, Mantua, Modena, and Bologna. Pius VI. was expelled from Rome, and died in exile; king Ferdinand was forced to abandon Naples, and take refuge in Sicily; and the king of Sardinia was deprived of all his dominions but that island. During Bonaparte’s absence in Egypt, the attack of Tuscany excited a new coalition, and under Suwarow and the Archduke Charles, the French were again driven from Italy. But the return of Napoleon soon gave energy to the French, and the decisive victories of Novi and Marengo again established his dominion in Italy. In 1805, he assumed the title of king of Italy or Lombardy; and under the mild administration of prince Eugene Beauharnais, his viceroy, that country began to recover from the misfortunes of the war. Louis duke of Parma was made nominal king of Etruria, and Joseph Bonaparte of Naples. The latter, on being appointed king of Spain, was succeeded by Joachim Murat, (brother-in-law to Napoleon,) whose distinguished bravery had often contributed to the victories of the French. After the battle of Leipsic, the subsequent defeats of Napoleon in France, and the surrender of Paris, the kingdom of Italy was occupied by the Austrians, with whom Joachim made a treaty. But on the return of Napoleon from Elba, he again joined his ancient leader; the Austrians invaded Naples, and Joachim, defeated by his troops, left that kingdom to be again occupied by the Bourbons. In 1815, he landed again in Calabria, with a few troops, but was seized, and being tried by a military commission, condemned to be shot.

Before closing this article, it is proper to state, in a few words, the present political divisions of Italy. Victor Emanuel king of Sardinia, is now reinstated in Savoy. The Duchies of Milan, Mantua, and Modena, with the cities of Verona, Vicenza, and Padua, Venice, and its former territories in Istria, and Dalmatia, are now comprised in the kingdom of Venice and Lombardy, and belong to Francis II. Emperor of Austria. It is, however, to be known, in what truth, that this kingdom is to be conferred on one of the princes descended from the Austrian family. The duchy of Parma and Placentia is governed by the archduchess Maria Louisa, formerly empress of the French, and the succession is settled on her son Napoleon Charles Francis. The territories of Florence, Lucca, Siena, and Pisa, form the kingdom of Etruria, under Charles son of the late king. The aged Pius VII. has been reinstated in the ancient papal dominions, the temporal administration of which is chiefly committed to Cardinal Consalve. The kingdoms of Naples and Sicily are again united under the feeble sway of Ferdinand IV. brother of Charles IV. and uncle of Ferdinand VII. of Spain. The island of Corsica remains annexed to France. From this sketch it appears, that the Austrian power is predominant; and connected as he is by marriage, with the kings of Sardinia and Naples, the emperor Francis may be regarded as master of the destinies of Italy. See Micali, L'Italia antica il dominio dei Romani; Deni, Rivoluzione dell'Italia; Sismondi Histoire des Republiques Italiennes du Moyen age; Robertson's Charles V.; Wraxall's Memoirs of the House of Valois; Cunningham's History of Britain, &c. &c.

(E. J.)
ITALY.

PART II. STATISTICS OF ITALY.

ITALY is bounded on the north and north-west, by the Alps; on the east, by the Adriatic Sea, or Gulph of Venice; on the west, by the Tuscan Sea; and on the south, by the Ionian Sea. Its boundaries are thus strongly marked, and its situation entirely peninsular, being washed on all sides by the waves of the Mediterranean sea, except on the northern frontier, where it is separated by the lofty barrier of the Alpine ridge from France, Switzerland, and Germany.

Its form is usually compared to that of a boot; it extends, in an oblique direction from north-west to south-east, from 47° to 37° 45' of north latitude. Its length from Mount Ithaka, the highest summit of the Italian Alps, to Cape de Leuca, is about 670 British miles; and its breadth varies from 100 to 200 miles.

It was anciently known by a variety of names, originally appropriated to particular provinces, but in process of time, applied to the whole country, especially by the poets. It was named Saturnia, from Saturn; Latium, from the Latins; Ausonia, from the Ausones; Venetia, from a tribe settled between Paestum and Tarentum; Hesperia, from its western situation in respect of Greece; and Italia, from Italy, a prince unknown in history.

In all periods of its history it has been divided into three great portions, namely, the northern, called Gallia Cisalpina, comprehending the provinces between the Alps and the Rubicon, originally peopled by Illyrians, succeeded by German-Gauls; the central, called Italia Propria, comprehending all the states of Etruria, as far south as Capua, the inhabitants of which are supposed to have been of Lydian extraction; and the southern, called Magna Graecia, comprising the provinces adjacent to Greece and Sicily, and peopled at first by the Pelasgi from the Peloponnesus.

Gallia Cisalpina, afterwards called Togata, from its inhabitants being permitted to wear the toga as Roman citizens, contained the following tribes. 1. Ligures, who occupied the greater part of the districts of Nice, Piedmont, Montserrat, Genoa, Modena and Parma, and whose principal towns were Genoa, Nice, Portus Herculis, and Monasci. 2. Taurini, who occupied a part of Piedmont lying between the Alps and the river Po, from its source to the river Orco, and whose chief town was Augusta Taurinorum, now Turin. 3. Insulans, who occupied the northern portion of the duchy of Milan, and whose principal towns were Mediolanum and Ticinum. 4. Cenomanni, who occupied both sides of the river Seunus, and whose towns were Bruxia, Cremona, Bebricum, and Mantua. 5. Euganei, who were settled at the bottom of the Adriatic Gulf, and whose towns were Tarentum and Verona. 6. Veneti, who possessed the country along the coast of the Adriatic, from the mouth of the Po to that of the Taisamento, of which the chief towns were Patavium, Aquileia, and Forum Iulii. 7. Istri, who inhabited a tract along the eastern coast of the Adriatic, between the river Tisnemus, and the promontory of Polaicus, whose principal towns were Aquileia and Termesia. 8. Boii, who inhabited the countries around Bononia and Mutina, (Bologna and Modena.)

Italia Propria, under which is commonly included the other division of Magna Graecia, contained, in this more extended sense, all the other provinces of the country, namely, 1. Etruria or Tyrhenia, lying between the river Maera, the Appenine Mountains, the Tiber and the Tuscan Sea, was anciently divided into twelve districts, and contained the towns of Pisa, Luca, Florentia, Festus Portus Herculis, Liburni (Leghorn) Sena, Aretrum, Centum Cellae (Civita Vecchia), &c. 2. Umbria, the supposed territory of the most ancient people of Italy; lying between the Rubicon, the Adriatic, the Tiber, and an imaginary line from the mouth of the Meta to Oecriculum, and divided by the Appennines into two portions, the Cisapennine, or Maritime Umbria, and the Transapennine, or Hither Umbria, contained, in the former division, Arminium, Pisaurum, Busta Gallorum, (Bastia,) Urbium, Senogallia; and, in the latter, Nucerium, Spoleatum, Narnia, Interaunium, Oecriculum. 3. Picenum, a fruitful territory between Umbria and the river Aenurus (Pescara), containing Ancona, Firmum, Asculum. 4. Sabinium, west of Picenum, between the Tiber, the Nar, and the Anio, containing Fidenae, Cures, Crustumerium. 5. Latium, along the coast of the Tuscan Sea, extending south from the Tiber to the promontory of Circeii, anciently inhabited by the Equi, Volsci, Hernici, Rutuli, &c. and containing Roma, Ostia, Ardea, Tusculum, Praeneoste, Alba, Tibur, Antium, Anxur, Minturnae. 6. Campania, extending along the Tuscan shore, from Suessa to the river Silarus, and bounded on the east and north by Samnium, and containing Capua, Liternum, Baie, Puteoli, Neapolis, Herculanum, Pompeii, Surrentum, Nolae, Casilinum, Venagrum. 7. Samnium, lying on both sides of the Appennines, east from Campania, and bounded on the north by Latium, on the east by the Adriatic, and on the south by Apulia, contained Beneventum, Bovinum, Saticum, Cauldium. 8. Apulia, called also Daunia, east of Samnium, and bounded by the Fronto on the north, the Adriatic on the east, and Calabria on the south, contained Apri, Uria, Luseria, Asculum, Canusium, Vena, Perentum. 9. Calabria, called also Messapia and Japygia, a peninsula running out into the Ionian Sea, contained Brundusium, Hydruntum, Castrum Minerum, Salentinum, Luca, Tarentum, Calpillo. 10. Lucania, between the Tarentine Gulf and Tuscan Sea, contained Paestum, or Pessidonia, Forum Popilii, Potentia, Anxia, Metapontum, Herculane, Sybaris, Velia. 11. Bruttium, a peninsula south of Lucania, divided by the Appennines into two maritime tracts, called sometimes Calabria Citra and Ultra, contained Pandosa, Scyllum, Hyegium, Croton, Metaurum, Mamertum, Petelia, &c.

Through these ancient districts and towns, highways from the capital were formed at different periods of the Roman empire, of which the most remarkable were, Via Appia, constructed by Appius Claudius, the most ancient of the Roman roads, passing through Forum Appii, Fundi, Minturnae, and Sinarium to Capua, and thence through Caulum, Beneventum, Casinum, and Batium, to Brundusium; Via Flaminia, leading through Etruria and Umbria to Arminium, passed by the towns of Oecriculum, Narnia, Fulginiurn, Forum Flaminii, Callis, Forum Sempronii, and Pessatium; Via
ITALY.

The progressive geography of Italy, since the fall of the Roman empire, cannot be accurately described, without a recapitulation of its eventful history; and to the preceding view of its political epochs and revolutions we must therefore refer for much of its civil geography. The following sketch of its principal divisions, previous to the French Revolution, is all that can at present be admitted on this part of the subject.

Upper or Northern Italy, called also Lombardy, contained seven dutchies, namely, Savoy, Piedmont, Montserrat, Milan, Mantua, Modena, Parma, and Placentia; of which the three first, and part of the fourth, belonged to the King of Sardinia, and the other to the Emperor of Austria. These territories of Austria, together with part of the Venetian dominions and the Ecclesiastical states, were formed by the French in 1797, into a new republic, called the Cisalpine, or Italian republic; and were divided into twelve departments, which were again subdivided into forty-five districts; namely, Agognia, containing the districts of Novarre, Vigevano, Domo D'Ossola, Varallo, and Arona; Del Lario, containing Como, Variso, Londrio, and Lecco; Olona, containing Milan, Pavia, and Monza; Serio, containing Bergamo, Treviglio, Clusone, and Bresio; Mella, containing Brescia, Chiari, Verola, Alghisi, and Solto; Alto-Po, containing Cremona, Crema, Lodi, and Casal; Mincio, containing Mantua, Reovero, Verona, and Castiglione delle Stiviere; Crostolo, containing Reggio and Carrara; Panaro, containing Modena, and Castelvetro di Garfagnana; Basso-Po, containing Ferrara, Comacchio and Rovigo; Reno, containing Bologna, Imola, Cento, and Forli; and Rubicon, containing Cesena, Sorti, Faenza, Ravenna, and Rimini. Besides these, Northern Italy comprehended the republics of Genoa and Lucca.

Central Italy comprehends the Ecclesiastical State, consisting of Campagna di Roma, Sabina, Il Patrimonio di S. Pietro, Ducato de Castro, Contado de Ronciglione, Luriga, Contado de Citta di Castello, Umbria, or Ducato di Spoleto, La Marca d'Ancona, Ducato D'Urbino, Romagna, Territorio of Bologna; the small republic of S. Marino, under the protection of the Pontiff; the Venetian dominions in Italy, namely, Dogado de Venezia, Il Paduana, il Polese de Rovigo, il Veronese, il Vicentino, il Bressano, il Bergamasco, il Cremonese, la Marca Trevigiana, Patria de Friuli; Istria, Dalmatia; Ragusa, an independent state, generally under the protection of the Turks; and the Grand Duchy of Tuscany, containing il dominio Fiorentino, il territorio Pisano, and il territorio di Sienna; This last portion of Central Italy, together with Parma, Placentia, and Guastalla, was formed under the French into the kingdom of Etruria.

Southern, or Lower Italy, comprising the ancient Sicily, Apulia, Campania, Lucania, and Bruttium, forms the kingdom of Naples, which is divided into twelve provinces, called Giustizierati, or Jurisdictions, namely, Terra di Lavoro, Principato Ultra, Principato Citera, Calabria Citera, Calabria Ultra, Basileata, Terra d'Otranto, Terra di Bar, Capitanata, Contado di Molise, Abruzzo Citera, and Abruzzo Ultra.

These different divisions have been again replaced nearly in their former political state. The King of Sardinia has recovered his dominions such as they were in 1792. The Emperor of Austria has acquired the Venetian States, and all the territory between the Tessino, the Po, and the Adriatic, the valleys of Valtelline, Bormio, and Chiavenna. The Archduke Francis D'Este is made Grand Duke of Modena. The Archduchess Maria Beatrice d'Este becomes the hereditary sovereign of the duchy of Massa, and principality of Carrara, with the imperial fiefs of Lunigiana. The Archduchess Maria Luisa (late Empress of France) is sovereign of the dukedoms of Parma, Placentia, and Guastalla. The reverion of these states remains to be regulated by the allied courts; and is said to have been recently arranged in the following manner. After the death of her Imperial Highness, these dukedoms will be restored to the Infanta Maria Luisa (widow of the Duke of Parma) and King of Etruria) and to her male descendants in a direct line, with the exception of the districts situated on the left bank of the Po, and inclosed in the estates of the Emperor of Austria. In default of male issue, the rights of succession of the Emperor of Austria and of the King of Sardinia will be revived. The Infanta Maria Luisa, in the mean time, obtains provisionai possession of the principality of Lucca, with certain annuities assigned to her by congress. The Archduke Ferdinand of Austria regains the Grand Duchy of Tuscany and also the principality of Piombino, with that part of Elba which formerly belonged to the king of the two Sicilies. The Pope receives again the Marshes and their dependencies, the territories of Benevento, Ponto Corvo, Ravenna, Bologna, Ferrara, Comacchio, &c. Ferdinand IV. King of the two Sicilies, is restored to the throne of Naples, without any change of territory or authority.

Aspect of the Country.

Italy may be regarded as a mountainous country. The Alps, the highest range of mountains in the ancient world, form its northern boundary, separating it from France, Switzerland, and Germany; and the Apennines, rising near Genoa, extend through the whole length of the peninsula in a southerly direction, dividing it into two parts nearly equal, and branching out into various ridges in their progress, so as to form a number of districts and valleys differing from each other in climate and productions. (See ALPS and APPENINES.)

Italy is intersected by rivers in almost every direction. The Po, which rises from Mount Vesuba, about 90 miles south-west from Turin, (at which city it is 1200 feet broad,) flows through a course of 300 miles, waters 50 cities in its

---

* Of the fine country even of Tuscany, one half is mountainous, and produces nothing but timber; a sixth part consists of hills, covered with the olive and vine; and the remaining third only is plain.
progress, receives innumerable rivers and streams into its channel, (the chief of which are the Doria, Lesia, Tanaro, Tesino, Trebia, Adda, Oglio, and Mincio,) and is navigable within 25 miles of its source;—the Adige, which flows from the Tyrol southward to Verona, and thence south-east to the Gulf of Venice, north from the Po;—the Arno, which rises in the Appenines, and flows by Florence and Pisa into the gulf of Genoa;—the Tiber, which rises also in the Appenines south-east of St. Marino, passes by Perugia and Rome (from which to its mouth it is at an average 300 feet broad,) receives in its progress 42 tributary streams or torrents, and reaches the Tuscan sea at Ostia, after flowing through a course of 150 British miles;—the Flumesino, the ancient Rubicon, a diminutive, but celebrated stream in the northern part of the Ecclesiastical State, which enters the Adriatic about 8 miles north of Rimini; and the Volturino, which rises in the Appenines above Venafrò, runs south-east, and afterwards westward, receiving the Sabato in its course, and falls into the sea at Castello del Voltorno. The rivers, which descend from the Appenines, are so apt to swell suddenly, and to overflow the adjacent country, that it became necessary to erect strong dikes or mounds along their banks. But the stones and gravel brought down by these floods, being also confined by the banks, are continually raising the bed of the stream, and requiring the embankments to be proportionally elevated. This is particularly the case with the Po and its tributary streams; so that the country, in the progress of this river, appears to be intersected by a multitude of aqueducts, in some places not less than 30 feet in height, which are continually in danger of breaking out into the most destructive inundations, and which render it necessary for the inhabitants to have a large boat always at hand, in which they float with their families and most valuable effects, till the overflowing waters have subsided. These embankments must soon be incapable of farther elevation, and the rivers, no longer restrained, may at no distant period convert the fine delta of the Po into an extensive and useless marsh. The only possible remedy, if practicable, appears to be to deepen the channel, instead of embanking it.

Italy contains many beautiful lakes, particularly in the northern division. Of these the most worthy of notice are—Lago Maggiore (anciently Verbanus), which is 27 miles in length, 7 or 8 in breadth, and in some places 1800 feet deep, contains the delightful Borromeo islands, which may be ranked among the wonders of Italy, and is surrounded with banks abounding in every alpine beauty;—Lago di Lugano (anciently Ceresius Lacus) about 25 miles in length, from 3 to 6 in breadth, of an immense depth, and in some places said to be almost unfathomable, is surrounded with very high and steep banks, which cast a blackening shade over the surface of its waters;—Lago di Como, or Larian Lake, less beautiful, but more magnificent than Lago Maggiore, about 50 miles in length, from 3 to 6 in breadth, and from 40 to 600 feet deep, is surrounded with a lofty ridge of mountains, whose sides, down to the border of the lake, are covered with shady woods and fruitful orchards, and its waters are subject to sudden squalls and violent swells;—Lago di Varese, a noble expanse of water, of an oval form, about 12 miles long and 6 broad, is surrounded with gently sloping banks, which are clothed with all the luxuriance of vegetation;—Lago di Garda, or Benacus, 18 miles from Verona, is 30 miles in length, 3 in breadth, of very unequal depth, is surrounded with beautifully diversified scenery; and its waters, though usually tranquil, and presenting the finest sea-green hue, are at times agitated by waves, resembling rather the swellings of the ocean, than the commotion of inland waters, a circumstance strikingly described in a single line of Virgil:

Teque
Fluctibus et fremuit assurgent, Benaco, marino.

In the central parts of the country, the largest lakes are those of Perugia and Bolsena; and, in the southern districts, those of Varano, near Mount Gargano, and Celano (anciently Fucinus,) which is 47 miles in circumference, and from 4 to 10 in breadth. There are many smaller lakes in different parts of Italy, some of which are much celebrated for the beauty of their scenery, particularly Lago Albano in the vicinity of Rome, and Lago d'Agnano, supposed to be the famous pond of Lucullus, near Naples. It has been remarked as a singular circumstance, that the lakes of Italy are so little celebrated by the Roman poets, scarcely any of them being once mentioned, except Larius and Benacus, in two lines of Virgil; which is supposed to have been owing to the barren and unsettled state of Cisalpine Gaul in those times, which was scarcely considered as a part of Italy. But these deficiencies are now fully supplied, and the principal feature which distinguishes the Italian from the British lakes is, that the former, besides their greater extent, are surrounded by towns, villages, churches, and country seats, all placed, as it would appear, by the hand of a painter, in the most picturesque situations, finely contrasting and relieving the sublime and rougher parts of the landscape.

Nothing can exceed the natural scenery of Italy, Scenery. in all the ingredients which compose the sublime or the beautiful. Its mountains present every variety of shape and magnitude, of rugged precipices, woody declivities, snowy summits, winding bases, and all the possible materials of picturesque beauty. Even the plains are varied by gentle swells and bolder elevations; while the extraordinary purity of the atmosphere, and consequent brightness of the light, gives a distinctness to every object, which cannot be conceived by those who are accustomed to the dimness of a vapoury sky. Its views, in short, we are assured by the concurrent testimony of the most intelligent observers, never disappoint the traveller, or fall short of his expectations. The highest picturing of imagination, and brightest description of poetry, do not surpass the effect produced by viewing the vale of Clitumnus, the falls of the Anio, the banks of the Nar, the waters of Tibur, the groves of Albano, the plains, hills, coasts, and bays of Campania Felix.

Some of the more celebrated Italian landscapes, besides those already mentioned, are the bay of Naples, the adjacent promontory of P鲢lippo; the Val d'Arno, near Florence, which is the Arcadian of Italy; the road by La Cava to Calabria; the prospect from the Palombiera of Vietri; the eastern shore of Mare Piccolo, &c.

In this place may be mentioned also a few of those natural curiosities with which the country abounds, and curiosities. which usually attract the notice of travellers, but which our limits will not allow us to describe; namely, the Grotto of Puzzuolano, an excavation or tunnel nearly a quarter of a mile in length, leading to the Lago d'Ag-
Climate.

In regard to climate, Italy has been counted the garden of Europe, and the most delightful region on the face of the globe. Extending between the 38th and 46th degrees of north latitude, it would be exposed, by its situation, to a considerable degree of heat in summer, and of cold in winter; but by the influence of the sea, by which it is inclosed on so many sides, and of the mountains, by which it is intersected, its temperature is greatly moderated, and preserved from all extremes. Its climate, therefore, may be pronounced in general to be genial and temperate; but varies considerably even in districts not far distant from each other. It has been divided into four regions, each of which possesses a climate somewhat peculiar to itself. First, the Vale of the Po, or Lombardy, about 260 miles in length, and 150 at its greatest breadth, bounded by the Alps on the north-west and south, and open to the Adriatic on the east. This is accounted one of the most delicious climates in the world, its sunshine uniformly bright, its atmosphere clear and unclouded, and its sultry season cooled by the gales from the surrounding mountains. The second extends over the Roman and Tuscan territories, and being inclosed by the Appenines, so as to be well protected from the north, is more recommended by the heats of summer than the cold of winter. Frost and snow are occasionally experienced; but the temperature is sufficiently high, and continued, to ripen completely the orange and the grape. The third is that of Campania Felix, and its immediate dependencies, where nature appears to pour out all its treasures, where the air is almost invariably genial, and the sky continually serene, and where the most delicate vegetable productions flourish in perfection. The fourth, lying beyond the Appenines, and opening to the east, is still warmer than the last; and abounds more in the productions of a southern latitude, such as the aloe and the palm. This extends over the southern extremity of Italy, including L'Abruzzo, Apulia, and Calabria. The mountainous regions vary in climate according to their elevation; and such is the influence of these local causes, that in their smaller valleys a cool temperature may be experienced in the south, and a sultry atmosphere in the north. The climate over the whole country may be considered in general as inclining to heat, the rays of the sun being powerful even in winter; and in summer, especially when the sirocco blows, particularly sultry and oppressive. At the same time, the heat is never intolerable, but is cooled by breezes from the mountains or the sea. The sea breeze rises about eight in the morning, and continues without interruption till four in the afternoon; while, in the mountainous tracts, many retreats may be found, such as the baths of Lucca and the valley of Vallombrosa, where the mildest temperature may be enjoyed, even during the raging heat of the dog-days. Rain is not frequent during the spring and summer months; but occasional showers sufficiently refresh the air, and revive vegetation. These are not unfrequently accompanied by thunder storms, which in harvest are sometimes very destructive to the crops. In the end of autumn, rains are regular, and extremely heavy; and in winter, inundations to a wide extent often take place. But all these are only temporary interruptions of the prevailing serenity which constitutes the chief advantage of the Italian climate.

It has been recommended to invalids, especially to those of a consumptive habit, to reside at Pisa during the winter season; at the baths of Pisa, or the city of Florence, during the first part of summer; and, during the great heats of midsummer, at the country retreats on the hills beneath Fiesole.

It has been imagined, that the climate of Italy has supposed become warmer than the descriptions by the ancient increase of Romans would lead us to suppose it to have been in temper- their time; and this change has been ascribed to the due, cultivation of Germany, by the clearing away of its immense forests, and the draining of its extensive swamps. But the lofty barriers of the Alps seem to preclude any cause of this kind from operating upon Italy; and others consider this higher temperature as the effect rather of earthquakes, volcanic eruptions, and similar local causes. It may be questioned, however, whether any change at all has taken place; and it is observed by travellers, that the same places which are described by the Roman writers as peculiarly cold, are still liable, in consequence of their situation, to severe winter blasts. But the most remarkable peculiarity in the climate of Italy, is the Mal-Aria, or unhealthy state of Mal-Aria, the districts called Maremma, in the summer and autumn months. This tract extends about 192 geographical miles in length, from Leghorn to Terracina, and about 40 in its greatest breadth in the Campagna di Roma. There is no visible sign of any insalubrity in the atmosphere of these regions; but the sky is as clear, the air as tranquil, and the verdure as fresh as in the most healthy district. Many of the places where it prevails, are even elevated, dry, and airy. But nothing can be more fatal than its influence, which occasions the worst kind of intermittent fevers, and is particularly hurtful to those who sleep in the open air during the night. The few inhabitants who remain in these tracts, are sickly and languid in their whole appearance; and even those who repair only to the temporary labours of the harvest, very frequently fall a sacrifice to the distemper, or at least have their constitutions seriously injured for life. Even in the vicinity of Rome, the shepherds and their flocks come every night.
during summer to take shelter within the walls from the noxious atmosphere of the adjoining country. The city itself is not free from the evil, and even its more elevated situations have begun to experience the influence of this spreading insalubrity. To this increasing action of the mal-aria, the diminished population of Rome during the last 20 years is, in the opinion of Chateauneuf, to be in a great measure ascribed; and the most fatal consequences must attend its farther progress. The real cause of this evil has hitherto escaped all research, and has been ascribed to the pestilential air of the stagnant marshes, or the exhalations of a volcanic soil. But it is not confined to the places more immediately exposed to such influences; and is found to increase with the diminution of the population, and the decay of cultivation. It appears to have been felt in the times of the Roman republic, but to have been limited to a few inconsiderable spots. The destruction of the Roman empire, the abolition of slavery by the influence of Christianity, the translation of the seat of government to Constantinople, by diminishing the cultivation of the surrounding country, are supposed to have occasioned that neglected state of the soil which produces the mal-aria; while the influence of the evil itself is gradually augmenting the cause, depopulating the fields, and leaving the soil to fall back into its naturally rank and humid state. It has, at the same time, been observed, that much of the sickness is occasioned by the peasants, employed in these regions, sleeping on the ground during the night season, and neglecting to protect themselves from the sudden transition of the atmosphere, from the heat of the day to the chill of the evening; and that, if the lands were portioned out in small farms, proper houses built for the cultivators, and prudent precautions used during the unwholesome season, the Maremma might again be brought into tillage, and covered with inhabitants.

Soil and Agriculture.

In describing the soil and agriculture of Italy, it has been divided into three regions, each of which is distinguished by several prevailing features of hilly, flat, and which respectively excel in grain, fruits, or pasture. The first, or principal corn-country, is that of Lombardy, or the great plain traversed by the Po, and already described, as to its boundaries, in the account of the different climates of Italy. This tract is, without doubt, one of the most fertile on the face of the earth; but not more in consequence of natural advantages than of human industry. The soil, which reaches to an unknown depth, is entirely alluvial, and consists of a black fertile mould, which is gradually more mixed with gravel, and that of a larger size, so as approaches the mountains. The principal labour of the cultivators consists in the use of irrigation, a practice which the number of rivers flowing with great regularity from the lakes at the foot of the Alps renders peculiarly applicable, and which the inhabitants have spared neither capital nor skill in carrying into effect. Where the fields are of considerable extent, two principal canals must be opened on different levels; the first of which, called the Gora, or canal of irrigation, receives the water from the river, so as to reach the highest of the fields, and distributes its contents on all sides by a multitude of inferior branches; and the second, called the Scolo, or canal of discharge, beginning from the level of the lowest grounds, carries off the water after it has passed through the fields, and conducts it into the river at a lower part of its course. The country between Lodi and Cremona is the richest part of these beautiful plains, where the soil is peculiarly fertile, and the irrigation most perfect. This fertility admits of the land being greatly subdivided; and a farm of sixty English acres is accounted large. These farms are laid out in fields of two or three acres, by rows of poplars, which gives the appearance of a wooded country; and in most of them pasturage is preferred to the culture of grain. The grass is chiefly clover, which is cut four times a-year, and serves for the food of the cows, from whose milk is prepared the celebrated Parmesan cheese. The cows are fed in the house with two of the crops cut green in summer, and the other two in winter made into hay. It is only during a few weeks in autumn that they are turned out to eat up the last shoots of the pasture. As it requires the milk of at least fifty cows to make the Parmesan cheese, the farmers of a district frequently unite their dairies for this purpose, and afterwards divide the profits in proportion to the quantity of milk supplied by their respective herds. Upon a farm of 100 acres, 30 of which are ploughed and 70 under grass, a farmer will maintain 100 cows, besides a few cattle for draught, and generally values his pasture lands at double the rate of those under corn. In these pastures the soil receives a top-dressing of dung every three years, as the irrigation would otherwise injure the quality of the grass; but, in the course of fifteen years, it becomes necessary to renew the herbage. The sluices are then shut, the ground ploughed in the autumn, and sown with hemp in the following spring. A course of cropping next succeeds, in the following order, forming a rotation of twenty years.

1st year, Hemp, followed by legumes.
2d ... Oats, which grow to the height of six or seven feet.
3d ... Wheat, followed by legumes.
4th ... Maize.
5th ... Wheat.
6th, and 14 following years, grass dunged every three years, and the grass cut four times a-year.

But with all this fertility of soil, ease of cropping, and favourable climate, the land of this finest district of Italy, according to a computation by M. Chateauneuf, with every allowance for the relative value of money, does not seem to yield above £3, 18s. an acre; which would imply considerable deficiency in the agricultural management. A greater produce is raised by Rice, the culture of rice in the more level plains, where there is not a sufficient deprivity to admit the ordinary process of irrigation. The ground, after receiving a single furrow, is sown with the rice, and when the plant is a few inches above the surface, the fields are laid entirely under water to the depth of several inches; in which state they remain till the crop be nearly ripe. After three successive crops without any manure, the ground is left without culture, and dung is spread upon the crop of plants which naturally spring from the soil. This produces an abundant, but inferior kind of grass, which is cut for two successive years, when the ground is ploughed, and the rice crops succeed as before. The profit of these rice crops is so great, being three times that of corn, that the proprietors let them at a separate rent, about £5, 6s. per acre, and the farmers nevertheless usually acquire large fortunes. But the stagnation of so much water in a hot climate, renders this species of husbandry so fatal to the
health of the labourers and reapers, that the Milanese government has prohibited its extension beyond the limits to which it had reached at the time of the enactment.

The second region, where the culture of fruits, especially of the olive, predominates over that of grain, extends along the south declivity of the Appenines, from the frontiers of France to the borders of Calabria. In this district, particularly in Tuscany, the alluvial soil prevails, and is so deep and rich as to require manure only once in five years. The property is extremely subdivided, and the farms also so very small, that a single pair of oxen is sufficient to serve ten or twelve of them for ploughing the ground. The greater part of the tillage, indeed, is performed by a triangular spade, which the tenant is often bound to use, as supposed to be more favourable for the produce; and the corn fields are so much intersected by rows of vines and olive-trees, that a plough can with difficulty work between them. The most common rotation of crops is the following:

1st year, Maize, haricots, peas, or other legumes, with dung.
2d . . . Wheat.
3d . . . Winter beans.
4th . . . Wheat.
5th . . . Clover sown after the wheat, and cut in the spring, followed by sorgho, a sort of great parsnip, which yields a coarse flour for soup.

In this country, the utmost care and skill are exerted in the cultivation of the soil; and every spot presents the appearance of a garden. The produce is abundant, and the population immense; but the cultivators are always poor, and rather to be regarded as peasantry than as farmers. No leases are granted to the metayers, or tenants, who are, however, scarcely ever known to be ejected; but the terms of rent are highly unfavourable to industry or saving on the part of the labourer. The farmer engages to perform all the labour of the field at his own expense—to furnish the wood for the support of the vines—to bear half the cost of seed and dung—to pay the proprietor half the produce, or, if required, to sell it for his benefit—and to divide equally with him all the profit of the stock, even of the poultry and pigeons. On the other hand, the landlord lays out all other expenses, and provides all other things not mentioned in the preceding articles. Thus the farmer has little inducement to improve his possessions, to repair his house, or to add to the stock, which belongs to the landlord, or to take in more ground, which should be done at the expense of his proprietor; and having thus no direct or profitable mode of laying out his savings, he generally spends every year on himself and family all the gains of the season. Being too poor also to hire labourers, and having to attend alone to the labours of the seed-time and harvest, the pruning of the vines, and the culture of the olives, he is often too late in the most essential operations, and loses much time in the irresolution and indifference which his hurry creates. Hence, in the midst of a country, where every spot is covered with valuable produce, and every individual actively employed, there is nevertheless an entire absence of the conveniences of life, and an appearance even of the greatest penury.

By the utmost labour and skill the soil is supported by mounds of earth or stone, and the benefits of irrigation carried along the heights and declivities of the mountainous districts, which are thus clothed almost to the summit with vines and olives. One great agricultural improvement deserves to be particularly noticed, by which the Tuscans have contrived at once to arrest the fury of the inundatory torrents from the Appenines, and to convert them into a source of wealth. The quantity of mud and sand, carried down by the streams during the violent rains, is so great, as frequently to obstruct the course of the rivers in the more level parts of the country, and particularly to form complete marshes at their entrances into the sea. At the suggestion originally of the celebrated Torricelli, these marshy grounds are inclosed with a dike or embankment, and the water of the river being admitted into this enclosure, is retained by sluices in a stagnant state, till its sediment be deposited. This operation is repeated several times in the year; and, as three or four inches of earth are often deposited at one time, the level in the course of three or four years is so much raised, as to be no longer liable to be overflowed by the river; while the soil thus acquired is of the richest kind and highest fertility, so as to have been known in one instance to yield in the first crop twenty-five measures of wheat from one. This operation is named Colmata, and some of the most remarkable instances of it are to be seen in the Val di Chiana, in the plain of Pisa, and in the Val di Nievole.

The third region, or pastoral district, extends along the shore of the Mediterranean from Leghorn to Terni, and reaches inland as far as the first chain of the Appenines, about 192 geographical miles in length, and about 40 at its greatest breadth, in the Campagna di Roma. This tract is denominated Maremma, and remains chiefly in a state of natural pasture, not in consequence of its being unfit for cultivation, but of its being uninhabitable except in winter. This proceeds from the prevalence of what is characteristically denominated Mal-Aria, an unhealthy constitution of the atmosphere, or of the soil, during the summer season, which produces the worst kind of intermittent fever, and which has been already described. (See under Climate, p. 364.) In the Tuscan Maremma, the soil seems to consist of pure argill, mixed with a little sulphur, and is becoming quite sterile. In the eastern part, where the Pontine marshes extend, the soil is constantly humid; but produces, when drained, the finest crops of maize, hemp, and legumes. These marshes, which had often been unsuccessfully and partially drained in former times, were more completely improved by Pius VI. between the years 1778 and 1788; but a still more effectual plan was commenced by the French engineers in 1813, under the direction of M. Prony. As the ground falls towards the sea by an inclination of seven feet, it was proposed to open parallels at certain distances for carrying off the water, and to intersect these by secondary canals, at an angle of 45°, by which means, as far as can be judged from the portion finished, the whole surface of the marsh might be rendered capable of cultivation. The soil in the Campagna di Roma, as well as in many other parts of the Maremma, is composed of those substances which are thrown out from volcanoes, such as Tufa and Lava, upon a basis of calcareous sand-stone, more or less consolidated, and abounding in sea-shells. The vegetable productions of the Maremma are rich and luxuriant. The lands are allowed to rest in pasturage during six successive years; are ploughed and sown on the seventh; and being left to themselves, are immediately covered with verdure, which is pastured again for five or six years by herds of cattle, horses, and sheep, during the winter season. The principal inhabitants of these countries are a race of wandering
elles, who remove to the hilly or level districts according to the seasons; and a few sickly labourers, who remain only as long as the sowing and reaping of the crops require their presence. In the Tuscan Ma- remma, 400,000 sheep, 30,000 horses, and a vast number of cows and goats are annually reared for the supply of the Valdarno, and other vales of Tuscany, where no cattle are bred.

In the south of Italy the state of agriculture is as low as can well be conceived, and even the wealthiest proprietors are both ignorant of the subject, and indifferent about any attempts for its improvement. Throughout the whole realm of Naples, every kind of agricultural production is indolent to the fulness of the climate, and the fertility of the soil, rather than to the industry and skill of the inhabitants. They have no idea of the proper management of land, especially in the application of manure, and the sowing of artificial grasses; and, except in the districts, where wine, oil, and almonds are produced, the uniform round of husbandry consists in sowing corn, as long as the land will yield a crop, and then letting it lie fallow, or rather in natural grass, to recover its exhausted powers. Even the most ordinary attention to the nature of the soil is often neglected, in laying it under by laying and in many towns and villages, the usual order of cultivation, namely, gardens in the nearest grounds, then orchards, then olive-groves, then vineyards, then natural pastures, is pertinaciously followed, though it should even happen that the nature of the soil was such, as to require the very reverse of such an arrangement. The grains most frequently sown are wheat, barley, Indian corn, and pulse; but not one half of what might easily be raised; and for every ten persons employed in the culture of corn, it is calculated that twenty are occupied in that of the grape. These two kinds of produce also are greatly mixed together. Elms and poplars are planted in rows for the support of the vines, and between these rows are sown corn and pulse, without any fallow; but sometimes, to prevent the land from being exhausted, early crops of lupins and beans are put in, which are hoed up before coming to fruit, and buried under the surface by way of manure. Yet, though the husbandry is so slovenly, and the horticulture almost equally superfluous, every production is found in the highest perfection, and greatest abundance; and, in some places, the fields are so fertile as to yield three crops in one year; namely, beans, Turkey-wheat, and broccoli, or some similar vegetable, which grows through the winter. It is no small discouragement to agricultural improvement in the Neapolitan territories, that every kind of stock and produce, all live animals, and even the sheep, are subject to an excise, which is rendered still more injurious by the oppressive mode in which it is collected.

The implements of husbandry in Italy are very where of a rude construction. Even in Lombardy, the waggon is one of the clumsiest vehicles possible, being raised like a high scaffold above four small wheels, and drawn by means of an elevated pole, under which the oxen are yoked in a very uneasy manner. The plough is constructed in a very awkward style, and in despite of all the known principles of mechanics. The handles are of unequal lengths, and both so very short, that the ploughman, having no lever to assist him, is forced to bend much forwards, and to use all his weight to keep the share from entering too deep into the ground. Oxen are uniformly employed by the farmers, both in the plough and waggon; and horses used only for riding to market and church, or for drawing a small provision cart, or other family conveyance. In many places, especially in small inclosures, most of the work is done by the spade and hoe. The grain is separated from the straw in many places, by the transplanting of cattle, which are tied in a string, and whipped round and round till the operation be finished. In the Terra di Otranto, it is done by two oxen dragging between them a heavy rough stone, which breaks the sheaves and shakes out the corn.

The operations and productions of agriculture are various in different parts of Italy, that no general description can be given, which would be nearly applicable to the whole country, especially to the southern districts. A few of the prevailing objects and modes of culture may, however, be cursorily mentioned, in addition to those already detailed.

Rice is cultivated in many of the marshy districts of Bicchento, especially around Salerno, and in the fertile vale of Diono; but its cultivation always adds to the insalubrity of the place; and, while it enriches the trading inhabitant of the city, usually shortens the life of the industrious peasant.

Rye is sown in many grounds of Calabria, whose rye, elevated situation renders them too cold for wheat. Its introduction is ascribed to Charles V., who observed in his progress through the province so many lands lying waste from the want of a crop suitable to their temperature, and ordered a more hardly species of grain to be imported from the north; Hence the natives distinguish it by the name of Germano.

Millet grows to great perfection in the more humid Millet soils, and particularly in the vicinity of Nocera.

Flax and hemp, which grow to a great height in so Flax fertile a soil, are cultivated in many parts of Italy, but especially at Bologna, Reggio, and Cape Leuca; at which last mentioned place the seed appears to be the principal object of the cultivator, and is a principal article of exportation to Venice and Trieste.

Cotton is very generally raised, and with great profit, Cotton through the whole province of Otranto, but particularly around the city of Taranto, where the soil, light and somewhat swampy, appears to be peculiarly favourable for its cultivation. It is the shrubby kind that is cultivated, which, when fully grown, resembles the raspberry plant.* Even when the ground is designed for cotton, it is carefully ploughed, and sometimes dug with the spade, after harvest, or repeatedly tilled between January and April, and the more it is treated like garden ground, the nearer is its produce. It is well manured before the seed is sown in the end of March, or beginning of April, and neatly dressed in flat narrow ridges. As soon as the plants are four fingers high, they are thinned to the width of eight inches, and the ground carefully hoed, to eradicate the weeds. When they are eight or nine inches high, two inches are broken off from the tops, that the growth of the leaves and stalks may be checked, and a greater portion of blossoms produced. About the end of September the pods begin to burst, and from that time the cotton harvest continues to the end of October, the women being daily employ-

* The true cotton tree, **Gossypium arboreum**, grows also around Taranto, and bears much larger pods than the cotton plant, which furnish double the quantity of cotton; but it is of a coarser quality, and brings a very inferior price.
ed in breaking off the ripe capsules, and carrying them home in sacks. The cotton is then separated from the seed, by means of two cylinders, and is afterwards drawn through a comb, or heckle. On account of the careful tillage of the land in raising the cotton, it is followed by an abundant crop of wheat or barley next year; and the produce of the cotton itself, is the most profitable of all crops, surpassing even the vine and the olive. A tomolata of land, that would be adapted to the cultivation of cotton, bears a higher price, but still yields a greater profit, than what is employed either in vineyards or olive plantations, according to the following statement by M. de Salis.

The proprietor and tenant usually cultivate the cotton fields in partnership. The latter generally furnishes the seed; but the trouble of tillage, the expense of the harvest, and the profits of the crop, are equally shared by both parties.

**Tobacco.**

Tobacco is cultivated successfully in many of the southern districts; but the best is produced near Cape Leuca. It is transplanted in April, and the leaves gradually stripped off. These are dried in the shade, and placed in a heap, but never moistened. The points of the leaves, dried in ovens, and then ground, are considered as yielding the best sort of snuff. This article forms also a considerable branch of interior trade in the Ecclesiastical territory.

**Fruits.**

Among the fruits of Italy most deserving of particular notice, must be ranked the grapes and olives, which are cultivated so generally and on so great a scale, as to come properly under the head of agricultural produce. In many farms, corn, wine, and oil, are equally the objects of attention; and the fields which bear the grain and pulse are little more than ridges, or narrow stripes between the rows of olive-trees, or of poplars and elms clothed with the vine. The vines are also in many places, particularly at Taranto, kept low upon pales; but little care is taken in selecting the grape, according to its quality; and the modern wines of Italy, except in some of the southern districts, are so very inferior to what the ancient vintage must be supposed to have produced, that the inferiority has been ascribed to an alleged change in the climate. But, even in the days of Pliny, the two most celebrated of the ancient wines, the Cecuban and the Falernian, had lost much of their excellence; the former, in consequence of a canal cut by Nero across the vale of Amycle, where it was produced; and the latter, in consequence of the cultivators being induced, by the great demand, to pay more attention to the quantity than to the quality of their produce. In the Ecclesiastical states particularly, it is a practice to put a great quantity of water into the vat along with the grape, which renders the wine, though otherwise good, unfit for exportation or long keeping. The modern Italians also, being habitually sober, and using wine chiefly for the purpose of quenching thirst, are not very careful of the qualities of their wines, and are quite satisfied if they are not new, flat, or unwholesome. They are generally either too racy or too luscious for the taste of the European nations.

**Grapes and wines.**

The olive is cultivated very generally in Tuscany; and particularly in the southern provinces of Bari, Otranto, Calabria, and Abruzzo. Six hundred thousand salme of oil are estimated as the annual produce of the Neapolitan dominions, of which more than one half is consumed within the kingdom. Olive plantations extend along the whole coast of Ba-

---

*One salme is equal to 40 English gallons.*
In Italy, all the fruits common in the more temperate countries of Europe are produced in the greatest abundance and the highest perfection, besides many other productions which properly belong to more southern latitudes. Apples, pears, peaches, apricots, pineapples, medlars, pomegranates, melons, red and yellow azarol-plums, cherries, almonds, dates, figs, chestnuts, pistachio-nuts, carobs, lemons, citrons, oranges, are commonly produced throughout the country, and many of them without culture. Cherries have been known to be so abundant at Nocera, that hands have been wanting to gather them; and so cheap as not to repay their carriage to Naples; so that the owners of orchards have invited the public to eat and carry away what quantities they pleased.—Date trees were formerly more abundant in the south of Italy; but the Saracens cut down most of the male-palms at the time of their expulsion from the country, and even the Christians were ready to wreak their vengeance on the plant, as if particularly connected with Mahommedanism. They are still found in some places to the height of 40 feet, but their fruit rarely ripens well, except when the sirocco and other southerly winds prevail much during the season.—Fig trees attain a considerable size, and are found in great variety in the country; but those which are earliest ripe are most esteemed. They are generally propagated by slips, planted in a shady place, and regularly watered. Though the wild plant abounds everywhere, so as to afford easy opportunities of cultivation, this method is rarely employed; but the Neapolitans ripen the fruit by touching the eye of it with a feather dipped in oil. Near Trani, the trees are planted in rows, and dressed like dwarfs and espaliers, according to the practice of the ancients, which renders the fruit larger, and the trees more vigorous.—Almond trees appear in forests, especially along the eastern coast; and the chief cultivation which they receive, is to stir the ground around the roots, and to prune out the central branches for the admission of the air.—The hazel-nut is cultivated in many places, especially in the principality of Avellina, hence called “Nux Avellana.” Around the town are more nut-plants than in any country whatever, which are planted in rows in the best soil, regularly pruned in the form of bushes with straight stems; while the general between the rows is dug and manured during winter, and generally planted with corn in the spring. So great is the produce, that the trade in nuts is said to bring annually 60,000 ducats (£11,250) to the town of Avellina.—Oranges are said to have been first cultivated at Reggio, and thence to have spread over the country. They are now found to thrive in the northern districts around the lakes of Como, Garda, and Maggiora, and even at the very foot of the Apennines, where there is often frost in the winter season strong enough to congeal water. At Taranto, they are propagated by layers, a twig being stuck in a pot full of earth in the autumn, and, in the following May, severed from the parent stock for transplantation. It is generally six or eight years before the trees arrive at a full bearing state.

Italy affords many vegetable productions, which scarcely require any cultivation, yet yield a valuable article of home consumption, or of foreign trade. Among these may be noticed the onions or manna ash-tree, which grows spontaneously, requiring no other culture than cutting down the strong shoots around the trunk, and which continues to yield manna every year for the space of a century; but, in consequence of these an

**VOL. XII. PART I.**
spirited in their motions, and capable of enduring great fatigue; but are in general of a small size, and seldom free from vice.

Very little attention is paid to the breeding of cattle throughout Italy in general, though the labours of husbandry are so uniformly carried on by means of oxen. In Lombardy and Tuscany, the cows are generally of a blood-red colour, and long lank figure; but the oxen of a grey colour, moderate size, good shape, gentle disposition, and great strength. The breed is kept up by regular importation from Switzerland; and 3000 cows are reckoned to pass every year over St. Gotthard, to be dispersed in northern Italy. In Tuscany, the farmers understand well the fattening of the cattle; and, in the winter, they make use of heifers, which they buy in at the age of three months, and sell about twelve or fifteen months afterwards to the butcher. Considerable quantities of cattle are reared in Abruzzo and Calabria; and De Salis describes a beautiful breed on the lands of the Duke of Martini in Otranto, with small heads, short legs, long carcasses, the oxen of which, in particular, were of remarkable size, and majestic appearance, with sparkling eyes, enormous dewlaps, and hinder parts greatly resembling those of a lion. Little butter is made in any district of Italy, as oil is so much in use everywhere; but the milk is employed in making cheese, sherbets, &c.

Italy is the only country of Europe in which the buffalo is found, and great droves of them are fed in the extensive marshes along the coast of the Mediterranean sea, from Salerno to Piana di Calabria, particularly upon the banks of the Garigliano and the northern plains of the Terra di Lavoro. They are of a black colour, ferocious aspect, yet easily tamed, and very submissive to the drivers, but said to be very veneful of injuries. They are seldom used for draught, except in conveying timber for the royal navy from the forests of Calabria. They partake as much of the hog as of the bull; and their flesh, which is extremely fat and rancid, is eaten chiefly by the lower classes of the people; the chine being the only part that comes to the tables of the wealthy. Their milk, however, is extremely pleasant; and the small new cheeses made of it, called Muzzarelle, are accounted a great delicacy. Their hide also, though light, is so compact as to have supplied the buffalo-coats, used as armour in the 17th century.—The sheep in Puglia are very large, and in Otranto are almost universally of a black colour. The white breed, whose beautiful fine wool is so much admired by the ancients, and which are known by the name of pecore gentili, are almost quite extinct, as they are of a very delicate constitution, and require (what the poverty of the shepherds cannot afford) the protection of housing during the colder seasons. Besides, there is now less demand for wool in these districts, than for the cheese made from the ewe-milk, of which the black species, called pecore mossie, yield a greater quantity.—The swine are fed in large herds, in the forests, especially in Calabria, where their keeper goes before them with a horn or bagpipe, whom they learn to follow with wonderful docility. In the southern provinces, these animals are almost universally of a black colour, and without any hair on their skin, which bears a considerable resemblance to that of the elephant; hence they are never called porc, but animali neri.

In the Apennines, the wild boar is sufficiently common, and is hunted with one lurcher and two or three mastiffs, the huntsman keeping on horseback, and being armed with a lance and pistols. In Puglia, stags are numerous, particularly in the royal forests. The marmot and the ibex are also reckoned among the wild animals of the Apennines; and the crested porcupine is supposed to be peculiar to the south of Italy. Dormice, which, in the times of ancient Rome, were kept in warrens, and fattened for the tables of the emperors, are still accounted delicate game in the southern districts, and are caught with sheep-hooks, after being smoked out of their nests in hollow trees. But the most remarkable of the wild animals of Italy is the lynx, or tyger-on, which is most frequent in the mountains of Abruzzo, and is peculiarly fierce, swift, and subtile. It is from 18 to 20 inches high, and above 25 inches in length to the root of the tail; of a whitish colour, with yellow spots like stars; with soft short hair, and a large head like that of a tyger. All its motions and habits greatly resemble those of a cat, and, when taken young, it is easily domesticated.

Among the most curious of the feathered race in this birdy country, may be mentioned the little falcon of Malta, the erithia muraria, the turdus roseus, the cyanus, and the alauda spinelleta. All kinds of wild fowl, usually denominated game, are very abundant; particularly ducks and snipes, which frequent the marshy tracks. Great quantities of quails and stock-doves are taken by means of nets placed across the defiles, through which they pass in their annual flights. Of the former, 60,000 are said to be taken annually in the island of Capri alone.

Snakes, and particularly asps, are very frequent in Reptiles many of the southern provinces, and the latter abound chiefly on such of the calcareous mountains as are covered with fragrant aromatics. The lacerta orbiculata is considered as peculiar to the kingdom of Naples. The meloe uckerii is found in astonishing quantities in the vicinity of Supersano, in the province of Otranto; and the liquor pressed from them is often employed as an astringent in removing warts, and as a substitute for the common blistering fly. The famous tarantula spider is an inhabitant of the Tarentine fields; but its bite has not been found, on experiment, to produce the effects ascribed to it.*

The finny tribe, which frequent the coast of Italy, Fish are extremely numerous; and there are numerous fisheries, particularly on the southern shores, furnish a great proportion of the food of the inhabitants. The people of Taranto may be said to depend entirely on their fisheries, and pay immense sums annually to the crown, and to private persons, for the right of fishing:

The most remarkable and productive of the Italian fisheries is that of the tunny, which enters the Mediterranean about the vernal equinox, and, steering along the European shores, repair to the seas of Greece to deposit their spawn, returning in May in a direction which brings

---

† Swinburne gives a list of 50 different sorts of fish which are taken in the vicinity of Taranto.
Italy.

them nearer the African coast. About that time, they abound on the southern shore of Italy; and, in autumn, steer northward to Amalfi and Naples; but stragglers are occasionally caught through the whole year. They are taken by nets, spread over a large space of sea (by means of cables, fastened to anchors,) and divided into several compartments; the entrance being always directed towards that part of the water from which the fish are expected to come. A man, placed on the summit of a high rock, gives the signal of their approach, which is more easily perceived, as they proceed in large shoals, shaped like a pyramid, having the base directed to the tide or current, which enables them to swim with extraordinary velocity. As soon as the shoal has penetrated to the inner compartment, the passage is closed, and the slaughter commences. The quantity of this fish consumed annually in the two Sicilies, is said to exceed all calculation. From the beginning of May to the end of October, they are eaten fresh, and used in a salted state all the rest of the year. The sword-fish, and the pelamites are also taken in considerable quantities, the former by boats, provided with harpooners, and the latter by nets. Many of the smaller fish are taken by night-nets, of a very simple construction, being nothing more than baskets made of the twisted branches of the myrtle.

Shell-fish. Shell fish are, if possible, still more various and abundant; of which a hundred different kinds have been enumerated in the Mare Piccolo alone. Of these the muscles and oysters are the most valuable. The velvet muscle, or Cozza nera, as it is called by the Italians, is universally esteemed for its delicacy, and nearly 10,000 cantars of them are said to be annually taken in the Mare Piccolo, into which they are carefully transplanted in beds; and poles being driven into the sand, are afterwards drawn up with the fish adhering to them. The oysters of Taranto are considered as the most excellent in Europe; and, during the winter season, (in which alone it is allowed to take them,) are sent in large hampers overland to Naples. The scallop also is a very large and fat on the south coast, still verifying the saying of Horace.

Pectenius patula jocasti se molle Tarcentum.

The murex purpurea may likewise be mentioned as the shell fish which is supposed to have furnished the Tarrentines with their finest purple dye. But the most curious of all the testaceous tribe on these shores is the Pinnia marina, one of the muscle species, which frequently exceeds two feet in length, and throws out a large tuft of silky threads, which float about as a snare to allure small fish. This shell-fish is torn from the rocks and sand, by a kind of hook, or rather forceps, for the sake of its bunch of silk, called lusapenna, which is sold in its crude state for about 5s. 6d. a pound, and forms a very valuable article of manufacture. (See Manufactures, p. 371.)

Minerals.

The mineralogy of Italy, particularly its volcanic products, would furnish a very extensive and interesting subject, but far beyond the compass of our present limits. The richest mineralogical region is Piedmont, which almost rivals the Carpathian mountains in Hungary; and, next to Piedmont, is the Milanese territory, particularly around Sienna; but its mines have been almost entirely neglected, as Austria possesses already abundant of ancient and productive mines.

Gold is found in the mountains of Challdad, near the Gold. Vale of Aosta, in the superior regions near Macugna- na, in the vale of Sesia; and the torrent of Envenson rolls down pebbles of quartz, veined with this precious metal. The mountain of Polino is also said to contain a gold mine belonging to the Duke of Spoleto, but it is scarcely at all wrought, and probably its ore is not rich.

Silver is found in the valley of Sesia and Aosta, in Orco, Lans, Susa, Iron Vrissa, Gen, Venenagna, and in the province of Abruzzo Ultra. One very productive, was recently discovered on the mountain of Arunzo, near the lake Celano.

Copper mines are very numerous in the district of Copper Aosta; and in the other places of Piedmont already mentioned as containing mines of silver and iron. It is found also above the lake of Como, in the Milanese territory. Antimony, arsenic, and zinc, are also found along with the copper and lead in the silver mines. A rich vein of cobalt has been discovered to the east of Mount Blanc; and plumbago, or black lead, near the baths of Binay. There are several mines of alun in the Ecclesiastical territory, which are generally found very near the surface, particularly in the mountains of Tolsa, and which are said to be discovered by the prevalence on the soil of certain verdant shrubs, named agrifolio.

The calcareous combinations form the prevailing feature in the Italian mountains, and their volcanic productions. Limestone is the general base of the southern hills; and one mountain particularly, which advances into the plain between Intro d’Aqua and Pitto Rano in Abruzzo Ultra, contains a multitude of round limestone balls, some of which are extremely large, and, when sewn through, display concentrated strata in their interior. Beautiful marbles, of various hues, are found in the Genoese and Tuscan territories. Native sulphur is very abundant, especially in the volcanic regions of the south. Coal is not unknown in the country, and a vein of excellent quality has been discovered near the source of the Garigliano. In Calabria there are natural mountains of rock-salt, much stronger than what is made from sea water; but they are not permitted to be worked, as the revenue derives so great a tax from the manufacture of that article. In the neighbourhood of Taranto, are two immense salt lakes, one of which is nearly eight miles in circumference during winter, when they are filled with water; but in the summer, when they are dried up, a considerable quantity of fine white salt is deposited, which is the property of the crown, and of which, more than 10,000 tons are annually sold, besides what is secretly carried off by the peasants. There are several salt pits in the Ecclesiastical territory, particularly at Servia and Ostia.

Manufactures.

The manufactures of Italy are neither numerous nor extensive, when compared with the fertility of the soil,
Of silk.

Silk, wool, and cotton are the principal articles which occupy the manufacturing population; but a greater proportion of these commodities are exported in the raw state, than were formerly employed in the care of the silk-worm, and the culture of the mulberry tree, on which it feeds. The Tuscans manage their silk-worms so as to have two hatchings in a year; but, in Calabria, though with a more propitious climate, they are less successful. Even in this latter district, they find it necessary to rear the worm in houses of a particular construction. The windows are long, but only about six inches wide, which prevents too great a quantity of air from being admitted at a time; and when the eggs are on the point of being hatched, these openings are entirely shut, and a moderate fire kept up in the rooms. As soon as the insects come out of the shell, they are placed on beds of reeds, and there fed with the leaves of the red mulberry, which the Calabrese prefer to the white, so generally employed in China, Piedmont, and Languedoc; and which, they imagine, (apparently without reason,) to produce a more compact, heavy silk. In case of a blight among the mulberries, various leaves have been tried as a succedaneum, and the tops of brambles been found to answer the purpose best. The silk houses in the south are usually the property of the more wealthy inhabitants, who furnish rooms, leaves, eggs, and every necessary implement, for which they take two-thirds of the profit, leaving the other third for the attendants.

A succession of eggs from different places is found necessary to renew the breed, and preserve the good quality of the silk. The pods are carried to public caldrons, where a duty is paid for boiling and winding; and as the winders work by the pound, they perform their task in a slovenly careless manner. In the Neapolitan territories, excise duties are extremely heavy on this article. Every mulberry tree pays a tax of two carlini, (about nine-pence Sterling,) per annum. As soon as the silk is drawn, while the article is still wet and heavy, forty-two grains, (about 1s. 6d. Sterling,) are exacted for every pound, and even the refuse and unprofitable pods are forced to pay one grain, (nearly a halfpenny,) per pound. Great duties are also laid upon the exportation of the raw material, so that the poor merchants are compelled to smuggle for a livelihood. Yet, with all these exactions and oppressions, about 500,000 pounds weight are annually produced in the kingdom Naples, of which one half is supposed to be worked at home, and the other half exported in the raw state. The best silks in the whole of the Italian districts, and, perhaps, in the world, are said to be those of Mondovi, Dronero, and Caviglione, near Coni, and of the little tract of Fossombrone in the duchy of Urbino. The most curious silk manufacture in Italy is that which is made from the tuft of the pinna marina, which is called in its crude state, lana-penna; but it is cleansed from its impurities by washing in soap and water, drying and rubbing with the hands. It is then passed through combs of bone, and afterwards, for finer purposes, through iron combs, or cards, so that a pound of the coarse filaments is usually reduced to about three ounces of fine thread. When mixed with about one-third of real silk, it is spun on the distaff, and knitted into globes, caps, stockings, vests, &c. forming a stuff of a beautiful brownish yellow colour, (resembling the burnished golden hue on the back of certain flies and beetles,) but very liable to be moth-eaten, and requiring to be wrapped in fine linen. A pair of gloves costs on the spot about six shillings, and a pair of stockings eleven, but its sale is not very extensive, and the manufacture is peculiar to Taranto.

Wool is exported chiefly in the raw material; and the provinces of Italy, particularly those of the south, with every advantage for the manufacture of broad cloths, depend almost entirely on the foreign market for most woollen stuffs. Formerly, the woollen manufactures of Padua were in a very flourishing state; and its cloths are still esteemed the best in Italy. Manufactures of woollens have been recently established at Rome; and that named St. Michael is famous for its fine cloths, but are all undersold by the English articles. The cotton is also exported in great quantities; but, in several provinces, especially that of Otranto, is manufactured into a variety of valuable commodities. In Gallipoli, muslins of all kinds, and cotton stockings, are made in considerable quantities; and at Nardo and Galatium, in its vicinity, are wrought those famous cotton coverslets which are exported to all parts of the world, and bring in a considerable revenue to the crown. At Taranto and Francavilla, a sort of Manchester, not so fine, but more durable than the English, is produced, and also a peculiar kind of cloth, called pelle di diavolo, with several other articles; but the former of these towns is chiefly celebrated for the extraordinary beauty and fineness of the cotton stockings which are made by its inhabitants, some of which coat on the spot not less than a guinea a pair.

A singular manufacture of thread from the leaves of aloe, which was introduced by the Spanish soldiers who served in Sicily when that island was subject to the crown of Spain, is still prepared in the south of Italy. The white, smooth, and tender leaves which cover the stem, after being soaked in running water eight or ten days, and then bruised by beating between two stones, are stretched upon a table, and scraped with a blunt, smooth iron, to remove the coarser fibres, leaving the fine yellow filaments, which are again soaked, washed, and beaten, to soften and whiten them, and then made into nets, night caps, handkerchiefs, &c., which, with a little improvement in the preparation of the thread and dyeing of the stuffs, might be rendered at once a cheap and valuable article of clothing.

At Teramo, in Abruzzo Ultra, is a manufacture of pottery ware, remarkably hard and fine, for which there is a considerable demand in Germany by the way of Trieste; and the porcelain made at Naples and Milan may vie with any in the world as to elegance of form, and beauty of design. The mosaic manufacture at Rome and that of tortoise-shell and musical strings at Naples, may also be noticed as both of them distinguished for their superiority. The king of Spain attempted to introduce a variety of manufactures into the Neapolitan provinces; but all those branches, which required industry and patience, entirely failed. A manufacture of fire-arms in the vicinity of the capital, succeeded beyond all others; and the Italian artificers speedily equalled, in this handicraft, the skill of their German instructors.

Naples excels also in works of embroidery, in confections, and liqueurs. The velvets and damasks of Genoa and Venice still preserve their ancient reputation; and rich silk stuffs are manufactured to a considerable extent in Lucca, Florence, and Milan. There are manufactures of hats in the Ecclesiastical territory, where they possess a remarkable fine black dye for the purpose; and at Civita Vecchia are several establishments by the government, for making sail cloth, cordage, and
different kinds of cotton stuffs, which are succeeding well, but still very inferior to those of France and Britain. There are also several glass-works in these states, which the government use every exertion to encourage and protect.

Commerce.

The commerce of Italy, both between its own provinces and with foreign nations, is extremely limited and fettered. Along the coast of the Adriatic, where the towns, though numerous, are all jealous of each other, restricted by their privileges, and averse from friendly intercourse, trade has long been in a very languid state. In the Neapolitan territories, it is still more severely cramped by feudal prerogatives, revenue exactions, and impolitic taxes; while nothing is done for its encouragement by the improvement of roads, harbours, or other public works. It is chiefly along the coast of the Tuscan sea that commerce can be said to possess a free scope for its operations, and that some remains of its ancient vigour in these quarters are still found to exist. The particular branches of traffic in the different towns and districts must be referred, with many other topics, to the separate articles in this work devoted to these places;* and the present short account be confined to the more general views of the subject. The principal exports of Italy are silk, wool, and cotton in the raw state, cattle, corn, wine, fruits, and a variety of native products. The official value of the exports from Italy to Great Britain alone, in the year 1800, was—

Total imports: £440,118

Consisting of alum; wrought brass, iron, and silver; plated ware; woollen goods of all sorts; cotton goods to a considerable amount; a few linens; earthenware; glass; hard-ware; tinned plates; pitch-irons, 32,891 hhd.s.;

red and white hertings; dry cod; tanned leather; wrought leather. Foreign goods; namely, cochineal, indigo, rustie, logwood, and other dye-stuffs; cinnamon, cloves, pepper, gingrey, &c.; cocoa; coffee; sugar; bar and plate iron; Indian piece goods; excguts; rum; tar; tobacco; whalebone.†

There are imported also from France great quantities of ribbons, laces, and embroidered silks, particularly from Lyons and Tours, besides wines from Languedoc and Provence. A considerable part of the traffic with that country is carried on by means of mules over the Alps; and a new communication has been opened between Trieste and Mesola, to facilitate the commerce with Austria.

Arts and Antiquities.

The productions of the arts, and the speciments of classic antiquities, which abound in Italy, have furnished ample materials for volumes to describe;‡ and we can here only present a few general hasty notices on the subject, to excite rather than to gratify the curiosity of the reader.

Italy stands pre-eminent above every country in the Music world, both as to the composition and the execution of music; but this delightful art, in the hands of the modern Italians, has lost both its strength and dignity, and become almost exclusively devoted to the purpose of licentiousness, or, at best, of effeminacy. The people of this country evince an ardent and universal sensibility to the power of music; and the Neapolitans particularly are accounted the most refined and correct judges of the art.

In painting and sculpture, Italy furnishes the most abundant opportunities of improvement to the artist, or and sculptor; and gratification to the amateur. "The enormous collection of statues, inscriptions, busts, and bas-reliefs, amassed together in this palace, by the care of the late popes," says Barthelmy, referring to the Roman capitol alone, "exhausts admiration. We live in an iron country as antiquaries; it is in Italy alone that we must make researches. Figure to yourself vast apartments, I will not say ornamented, but filled,—filled even to throbbing, with statues and all sorts of remains; a cabinet full of busts of philosophers; another of busts of emperors; gallery after gallery, corridors, stair-cases, in which nothing is to be seen but grand statues, grand inscriptions, grand bas-reliefs, consular calendars, an ancient plan of Rome in mosaic, colossal Egyptian statues in basalt, or black marble. But why mention particulars? We find here ancient Egypt, ancient Athens, ancient Rome." Notwithstanding all that the French carried away, (and which, though now restored, yet, as sufficiently known, need not be specified,) Italy is full of such objects of art. The fresco paintings, especially of Fies, Florence, and Rome, still remain uninjured, and also the master pieces of Bologna. Besides immense numbers of statues, relieves, and oil-paintings in the churches and palaces, there are museums and galleries almost in every town. Of these, the most celebrated are the gallery in the Vatican; in the villa of Aldobrandini; in the villa of Borghese at Rome; and those of Florence and Milan. Portrait painting alone is a branch of the art which is rather in low estimation in Italy. The inhabitants in general regard such per-

* See particularly Florence, Genoa, Leghorn, Naples, Piedmont, Venice.
† See McNab's ANNALS OF COMMERCE, vol. iv.
‡ See particularly Magnier's History of Rome; Duetscher itineraire des Routes de l'Europe; Remarks on the Antiquities of Rome, by Andrew Langford, Esq.; and Boerth's Remarks on Antiquities, Arts, and Letters, during an excursion in Italy.
formsance as engaging the admiration only of the person represented, or of the painter himself; and those who are able to pay the best artists, generally employ them on subjects more universally interesting. Among the works of the sculptor most worthy of attention, may be mentioned the statues of Modesty and of the Saviour, in the sepulchre of the family of San Severo at Naples—of Adonis and Venus, in the garden of Palazzo Ber- rio—of Hercules, by Glycon, in the university—of the celebrated Farnesian bull, in the royal garden—the bas-reliefs in the square of Putcoli or Puzzuolo—the fine sculptures of Puget at Genoa—the colossal statue of St. Charles Borromeo, on a hill near Arona, which is about 70 feet high, on a pedestal of 40 feet—and a bronce statue, about 17 feet in height, in the market place of Barletta, supposed to have been designed to represent the Emperor Heraclius.

The modern buildings of Italy are extremely numerous, and generally beautiful. The grand colonnade of the Vatican is one of the most extensive and beautiful specimens of the pillared-portico in the world; and the galleries of Vicenza and Bologna, of the arcade style. The cathedrals of Florence and Milan excel in magnitude; and those of St. George at Venice, and Sta. Giusta at Padua, are distinguished for internal beauty. The churches, and particularly the cathedrals, present striking instances of architectural elegance, and each of them contains a chapel of the holy sacrament, which is almost universally of exquisite workmanship and splendid decorations. One-half of the Italian churches are imperfectly finished on the outside, in consequence of their founders wanting funds to complete their plans, and the buildings having thus been carried on at different periods. The palaces also are frequently, in their exterior, deficient in strict architectural beauty, but well furnished with marbles, statues, and paintings. It has, however, been said of Italy, with truth, that no country possesses so many specimens both of good and of bad architecture. Among the most noted of the modern structures may be mentioned—at Rome, the churches of St. Peter, St. Clement, St. Martin, St. Sylvestrer, St. Lawrence, St. John Lateran, St. Paul; the palaces of the pontiff, in the Quirinal Lateran and Vatican; of the families Barberini, Odescalchi, Farnesi, Braschi, Borghese, Medici, Ruspoli, Orsini, Giustiani, Altieri, Cicciaporci, Corsini, Costaguti, Doria in Corso, and Spada Colonna; the piazzas of Ravenna, Colonna, Monte Citorio; the villas Albani and Borghese. At Naples, (where the churches are deficient in architectural taste, but superior in the riches which they contain) the cathedral of St. Paul, and of Spirito Santo; the sepulchral chapel of the family of San Severo; the theatre of San Carlo, the most spacious and magnificent in the world; and innumerable palaces, which, like the churches, are encumbered with ornaments. At Genoa, the palaces of Durazzo and Doria, the Hospital and Albergo Dei Poveri, and the mole of the harbour. At Venice, the churches of St. Marco, Salute, de Redemptore, St. Giorgio Maggiore, the chapel of the Virgin and Mausoleum in the church of St. Giovani and Paolo; the ducale palace, the mount of St. Marco, the bridge of Rialto, and the arsenal. At Pa- dua, the abbey of St. Giustina, planned by Palladio; the church of St. Santo, with its beautiful chapel; the town-hall, the largest in Europe, being 312 feet in length, 108 in breadth, and 108 in height; and the castle of Obizzi in the vicinity of the town. At Ve- rona, the churches of the Francisca Friars, and St. Zeno; the beautiful chapel of St. Bernardino, Gran Guardia, and Museo Lapidario. At Vicenza, where Palladio was a native and builder, the public edifices display great taste, of which the most distinguished are the palaces della Ragione, and del Capitanee, and many others of unusual magnificence, superior in design, though inferior in magnitude, to those of Genoa; the grotto of the Campus Martius, the villa of Marchesi, the triumphal arch leading to the church on Monte Berico, and the Olympic theatre, constructed in imitation of the ancient theatres. At Florence, the cathedral, inferior in magnitude only to the Vatican, the churches of St. Lorenzo, Sta. Maria Novella, and Santo Croce; the mausoleum of the Medici family; the Ponte della Trinita, one of the most beautiful bridges in Europe; and the gallery of paintings, next to that of the Vatican. At Pisa, the church of Santa Maria della Spina, a curious specimen of the Gotico-Moresco style of architecture, and the cathedral, which is a still finer structure in the same style, with its baptismy, belfry, and cemetery. At Cremona, the church of St. Pietro al Po, the baptistry near the cathedral, and the chapel set apart for the preservation of relics. At Bologna, the church of St. Salvador, and especially La Madonna di S. Luca, the fountain of the great square, and the brick towers of Adiselli and de Garisendii, remarkable only for their height, and deviation from the perpendicular. At Milan, the cathedral, extraordinary for its magnitude, and the number of its statues; the college of Brera, Ossepedale Maggiore, and the Lazaretto. At Turin, the churches of Corpus Domini, S. Lorenzo, S. Philipno, Neri, Sta. Christina, S. Roco, and the university. The theatre of Parma, which is formed on the same plan as that of Vicenza; the church and cathedral of Forli, the work of Michael Angelo; the bridges of Cesena, and of Pesaro; the cathedral of Senegaglia; the abbey of Chiaravalla, about four miles from Pavia; the abbey of Vallombrosa; the cathedral of Barletta, remarkable for its antique columns of granite; the cathedral of Bari, the steeple of which is 263 feet high; and the palace of Caserta, which surpasses in size and solidity every royal edifice in Europe, its two principal fronts being 787 feet in length, the other two 769, and both of them five stories in height.

There are magnificent heaps of the remains of antiquity on the seven hills of ancient Rome, at Pestum, Beneventum, Agrigentum and Selinus; but these objects are not frequent; and, excepting the temple of Tivoli, the amphitheatre and gates of Verona, and two or three triumphal arches, little more appears but vast masses of brick. Until the fifteenh century, the ruins throughout Italy were employed as quarries for modern buildings, particularly for fortifications, without the slightest reverence or reflection; but, in later times, the inhabitants, on the contrary, frequently contribute large sums to preserve and repair the monuments of antiquity in their neighbourhood. The most remarkable of these remains, still visible in Rome, are, the Roman Forum, the Coliseum, the Cloaca Maxima, a work of Tarquinius Priscus, the circus of Caracalla, the Agger Tarquinius in the garden of Villa Negroni, the place of the Pyramid, the arch of Constantine on the Palatine, the mausoleum of Cecilia Metella, the church of St. Agnes, erected by Constantine; the obelisks (especially at the entrance of the Curia Innocenzenz, in the Piazza del Popoli, in the centre of the Colonna-do of St. Peter, and near St. John Lateran); the aque-ducts on the Viminal, (now fontana felice), on the brow of the Janiculum (qua Paola), and the fontana de Trevi, the most magnificent in the world; the tem-
ITALY.

The origin of the Italian language has long been a subject of much curious research among the learned. Three hypotheses have been formed for the solution of the problem. The first, supported by Leonard Aretil, and afterwards by Bembo, supposes the Italian to be coeval with the Latin itself, and to have been, at all times, the dialect of the common classes, while the other was the chosen vehicle of learning, and of public documents. The second, suggested by the Marquis Maffei, supposes the Latin, without the aid of any external cause, to have gradually corrupted itself, by receiving from time to time into the regular forms of composition, all the idioms of the illiterate vulgar. The third, maintained by Muratori, considers the Latin language to have been successively adopted by the barbarous conquerors of Italy, but to have received from each a portion of their own inflexions, phrases, and pronunciation. The two former, as more flattering to national feelings, are chiefly supported by native authors; but most other critics adopt the last mentioned. Nevertheless, the whole of the three causes enumerated may have contributed to produce the final result; and it may not be easy to decide which of them has exercised the most extensive influence. It is unquestionable, that some of the oldest inscriptions, of a date long prior to the perfection of the Latin language, bear a striking resemblance in certain points to the modern dialect. It is highly probable, that even from the time of Julius Cæsar, the Latin, as spoken by the people at large, was gradually deteriorated long before the subjugation of Italy to the barbarians; that the number of provincials, whom he brought to Rome in support of his cause, and the acting of plays in various languages on their account, greatly contributed to the corruption of the Roman tongue; that the suspension of literary pursuits, and the destruction of public seminaries, during the disastrous times of the empire, left the orthography and the pronunciation to be chiefly regulated by the ear; and that the effeminacy of the Romans themselves may have extended its influence even to their language, multiplying its smoother sounds, and retrenching its rougher combinations. Finally, the change of meaning, and the introduction of new terms, may be ascribed to the influence of the several invading hosts; to the prevalence of the Greek language in the south of Italy, which continued to be united to the Greek empire long after the fall of the western power, and where it is still spoken in some villages in greater purity than by the inhabitants of the Morea; to the introduction of the Slavonian dialect by a colony of Bulgarians established in the southern provinces by the Greek emperors, about the middle of the seventh century; and to the vicinity of the Arabic, when the Saracens had possession of Sicily and several sea-ports of Calabria, during the ninth and tenth centuries.

The Latin language, however, though with little elegance, yet still genuine in respect of its grammar, continued to be spoken in Rome about the beginning of the seventh century, as appears from the letters of that period preserved by Cassiodorus, and from the sermons of Gregory the Great, addressed to his ordinary congregation in that city. Even during the four following centuries, all the public records, and all the writings of the learned now extant, were written in Latin, more or less corrupted. But, from the seventh century, the alteration of the language proceeded with great rapidity; and, in the ninth century, the clergy were required to preach "in Rustica Romana Lingua." The first regular inscription of the modern language is found on the front of the cathedral of Ferrara, of date 1185; and the first written specimen are the verses of a few obscure Sicilian poets, about the beginning of the thirteenth century. But the most singular circumstance in the history of the Italian language, is the rapidity of its improvement. Though the last of all the modern dialects in order of birth, it was the first which served as a vehicle to productions of human genius; and while the world was scarcely conscious of its existence, it burst upon them at once in all the splendour of maturity. It was brought nearly to its present standard by Dante, or at least by his successors Petrarch and Boccaccio; and, what is scarcely less remarkable, it has continued in the same state, almost wholly unvaried, from the age of these distinguished writers to the present day. For the space of five centuries, the Italian authors (and they have been suf-
The Italian muse, which produced the heroic romances of Ariosto and Francesco Berni, and the more serious epic of Tasso; and from that period, its poets have not been inferior in number and celebrity to those of any other country in Europe. Its dramatic writers have not been numerous, but sufficient to prove the power of the language in that department of literature: its dignity and vigour in the tragedies of Alfieri; its graces and ease in the comedies of Gherardo di Rossi; its tenderness, delicacy, and simplicity in the pastorals of Metastasio.

Italy is peculiarly rich in history. Every republic and almost every town has its historian, most of whom display information and talent sufficient to render their limited subjects both instructive and amusing. Among the most eminent in this department may be ranked Paolo Sarpi, whose history of the Council of Trent is distinguished for its depth and energy; Cardinal Pallavicini, who writes on the same subject with great ease and dignity; Guicciardini, who unites in his history of Florence the penetration of Tacitus with the fullness of Livy; Giamnome, esteemed for the partiality of his statements, and the elegance of his style; Machiavelli, an imitator of Tacitus, in the conciseness of his narrative, and strength of his expression. To these may be added Angelo de Costanzo, the historian of Naples; Bembo, Morosini and Paruta of Venice; Adriani and Ammirat of Florence;Bernardino Corio of Milan. In general history, Tacagnoto, Campagna, Davila, and Bentivoglio; and especially, in the 18th century, may be specified the judicious Muratori, whose works are distinguished for erudition, selection, and sound criticism, comprising all the documents of Italian history and antiquity, with the best reflections which they are capable of suggesting. Italy has produced more antiquarians than all Europe together, of whom may be chiefly mentioned Muratori, Maffei, Mazzochi, Carli and Pacaudi. It has many excellent writers in political economy, extracts of whose productions have been published in 50 volumes 8vo; and in essays, journals, reviews, as it led the way, so it is still not far behind any other country in the world. It has been considered as deficient in science; but those who are well versed in its literature, enumerate a multitude of astronomers, mathematicians, geographers, and natural philosophers, from Galileo to the present day. "Les sciences," says Barthelemy, in his travels, "sont plus cultivées à Rome qu'on le croit en France. Je vous dirai sur cela, quelque jour, des détails que vous étonneront." There are in fact, in the different states in Italy, a greater number of scientific institutions, distinguished by their abundance of research, and regularity of publications, than in any other equal portion of territory in Europe; and the Italian philosophers discover no ignorance of the most recent inventions and improvements of their transalpine fellow-labourers. They possess all the most valuable qualities of an inquirer after knowledge; and, if not renowned for original discoveries, are found to display an uncommon degree of elegance, acuteness, and ingenuity in their physical disquisitions. The Memoirs of the Academies of Mantua, Milan, Padua, Turin, and especially of Verona, are all eminent productions. Those of Bologna and Florence are particularly distinguished for scientific researches; and the Royal Institute at Naples is noted for its productions on mathematics. The Italians are doubtless deficient in theological learning, a circumstance for which some would account by the absence of all occasion for controversy. The following native writers may be mentioned in addition to those already named, both as examples of individual excellence, and as sources of the best information in regard to Italian literature in general; namely, Tarlachetti's Storia della letteratura Italiana, which comprises the whole history of the ancient and modern learning of the country, and is considered as one of the most interesting works of modern times; Abate D.G. Andres dell' Origine, di Progressi, et dello stato di ogni Letteratura, a masterly and comprehensive production; Della Recoluzione d'Italia, characterized by those best acquainted with the subject, for its manly perspicuity and political sagacity; and the work of the same author, Sopra la vicende della Letteratura, which is at once a compendious history and masterly review of general literature. In Great Britain, Italian literature has been much and most unjustly depreciated, partly from its not being known, and probably, in no small degree, also from the authority of the French critics, who have generally contrived to make it be considered as undeserving of attention; but by the publications of Mr. Rossee, and the author of the Pursuit of Literature, its attractions have been better known and understood.

Population—Manners and Customs—National Character.

The population of Italy, which, in the time of Pliny, was estimated at fourteen millions, is equally great, or rather is considerably augmented, even in its present state of depression. All the cities, and almost all the great towns, with most places of any celebrity, still exist nearly under the same names as in ancient times. Many of them have regained, and several exceeded, their former prosperity and population; and if a few have entirely perished, others have risen in their stead. In the year 1784, Italy, Sicily, and Sardinia, were supposed to contain from sixteen to eighteen millions of inhabitants; and in 1798, the amount was calculated to be no less than twenty millions.

The manners and customs of the Italians are very different and discordant in the several provinces; and not easily brought under any general description. Their dress, though not very dissimilar to that of the adjoining nations, is extremely diversified; and, in the south particularly, all kinds of costumes are observable. The attire of the females is generally very becoming; and, in Naples, is composed principally of black silk, with enormous black-hoods. In point of food, the people are more uniform. The lower classes live commonly on soups, garden stuffs, milk, and cheese, Turkish corn, different sorts of pulse, and great quan-
National character.

There are perhaps no people in the world, of whose national character more opposite and inconsistent sketches have been given, than of the modern inhabitants of Italy. It is utterly impossible to reconcile the varying testimonies of different travellers on the subject, or to collect the leading features of one generally applicable description. The cause may probably be found, not merely in the different degrees of judgment, candour, and impartiality possessed by the writers; but in the great diversity of character, which exists in the country, where the inhabitants live under so many different forms of government, and in such diversified circumstances of condition. "The oaths and curses, (for instance,) so frequent in the mouths of the vulgar," says Beccaria, quoted by M. de la Tour, "are the simple, and in the most correct manner, the great door of Italian speech, and open to all. The Romans, having the fear of the inquisition before their eyes, vent their cholera in obscure words or pious ejaculations; but the swearing of the Neapolitan, who is under no such restraint, borders upon blasphemy." Nay, even in the different provinces of the same state, diversities are observable in the manners and dispositions of the inhabitants. The North Calabrese (according to the testimony of the last mentioned writer, founded upon the authority of a learned native,) have a great deal of German solidity in their disposition, supposed to arise from the colonies transplanted thither under the Sabolian princes; while the most evident traces of Greek manners are always about theNeapolitan and southern Calabrese and the Neapolitans; and the Piedmontese approach in like manner to the French character. We must therefore content ourselves (after specifying a few points which appear to be best authenticated, and almost universally allowed,) with extracting the testimonies of the more intelligent observers on the subject of the Italian character in general.

Among the Neapolitans the upper ranks are ignorant, licentious, dissipated, and invertebrately addicted to the most ruinous gaiety; the gentlemen of the church and the law tolerably well educated; the middle class possessed of considerable worth; and the lower populace good humoured, open-hearted, passionate, but not violent, and so fond of gallantry, that a joke will frequently serve to check their most violent fits of anger.

The Tuscans are, in every view, the most worthy and industrious part of the nation. The wealthier individuals are fond of learning, and friendly to strangers. The peasantry sober in their manners, and even distinguished above the other Italians in respect of their personal appearance.

The Romans possess neither the worth of the Tuscans, nor the good-natured bufoonery of the Neapolitans. The nobles are polite to foreigners, but the trades-people and populace are savage and fraudulent, retaining much of the ancient haughty character, and proud of their descent from the conquerors of the world.

The higher ranks throughout Italy are extremely hospitable, so that a good letter of recommendation may carry a traveller from house to house all over the country. Persons of rank among themselves, usually pass in their journeys from one villa to another without making use of the inns, which are consequently possessed of very inferior accommodations. The inhabitants, in general, are full of civility to strangers; and are remarkable for honesty to one another, so that, even in Calabria, the houses are left entirely open during the absence of the family on their daily avocations. The Italians in general, are described as dirty in their dress, cookery, and persons.

"The Italians," says Semple, referring to the country between Leghorn and Naples, "are a singular mixture of eagerness and cunning, of mildness and violence, of superstition and irreligion. They are vehement in their gestures on trivial occasions; but, at the very time that they appear absorbed in the violence of passion, they are full of duplicity, and grow cool in a moment, if they see any advantage in doing so. They affect to speak with great mildness and appearance of regard, even to an absolute stranger, and yet suddenly break out into violent fits of passion. They will talk lightly of the church, and turn their priests into ridicule, but, after uttering an irreligious jest, a sacred awe seems to drive them to the altar, where they receive the sacrament from the very hand which they have ridiculed. No people that I have yet seen, descend so low in order to excite compassion. If they gain their object by any means, they are satisfied; and, in order to effect this, they fawn upon strangers in a manner which quickly becomes tedious, and even disgusting. They feel with greater accuracy than they reason; and are more apt to mislead themselves when they take time to deliberate, than when they act from the impulse of the moment. The mildness of their climate inspires them with cheerfulness, and they give themselves up with ardour to every pleasure, even the most trifling; yet their moods are composed, and even grave, and their walk has nothing in it which indicates levity. In the observance of the matrimonial engagements, no people can be more lax; nor is there any country where jealousy is so little known, nor indeed where it would be so very useless."

A more favourable view is conveyed by the following Italian painting of Dr. Moore. "In the external deportment, the Italians have a grave solemnity of manner,
ITALY.

which is sometimes thought to arise from a natural
gloominess of disposition. Though, in the pulpit, or
the theatre, and even in common conversation, the Ita-
lians make use of a great deal of action; yet Italian vi-
vacity is different from French; the former proceeds
from sensibility, the latter from animal spirits. The
inhabitants of this country have not the brisk look and
elastic trip, which is universal in France; they move
rather with a slow composed pace; their spins, never
having been forced into a straight line, retain the natu-
ral bend; and the people of the most finished fashion,
as well as the neglected vulgar, seem to prefer the un-
constrained attitude of the Antinous, and other antique
statues, to the artificial graces of a French, garancing
master, or the erect strut of a German soldier. I imagine
I perceive a great resemblance between many of the
living countenances I see daily, and the features of the
ancient busts and statues; which leads me to believe
that there are a greater number of the genuine descend-
ants of the old Romans in Italy than is generally ima-
gined. I am often struck with the fine character of
countenance to be seen in the streets of Rome. I never
Saw features more expressive of reflection, sense, and
genius; in the very lowest ranks there are countenances
which announce minds fit for the highest and most im-
portant situations; we cannot help regretting that those
to whom they belong have not received an education
adequate to the natural abilities we are convinced they
possess and placed where these abilities could be brought
into action."

"The present race of women of high rank are more
distinguished by their other ornaments, than by their
beauty. Among the citizens, however, and the lower
classes, you frequently meet with the most beautiful
countenances. I will give you a sketch of the general
style of the most beautiful female heads in this country.
A great profusion of dark hair, which seems to encroach
upon the forehead, rendering it short and narrow; the
nose generally either aquiline, or continued in a straight
line from the lower part of the brow; a full and short
upper lip; the eyes are large, and of a sparkling black,
and wonderfully expressive. The complexion, for the
most part, is of a clear brown, sometimes fair, but very
seldom florid, or of that bright fairness which is common
in England and Saxony.

"In the midst of all the idleness, (of Naples) fewer
riots or outrages of any kind happen than might be ex-
pected in a town where the police is far from being
strict, and where such multitudes of poor unemployed
people meet together every day. This partly proceeds
from the national character of the Italians, which, in
my opinion, is quiet, submissive, and averse to riot
and sedition; and partly to the common people being
universally sober, and never inflamed with strong li-
quors, as they are in the northern countries. If these
poor fellows are idle, it is not their fault; they are con-
tinually running about the streets, as we are told of the
artificers in China, offering their service and begging
for employment; and are considered by many as of
more real utility than any of the classes above men-
tioned.

"The Italians are the greatest loungers in the world;
and, while walking in the fields, or stretched in the
shade, seem to enjoy the serenity and warmth of their
climate with a degree of luxurious indulgence peculiar
to themselves. Without ever running into the daring
excesses of the English, displaying the frisky vivacity
of the French, or the invincible phlegm of the Ger-
mans, the Italian populace discover a species of sedate
sensibility to every source of enjoyment, from which,
perhaps, they derive a greater degree of happiness than
any of the other. The frequent processions and reli-
gious ceremonies, besides amusing and comforting them,
serve to fill up their time, and prevent that ennui and
those immoral practices which are apt to accompany
poverty and idleness.

"The stories which circulate in Protestant countries
concerning the scandalous debauchery of monks, and
the luxurious manner in which they live in their con-
vents, whatever truth there may have been to them
formerly, are certainly now in a great measure without
foundation."—"From the inquiries I have made in France,
Germany, and Italy, I am convinced that this is usually
the case with those persons who belong to convent
lands; (holding them on easy terms) and very often, I
have been informed, besides having easy rents, they
also find affectionate friends and protectors in their mas-
ters, who visit them in sickness, comfort them in all
their distresses, and are of service to their families in
various shapes."

"Though my acquaintance with the Roman Catholic
clergy is very limited, yet the few I do know could not
be mentioned as exceptions to what I have just said of
the Protestant (as men of learning and ingenuity, of
quiet, speculative, and benevolent dispositions). It is a
common error prevailing in Protestant countries to
imagine that the Roman Catholic clergy laugb at the
religion they inculcate, and regard their flocks as the
dupes of an artful plan of imposition. By far the greater
part of Roman Catholic priests and monks are them-
sems met sincere believers, and teach the doctrines of
Christianity, and all the miracles of the legend, with a
perfect conviction of their divinity and truth."—"The
accounts we receive of their gluttony are often as ill-
formed as those of their infidelity. The real character
of the majority of monks and inferior ecclesiastics, both
in France and Italy, is that of a simple, superstitious,
well-meaning race of men, who for the most part live
in a very abstemious and mortified manner, notwith-
standing all that we have heard of their gluttony, their
luxury, and voluptuousness."

"The nobility, especially of Naples, are seldom call-
ed to the management of public affairs; have little
temptation for their ambition either in the civil or mi-
itary establishments; are generally regardless of liter-
ature, and devote their lives to gaming, gallantry, mu-
 sic, the parade of equipage, the refinements of dress,
and other nameless refinements.

"In attendance on public worship," says Mr. Eus-
borne, *"the Italians are universally regular; and, charac-
ter, though such constant attendance may not be consid-
ered as a certain evidence of sincere faith, yet every rea-
der of reflection will admit, that it is incompatible with
either infidelity or indifference. These latter vices are
indeed very rare in this country, and entirely confined
to a few individuals of the higher class, and to some of-
icers in the army."—"Nor is the devotion of the Italians
confined to public service. The churches are almost
always open: persons of regular life and independent
circumstances generally visit some one or other of them
every day; and individuals of all conditions may be seen
at all hours on their knees, humbly offering up their

* As our readers must refer original testimonies on the contested points of the Italian character and condition, we here continue
as far as possible to quote the language, though obliged to abridge the remarks, of the writers referred to.
prayers at the throne of mercy."—"No country exhibits more splendid examples of public benevolence, or furnishes more affecting instances of private charity than Italy; and, whoever has visited and examined in detail the hospitals of Rome, Naples, Genoa, Venice, and Milan, will readily admit that Italy has the honourable advantage of surpassing all the kingdoms of Europe in the number and magnificence of her charitable foundations."—"In many of them the sick are attended, and the ignorant instructed, by persons who devote themselves voluntarily to that disagreeable and laborious task, and perform it with a tenderness and a delicacy, which personal attachment, or the still more active and disinterested principle of Christian charity is alone capable of inspiring." There are also benevolent institutions, confinements or sordidities, "formed by the voluntary agreement of a certain number of charitable persons, who unite together, in order to relieve more effectually some particular species of distress;" so that every want, and every misfortune, are certain of meeting with corresponding assistance from some bond or other of generous brethren."—"In the vast tract of country included between the Alps and the Appenines, and subject to the visitation of the Arch-bishops See of Milan, in every parish Whatever is done as a matter of course, the ordinary of every Sunday in the year, and all the youth of the parish assemble in the church; the girls are placed on one side, the boys on the other. They are then divided into classes, according to their ages and their progress, and instructed either by the clergy attached to the church, or by pious persons who voluntarily devote their time to this most useful employment. In other parts of Italy, the children are catechised regularly, and almost invariably in the parish church by their pastor." The Italian common people are, to say the least, full as well acquainted with the truths, the duties, and the motives of religion, as the same class in England; and instances of very gross ignorance seldom occur, unless in the superabundant population of great towns, and of overgrown capitals." Translations of the Bible, "when considered as tolerably accurate, are allowed, and encouraged; and an Italian translation exists, penned with great elegance, and recommended to public perusal by no less than Papal authority."—"The peasantry of the north of Italy, were, previous to the French invasion, universally taught to read and write; and equal in point of information to the peasantry of the most flourishing countries in Europe."—"The middling classes are generally very well acquainted with every thing that regards their duty, the object of their profession, and their respective interests."—"But even where the ordinary share of information is wanting, the deficiency is not so perceptible as in more northern countries. The Italian is acute and observing. These two qualities united, supply in some degree the place of reading; and give his conversation more life, more sense, and more interest, than are to be found in the discourse of transalpines of much better education."—"The Italian nobility have always distinguished themselves by cultivating and encouraging the arts and sciences. Many, or rather most of the Italian academies were founded by gentlemen, and are still composed principally of members of that class. The Italian nobility has produced more authors, even in our own days, than the same class has ever yet done in any country. Moreover, a taste for the fine arts, sculpture, painting, architecture, music, is almost innate in the Italian genius—a taste scarcely separable from an ac- quaintance with the two great sources of information, antiquities and history."—"To accuse the Italians of cowardice, is to belie their whole history. Even in the late invasion, the peasantry themselves, in some parts of the Neapolitan, and particularly of the Roman state, made a bold and generous, though ineffectual resistance. Not courage, therefore, but the motives which call it forth, and the means which give it effect, that is, discipline, hope, interest, &c. are wanting to the Italians."—"In many of the great towns, due respect is not paid to the matrimonial contract, especially in Venice and Naples, whose circumscription exists in all its profusion among the higher classes; but the middling classes and the peasantry are in Italy as chaste as persons of the same description in any, and more chaste than they are in many countries."—"The industry also of the Italian peasantry may be traced over every plain, and discovered on almost every mountain, from the Alps to the Straits of Messina."—"They obey the call of nature in repose during the sultry hours, when labour is dangerous and the heat is intolerable; but "to compensate for this suspension, they begin their labours with the dawn, and prolong them till the close of evening; so that the Italian sleeps less and labours more in the twenty-four hours than the English peasant."—"The Italian is neither vindictive nor cruel; he is hasty and passionate."—"An unexpected insult, a hasty word, occasion a quarrel; both parties lose their temper: daggers are drawn, and a mortal blow is given: the whole transaction is over so soon, that the by-standers have scarce time to notice it, much less to prevent it. The deed is considered, not as the effect of deliberate malice, but of an involuntary and irresistible impulse; and the perpetrator, generally repentant and horror-struck at his own madness, is pitied and allowed to fly to some forest or fastness. Yet the remedy is easy and obvious; a prohibition under the severest penalty to carry arms of any description. This remedy has been applied with full success by the French, while masters of the south; and by the Austrians, while in possession of the north of Italy."—"But actual murder and deliberate assassination is very uncommon among them;" and "even robberies are rarely met with at present."—

**Governments.**

No country has exhibited more various forms of government, or given birth to more powerful empires and nations, than Italy: "Gravidam imperii, belloque fremitant." From the 10th to the 17th century, the greater cities rose into independence and republics; and their history is not inferior to those of Greece, in the virtues which the members of such states usually display. The smaller republics have in latter times been annexed to the more powerful: Florence, Pisa, and Scienna have been enslaved by their Dukes; but enjoyed a considerable portion of tranquillity and property previous to the French revolution. The modern Italians are by no means deficient either in the love of liberty, or the feelings of patriotism; but their country is too much subdivided, and by the intrigues and influence of foreign powers, kept in a state of too great dispersion, to allow its inhabitants any opportunity of exerting their natural magnanimity, and availing themselves of their natural advantages as one people. The political arrangements of the northern states and principalities, and the re-establishment of the Neapolitan and Ecclesiastical governments, have been al-
ITALY.

Statistics.

The Church and Religion.

The established Catholic or Roman faith and worship prevails exclusively over all Italy; and no where is its authority and jurisdiction more complete. Over this The Pontiff: church of Italy the Pope presides as priimate, with the same prerogatives which accompany that title and station in other countries. But besides the peculiar office, which merely expresses his relation to the Italian ecclesiastical constitution, he is also the chief pastor of the Catholic church over the whole world; and thus possesses, in the opinion of that church, a spiritual supremacy and influence in every country, where any portion of it exists. In this character, he is regarded not only as bishop of Rome, metropolitan, and primae of Italy, Sicily, &c. and a patriarch of the West, enjoying all the privileges, and subject to all the control, of other bishops, primates, or patriarchs in their respective districts; but also as the successor of St. Peter, sitting as the first pastor of the Catholic church, by divine right and appointment, and holding the primacy of honour and jurisdiction over the whole Christian church. To refuse him this name and honour, is deemed an act of spiritual rebellion; but, at the same time, the precise rights and prerogatives connected with it have never yet been defined; and the exactions of pontifical power in general are regarded, at least by modern Catholics, as only of human institution, which it would be neither hereay nor assim to resist. For an account of the progress of this usurpation, and its consequent connection with a temporal sovereignty, we refer our readers to the article ECCLESIASTICAL HISTORY, chap. i. and must be considered at present as merely stating the modern views and practice of the Catholic church on the subject of its spiritual head. To this topie also we must only allude by the way; and confine our account of the Roman Pontiff to his office as head of the church of Italy and Bishop of Rome. He is, however, at the same time, a temporal prince, and sovereign of a considerable portion of the country; and thus comes to be noticed both under the political and ecclesiastical branches of this article. It is, nevertheless, to the latter of these characters, that his dress, titles, equipage, &c. are adapted; and, in his own court, he is exclusively addressed by the appellations of Holiness or Holy Father. His robes resemble those of a bishop in pontificals, excepting the stole and the colom, which is white instead of purple. His vestments, when he officiates in church, do not differ from those of other prelates, and it is only on extraordinary occasions that he wears the "tiara," or triple crown. Both in public and private, he is encircled with all the forms of majesty, and approached with the greatest reverence. A prelate in full robes is always in waiting in his antechamber; and, when the apartment opens, he is seen sitting in a chair of state, with a small table before him. The person who is introduced to this presence-chamber, kneels first in the threshold, again in the middle of the room, and, lastly, at the feet of the Pontiff, where he is allowed to kiss the cross embroidered on his shoes, or is raised by his hand, and, after conversing a short time, commonly receives a slight present of beads or medals, as a memorial, and then retires with the same ceremonies of kneeling. In public, a large elevated silver
cross is carried before his Holiness as a sacred banner, the church bells ring as he passes, and all men kneel in his sight. His whole life is spent in ceremony and restraint; and no dignity is more cumbersome and continued than that under which he is placed; always encumbered with the same robes, surrounded by the same attendants, confined within the same circle of ceremony, and never possessing one hour of relaxation. After a morning spent in business, a walk in the gardens of the Quirinal or the Vatican, a visit to a church or a hospital, are his only exercises. Even his repasts are solitary, short, and frugal; and the expense of his table, in the present value of money, never exceeds five shillings a day. His person and conduct are under perpetual restraint and inspection, and the least deviation from strict propriety, or even from customary forms, would be immediately noticed, and censured in pasquinades. Leo X. gave great scandal by shooting; Ganganelli, by riding; and when Benedict XIV. went to see the interior arrangement of a new theatre before it was opened to the public, there appeared next morning the following inscription on the door by which he had entered, "porta sancta, plenary indulgence to all who enter." This strict decorum in the Papal court, so different from the splendour and gaiety which it exhibited in former centuries, has been ascribed by the Catholic writers to the influence of the celebrated Council of Trent.

The College of Cardinals form the council of the Pontiff, and the senate of modern Rome; and are also the officers of state entrusted with the management of the church at large, and of the Roman territories in particular. They are seventy-two in number, including the six archbishops of Venice; and some of the posts being generally kept in reserve, in case of any emergency, the number is seldom full. All the Catholic powers are allowed to recommend a certain number; but the nomination rests solely with the Pope. Their grand assembly is called the consistory, where they appear in all their splendour, and the Pope presides in person; but, for the purpose of discussing than witnessing the ratification of measures already adopted in the cabinet of the Pontiff. Their principal prerogative is exercised in the conclave, where they are confined within the Vatican palace till they agree in the election of a pope. The large halls are then divided into temporary apartments, of which each cardinal has four, with two attendants; while in order to exclude all undue influence from the assembly, the different entrances are guarded by the senators of Rome, conservators, patriarchs, archbishops, and bishops, in the city at the time. The tickets, containing the names of the cardinals, are put upon the communion plates and then into the chalice; and the pope, as soon as elected, is placed on a chair upon the altar itself, where he receives the adoration or homage of those who are present. These two ceremonies the more enlightened Catholics themselves consider as bordering on profanation; but perhaps, their intoxicating influence is meant to be counteracted by another, which, to ensure its effect, is repeated three times in succession. As the new pontiff advances towards the high altar of St. Peter's to be placed upon it, the master of the ceremonies, kneeling before him, sets fire to a small quantity of tow placed on the top of a gilt staff, and, as it blazes and vanishes into smoke, addresses his Holiness in these words: "Sancte Pater! sic transit gloria mundi."

All the great cities, and some even of a secondary rate, have archbishops; while almost every town, especially if it be of ancient name, is the see of a bishop; a circumstance which confirms the fact, that primitive bishops were more like the first ministers of a parish than a diocese. Besides the cathedrals, there are several collegiate churches, which have their deans and chapters. Every bishop has his diocesan college for the purpose only of ecclesiastical education; in this seminary, under his own inspection, with the assistance of a few of his more eminent clergy, the candidates for orders in the diocese must attend three years in a course of preparation for their clerical functions, which course consists in hearing lectures on the Scriptures, and the scholastic systems of ethics and theology.

The parochial clergy are numerous; pluralities are never allowed; and residence is strictly enforced. These regular clergy are described as generally exemplary and active in the discharge of their duties; but though their number has been considerably diminished by the alienation of church property during the French domination, they are acknowledged to be still too numerous, especially the lower orders of them. It is pleaded, at the same time, that the population of the country is great, and all of the established religion; that the priests are usually also the schoolmasters of every place, occupied in the instruction of children, and other departments of education; that, by the forms of their church, they have a great multiplicity of servitors to perform, especially in visiting the sick, and administering the communion, which by many is received often, and by all at least once in the year. There is said also to be a class of persons in Italy who assume the clerical habit as a respectable dress, which gives them easier access to good company, but who are no way engaged in the service of the church, and whose manner often bring an undeserved reproach upon the whole body.

The irregular clergy, so called from taking upon themselves certain rules and statutes not connected with the clerical profession, are still more numerous, and exhibit a great variety of costumes. They may be divided into two great classes, namely, monks and friars, who are bound in common by the three vows of poverty, chastity, and obedience, but who live under very different regulations. The monks, under various apppellations, follow almost universally the rule of St. Benedict, which is rather a treatise of morals than a set of statutes, enjoining various virtues, but prescribing only a few regulations respecting the employment of time, the order of the psalms, the practice of hospitality, the duties of the officers of the abbey, the pursuit of manual labour, and the use of the library. These are said to have adhered more rigidly to the ancient practice, (except in dropping manual labour, and applying, or professing to apply, themselves rather to science and tuition,) and to have taken little share in political or theological contests. To the monks may be added the canons regular, who take upon themselves the life and engagements of a convent, while they bear the dress and discharge the duties of ordinary prebendaries. Several other congregations of clergy live together in communities, without taking vows, and devote themselves to the instruction of youth and the education of the poor; such as the Theatines, Hieronymites, &c. a useful and unobjectionable class, who have produced many individuals eminent in literature. All these are supported by a regular income, derived from landed property, or public grants, which contributes much to their general respectability, and distinguishes them from the second class of irregular clergy, who subsist upon alms and donations, and are

The parochial clergy.
There are several harbours along the coast, as Vathi, Skinos, and Aito, all in Porto Molo; and on the north side, Chioni, together with Port Frioljes, not far from the commencement of a long peninsula terminating the extremity of the island in Cape St. John.

Ithaca, in common with the neighbouring islands, is subject to earthquakes, which rarely do much damage, and violent squalls prevail in the deep channel between it and Cephalonia, which deter small vessels from attempting its navigation, except in steady winds.

Water is scarce: that of Vathi is brackish; the largest brook, Melainudros, flowing into the sea at Frioljes, comes from a spring of the same name. The residue of the rains is preserved in cisterns, which are sometimes excavated in the rock, or the inhabitants draw their supplies from wells.

This island consists of a single narrow ridge of limestone rock. Its surface is exceedingly unequal, scarcely presenting 100 yards of continuous level ground, and every where rising into rugged eminences, of which the highest are the mountains Stephanos and Neritos, on opposite sides of Porto Molo. Although a small portion can be devoted to agriculture, yet the grain obtained is sufficient for the consumption of the inhabitants, and affords an inconsiderable quantity for export to Cephalonia and Zante, where the natives of the latter store it up, owing to its superior quality. There are pleasant gardens here. In different parts terraces are formed for the cultivation of plants; almonds, olives, and grapes are among the fruits, the last of which hang in the greatest luxuriance from vines, growing where scarcely a particle of earth can be seen, and are of that particular species called currants in Britain. We read of various fruits in the garden of Laertes, and the same still remain indigenous around the village of Leuka. Ithaca seems to have been celebrated for trees in the time of Homer, and there is yet a wood of arbutus and prickly-leaved oak, intermixed with wild olives, juniper and mastic, on a hill towards the southern extremity. The larger quadrupeds are brought hither from the Grecian coast. Some of the islets in the neighbourhood of the island are devoted to pastureage, but not during the heat of summer, as they contain no water. Pliny asserts that hares died when they were carried to Ithaca: at present they are cursed with a particular species of greyhounds.

The total population of the island, according to a return obtained by the French in 1807, amounted to 8000, who are dispersed in the town of Vathi and four or five villages. Vathi stands in a fine district, where almond trees and groves of oranges afford fruit, shade, and fragrance to the inhabitants. It is situated close to the port, extending along its eastern, and part of its southern and northern shores, and consists of about 400 houses, with a population of 3000, or, according to some, of only 2000 souls. Of late years it has been greatly improved, and the street containing the government house, together with other public buildings, now assumes a regular appearance. From the frequency of earthquakes, the bell towers have been erected at a distance from the churches. The relics of the Greek church is preserved here, and the clergy are under the direction of a proto-papas, dependent on the archbishop of Cephalonia. There is no church of the Latin rite in Ithaca, nor any nunneries; but churches and chapels are numerous; and there are four monasteries. Some of these are of late erection; and one, dedicated to the archangel Michael, among the mountains, was lately inhabited by no more than 1 a
single monk, who subsisted on alms. In Vathi and elsewhere, the inhabitants dance before their houses on the evening of religious festivals; and a modern traveller informs us, that he saw the figure of one dance, said to have been first used by the youths and virgins of Delos, commemorating the return of Theseus from his expedition to the Cretan Labyrinth, though it has now lost much of that intricacy supposed to illustrate its windings. No regular inns are to be seen in Vathi, but a place of entertainment has been recently established for mariners. About fifty vessels of all denominations belong to the port, which trade to every part of the Mediterranean; yet the only exports are about 500,000 pounds of currants, which were formerly carried to the London market; an inconsiderable quantity of grain; and a little wine, in appearance and flavour somewhat intermediate between port and claret, but which is reputed the best of all produced in the Ionian isles. The manners of the inhabitants of Vathi are engaging and polite, and strangers are received with much hospitality. Most of them are able to converse in Greek and Italian. They can speak French with almost equal fluency. The towns next in size to Vathi seem to be Oxoai, where there is a school, as well as in the former, under the inspection of the proto-papas, or head priest, and Anoai, which its inhabitants are deserting for the village of Chioni.

While this island was in the hands of the Venetians, its government was vested in a Cephalonian nobleman, elected by the council of Argostoli, the chief town. Although not lucrative, the appointment was an object of ambition among the Cephalienses, and never bestowed on any one who had not previously filled the highest offices; and he was replaced annually. His authority was limited chiefly to matters of police; he had to make reports on what proceedings were necessary to the provostire of Cephalonia, whose instructions he was bound to observe. By the later regulations of the Ionian republic, no native of the island can be named; and the governor is changed every second year. He is entitled to a residence in the palace, and is assisted by a secretary and other public officers.

No vestiges whatever remain to prove the ancient celebrity of Ithaca. Its situation and natural aspect utterly preclude it from having ever been of any political importance; it even seems to have been totally deserted; for, according to some authors, it was twice colonized from Cephalonia in modern times; and on one occasion, the Venetians granted as much land to each settler as his circumstances would enable him to cultivate.

Nevertheless, late travellers affirm, that the descriptive parts of the Odyssey, relative to Ithaca, must have been made by Homer on the very spot, for they think that they can be actually recognized. Foundations lately discovered on the hill of Aito, on the narrow isthmus above alluded to, are apparently those of a city of the highest antiquity. Some of the stones forming the vestiges of the walls, are of very large dimensions, and their arrangement is such as exclusively belongs to the earliest periods. A modern author remarks, that the city on the hill of Aito was situated "upon an isthmus, but in the time of Homer it certainly was known by the name of the island." It has been usually affirmed, however, though without any other grounds than mere conjecture, that Vathi occupies the site of the ancient Ithaca. The foundations yet visible on the hill of Aito, it is supposed, may correspond with the description given of the house of Ulysses, which, from its position, commanded a view of the opposite sides of the island. A second city, supposed Alacomene, mentioned by Plutarch, is said to have stood between Port Polis and Friichies, on a neck of land, cut as narrow as the isthmus of Aito. Not far from Oxoai, there is a rock called Homer's School, which preserves the vestiges of very ancient masonry, and has had niches, which probably have contained native offerings. When it received this name is unknown; but it is recorded, that several cities having disputed the honour of giving birth to Homer, Adri-an consulted an oracle, by which Ithaca was named. The most conspicuous antiquities now extant, are such tombs or sarcophagi as are usually found near the remains of the oldest cities in other parts of the Grecian territories, though so simple and void of ornament, as to preclude any opinion being formed regarding their real use. Coins and medals also are frequently dug up here, but those having the name of Ithaca itself are rare; and, according to the inhabitants, are found only between the ruins on the hill of Aito and Porto Moloi.

M. Bosset describes several of these, which he says have evidently been struck in commemoration of Ulysses. Yet notwithstanding all that has been written regarding Ithaca, the antiquities now extant may belong to a period long posterior to that in which Homer has laid the scenes of his poetry; while they may still be very old. Traditions are not wanting in the island of Ithaca regarding Ulysses, and there are even individuals among the inhabitants, who are believed to be his descendants. East Long. 21° 40', North Lat. 35° 47'.

JUD. The island of Cephalonia, which is described both by ancient and modern geographers under a great variety of names, and with great diversities of extent. In the most extensive application of the name, it comprehends the whole country possessed by the Jews, or people of Israel; and included, therefore, very different portions of territory, at different periods of their history. Upon the conquest of the country by Joshua, it was divided into twelve portions, according to the number of the tribes of Israel; and a general view of their respective allotments (though the intermediate boundaries cannot be very precisely ascertained), may convey some idea of its extent at that period. The

portion of the tribe of Judah comprised all the country between Edom, or Idumea, on the south, the Mediter-ranean on the west, the Salt-Sea on the east, and an imaginary line on the north, from the northern extremity of the Salt-Sea to the Mediterranean. — The portion of Simeon was included within that of Judah, and formed the south-western corner of the country, comprehending the towns of Ilerassa, Gerar, Rapia, Gaza, Ascalon, and Azotus. — The portion of Benjamin was situated to the north of Judah, near the centre of the kingdom, bounded on the east by the river Jordan, and containing part of Jerusalem, Jericho, Bethel, Rama, &c. — The portion of Dan lay to the north-west of Ju-dah, between that of Benjamin and the Mediterranean, reaching as far north as the latter, and containing Acaron and Jamnia. — The portion of Ephraim stretched along the northern limits of Dan and Benjamin, between the river Jordan on the east, and the Mediterranean on the west, containing Sychar, Tappu-ia, Gazara, &c. — The portion of the half tribe of Ma-nasseh was situated north of Ephraim, between the river Jordan and the Mediterranean, reaching as far north as Dora, at the foot of Mount Carmel. — The
Judea. 

The portion of Issachar stretched northwards from Manasseh, and westwards from Jordan, as far as Mount Tabor. — The portion of Asher comprehended the maritime tract between Mount Carmel, as far as Sidon. — The portion of Zabulon, bounded by Asher on the west, and Mount Tabor on the south, joined on the east, the portion of Naphtali, which occupied the borders of the lake Gennesareth, or sea of Tiberias. — The portion of Reuben lay to the eastward of the river Jordan, bounded on the south by the torrent of Arnon, and on the north by the river Jabbok. — The portion of Gad, also on the east of the Jordan, stretched from the Jabbok towards the north, where it was bounded by the other half tribe of Manasseh, which occupied the country east of the lake Gennesareth, to the northern limits of the country. The whole of this extent between Coele Syria on the north, and Arabia Petraea on the south, the Mediterranean on the west, and Arabia Deserta on the east, may be considered as situated between 31° 10' and 33° 15' of north latitude, about 140 miles in length, and nearly 100 in breadth. Reckoning from Dan to Beerseba, which are often mentioned in sacred Scripture as including the more settled and permanent possessions of the Israelites, its length would not exceed 120 miles. But, if estimated from its boundaries, in the reigns of David and Solomon, and several succeeding princes, its extent must be enlarged more than three-fold, including both the land of Palestine or of the Philistines, on the south, and the country of Phenice on the north, with part of Syria to the north-east. All this extent was originally comprehended in the land of promise, (Gen. xvi. 18. Deut. xi. 24.) and was actually possessed by David and Solomon, (1 Kings ix. 20. 2 Chron. viii. 7.) It is described in numerous passages of the sacred writings, as all comprised in the holy land, from Hamath on the north, to the river of Egypt on the south, and from the Great, or Mediterranean sea on the west, to the deserts of Arabia on the east; a tract of country at least 460 miles in length, and more than 100 in breadth. 

After the death of Solomon, when the kingdom of the Hebrews had attained its greatest extent, it was divided, in consequence of a revolt of ten tribes, into two distinct sovereignties, named Israel and Judah; the former of which had its seat of government in Samaria, and the latter in Jerusalem. The territories of both were gradually curtailed and laid waste by the revolt of tributary princes, and the incursions of powerful neighbours; and both were at length completely overthrown, that of Israel by the king of Assyria, about 720 years before Christ; and that of Judah by Nebuchadnezzar, about 114 years later.

After a captivity of 70 years, the Jews, who had been the subjects of Judah, having received permission from Cyrus to return to their native country, they not only occupied the former territories of that kingdom, but extended themselves over great part of what had belonged to the ten tribes of the kingdom of Israel; and then, for the first time, gave the name of Judea to the whole country over which they had again established their dominion. The same name was given to that kingdom, as possessed by Herod the Great under the Romans; but, in the enumeration of the provinces of the empire, it was recognized only by the name of Palestine. All traces of its ancient division among the twelve tribes were now abolished, and it was distributed into four provinces, viz. Judea Proper in the south, Galilee in the north, Samaria in the centre, and Perea on the east of the river Jordan.

Judea Proper was bounded on the north by Samaria, on the west by the Mediterranean, on the east by the river Jordan, and on the south by Arabia Petraea; and comprised the ancient settlements of Judah, Benjamin, Dan, and Simeon, with Philistea and Idumea. It is divided by Josephus into eleven toparchies, and by Pliny into ten, but these subdivisions are little noticed by ancient writers, and their boundaries are very imperfectly ascertained. The principal places in the north-east quarter of the province were, Jerusalem the capital, which was entirely destroyed in the reign of Hadrian, and replaced by a new city named Eilah, a little farther north, which is now the site of the modern Jerusalem; Jerecho, the city of palm trees, about 19 miles eastward of Jerusalem, and eight from the river Jordan; Phasaelis, built by Herod in memory of his brother, 15 miles north-west of Jerecho; Archelais, built by Archelaus, 10 miles north of Jerecho; Gophna, 15 miles north of Jerusalem in the road to Sichem; Bethel, 12 miles north of Jerusalem, originally called Luz; Gilgal, about one mile and a half from Jerecho; Engeddi, 100 furlongs south south-east of Jerecho, near the northern extremity of the Dead Sea; Massada, a strong fortress built by Judas Maccabeus, the last refuge of the Jews after the fall of Jerusalem; Ephraim, a small town westward of Jerecho; Anaathoth, a Levitical town, nearly four miles north of Jerusalem. In the south-east quarter of the province, were situated, Bethlehem or Ephraim, about six miles south from the capital; Bethzur, now St. Philip, a strong place on the road to Hebron, 10 miles south of Jerusalem; Ziph, a small town between Hebron and the Dead Sea; Zorr, at the southern extremity of the Dead Sea, near the situation of Sodom; Hebron, formerly Kirjath-Arba, a very ancient town in a hilly country, 25 miles south of the capital; Arad, about 42 miles southward from Hebron, and near the Ascension Avrabin, or Scorpion Mountains, on the border of Arabia Petraea; and Thamar, on the southern limit of the province, near the south extremity of the Dead Sea. In the north-west quarter, were Bethlehem, or Helipol, a Levitical city, about ten miles west of the capital; Rama, six miles north from Jerusalem; Emmaus, a village eight miles north north-west from Jerusalem, afterwards called Nicopolis, in consequence of a victory gained by Vespasian over the revolted Jews; Bethoron, a populous Levitical city on the road to Lydda, a few miles north-west of Emmaus; Kirjathjearim, on the road to Joppa, nine miles westward from the capital; Lydda, now Lod, and called by the Greeks Diospolis, about 12 miles west of Joppa; Ramla, supposed to be the same as Arimathea, about five miles south-west of Lydda; Joppa, a maritime town, now Jaffa, about 12 leagues north-west of Jerusalem; Japhne, a walled sea port town between Joppa and Azotus; and Ekron, a town on the north boundary of the Philistines. In the south-west quarter of Judea were, Gath, about 20 miles west from Jerusalem, near to which was the city of Eleutheropolis, a flourishing place in the second century; Makkedah, a strong place, eight miles north-east from Eleutheropolis; Bersabe, or Beerseba, about 26 miles south from Eleutheropolis; Gerar, be-

JUDAIA.

Judea.

Judea.

Jotapata, the strongest town in Galilee, about four leagues north-east of Dios-Caesarea; and Japha and Gischala, two other fortified places in the same district.

Persea, though the name would denote any extent of Persean country beyond Jordan, is more particularly applied to that district in 32° North Latitude, which formerly composed the territories of Sihon the Ammonite, and Og, king of Bashan, extending from the river Arnon, (which flows through an extensive plain into the Dead Sea,) to the Mount of Gilead, where the Jordan issues from the sea of Tiberias; and which fell to the lot of the tribes of Reuben and Gad, and the half of Manasseh. This province was about 60 miles from north to south, and 40 from east to west. The principal places were, Peniel, on the left of the Jabbok, which forms the northern border of the country; Succoth, on the banks of the Jordan, a little farther south; Bethabara, a little below Succoth, where was a place of passage over the river; Amathus, afterwards named Assalt, a strong town below the influx of the torrent Jazer; Libias, between Mount Nebo and the northern extremity of the Dead Sea, a town which was so named by Herod, in honour of Livia the wife of Augustus; Machærus, a citadel on a steep rock, south of Libias, near the upper end of the Dead Sea; Laass, or Calle-rhoe, celebrated for its hot-springs, between Machærus and the river Arnon; Herodium, a fort built by Herod, a few miles farther inland; as a protection against the Moabites; Aræo, a town of Moab, seven leagues east of the Dead Sea; Castra Ammonensis, a Roman station, supposed to be the ancient Mephoath, seven leagues north-east of Arœo; Hesbon, or Ebusus, the capital of Sihon, and anciently named for its fish-pools, seven leagues east from the Jordan, three from Mount Nebo, and nearly in the centre of the province; Medaba, now El-Belka, three leagues south-east of Hesbon; Jazel, or Tiræ, a Levitical city on a small lake, five leagues north-east of Hesbon. To the south of Persea, lies a territory called Moabites, the capital of which was Rabbath Moab, afterwards named Areopolis; and to the south-west of which was Charæ-Moab, or Karak, a fortress on the summit of a hill, at the entrance of a deep valley.

To the north of Persea were situated several districts, which, as forming part of the kingdom of Judea under Herod the Great, require to be briefly noticed in this account, and which do properly come under the general name of Persea, as being situated on the eastward of the river Jordan. These were Galæadites, or Gileadites, in 22° 0' North Latitude, now Zarq; west from Jordan, and north from the Jabbok, containing the cities of Ramoth-Gilead, Mahanaim, Jezabel-Gilead, at the foot of Mount Gilead. Ibatæa, anciently Basan, now Baimex, in 22° 27' North Latitude, formerly celebrated for its oaks and pastures, was situated to the north of Galæadites, and contained the cities of Adrea or Edrei, Astaroth, and Bathylæa.—Gaulonitis, a narrow strip of land between Ibatæa, and the shore of the Sea of Tiberias, stretching northward to Mount Hermon, and containing Gamala, a strong town near the southern extremity of the sea of Tiberias; Argob, between this sea and mount Hippos; Julias, supposed to be the same as Chorazin, and others by others to be Bethsaida; and Seilene-sa, a fortified place on the east border of Laos Samochoinitis.—Auranitis, or Iuræa, a mountainous and barren track north of Ibatæa, and bounded on the west by a branch of Mount Hermon, contained Dorestra or Bozra, about 50 miles east from the sea of Tiberias,

Vol. XII. Part II.

Samaria.

Samaria, lying between Judæa and Galilee, in 32° 15' north latitude, extended along the sea-coast from Joppa to Doris, and along the river Jordan from the rivulet of Alexandria to the southern extremity of the sea of Tiberias, comprehending the territory of the tribe of Ephraim, of the half-tribe of Manasseh, and part of Issachar. Its principal cities were Samaria, the capital of the kingdom of Israel, north of Sichem, and equally distant from Jordan and the sea-coast, afterwards named Sebastæ by Herod, in honour of Augustus; Jerusalem, or Esdraelon, about four leagues north from Samaria; Sichem, or Sychar, called by the Romans Neapolis, eight miles south of Samaria, in a valley between the mountains Gerizim and Ebal; Bethsan, called by the Greek writers Seythopolis, about 20 miles north-east of Sichem; Cæsarea of Palestine, anciently called Turris Stratontis, greatly enlarged by Herod, and long the principal city of the province, about 19 leagues north-west from Jerusalem; Dora, now Tartura, nine miles north from Cæsarea on the road to Tyre; Apollonia, now Aræon, on the sea-coast, 22 miles south of Cæsarea; and Haidrthrimmon, afterwards called Maximianopolis, about 17 miles eastward of Cæsarea.

Galilee.

Galilee, in 32° north latitude, bounded on the south by Samaria, on the west by the Mediterranean, on the north by Syria, on the east by the river Jordan and the lake Gennesaret, comprehended the possessions of Asher, Naphtali, and Zabulon, with part of the allotment of Issachar. The northern division of the province was thinly inhabited by Jews; and was sometimes called Galilee of the Gentiles; but the southern portion was very populous. Its principal towns were: Capernaum, at the northern extremity of the lake of Gennesaret; Bethsaida, a considerable village a few leagues south of Capernaum; Cinnereth, south of Bethsaida, rebuilt by Herod Antipas, and named Tiberias; Taricheæ, a considerable town at the eflux of the river Jordan from the sea of Tiberias, 30 stadia south from the town of Tiberias; Nazareth, two leagues north-west of Mount Tabor, and equally distant from the lake of Gennesaret and the sea-coast; Arbel, six miles west of Nazareth; Sepphoris, or Dio-Cæsarea, now Sefouri, a large and well fortified town, about five leagues north-west of Mount Tabor; Zabulon, a strong and populous place, 60 stadia south-east of Tzolemas; Acre, or Accon, seven miles north from the promontory of Carmel, afterwards enlarged and called Tzolemas by Ptolemy I. of Egypt, and in the time of the crusades distinguished by the name of Acre, the last city possessed by the Christians in Syria, and was taken and destroyed by the Sultan Saphra of Egypt in 1291; Kedess, or Cydissus, a Levitical city at the foot of Mount Panhum, 20 miles south-east of Tyre; Dane, originally Laish, on the northern boundary of the Holy Land, about 30 miles south-east of Sinon; Paneas, near to Dan, or according to some, only a different name for the same place, was repaired by Philip, son of Herod the Great, and by him named Cæsarea, in honour of Augustus, with the addition of Philippi, to distinguish it from the other town of the same name in Samaria; Jotapata, the strongest town in Galilee, about four leagues north-east of Dio-Cæsarea; and Japha and Gischala, two other fortified places in the same district.
bordering on Arabia Petrea, afterwards enlarged by
Trajan, and named Trajana Bostra. And Trachonitis,
in 35° 15' North Latitude, between Hermon and Anti-
libanus, excepted from the sources of Jordan, and con-
taining Baalgad, Misaph, Paneas, or Cäsarea Philippi,
and Ainos, nearly 22 miles east of Paneas, and as far
south-west of Damascus. There remains to be
noticed the Decapolis, or confederation of ten cities
in the last mentioned districts, which having been occu-
pied during the Babylonish captivity by heathen inha-
bitants, refused to adopt the Mosaic ritual after the re-
toration of the Jews, and found it necessary to unite
their strength against the enterprises of the Asmonian
princes. One of them, namely Scythopolis, already
described in the account of Samaria, was situated to
the west of Jordan; but the other nine were all to the
east of that river, namely, Gadara, or Oeder, a strong
place on a hill, the capital of Perea in the time of
Josephus, about 60 stadia east from the Sea of Tiberias,
and much frequented for its hot-baths; Hippos, some-
times called Susitha, 30 stadia north-west of Gadara;
Dium, or Dion, of which the situation is unknown, but
conjectured by D'Anville to have been about seven
leagues eastward from Pella, a considerable town sup-
plied with copious fountains, on the river Jabok, 14
miles south-east of Gadara, and celebrated as the
place to which the Christians retired, by Divine admo-
nition, before the destruction of Jerusalem; Canatha,
south-east of Cäsarea, and between the Jordan and
Mount Hermon; Garasa, afterwards Jarsa, three leagues
north-east from the upper extremity of the Sea of Ti-
berias, and much noted during the crusades; Rabbath-
Ammon, the capital of the Ammonites, south-east of
Ramoth, and near the source of the Jabok, on the con-
fines of Arabia, afterwards called Philadelphia by Pto-
lemys Philadephus, from whom it had received con-
siderable improvements, of which the ruins are still vis-
able; Abila, four leagues east from Gadara, in a fertile
track between the river Hieromax and Mount Gilead;
and Capitolias, a town in Batanea, five or six leagues
east-north-east of Gadara.

Several chains of lofty mountains traverse the Holy
Land in a longitudinal direction; and the country in
general may be denominated hilly. Some of the most
celebrated of these ridges are Gilboa, about six miles
westward of Scythopolis, in the province of Samaria;
Hermon, a group of hills north-west of the same town,
which environ the sources of the Jordan; Ephraim, in
the south-west corner of the province; Carmel, a woody
and fertile ridge of hills, extending southward from Car-
mel promontory towards Sichem, where it assumes the
name of Gerizim; Tabor, an insulated hill, north from
the ridge of Hermon, about 15 miles west from the sea
of Gennesareth, the summit of which is flat, and about
twenty-six stadia in circumference; Sela Tyrhousum,
the ladder of the Tyrians, the termination of an elevated
ridge of mountains along the coast to the north of Ptolemais;
Gilead, extending nearly from the southern extremity of the
sea of Tiberias, in a south-east direction towards Arabia, and covered
with a species of trees, which yielded a kind of gum, esteemed greatly
as a remedy for wounds; Alarim, a mountainous ridge between Jordan and Hesbon, composed of many
hills under different names, as Nebo, where Moses
died, Pisgah, Peor, &c. But, though the country is
mountainous, it is not abundant in streams. A few ri-
vulets water the plains and valleys; but there is only
one river that deserves the appellation, namely, the
Jordan, or Nahr-el-arden, which originates in Mount
Hermon, a branch of Antilibanus, about 120 furlongs
north of Cäsarea Philippi. Running southward, it
flows through the lake Gennesareth, or Sea of Tiberias,
and then traversing an extensive plain named Aulon,
falls into the southern extremity of the Lacus Asphaltiti-
s, or Dead Sea. A few torrents may be mentioned, which
flow chiefly during the rainy or winter season, par-
icularly the Kison, which springs from the south side of Mount Tabor, and, after receiving several brooks,
traverses the plain of Esdraelon, and falls into a gulf
between Mount Carmel and the point of Acre; the Ar-
non, which flows past the principal city of Moab, in a
south-west direction, then, turning north-west, falls in-
to the Dead Sea; the Jabok, which flows in a west-
erly course into the Jordan, a little below the Sea of Ti-
berias; the Hieromax, now Yermuk, which passing
Gadara, falls into the Sea of Tiberias; and the Cedron,
which flows close by the east side of Jerusalem. The
inland lakes are, Phiala, a small basin near Hermon,
which has no perceptible outlet, and has been regarded
as the fountain of the Jordan; Lacus Samochonitis, or
Meron, now Bahr-el-Jebel, at the conflux of two
branches of the Jordan, between Panaes and the lake of
Genneza, about 60 stadia in length, and 30 in breadth,
but greatly contracted in dry seasons; the Sea of Ti-
berias, or Sea of Galilee, or lake of Gennesareth,
about 13 miles in length and five in breadth; and the
Lacus Asphaltiti, or Dead Sea, now Almouanak, with
70 miles in length and 18 in breadth. (See ASPHALT-
tites.) For the ancient history of Judaea and its in-
habitants, see JEWS; and, for its modern state, see PA-
LESTINE. See D'Anville's Ancient Geography; Shaw's
ii. preface; Well's Scripture Geography. (q)

IVES, Sr. or St. lies, anciently Pendihas, is a
burgh and sea-port town of England, in the county of
Cornwall. It is situated near the north-east angle of
St. Ives Bay, in the Bristol Channel; but the
harbour is almost choked up by the shoals of sand
driven in by the north-west wind. The town con-
stitutes principally of one long street, dividing itself
into two smaller ones at the south end. The church,
which is low, though spacious, has a nave and two aisle;
and is often covered with spray in high tides and tem-
pests, from its proximity to the sea. Slate and pila-
chars are the principal articles which are exported. The
pila-
chars are caught in the bay in large quantities; and
when they appear in great shoals, all the inhabitants
lend their assistance, and even the church is deserted
when they happen to appear on Sunday. The town is
governed by a mayor, a recorder, 12 capital, and 24 in-
ferior burgesses. St Ives sends two members to par-
liament, and the number of voters is about 180. When-
ever any person dies at St. Ives worth ten pounds a
year, ten shillings are given to the vicar. There is a
good grammar-school here, founded by Charles I. In
1811, the burgh and parish contained

Inhabited houses 712
Families 748
Do. employed in trade and manufactures 144
Males 1532
Females 1749
Total population 3281

and Polywhele's History of Cornwall.

IVES, Sr. is a market town of England, in the coun-
ty of Huntingdon, and is said to derive its name from
Ivo, a Persian bishop, who preached here about the
JUGGERNAUTH.

Ives, St. Juggernauth.

year 600; and to whose memory the monks of Ramsey founded at St Ives a Benedictine Priory. The town is situated on the river Ouse, over which there is a handsome stone bridge, with four pointed and two semicircular arches. There are three principal streets irregularly arranged; and though the town is modern, there are no buildings deserving of notice. The parish church is a tolerably neat structure: it consists of a nave, chancel, and aisles, and has a handsome tower, with a spire. The spire of this church has been twice blown down. The Baptists have two places of worship here, and the Presbyterians and Quakers one each. Several breweries and malt kilns have been established. The inhabitants are chiefly employed in agriculture. In 1811, the town and parish of St. Ives contained

JUGGERNAUTH, or JUGGUNNATHA. (Jagannatha, the Lord of the World.) A celebrated place of Hindoo worship, in the district of Cuttack, on the sea-coast of Orissa. It is situated in North Latitude 19° 49'; and East Longitude 80° 5'; and stands close to the sea shore, a few miles north-east of the Chilkalkshe, and immediately adjacent to the town of Purisotom. The town and temple are encompassed with low sand hills; and the surrounding country is extremely sterile. The pagoda itself is a shapeless mass, and is in no way remarkable, except as an object of Hindoo veneration. The idol is a carved block of wood, with a frightful visage painted black, and a distended mouth of a bloody colour. He is dressed in gorgeous apparel; and his appellation is one of the numerous names of Vishnu, the preserving power of the universe, according to the theology of the Brahmins. On festival days, the throne of the idol is placed upon a stupendous moveable tower, about 60 feet high, resting on wheels, which indent the ground deeply as they turn slowly under the ponderous machine. He is accompanied by two other idols, his brother Balaram, and his sister Subudra, of a white and yellow colour, each on a separate tower, and sitting upon thrones of nearly an equal height. Attached to the principal tower are six ropes, of the length and size of a ship's cable, by which the people draw it along. The priests and attendants are stationed around the throne on the car; and occasionally address the worshippers in Ilidibus songs and gestures. Both the walls of the temple and the sides of the car, are covered with the most indecent emblems, in large and durable sculpture. Obscenity and blood are the characteristics of the idol's worship. As the tower moves along, devotees, throwing themselves under the wheels, are crushed to death; and such acts are hailed with the acclamations of the multitude as the most acceptable sacrifices. A body of prostitutes are maintained in the temple for the use of the worshippers; and various other systematic indecencies, which will not admit of description, form a part of the service. A number of sacred bulls are kept in the place, which are generally fed with vegetables from the hands of the pilgrims; but, from the scarcity of vegetation, are commonly seen walking about, and eating the fresh ordure of the worshipping crowds. In the temple, also, is preserved a bone of Krishna, which is considered as a most venerable and precious relic, and which few persons are allowed to see.

This temple of Juggernauth is esteemed the most sacred of all the religious establishments of the Hindoos; and the concourse of pilgrims by whom it is annually visited, is immense, particularly in March, when the Dole Jattrah takes place, and in July, when the Ruth Jattrah is celebrated. The natives themselves, when speaking of the numbers present at these festivals, usually say, that a lack of people (100,000) would not be missed. Dr. Carey is of opinion, that, on the lowest calculation, 1,200,000 attend every year, of whom an incredible proportion, (some suppose nine out of ten,) die by the way, from want, fatigue, or disease. One fact is certain, that at 50 miles distance, the approach to the spot is known by the quantity of human bones which are strewn by the way. Many old people take the journey on purpose to die within the sacred precincts. The sand plains around the town are in some places whitened with the bones of the pilgrims; and there is a spot at a little distance, called by the Europeans Golgotha, where the dead bodies are usually cast forth, and where dogs and vultures are seen continually feeding upon them. Multitudes are crushed to death by the pressure of the crowd; and at one time, as mentioned by some of the missionaries who were present, 150 were killed around the temple gate. The vicinity of the sea, and the arid nature of the soil, contribute to prevent the contagion which might otherwise be produced by such a number of putrid carcasses.

A considerable revenue arises from the tax paid by the pilgrims, which, after defraying the expenses of the temple, goes to the government. In 1734, the Raja of Purisotom carried away the idol Juggernauth beyond the boundaries of Orissa, and placed it upon a mountain, and thus caused a loss in the revenue of the province, of nine lacks of rupees per annum. In 1809, when the province was wrested from the Maharratas by the British, they succeeded to all the rights of the preceding sovereign, and consequently to the revenue derived from the resort of pilgrims to Juggernauth, but the tax was never levied during the administration of the Marquis of Wellesley; and it was not till after his departure from India, in 1806, that a law was made by the Supreme Council of Bengal for regulating the management of the temple, and the taxation of the pilgrims. The sum realized, during the first year, amounted to 117,490 sicks rupees; and the annual expenditure for the support of the worship, is computed at 56,000, to provide for which, besides established endowments, consisting of lands and villages, an allowance of 20 per cent. on the net receipts from the tax is granted by the British government. In 1809, the superintendence of the temple, and the control of the priests, were vested in the Rajah of Khoordah, who was directed to follow the recorded rules of the institution, or the ancient established usage. Various sects of devotees and religious persons are, by long custom, exempted from the payment of the tax; and likewise all the inhabitants who have been born, or have resided with their families for the space of ten years within the district of Cuttuck, between the rivers Byturnee and Ganjam, which is the holy land of Juggernauth. All pilgrims, also, in a state of actual poverty, or declaring their condition according to certain ceremonies, are allowed access to the temple for three days; and all the individuals who carry water from the Ganges to pour it over the idol, or who have resorted to the town of Juggernauth poor for purposes of trade, escape the tax. Those who are
liable to the assessment are arranged in four classes; and all, who are entitled to visit the interior of the temple, are at liberty to enrol themselves in the class which they prefer, upon paying the prescribed rate of tax. The first, called the Laul Jatiris, upon paying ten rupees if they come from the north, and six if from the south, have free access to the temple for thirty days. The second, called the Nemo Lalas, upon paying five rupees if from the north, and three if from the south, have access for ten days. The third, called the Blurngs, upon paying two rupees, whether from the north or south, have access during four days. The fourth, the Puny Tirhees, comprehending the low castes, are not allowed to enter the temple; but, upon paying two rupees, are permitted to perform the customary ceremonies on the outside for sixteen days. In order to prevent persons from eluding payment by a clandestine or forcible entrance, a strong barrier is constructed of prickly bamboos; and a guard of soldiers is placed at the gates to exclude every passenger, except those who duly pay the tax. At times, however, when a large body happens to collect, they attempt to force their way; and a crowd merely of women, children, and old men, trusting to the physical weight of their mass, have been known to make a charge on the armed guard, who are seldom willing on such occasions to oppose their bayonets. Both for the accommodation of these numerous travellers, and also in a military point of view, a road from Calcutta in the direction of Juggernauth had long been an object highly desirable. In 1810, Rajah Soomay Roy, an opulent Hindoo inhabitant of Calcutta, offered to contribute one and a half lack of rupees (£16,000) towards the accomplishment of this object, on condition that the road, when completed, should bear his name; and though he himself died soon after the payment of the money into the treasury, the undertaking has been prosecuted in conjunction with his heirs. Juggernauth is 311 miles distant from Calcutta, 500 from Nagpore, 512 from Benares, 719 from Madras, 910 from Delhi, and 1052 from Bombay. See Campbell's Journey over land to India; Buchanan's Christian Researches; Renmel's Memoirs of A Map of Hindostan; Christian Observer, vol. xii.; Baptist Missionary Periodical Accounts, No. xxiii.; and Hamilton's East India Gazetteer (q).

JUGURTHA,- a celebrated Numidian Prince, was the grandson of Masinissa, the faithful African ally of the Roman people, and appears to have been born about 152 years before the Christian era, and 606 after the building of Rome. He was the illegitimate son of Manstabal, the youngest son of Masinissa; and, after his death, was educated in the family of his uncle Micipsa, king of Numidia. He was handsome in his person, endowed with great bodily strength, and superior to all his companions in every athletic and military exercise. He was possessed also of great natural talents, and by his gallant, yet modest, demeanour, rendered himself greatly beloved in his younger years. He was highly honored at first by his uncle Micipsa, as promising to prove an ornament to his kingdom; but became at length an object of his dislike, as too dangerous a rival to his own sons in the affections of the Numidian people. In this apprehension, the king was desirous to put him privately to death, but had not been afraid that such an act might excite a sedition among his subjects; and, therefore contented himself, with sending his nephew to command the Numidian auxiliaries in the Roman army, in the hope of his falling by the chance of war, and his own adventurous spirit. But this measure, devised for the destruction of Jugurtha, contributed to advance his reputation and influence. By his ability in council, his courage in battle, his strict obedience to order, and his success in every enterprise, he acquired the esteem of the Roman army, and returned to Micipsa with a high recommendation from the general under whom he had served, the younger Scipio Africanus. Micipsa, thus finding his former scheme less practicable than before, emboldened himself rather to gain the affections of his nephew, and to secure him as the friend and protector of his children. In this view he adopted him into his family, and left him, by his will, joint heir in the kingdom with his two sons, Adherbal and Hiempsal. The latter of these, soon after the old king's death, expressed so openly his contempt of Jugurtha, and his displeasure on account of his being associated in the kingdom, that the most bitter enmity was excited between them, which speedily led to the death of Hiempsal, who, according to Sallust, was secretly assassinated by order of Jugurtha; but, according to the epitome of Livy, was vanquished and slain in battle. A civil war between Jugurtha and Adherbal was the consequence of this event; but the latter was soon obliged to yield in the struggle, and fled for protection and justice to Rome. Jugurtha, well acquainted with the venal character of the Roman senators, easily succeeded, by the payment of money, in procuring a division of Numidia between himself and Adherbal, and in securing farther the best of its provinces for his share. Confident, from this success, that he should find ways and means to avert any serious interposition from Rome, he resolved to render himself sole master of the kingdom; and, having put himself at the head of his army, compelled Adherbal, in a few days, to shut himself up in the town of Certa. By his former arts, he contrived to prevent any actual interference from Rome till he got the unfortunate Adherbal into his hands, whom he instantly put to death by means of torture. A Roman army was forthwith dispatched to Africa, with orders to bring the pernicious Numidian, to answer for his conduct before the majesty of the Roman people; but Jugurtha experienced little difficulty in rendering both the commissioners of the senate, and the commanders of the troops, favourable to his cause. Repairing afterwards to Rome, upon the assurance of safety to his person, and in obedience to a requisition from the senate, he first of all accused his nephews, and his intrigues to prevent the kingdom of Numidia from being transferred to Massi- va, another nephew of Micipsa; and, when all other means were likely to fail, he took care to have his rival removed by assassination. Permitted to leave Italy, in consequence of the safe conduct which had been promised, he was followed into Africa by the Consul Albinus, whose brother, Aulus, having been intrusted with the command of the army, artfully circumvented in such a manner as to force him to conclude an ignominious treaty of peace, and to pass his soldiers under the yoke. The celebrated Roman commanders, Metellus and Marius, were successively employed against him; but, for the space of three years, he baffled all their exertions, after reducing their armies to the greatest extremities, and returning more formidable after every defeat, proving himself their equal in military valour and skill, while they were not much his inferiors in duplicity and barbarity. When his Numidian adherents had either perished in his service, or deserted his interests, he still made head against the Roman legions, by assembling under his command the savage tribes of Gutulia, with a few auxiliaries from Maurita-
IVICA.

IVICA is an island of the Mediterranean, under the dominion of Spain, the largest of those denominated the Phynae, a name of doubtful etymology, derived by some of the ancients from their abounding in pines, and by others from certain earthen vessels fabricated by the inhabitants. Ivisa lies 16 leages from the promontory of Denia, the nearest part of the Spanish coast, and is separated by a channel above two miles wide from the island of Formentera. It extends seven leagues in length by 31 in breadth, and has two harbours, one known by the same appellation on the southeast, and St. Anthony on the north-west. The climate is mild and salubrious; the cold always very moderate in winter, while the summer heat is tempered by breezes from the sea. No venomous animal is found in the island. Ivisa is in general high and mountainous, and bordered almost around its whole extent by precipitous rocks. The coast sinks so rapidly, that, within a mile of the shore, the depth of water is twenty or thirty fathoms. On the south-west it declines more gradually, but on the north the sea is very deep. Fertile valleys of agreeable appearance are interspersed among the hills, and the soil requires nothing but the industry of man to render it productive. The hand of nature does everything here. Grain of different kinds is easily obtained: abundance of olives, grapes, almonds, and water-melons of superior quality, grow either wild, or almost entirely without cultivation; and the excellence of the figs was celebrated so long ago as the time of Pliny. But the richest parts of the ground remain unoccupied: no more grain is raised than what is absolutely requisite for the necessities of the inhabitants, who are averse to a surprising extent by prejudice.

Agriculture is therefore very far behind. Oil and wine are so negligently made, that not above half the advantage results that should be derived from the fruits employed. The inhabitants have even threatened the safety of persons, more experienced and liberal than themselves, who were desirous of introducing improvement. Game is plentiful, and the ordinary domesticated animals are common.

The inhabitants are for the most part of middle size, tawny complexions, and endowed with much personal activity. They are of a mild disposition, though possessing distinguished courage when it is roused, as has been seen in their conflicts with the Barbary corsairs. But they are exceedingly indolent, and testify an extraordinary aversion to labour. One of the governors of Ivisa endeavoured to cultivate mulberries, and to introduce the breeding of the silk-worm. The experiment succeeded, and some very fine and beautiful silk was obtained. But this new and productive source of benefit was soon lost by the extreme apathy of the inhabitants. They speak a jargon of the Spanish language with a guttural accent; and the dialect of the women is almost unintelligible.

Nothing remarkable appears in the costume of these people, except that the female islanders are partial to yellow. They likewise entertain a remarkable prediction for their hair, which is preserved to an astonishing length; and, not content with this profusion, it is far from uncommon for women in the country, to wear a cap in addition to their natural tresses.

Though little attention be paid to agriculture, the industry of the Ivisians is somewhat excited by the fisheries and the collection of salt. They are very expert seamen, and about 60 vessels of different sizes are to be seen in the principal port. Various kinds of fisheries are practised, and diversified according to the seasons, and the presence of the particular species of fish. In winter there is both net-fishing on the coast, and the deep-sea fishery with lines. The chief capture of the former is a small fish, not highly esteemed, the sparus minor of ichthyologists, but in such quantities as to employ one-half the fishermen, and afford a very reasonable supply of food. The deep-sea fishery is conducted at the depth of about 100 fathoms, and obtains greater variety. In summer, nets are stretched to the island of Formentera, for the capture of one species, and in autumn for that of another called langueur, which is in vast abundance. Part of the fish thus taken is salted, and some exported, but not enough to balance the import of salted cod, considerable quantities of which are consumed in the island.

Many hundreds of the islanders are occupied during August in collecting salt, produced by evaporation from ponds or marshes, which is carried in loads by mules to the coast, where it is taken in by foreign vessels. It is almost the sole export, together with a little wool; for the exportation of grain, fruit, and oil, though the principal natural products of the island, is injudiciously prohibited by government. The inhabitants therefore want every stimulus to exertion. They seek no more from agriculture, than to satisfy their exigencies; and bad seasons expose them to famine, while every superabundance of harvest is allowed to rot in the granaries. All the arts practised by them also are restricted to what necessity demands, and their main object is shelter. Their costume is rude, and their dwellings void of ornament. In traversing the island, a stranger would believe himself transported to a country where civilization is in an early stage. Except in the immediate neighbourhood of the villages, or leading to different ports where the salt is embarked, the roads are scarcely passable.

The island is partitioned into five districts: 1. The Town of Plain of the City; 2. St. Eulalia; 3. Balanzat; 4. Porto many; and, 5. The Salines. The first is the most important, and contains the town of Ivisa, which consists of about 200 houses, together with a cathedral, six churches, a convent, and barracks for troops. It is commanded by a small fortress, occupying an eminence on the coast, to the east of which are the suburbs, consisting of 400 houses. The total population of the place amounts to about 2600 or 2700 persons. This town is the seat of a governor, and was formerly a bishop's see. Its port is spacious and convenient, and sheltered from all sides; but although presenting good anchorage at present, it is gradually choking up with
the ballast discharged by the vessels coming hither to load with salt. Historians ascribe the foundation of the town to the Phorcynians, between six and seven centuries before Christ, and it is supposed to have been formerly more extensive. The fortress was erected by Charles V. of Spain, and repaired by Ferdinand I. Nothing of particular consequence is exhibited by the rest of the districts: that of Salines derives its name from the salt which is collected from it. There is a regular body of militia here, each district affording a quota, which altogether amounts to 1650 men. The island contains 2570 houses, and its total population is about 10,850 souls.

The history of Ivica does not afford matter of peculiar interest. It was anciently called Ebussus, and from hence the Carthaginians, long before the Christian era, attempted the conquest of other islands in the Mediterranean. It was reduced by the Spmiars in 1254; and at a much later period, namely 1706, it surrendered to the British fleet, commanded by Sir John Leake. Ivica has generally followed the fortunes of Majorca and Minorca, which have sometimes been captured by the naval force predominant in the Mediterranean. The position of the castle is in East Long. 10° 29' 12''. North Lat. 39° 38'.

JULIAN, the Roman Emperor, usually called the Apostle, was the younger son of Constantius, the brother of Constantine the Great, and was born at Constantinople on the 6th of November, A.D. 331. After the death of Constantine, in 337, Julian and his brother Gallus were with difficulty saved (by the care of Mark, bishop of Arethusa,) from the massacre of their family; and were afterwards spared through the policy or pity of their uncle Constantius, who had succeeded to the empire. As soon as the growing years of these unhappy youths excited the jealousy of the emperor, they were secured in the strong castle of Macellum, near Cesarea, where they were carefully educated under the best masters, and attended with all the honours of young princes. Their religious education was directed by Eusebius, bishop of Nicomedia, who was related to his pupils on the side of their mother; and, till Julian reached the twentieth year of his age, he prosecuted the studies rather of an ecclesiastic than of an emperor. He was actually admitted to the inferior offices of the priesthood, and publicly required he should not attend the church of Nicomedia. But he seems to have early associated in his mind the Christian principles in which he was instructed with the state of subjection in which he was held; and manifested, on various occasions, a strong predilection for the religion, as well as the literature, of the Greeks. After the exaltation of his brother, Gallus, to the dignity of Cesar, he was left more at liberty to gratify his own inclinations; and the crowd of sophists, who were attracted by his taste and liberality, soon succeeded in completing his conversion to the tenets of polytheism. In the twentieth year of his age, he was secretly initiated in all the mysteries of paganism; and, with all the enthusiasm of a new pro-sele, already anticipated the revival of the ancient religion of the empire. Suspected by the emperor of having participated in the disaffection of his brother Gallus, he was in great danger of sharing the same fate; and having been conveyed as a prisoner to Milan, he was kept for the space of seven months in daily apprehension of an ignominious death; but, by the earnest intercession of the Empress Eusebia, he was restored to liberty, and permitted to pursue his studies at Athens. Soon afterwards, by the same friendly influence, he was invested with the title of Caesar, espoused to Helena, the sister of Constantius, and appointed to the government of the countries beyond the Alps, in the 25th year of his age. In this command, though hitherto to a stranger to arms, he displayed all the qualities of an experienced soldier; and, by a succession of signal victories, completely checked the invasions of the barbarians in the west. Constantius, jealous of the reputation, and desirous to reduce the strength of so formidable a rival, required the legions of Gaul to join the expedition, which he was himself engaged in conducting against the Persians. These troops, reluctant to leave their own country in a defenceless state, or perhaps stimulated by the adherents of their leader, broke out into open mutiny, refused to march, and proclaimed Julian their emperor, in the 29th year of his age. The philosophical general long professed the most determined opposition to the offered sovereignty; but his pretending to yield at last, in consequence of having been solicited by the genius of the empire, and encouraged by a sign from Jupiter, sufficiently proves the fraud or the fanaticism of his conduct. Constantius, having indignantly rejected all the explanations and proposals of Julian as his colleague in the empire, the latter made a sallie into Illyricum, overthrew by the sudden death of his rival, he was left sole emperor of the Roman world about the end of the year 361.

As soon as he saw himself in full possession of the sovereignty, he threw off all his former disguises, and openly professed himself the votary and high pontiff of the Pagan divinities. But, while he established the ancient worship as the religion of the state, he proclaimed a free toleration to the Christians, and recalled those who had been banished by the Arian counsels of his predecessor. With all this show of philosophical moderation, he soon evinced his ardent aim to accomplish the entire subversion of the Christian faith, and the complete restoration of the rites of polytheism. He applied himself, amidst all the hurry of his preparations for the Persian war, to vindicate his preference of paganism by writing a refutation of Christianity; commanded many of the treaties in defence of the Gospel to be destroyed; excluded its adherents from all offices in the service of the state; prohibited them from teaching in the public schools; required, by a special edict, that no one should be called Christians, but Galileans; convoked at the fury of the populace and the brutality of his governors, who kindled in many provinces the flames of persecution; and dismissed the complaints of the oppressed accusers with the scoffing remark, that their religion required them to suffer without retaliation or repining. With a view to shake the fundamental evidences of the Christian revelation, by convicting its prophecies of error, he attempted to reassemble the Jews, and to rebuild their temple—a scheme which (according to the testimony of many contemporary writers, and even of the heathen historian and friend of Julian, Ammianus Marcellinus,) was miraculously defeated by eruptions of fire-balls from the foundation. Other Christian writers, however, of that age, and particularly Jerome, who lived in the vicinity of Jerusalem, are entirely silent on the subject; and it must still be regarded as a doubtful point, whether any such supernatural event took place. Nor is there any necessity, on the part of the Christian, to establish a specific miracle in the case. Julian’s avowed designs in favour of the Jewish people were rendered abortive; and whether by a miraculous interposition defeating the execution of them, or by other events preventing

JUN

Julier

Jungfrau

JULIER, the name of a lofty mountain, situated in the Grisons, in the northern chain of the Alps of the Engadine, or valley of the Inn. The passage over this mountain is accomplished in three hours; and as there are neither precipices nor avalanches, it is extremely safe and easy. At the highest point of the passage is an ancient monument, called the Julier Columns, which are columns four feet high, and made of the rough granite of which the mountain is composed. They are supposed to have formed part of an altar on which the ancient Celtic inhabitants had been accustomed to sacrifice a boar to the sun, whom they worshipped under the name of Thor. On the Julier, the granite passes to true sienite. On the northern side of the mountain, there is a fine formation of greenish black serpentine, which shelves along the top of the ridge to Septimer. Mines of iron seem to have been formerly worked in this mountain by the Counts Gelès of Altorf.

JUNGFAURA, or the Virgin, is a stupendous mountain of Switzerland, in the northern chain of the Alps, which, by the trigonometrical measurements of M. Tralles, is found to be elevated 12,672 feet above the level of the sea. This mountain, however, is only the seventh in respect to altitude among the Alpine ranges, being exceeded by Mont Blanc, Mont Baron, Ortelen, Cervin, Finster-Aarhorn, and the Col de Laniere. It rises from the valley of Lauterbrunnen, which extends about five leagues in length, by about only a quarter of a league in breadth, in the canton of Berne, and receives a number of torrents from the surrounding rocks, whence its name is supposed to be derived. But this valley owes its chief celebrity to the cascade of Staubach, precipitated from heights of 800 feet, opposite to which is the Jungfrau, rearing its summit 10,422 feet above the village of Lauterbrunnen. It is only from certain positions, however, that the appearance of this enormous mass can be properly contemplated; when immense glaciers are seen branching out into the valleys and the gorges of the mountains, but principally on the side of the Valais, where that of Aletsch descends, along a line of eight or nine leagues, nearly reaching the Rhône. The Jungfrau is surrounded on all sides by frightful rocks and precipices; and
its summit, which is completely hemispherical, is covered with perpetual snow. Almost in its centre terminate the crests of the three mountains of the Valais, of Lauterbrunnen, and Grindelwald. As the base of the Jungfrau exhibits calcareous strata, it is conjectured that they are continued to the summit. The debris washed down from the heights are calcareous, among which petrifications are sometimes discovered. The calcareous formation rests on the primitive rock, and the disposition of the strata may be seen in a cleft, where although the highest surface of the primitive rock, and the calcareous beds resting upon it, are inclined to the north, the primitive strata are perfectly vertical, or slightly inclined to the south; but this can be recognized only in the most obvious sections. Several caverns penetrate the base, of which that called Korbaline is the most remarkable. The view of the Cime, or top, of the Jungfrau is particularly grand, when the traveller approaches it, in ascending the valley of Lauterbrunnen. There is perhaps no mountain in the world that presents so magnificent an outline.

Some of the most lofty Alpine mountains have been ascended by enterprising travellers; but the difficulties by which the Jungfrau was everywhere observed, were long supposed to render it inaccessible. Two brothers named Meyer, however, lately resolved on the attempt; and having made the necessary preparations, in procuring guides, attendants, a lattar and ropes, left Aarau on the 29th of July 1811, and passed the valley of Laetschen. After a long ascent, they spent the first night on the place where the glacier of Laetschen joins that of Aletsch. Here among the most barren rocks, some insects of the genus Padura were seen under the stones upon the snow. The following day they made various Alpine discoveries in the union and position of different glaciers, but the reflection of the snow was such as rendered it necessary to hang a black veil before their eyes. Their attendants becoming alarmed at the difficulties of the ascent, they were dismissed, and the adventurers passed a second night on the ice. Next morning they resumed their exertions, and after a painful journey, guided by the direction of a wreath of snow, they at length gained the summit. The heavens now appeared of a deep azure, pure and cloudless; and none of those painful sensations described by Saussure and others were felt by the Messrs Meyer. They elevated a black flag on the summit, and descended the mountain in safety. (c)

JUNIUS, Letters of, a series of political letters which appeared in Woodfall's Public Advertiser, from the year 1769 to 1772. These Letters, written in a style at once vigorous and classical, displaying an extensive and minute acquaintance with the measures of government, and the character and conduct of the politicians of that day, distinguished by force of argument, eloquent declamations; and powerful invective, and by a zealous and steady assertion of popular rights, attracted a great degree of attention at the period of their appearance; and, having been frequently reprinted in a collective form, have been stamped with a character of celebrity which no similar productions, perhaps, have ever attained. The interest, too, which these popular philippics have excited in the public mind, has been kept alive, and greatly strengthened, by the impenetrable cloud of mystery which still continues to envelope their anonymous author. When we consider all the circumstances, indeed, this mystery must appear to be a very singular fact in literary history.

The unprecedented boldness with which this im-
The principal persons to whom the Letters of Junius have been at different times attributed, are the following: Charles Lloyd, a clerk of the treasury, and afterwards a deputy teller of the exchequer; John Roberts, also a clerk in the treasury, and afterwards, successively, private secretary to Mr. Pelham, when chancellor of the exchequer, member of Parliament for Harwich, and commissioner of the Board of Trade; Samuel Dyer; William Gerrard Hamilton; Dr. Butler, late Bishop of Hereford; the Rev. Philip Rosenhagen; Major-General Charles Lee; John Wilkes; Henry Flood; John Dunning, Lord Ashburton; Lord George Sackville; Hugh Macauley Boyd; Mr. Glover, author of Leonidas; M. De Lolme; the late Duke of Portland; and Sir Philip Francis.

Of the first nine candidates in the above list, we intend to say nothing, as we consider their pretensions to have been already sufficiently disproved; and shall, therefore, in so far as relates to them, merely refer our curious readers to the works mentioned at the end of this article.

The claims of Dunning, Lord Ashburton, to the honours of Junius, were formerly considered as superior to those of any other candidate. He possessed all the requisite talents, learning, and wit; his age, and rank in life, his political principles, attachments, and antipathies, together with his usual residence, during the period in question, are all in favour of that hypothesis which assumes him as the author. Yet there are one or two circumstances in his situation, which render this hypothesis highly improbable. Dunning was solicitor-general at the time these letters first appeared, and for more than two months afterwards; and he cannot therefore be supposed to have been the author of the famous letter to the king. Besides, it is pretty clear, as we have already hinted, both from his public letters, and his private correspondence with Mr. Woodfall, that Junius was not a professional lawyer.

The talents of Lord George Sackville were well known; his political principles made him incline to the same side of the question which Junius espoused; and he was suspected, by Sir William Draper and others, at an early period, of being the real author of Junius. It is very remarkable, too, that from a private letter from Junius to his printer, in which he asserts, that a person of the name of Swimney had called upon Lord Sackville, and taxed him with being Junius to his face; it appears that Junius was in the knowledge of this fact a few hours after it happened. It would seem to follow, therefore, either that Lord George Sackville was Junius, or that Junius, at least, must have been in habits of intimacy with that nobleman. On the other hand, his Lordship is said to have observed, on one occasion, to a friend of his: "I should be proud to be capable of writing as Junius has done; but there are many passages in his letters I should be very sorry to have written." And, moreover, in one of the letters of Junius, Lord George Sackville is roundly accused of want of courage.

Of all the candidates for the celebrity of Junius, there is none whose pretensions have been so obtrusively advanced as those of Hugh Macauley Boyd. This gentleman was born of a respectable family in Ireland, educated at the College of Dublin, and intended for the profession of the law. But, at an early age, having renounced his legal pursuits; and having come over to London in the year 1766, he addicted himself to politics, and led an unsettled life, which continually involved him in pecuniary difficulties. He is known as the author of The Freeholder, which he wrote at Belfast, in the year 1776; of The Whig, a series of papers published in the London Courant, between November 1779, and March 1780; and the Indian Observer, published at Madras in 1793. The chief advocates for the claims of this gentleman, are, Mr. Almon, Mr. Campbell, the editor of Boyd's works, and Mr. George Chalmers. We shall endeavour to give a concise statement of the arguments used by the last mentioned gentleman, omitting only such circumstances in the proof, as appear to us to be altogether trivial and inconclusive.

Mr. Woods, the player, who, at the period in question, was an apprentice with Mr. Woodfall, the printer, on seeing the fac-simile of Boyd's writing, in the year 1800, said he had no doubt that the hand-writing was the same as that of the letters of Junius. Mr. Almon, in the year 1786, having seen a manuscript letter of Junius, which Mr. Woodfall read at a meeting of booksellers and printers, he suspected Boyd, and taxed him with being the author. Boyd, it is said, instantly changed colour; and, after a short pause, he said, "the similitude of hand-writing is not a conclusive fact."

The evidence of Mrs. Boyd is brought forward to prove, that her husband commenced his correspondence with the Public Advertiser at the end of the year 1768; that he wrote occasionally in the same paper, during the years 1769 and 1770, under the signatures of Lucius and Brutus; that he was at great pains in accommodating himself to disguise his hand-writing; that he sent letters almost every week secretly to the Public Advertiser, and sometimes carried packets himself to some penny post office, or asked her to carry them to Woodfall's letter-box; that he manifested much solicitude to see the letters of Junius, and was continually talking about Junius; that she would often hint to him her suspicion that he was Junius, to which he made no reply. The same lady states, that Mr. Boyd took a house at Ruston-Green, near Harrow, when Junius' controversy with Mr. Horne commenced; that he wrote a great deal while it lasted, and was constantly talking upon the subject. She farther says, that in November 1771, Boyd borrowed from a neighbour at Ruston-Green, several law books and state trials, which he read with great attention, for the purpose, as she thinks, of supporting the charge of Junius against Lord Mansfield, which appeared on the 21st of January 1773; and that about three weeks after the publication of that letter, Boyd went to Ireland. Mr. Boyd also states, that on the very day on which the letters of Junius were republished, with a dedication, preface, and notes, Boyd presented her with a copy of the book.
and that in looking over the pages, she was much struck at seeing some anecdotes of Lord Irnham, Miss Davis, and Mr. Nisbet, one of her guardians, which she had communicated to him in confidence. A few years after Boyd went to Madras with Lord Maccartney, a paragraph appeared in the General Advertiser, which plainly alluded to him as the author of Junius. Mrs. Boyd immediately sent a friendly message to the printer, requesting that no more paragraphs alluding to Mr. Boyd might appear in the paper; and, at the same time, she wrote to Boyd, inclosing the paragraph, and urging him, if the imputation was not true, to contradict it without delay. But to this request, although frequently repeated, she never obtained a reply. To these circumstances it is added, that some persons, who were acquainted with Mr. Boyd in India, were of opinion that he was Junius; that Captain Neville, dining with Boyd at Calcutta, heard him say something when they were both mellow with wine, which convinced him that Boyd was the writer of Junius. And the proof is closed by the evidence of Monsieur Bonnecarrière, to whom Boyd is said to have made a confidential declaration, that he was the real author of Junius’ Letters.

Such is the amount of the evidence in favour of Hugh Macauley Boyd. The proofs have been brought forward with great confidence, and stated with much ingenuity; yet to us they still appear inconclusive, on the following grounds.

The evidence with regard to the hand-writing must go for nothing. Mr. Woods speaks from his recollection, at the distance of thirty years. Almon formed a conjecture, from a casual glance at a part of the manuscript of one letter of Junius; but Mr. Woodfall, who was well acquainted with the hand-writing of Boyd as well as of Junius, and had the very best opportunities of comparing them, denied that the Letters of Junius were written by Boyd. Besides, Boyd is said to have disguised his hand; the manuscript, therefore, which Almon saw, must have been written in this disguised hand; yet he is said to have immediately recognised it in the usual hand-writing of Boyd. In fact, upon an inspection of the fac-similes, it clearly appears that there is no resemblance at all, but rather the reverse. Boyd’s alleged change of colour, and his reply to the accusations of Almon, are little to the purpose. We shall afterwards have occasion to refer to, and our readers will probably have already perceived, that Boyd was not at all displeased with the imputation.

That Boyd occasionally corresponded with the Public Advertiser is well known. But his correspondence commenced, it is said, in the year 1768 or 1769; whereas the first authenticated letter of the author of Junius, under a different signature, appeared on the 28th of April 1767, at a period when Boyd had not yet attained his 21st year. Upon a strict examination of dates, also, it would appear, that some of the letters of Junius must have been written during Boyd’s visits to Ireland. But Junius must then have been resident in London, or its vicinity. There is pretty good evidence, that a letter on the state of parties, published in an Irish paper, under the signature of Sindercombe, which Boyd was in Ireland in 1768, was the production of that gentleman. Now, on the 26th Dec. 1772, long after Junius had declined to continue his papers, this Sindercombe addressed a card to the Public Advertiser, calling upon Junius to renew his correspondence. But upon comparing this card with the private correspondence of Junius with Mr. Woodfall, about the same period, it will be evident that Sindercombe could not be Junius. Moreover, the last public letter of Junius appeared on the 21st of January 1772; and Mr. Boyd is stated to have gone to Ireland about three weeks after that period. But during this absence of Mr. Boyd, Junius was engaged in an almost daily correspondence with Mr. Woodfall, relative to the new edition of the Letters.

With regard to Junius’ knowledge of the story of Lord Irnham, our readers will have no difficulty in conceiving, that Junius might have easily acquired information about this matter, when they reflect on the rapidity with which he received intimation, of Swinney’s visit to Lord George Sackville. There are many such instances of early information, both in his public and private letters. Besides, the story in question, although a sort of family secret, was known to several individuals, and might easily have been divulged and propagated. In fact, it had actually been published some years before it appeared in the note to Junius’ letter.

We come now to the Indian evidence. There is no doubt, that, by some individuals, Boyd was suspected of being the author of Junius. But mere suspicions and private opinions are of little weight, in a question that must ultimately be decided by real evidence. The information of Captain Neville is much too vague; we are not told what the something was which Boyd said when mellow with wine, which produced the particular impression on that gentleman when in the same situation. The evidence of Monsieur Bonnecarrière, indeed, is more to the purpose; but we own we are rather suspicious of such declarations as the one alluded to, when we reflect upon the whole conduct of Boyd in regard to his identity with Junius; and especially when we consider, that we have the very same sort of evidence in the claim advanced for General Lee, which has long since been abandoned. If our memory serves us, a similar declaration is also said to have been made by the late Mr. Suett, the player, in favour of his own claim, as the author of Junius.

In addition to the foregoing remarks on the weakness of the evidence in favour of Mr. Boyd’s claim, we shall state a few considerations, which, to our minds, render it almost incredible that Boyd should have been the author of Junius. At the period when Junius commenced his correspondence with the Public Advertiser, Boyd had not attained his 21st year. Now, although we do not mean to deny that Boyd was a man of considerable ability, we have seen no proofs of such precocious talents and intuitive knowledge, as could have enabled him at that age to contend with the greatest wits, and best informed and most experienced men of the day. Mr. Chalmers is aware of the strength of this objection; but we do not think he has been successful in his attempt to obviate it. He has produced no previous compositions of Boyd, which could lead us to anticipate the future Junius; and the reference to Chatterton proves nothing. It is easy for a youth of ability to seize upon a common topic, to gather the floating chit-chat of the quid-nuncs of the day, and to vamp up a composition, abounding in spirited declamation, and pointed invective. But Junius was evidently a writer of a different description. He possessed a knowledge of the world derived from experience; an intimate acquaintance with the leading characters in the state, which could only have been obtained from an inter-
of Junius. In many instances, he copies his sentences \textit{verbatim}, and sometimes blunders sadly through his metaphors. But it is impossible, we think, for a reader of any discrimination, to peruse the papers of both authors, without perceiving the manifest inferiority of Boyd. We do not mean to disparage the talents of this gentleman, or to assert that he could not write well; but we are satisfied, that he never attained the peculiar excellencies of Junius.

Boyd, moreover, seems rather to have courted, than to have been anxious to disclaim the imputation of being the author of Junius; as we may perceive from his ambiguous reply to Almon; and from his silence to his wife, when she mentioned to him her suspicions; although, at the same time, he seems to have used all the means in his power to impress such suspicions upon her mind. And how unlike to this conduct were the apprehensive which the real Junius betrayed in his private letters to Mr. Woodfall!

We shall only further observe, with regard to Mr. Boyd's claim, that it was at once rejected by all those who had the best opportunities of being acquainted with Boyd, and the best means of forming a correct opinion upon the subject. Mr. Woodfall constantly declared his belief, that Boyd was not Junius; and Lord Macartney, who "had frequent opportunities of sounding his depth, and of studying and knowing him well," expresses his opinion in the following words: "I do not say that he was incapable of writing to the full as well as Junius; but, I say, I do not by any means believe, that he was the author of Junius." And this was his lordship's deliberate opinion, after having perused Mr. Chalmers' Appendix to the \textit{Supplemental Apology}.

Having thus discussed the claim of Mr. Macauley to Boyd, we shall not detain our readers long with the pretensions of the remaining candidates.

The claim of \textit{Leonidas} Glover was first advanced a few years ago, and is founded chiefly upon a memoir of that author's writing, containing a sort of journal of political transactions, from the year 1742 to 1757. The political principles of Glover are found to coincide pretty nearly with those of Junius; his talents and acquirements were undoubtedly his; he was a man of ample fortune, a member of parliament, a popular man in the city, well acquainted with public characters, public measures, and ministerial intrigue. It is remarkable, too, that he declined taking an ostensible part in politics, just about the time when Junius first attracted public notice. He was well known, and much respected by Mr. Woodfall, the printer; who, in a letter addressed to Junius, says, after requesting instructions how to vote at the next general election, "I have no connections to warp me, nor am I acquainted but with one person who would speak to me on the subject, and that gentleman is, I believe, a true friend to the real good of his country; I mean Mr. Glover, the author of \textit{Leonidas}." To this letter Junius returned no answer.

Many other presumptive circumstances might be brought forward in support of this gentleman's claim; but as there is nothing at all, in his case, that approaches to direct evidence, we deem it unnecessary to prosecute the inquiry.

The claim of De Lolve, we believe, is not entirely new; but it has been recently revived, with "evidences multifarious, analogical, phraseological, autobiographical, argumentative, and circumstantial," by Dr. Busby, author of \textit{A Translation of Lucretius}. For Dr,
An ingenious publication has lately appeared, in a series of letters, tending to prove that the late Duke of Portland was the author of the Letters of Junius. The hypothesis is founded chiefly on the injuries received by the duke from the ministry of that day, and the frequent allusions in the letters of Junius to the "Nullius Tempus" bill, and other subjects, in which the duke's interest was involved. The subject is treated with considerable ingenuity; but the evidence is altogether of a presumptive nature, and we must therefore refer our readers to the work itself, for a view of the arguments by which the hypothesis is strengthened.

The latest hypothesis which has been advanced upon this subject, is that which ascribes the letters of Junius to Sir Philip Francis; and it will be found, we think, that the requisites we have demanded, at the commencement of this article, unite in him in a much stronger degree, than in any other candidate who has yet been started. Sir Philip was a clerk in the war office, 1763 to 1772, in which last year he was dismissed. The last letter received by Mr. Woodfall from Junius, as we have already mentioned, is dated January 19, 1773; and the appointment of Sir Philip, as one of the new council at Fort William, took place in the month of June of that year. The claim advanced for him is chiefly founded upon the coincidence of these and other corresponding dates; on Sir Philip's acknowledged talents; his opportunities of information on the subjects discussed in the Letters; the similarity of his style to that of Junius; and likewise the similarity of his handwriting to that of the facsimiles. These, and many other minute circumstances, have been brought forward in evidence of this claim, which the reader will find stated at large in the works referred to; and, upon the whole, it appears to us to be by far the most probable which has hitherto been advanced. We must not conceal, however, that Sir Philip, in his answer to an inquiry respecting the truth of this conjecture, by the editor of the Monthly Magazine, speaks of it as "a silly, malignant falsehood." We must leave it to our readers to determine for themselves, whether they will consider this declaration as a positive denial of the imputation, or as a mere evasion. In the former case, they would certainly be inclined to pause, even in the face of the strongest evidence; in the latter, that evidence must be allowed its full weight; and we should then regard this long agitated question as nearly set at rest.

See Woodfall's edition of Junius, 1812; Mr. Malone's Preface to Hamilton's Parliamentary Logic; Mr. L. D. Campbell's Life of Boyd, prefixed to Boyd's works; Mr. Chalmers' Appendix to the Supplemental Apology, and The Author of Junius ascertained, London 1817; Memoirs of Sir N. Wraxall; Memoirs by a celebrated Literary and Political Character, London, 1814; and An Inquiry concerning the Author of Junius, with reference to the Memoirs, &c.; Arguments and Facts, demonstrating that the Letters of Junius were written by John Lewis De Tolome, &c. by Thomas Busby, Mus. Doc. 1816; and Letters to a Nobleman, proving a late Prime Minister to have been Junius, &c. 1816; The Identity of Junius, with a distinguished Literary Character established, Lond. 1816; A Supplement to Junius identified, &c. 1817; and Edinburgh Review, No. iii. p. 96. JUNO, in the ancient heathen mythology, was the daughter of Saturn and Rhea, or Ops, the sister and wife of Jupiter, consequently the chief of the female deities, and therefore styled the queen of heaven. She was born in the island of Samos, where she continued to reside during the period of her virginity.

The character of Juno is represented in no very amiable light. Her haughty and rebellious disposition is said to have subjected her, in some instances, to the displeasure and chastisement of her husband. She was excessively jealous; but, as it would appear, not without reason; and she punished, with an unrelenting severity, Europa, Semel, Io, Latona, and the other ladies with whom Jupiter indulged himself in the pleasures of illicit love.

Juno was the mother of Vulcain, Mars, and Hebe. She was worshipped under the name of Lucina, having been considered as presiding over marriages and births. She is usually represented in a chariot drawn by peacocks, with a sceptre in her right hand, and a crown on her head. Homer describes her in a chariot adored with precious stones, the wheels of which were of ebony, and which was drawn by horses with reins of gold. In her temples at Corinth, she was represented on a throne, with a crown on her head, a pomegranate in one hand, and in the other a sceptre, with a coccus on its top.

As the queen of heaven, her usual attendants were Terror and Boldness, Castor, Pollux, and fourteen nymphs; but her principal attendant and peculiar messenger, was Iris, or the Rainbow, the daughter of Thamus and Electra.

A particular festival, called Junonalia, was celebrated by the Romans, in honour of Juno, and is fully described by Livy, lib. vii. dec. 3. (z)

IVORY is the bony substance of the teeth of animals, but is applied particularly to the tusks of the elephant. Those of the hippopotamus, wild boar, several placers, and the horn or tooth of the narwhal, pass by the same name. The tusk of the elephant is of a circular or oval shape, some inches thick at the root, and several feet in length, if full grown. It is hollow for a considerable space from its insertion into the jaw, and always tapers to an obtuse extremity. Most tusks are curved, generally more so in proportion to their size; for the smallest brought to this country are perfectly straight. Naturalists, however, conceive that the curvature of the tusk is not a decisive characteristic of the species of the elephant, but only constitutes a variety. Perhaps this is a point meriting further investigation; and it should be attended to, that those called mammoth's tusks, found on the shore of the Icy Sea, are said to be spiral, forming about a volute and a half, throughout their length. The size of the hollow is various in proportion to the tusk. It is of a conical figure, circular or elliptical, commonly corresponding to the exterior outline of the whole; and, indeed, it is to be observed, that all the lines and layers, observed in a transverse section, have a relation to the external circumference of the tusk. Thus it is probable, that these peculiarities depend on the original conformation of the pulpy nucleus occupying the cavity. In small tusks, the upper part of the hollow is totally lost in the solid, being scarcely perceptible, or forming only a dark shade. In those of larger size, it diminishes to an aperture of a line or less in diameter at its termination on the outside at a short distance from the tip. It is technically called the nerve on assuming the latter ap-
pearsance, and sometimes is encircled by so dark a shade as greatly to injure the ivory. Tusks are most esteemed which have least hollow.

Nothing can be more diversified than the dimensions of the tusks of the elephant, and hence the dealers in ivory distinguish them by names according to their size. If weighing under 14 or 20 pounds, they are called creelles, or, as the workmen say, crevilles, many not exceeding a foot in length. None brought from the south-west coast of India exceed four feet it is said; but some of an extraordinary bulk are obtained in other countries. In Roman history, we read of tusks ten feet long; and Mr. Pennant speaks of others equally large, brought from the coast of Mozambique, in modern times. One of eight or nine feet long, and several inches in thickness, is barely mentioned; and Hartenfels, in his work on elephants, instances one, of the wonderful length of 14 feet, in the possession of a merchant in Venice. Very large tusks are six, seven, or even nine inches thick, according to Camper, who observes, that one about seven feet nine inches long, nine inches thick, and weighing 208 pounds, belonged to a merchant of Amsterdam. No general conclusions regarding the weight are deducible from the size. Tusks have been known to weigh 525 or 550 pounds. Some fossil tusks are also very ponderous. One is described by Breyne, in the Philosophical Transactions, 136 inches 5 lines long on the exterior of the curve, whose circumference was 15 inches 5 lines at the root on clearing the socket, and which weighed 157 pounds. The largest, found on the shores of the frozen Ocean during the Russian voyage of discovery in 1737, were eight feet seven inches long following the volute, but only four feet and an inch in a straight line, very nearly 18 inches in circumference at the thickest part towards the root, and weighing 115 pounds avoidahps. Cuvier supposes, that tusks grow during the whole life of the elephant; and as the extremity is always wearing off, the real length is uncertain. But that learned author, on inspecting their sections, would have been sensible, that many want very little if any portion of the extremity, although others be greatly blunted, or even broken over by some uncommon degree of violence. The largest tusks are said to be brought from Africa, and the straightest from Asia; and it is thought that those least curved afford the best ivory. Nevertheless, we do not consider these points as established; and we are disposed to doubt whether the quality of the ivory is indicated by any external appearances, or whether much dependence can be placed on any except very simple rules for judging of it.

Ivory is hard and elastic, and is considerably more transparent than white paper of equal thickness. The outside is covered by a cortical substance, softer than the rest; brown or almost black externally, by which also the cavity is lined. In general, it is nearly a line thick, though sometimes scarcely perceptible on approaching the tip. The ivory, in both cases, is coarser; that is, the grain is larger and more perceptible in the vicinity of the bark, softer, and, as we think, more readily discours on exposure to the air. It progressively becomes finer on receding from the external cortical part; and where there is no sensible bark on the cavity, it seems to have attained the greatest perfection. Hardness and whiteness are the only properties desirable. But that is most prized which exhibits a kind of diaphanous appearance when first cut around. The outside is always to be rejected, as also portions near the nerve.

The structure of elephants' ivory exhibits no important differences. The disk of a transverse section always presents a number of granulated lines in a zigzag direction, which gradually become more delicate on approaching the interior, until they totally disappear from the naked eye. M. Cuvier affirms, that this character, common to all elephants' ivory, and depending immediately on the pores of the pulpy nucleus of the tusk, is not to be found in the tusks of any other animal. We shall remark, in general, that the texture of the ivory of different animals which we have examined, is very different. On reducing a transverse section of a portion of very fine ivory to the thickness of 100th part of an inch, we found innumerable concentric circles surrounding the cavity, disposed, as it were, in bands of irregular breadth. This thickness of ivory required a high polish to expose them; and they were indistinct without the aid of a magnifier. But on reducing a piece greatly thinner, and through which common printing would easily be read when laid upon a page, they were readily seen with the naked eye. Very minute lozenges were observed to be formed by intersecting curves, and many strisc or radiations, in which were minute square masses more opaque. Instead of the conical intersection, the grain near the bark exhibited waved white lines among the browner part. A longitudinal section of ivory presents somewhat of a lamellated aspect; of uniform colour in a fine tusk, but sometimes more distinctly marked, and with yellowish edges in others. The texture resembles that of wood; and, on examining a thin plate, it will be found to be extremely similar to the general appearance of ash, consisting of alternate irregular darker and lighter streaks. By reducing it to extreme thinness, they become infinitely less perceptible, and the ivory assumes a bluish transparency. It may be thence understood, that the tusk is formed of innumerable concentric circles, so intimately united as to constitute one solid and consistent whole. When in a state of decomposition by lying long in the earth, it separates into thin concentric conical plates; and sometimes, though very rarely, we have observed a portion separate in this manner from recent ivory. Mr. Corse Scott is of opinion, that the age of an elephant might be deduced from the number of layers; but it is not certain that they grow regularly year by year, and besides, they appear different in a large and thick section than in one which is very thin. The nature of this annular formation is particularly conspicuous in what is called the tooth of the whale, which is probably a real tooth. The cortical part is very thick, and much whiter than the rest, and it is of about equal hardness. That of a section of an inch and a half in diameter we found to be an eighth of an inch thick, of a homogeneous surface to the naked eye, but seen to consist of the thinnest layers on the application of a magnifier. Instead of the granulated appearance and intersecting curves of elephants' ivory, the whole is disposed in numerous concentric rings, exactly resembling those which surround the pith of a tree, proceeding from the centre to the circumference. They are of unequal breadth, and seem arranged in grains, with an intermediate transparent ring. Very fine and delicate radiations also proceed from the centre to the circumference, and a play of light is produced, which gives the surface somewhat the appearance of the cat's eye. Observations on plates of ivory are greatly facilitated by the application of oil or water, which produce such transparency as to expose the internal and also the superficial structure.

The teeth of the sea horse, morse, or trichecus ros-
Ivory.

We shall conclude our observations on the nature of ivory with an account of the tooth or horn of the narwhal, one of the cetaceous tribe. The largest are ten feet long, and some inches thick at the lower extremity, forming a slender cone of a spiral figure. This tooth consists of ivory of the finest description, equally hard as elephant's ivory, and susceptible of a higher polish. But we do not know that all of it is of the same character; and a prejudice against its ordinary use subsists among workers in ivory. Its texture is singular, differing in most respects from all other ivory. On giving the highest polish to a transverse section of about an inch and a half in diameter, the cortical part proved of a very dull white, somewhat of a greenish cast, of a hard horny consistency, and about an eighth of an inch broad. Interposed between it and the substance of the tooth there appeared a bright white circumferential line, narrower and much harder than the bark. The surface was beautiful, quite homogeneous to the naked eye, with a few of the faintest concentric circles more transparent than the rest. Nothing more is perceptible without reducing the thickness of the ivory, and resorting to the microscope. This being done, the faint circles of a section, about a 60th part of an inch in thickness, prove to consist of three lines, that in the middle darker than the others. Innumerable radiations of a fine feathery appearance proceed from around the central cavity, and terminate somewhat, within the circumferential line, but again becoming more conspicuous in what we have denominated the cortical part. These are not unlike the spicule shooting out during the crystallization of certain salts. But all are tubular, and the fact is demonstrated on subjecting a very thin longitudinal section to a magnifier of considerable power. We have not witnessed this peculiar conformation in any other ivory, though it is not improbable that the striae or radiations above alluded to in that of the elephant and whale’s tooth, may be analogous to it. No porosity was discovered in a longitudinal portion of the former, reduced so thin as to be bent double with the fingers, by throwing a particular light on the surface of the narwhal’s ivory, an irregularity is visible from the tubular formation, consisting of innumerable minute horizontal cavities. This peculiar structure merits farther examination, in which suitable attention should be paid to portions from various teeth. It is obvious, from what has been said, that the bony process of the narwhal is more probably a tooth than a horn.

Considerable anomalies are seen in the structure of the different kinds of ivory, and every tooth seems to have something peculiar to itself, especially in the arrangement of the concentric circles. In so far as our observations go, the most transparent is the hardest, which is particularly exemplified in the pellucid rings above alluded to. Thus, on reducing a plane surface of ivory by any ordinary mechanical operation, they will remain prominent, though the rest yields under it. The line interposed between the bark and the substance is also the hardest of the whole. We have seen the tusks of horses free of enamel, and having a thick bark, with fine ivory, which we were unable to trace to any of the ordinary species. Circumstances may render it difficult to ascertain the fact, especially if the ivory be not recent. On examining a small portion of an elephant’s tusk lately discovered in Ayrshire, it proved somewhat harder than recent ivory. The exterior consisted of an extremely thin coat of a deep brown colour, surrounding a portion of a broad circular ring, wherein very numerous concentric lines were visible. Within this appeared what seemed common ivory. But the fragment was small, which rendered its peculiarities less obvious; and these consisted chiefly in the concentric lines.

Ivory is found, by analysis, to consist of the phosphate of lime, and a gelatinous substance. The yellow colour acquired by exposure to the air, is supposed to arise from the combination of the gelatinous matter with the oxygen of the atmosphere. It is said that oxygenated muriatic acid will restore the original whiteness. Some ivory is exceedingly white from the beginning, and some whitens in drying. It is discoloured by being frequently handled, though the keys of an organ or piano most commonly used are said to retain their whiteness longer than the others. The colour may be renewed by removing the external surface, provided the discoloration be only superficial. Artists distinguish ivory into white and green, the former being characterized by a whitish or lemon-coloured bark. When cut up, it is of a faint olive or greenish hue, but soon becomes of a beautiful white.

Ivory is applied to a vast variety of purposes in the arts. Its hardness and texture adapt it for many works where wood would be speedily destroyed, and to which metal is unsuitable. The most elegant sculptures are executed in ivory, not only of images, but even of landscapes after nature; whereas the finest parts can only be compared to lace. It is universally employed for every kind of turnery, of which admirable specimens are brought from foreign countries; such as several hollow spheres, included within each other, successively, even to the number of 14, 15, or more; while the outside is carved in a variety of figures in open work. From its elasticity, it is used exclusively for making the balls employed in games of skill; as billiards, and also in those for demonstrating the doctrines of collision. It is sometimes formed into baskets of considerable size, elaborately wrought; and we have heard of furnaces composed exclusively of ivory. The scales of almost all mathematical instruments are made of it; for which, if properly and sufficiently seasoned, it is in many respects superior to brass, and fine ivory is almost always used for miniature paintings. One of the purposes to which it is most extensively and usefully applied, is comb-making; in which seventy teeth may be cut to the length of an inch, all executed by a saw; and the ivory of the sea horse has superseded every other
kind in the fabrication of artificial teeth. Artists, attracted by the beauty of this substance, have endeavoured to apply it to purposes for which it does not seem adapted; as in the construction of wind instruments. Ivory flutes, for example, are inferior to those made of wood; but whether this arises from the proper proportions of the materials not being yet ascertained, or whether the suitable vibration of the instrument or the included column of air, be not produced, is probably not determined. The ancients employed ivory more extensively in some respects than the moderns. It was formed into large statues by them, and we read in Scripture of the ivory throne of Solomon, ornamented with gold. The modern kings of Denmark, indeed, are said to have a magnificent throne, constructed of the teeth of the narwhal. Heyne expresses his surprise, that ivory should be known so much earlier among the Greeks than the Jews; but it must be admitted, that nations are familiarly acquainted with numberless substances which never become the subject of written descriptions. Medicinal virtues are ascribed by the Japanese, to the tooth of the narwhal; they believe that it contributes to elevate the spirits; to strengthen the memory; may, that it will contribute to the prolongation of life. Hence it bears a high price among them, and the sale of a single tooth has been known to realize a fortune to the owner. No such properties are ascribed to ivory in Europe; where, besides its use in the arts, we believe the only purpose to which it is applied, is making a weak glue from the shavings. The Dutch were wont to procure whole cargoes of the teeth of the narwhal in Europe, for export to Japan, while their commercial relations subsisted with that island.

Ivory is wrought with saws, files, and various edge-tools: the former must be narrow in the plate, and frequently moistened with water to make them operate freely. Some artists are prejudiced against oil, from conceiving that it yellowes the ivory; but if it is immediately to be reduced, oil can have no effect, as it does not penetrate the substance. It is affirmed, that the most delicate sawing should be performed under water; but this cannot be universal rule, as we have observed that the simple contact of that element makes it warp, or thin. Ivory is polished with pumice stone and tripoli. It takes a very high polish with chalk and water, or oil, applied with a piece of leather, and afterwards rubbed hard with the latter substance when dry. The finest ivory is susceptible of the highest polish; and the artist never should forget, that nothing conduces so much to the beauty of his work as the polish of the materials. There is so great a difference in the quality of ivory, however, that pieces may be seen which scarcely can be recognized for the same substance.

In the rough state, ivory is a very considerable article of commerce, both in Asia and Africa. Many African tribes deal in it to a great extent, particularly those dwelling on, what is called by Europeans, the Ivory Coast. It is not explained how the whole quantity required is supplied; but we know that elephants are hunted for the sake of their tusks exclusively; and, probably, the rest are found in the woods where they die, or are destroyed by their natural enemies. Ivory is scarcer at present than it was in the course of the preceding century, either from the interruption of the commercial relations of several European nations, with the Asiatic and African continents, or the greater devastation committed among the animals producing it. We have no data for computing the annual consumption, though it certainly is such as to excite our astonishment at the number of elephants that must perish, and the vast extent of country through which such herds must range in seeking subsistence. The largest importation into Britain, with which we are acquainted, was at the rate of 1576 cwt. annually, during the years from 1788 to 1799. This is much more than what was wont to be carried to France, where, in 1784, there were imported to Nantz and Bourdeaux, 1179 tusks, besides 8164 pounds of ivory. Probably the smaller teeth, under a certain weight, are not denominated tusks; whence the distinction arises between tusks and ivory. Supposing, that the ivory consisted of tusks, each weighing 40 pounds, there must have been 5940 tusks imported annually into Britain. Therefore, to supply Britain for a single year, at least 1970 elephants must have been destroyed. But that must be inferior to the real number; for it is not likely that the tusks weighed 40 pounds each. Last estimated the quantity imported into France, at 50,000 pounds yearly. Thus, if the quantity consumed in Europe be joined to that of the eastern nations, by all of which ivory is used for various purposes, it will appear quite incredible how the race of elephants is not exterminated. The value of ivory is much increased of late years. At present, 1818, the retail price of the finer parts is eight shillings a pound in Edinburgh.

The following Table shows the quantities of elephants tusks sold at the East India Company's sales, for five years, from 1804 to 1808, inclusive:

The importation of elephants' teeth into Great Britain, for twelve years, from 1788 to 1799, inclusive, was 16,914 cwt. or at the rate of 1576 cwt. annually.

(c) IVORY COAST. See Guinea, vol. x. p. 547.

JUPITER, (Zwö Nantz), the supreme deity, according to the mythology of the ancient Pagans, and the father and king of gods and men. He was the son of Saturn and Rhea, or Ops; and was born and educated upon mount Ida, in the island of Crete. The various fabulous accounts of his infancy are too extravagant and absurd to merit any notice. When he grew up, he is said to have deposed his father, Saturn, from the throne, and to have divided his kingdom with his brothers; to himself he reserved the air and the earth; Neptune obtained the sea, and Pluto the infernal regions. He was afterwards engaged in a war with the Giants, the sons of Titan, and the earth, whom he overthrew with his thunder, and confined them under the waters and mountains, whence they were unable to escape. He is said to have conferred such benefits upon mankind, that he became distinguished by the title of Jupiter, and obtained divine honours. He had four wives succes-
sively; the last of whom was the celebrated Juno. He was the father of the Muses and the Graces, of Mercury, Apollo, and the other gods; and had a prodigious number of children by his numerous mistresses.

Jupiter was anciently worshipped under a great variety of names; derived from his attributes, from circumstances connected with his history, from the situation of his temples, &c. At Athens, he was chiefly worshipped as Jupiter Olympius; at Rome, as Jupiter Capitolinus, from his temple on the Capitoline hill. He was also called Jupiter Stator, Tonans, Feretrix, &c. The Greeks also called him Ammon, or Hamman, which signifies Sandy. He first obtained this appellation in Libya, where he was worshipped under the form of a Ram.

In his chief temple on the Capitoline hill, Jupiter was represented as sitting on a curule chair, with the fulmen, or thunder, or rather lightning, in one hand, and a sceptre in the other. In the figures of the ancient artists, this fulmen was always adapted to the character under which they meant to represent the god. When they intended to represent him as calm and beneficent, they gave him the comic fulmen, which consisted of a bundle of flames wreathed close together, and held down in his hand. The Jupiter Tonans, or Terrible Jupiter, on the other hand, was represented as holding up the fulmen, with two transverse rays of lightning, sometimes with wings at each side of it; and when some exemplary punishment was to be inflicted, they put into his hand a quantity of flames, all let loose in their utmost fury. The statues of the Terrible Jupiter were generally made of black marble; those of the Mild Jupiter of white. In the former, he was represented as standing, in a disturbed attitude, and with an angry countenance. In the latter, as sitting, with an air of tranquillity, and a severe countenance. Jupiter, as the chief ruler of the air, and the dispenser of rain, was sometimes represented as Jupiter Pluvius, in which character he appears seated in the clouds, holding up his right hand, or extending his arms on each side, and pouring down rain or hail from his right hand upon the earth, while the fulmen is held down in his left.

The ancient artists bestowed great pains in expressing the superiority of Jupiter, by the air of majesty which they gave to his countenance, particular attention being paid to the hair, the eye-brows, and the beard. The most celebrated statue of Jupiter was that in his temple at Olympia, by Phidias, which is particularly described by Pausanias; and of which many of the ancient writers speak in terms of rapture. The artist is said to have conceived the idea of this statue from Homer, II. i. 528.

JURA is the name of one of the Hebrides, or Western Islands of Scotland, which lies to the north-east of the island of Islay. It is about 26 English miles long, and in some parts eight miles broad, but its average breadth is only about four and a half miles. Hence it contains about 117 square miles, or 58,500 Scotch, or 74,888 English acres.

The ridges of mountains occupy the middle of the island, extending along its whole length, and rising higher and higher to the south-west, till they terminate in four similar peaked mountains, called the Paps of Jura, two of which stand close to each other on the western part of the island, and are seen at a great distance. The highest of these peaks, called Beinn an oir, or the "golden mountain," rises 2340 feet above the level of the sea, according to Dr. Walker. According to Sir Joseph Banks, the second highest, or Beinn Shianta, the "enchanted mountain," is 2420 feet high, and it is 60 feet lower than the former. The other two, which are much lower, are called Beinn a chloaidhs, the "mountain near the land," and Corro-bheinn, or "the rugged mountain." Beinn-an-oir is composed of large stones, covered with mosses at its base, while the stones above are bare and unconnected, so as to give it the appearance of a great cairn. The prospect from the summit is grand and extensive, and has been fully described by Pennant and by Mr. Macdonald. The Isle of Man and the Isle of Skye are seen at the same time, though the distance is about 220 miles.

To the north of Jura, in the sound between it and Whirlpool Scarba, lies the famous whirlpool of Corrybheaccain, from Bheaccain, a son of the king of Denmark, who perished amid its waves. The strait is about a mile broad, and the whirlpool is on the Scarba side. When the flood has entered the sound, the sea appears in great commotion at the place of the whirlpool. It boils and foams, and rolls away in successive whirls. At the fourth hour of the flood, the commotion reaches its maximum, and throws up, with dreadful ebullitions, every thing from the bottom. The roar of the waves is often heard at the distance of six or seven miles. At this time, it is generally fatal to approach the gulf; but from the middle of the fifth hour to the sixth of the flood, and in deep tides from the fourth till the sixth, the commotion gradually subsides, and the smallest boat may pass in safety. After the return of the ebb, however, the same phenomena are repeated, increasing and diminishing at corresponding times, till the commotions again subside at the approach of the lowest ebb.

The west side of Jura is so wild and rugged, and so intersected by mountain torrents, that it is neither inhabited nor cultivated to any extent. The east coast is the principal residence of the inhabitants, who raise oats, barley, potatoes, and flax, on the land near the margin of the sea.

About the nineteenth part of the island, or 3000 acres, are under regular or occasional tillage; but the system of improvement which has been introduced into several of the other islands, has not yet found its way into Jura. The crops and the live stock admit of great improvement. Potatoes are cultivated with care, and form four-fifths of the nourishment of the inhabitants. About 80 or 90 tons of kelp are manufactured. Fern ashes were formerly exported; but this manufacture seems to have been abandoned. Many tons of the fine siliceous sand, was formerly exported for the manufacture of glass, from some of the bays on the west coast; but this material is now obtained from a less distance.

Mr. Macdonald considers enclosures as the great desideratum in Jura, implying a subdivision and regular appropriation of lands among the tenantry.

Among the mountains of Jura, are found several kinds of red deer, and grouse and black game are very plentiful. The number of cattle, when Mr. Pennant visited the island, was very great; but it has been much diminished, to make room for the numerous herds of sheep and goats which have since been introduced. Mr. Pennant informs us, that he had "some obscure account of a worm, which, though less pernicious, had considerable resemblance to the Furia infernalis of Linnaeus, the gallas, or little worm of Jura, which is
The island of Jura is composed of strata of mica slate, chlorite slate, numerous varieties of quartz-rock, and beds of hornblende-rock. The quartz-rock is that which forms the principal ingredient in the striking mountain named the Paps of Jura. Sometimes the quartz rock has a conglomerated character, or it appears passing into granite; and we find it exhibiting all those different kinds of veins which some theorists consider as confined to granite. A quartzose slate is used as a whetstone, and the island is said to contain some ore of iron and veins of grey manganese ore.

Jura contains several barrows and castellae; and near the Harbour of the small Isles is a considerable encampment, with a triple line of defence, and regular bastions towards the land. The population of Jura in 1811 was 1157. See Pennant's Tour to the Hebrides; Macdonald's Account of the Hebrides; and Jamieson's Mineralogy of the Scottish Isles.

JURA and COLONASY, is the name of the parish which includes these two islands, along with Oronsay, Scarba, Iula, Balnahaigh, and three small uninhabited islands on the north of Jura.

Colonsay is situated directly north of Islay, nearly at the same distance from it and from Jura. It is separated at high water from Oronsay by an arm of the sea, about a mile broad, and from 8 to 13 feet deep; but at low water they both form one island. The united length of Colonsay and Oronsay is about twelve miles, and their breadth varies from one to three miles. Their superficial extent is about 9000 Scotch acres, of which nearly 7000 is meadow or arable land.

The hills of Colonsay are scattered over the island, and none of them exceed 800 feet high. The island contains many fertile and pretty extensive valleys. The soil is in some places light and sandy, and these alternate with marshy or mossy ground, clay, gravel, loam, or till. The rocks dip from south-west to north-east. Black coal is found in detached plates, and in indurated clay. Rock stone formed of glimmer, of quartz, and an imperfect granite, also occurs.

Mr. Macneill, the present proprietor of Colonsay, deserves the highest praise for the agricultural improvements which he has introduced into the island. He has not only turned to the best account the land formerly in tillage, but he has reclaimed from a state of absolute waste, great extents of moors, hills, and peat moors, and converted them into good arable land. He has introduced the improved system of husbandry into the island; and his crops, and his live stock, have been reconned, by competent judges, among the best in the west of Scotland. Roads to a considerable extent have been made at his own expense; and he has built a quay at Port-na-feamuinn harbour, which was the only safe landing-place in the neighbourhood.

From 120 to 160 tons of kelp have been manufactured annually in the island; and as the tides rise here four or five feet higher than at Islay, on the opposite coast of Kintyre, the shores are more favourable for the production of kelp.

Flax is dressed and spun by the women and girls, and is wove into linen, so as to afford a profitable employment in winter to the inhabitants. The valued rent of Oronsay and Colonsay, is £77 10s. 8d. Fine forest trees, of considerable size, grow in the island.

The remains of several Romish chapels occur in the Antiquities of the island. The remains of the abbey of a monastery of Cistercian monks, were taken down some years ago in erecting a farm-house. The walls of the priory are still standing.

In 1811, Colonsay contained 138 houses and families, and 756 inhabitants. See Macdonald's Account of the Hebrides.

JURA, is also the name of one of the departments of France, which takes its name from the mountainous ridge of Jura, which it comprehends. It is bounded on the north by the department of the Higher Saone; on the west, by those of the Cote d'Or, the Saone and Loire, and the Ain; on the south by the Ain; and on the east, by Switzerland and the department of the Doubs. The principal rivers which traverse it, are the Loue, the Ain; the Bienne, which passes by Ste. Claude; and the Solvan, which passes by Lons-le-Saulnier. The climate of this department is cold, from the mountains being covered during a great part of the year with snow. The plains yield good crops of grain; but only barley, oats, and maize, are produced among the mountains. Iron is found in great abundance in the mountains. There are seven furnaces and 30 forges in the department. Wine is made in considerable quantities; and the wines of Arbois and Poligni, particularly the former, are much esteemed. The forests occupy 125,000 hectares, or 245,000 acres; of which the third belong to the nation, another third to individuals, and another third to the communes. The contributions in the year 1802, were 2,005,226 francs. The principal towns are,

The population of the department is 259,865. Lons-le-Saulnier is the capital. 

JURA, Jaques, or, in the Celtic, Jan-rag, which signifies the "government of God, or Jupiter," is a chain of mountains on the south-west of Switzerland, which stretches from Mont Vouche in Savoy, to the canton of Schaffhausen. Its direction is nearly south-west and north-east, almost parallel to that of the Alps. Its length is from 90 to 100 leagues, and its breadth, in a north-west direction, from 15 to 18 leagues.

The ridge of Jura rises to the height of 3000 or 4000 feet from the plain of Switzerland, with a declivity of often very steep, and presents at this elevation throughout the whole of its length an undulated line, above which there rise, in some places, rounded summits to the height of 600, 1000, or even 2000 feet above the rest of the chain. On the side of Franche Comté, the...
Jura is formed into several parallel ramifications, which diminish gradually in height, till they terminate in the plains of Burgundy. The following are the altitudes of the principal summits, as determined geometrically by Messrs. Piclet and Tralles:

The principal passes in the ridge of Jura, are that of Fort Ecluse, where the Rhone runs in a deep channel between the fort and the foot of Mont Vouachet; the passage of Esclées, at a little distance from Orbe, on the road of Pontarlier; that of the Cluse de Verrieres, in the principality of Neuchatel; that of the Pierre Pertuis, in the Valley of St. Imier; and the passes of the Valley of Moutier, of Ballstall, and of Wallenbourg.

As the Ridge of Jura lies below the line of perpetual snow, it contains no glaciers; but blocks of ice, and columns of snow, are found in some deep caverns; such as those near St. George's above Rolle, and between the valleys of Travers and Brevine. The pastures on that ridge are drier than those of the higher Alps; but in some places, particularly in the canton of Basle, the meadows are as beautiful and fertile as those of the central chain. Some of the ramifications of Jura, particularly those in the neighbourhood of St. Claude and Champagnol, produce a great quantity of box-wood, some of the plants of which rise to the height of 20 feet. The mountains, which extend for four or five leagues round Poligni, are covered with lofty pines, which afford to the ship-carpenters of Toulon the tallest masts for their vessels of war. The same forests furnish also the materials of numerous manufactures, which employ the inhabitants during the winter and form a considerable branch of trade. The iron foundries, the forges, and the salt pits of Salins, Arc, and Senans, obtain here the wood and the charcoal which they require.

The brown bear still inhabits the wildest parts of the western chain of Jura; and it is not many years ago since it made great ravages among the cattle, and even descended into the plains. Wild cats, the flesh of which is eaten by the inhabitants, are also found in the forests of Jura.

The ridge of Jura is composed of compact limestone, of a greyish or yellowish brown colour, but always less deep than that of the Alps. Sometimes it has a lively yellow colour. The strata alternate with beds of marl and of clay. There is also found gypsum, beds of alabaster, of the finest marble, sulphuretted springs, and salt springs. Those of Salins, Courbasion, Montmorot, near Lons-le-Saulnier, Grosos, Tormont, and St. Lys, are of considerable value, and all of which belong to France, are among the richest. A great number of beds of calcites are found in Jura.

The stratification of Jura is very singular. The inclination of the strata from south to north-west, their vertical position, the vaults which they form, and their junction in the form of the roofs of houses at the summit of the chain, are phenomena highly interesting to the mineralogist. The stretch of the strata is from S. S. W. to N. N. E.

Among the numerous petrifications found in the calcareous formation, are 40 species of the cornus amunicus, 20 other species of univalve marine shells, 8 species of oysters, as many species of bivalve marine shells, and 40 species of corals. The rarest petrifications are found on Mont Perouse, near Orgeler. Iron is found in such abundance in Jura, that it is capable of supplying all France. The iron mines in Franche Comté, and in the bishopric of Basle, have been worked with activity; but Switzerland has not taken advantage of her portion of this treasure. Strata of brown coal occur, which owe their origin to entire forests which have been burned by the dreadful earthquakes to which Jura has often been exposed.

The innumerable masses of granite and of gneiss, Blocks of granite.

which are scattered up and down on the eastern flank of this chain, even at the height of 2400 feet, form one of the most interesting facts in geology. One of these masses, which is found above Neuchatel, and which was measured by Professor Playfair in 1817, is 62 feet long, 92 feet wide, and nearly 17 feet high. As there is neither granite nor gneiss on this ridge, Saussure and Sir James Hall have supposed, that they have been carried away by some great flood, or deluge, across the lake of Geneva from the Savoy Alps; and it is a remarkable fact, that similar blocks are found in the lake of Geneva opposite to the mouths of the streams which descend from the Savoy hills. See Ebél's Manuel du Voyageur en Suisse, tom. iii.; Traité sur la Structure de la Terre, tom. ii. p. 90, 147. (For an account of the geology of Jura,) Zurich, 1808; Saussure's Voyage dans les Alpes; and Sir James Hall's paper in the Transactions of the Royal Society of Edinburgh, vol. vii. p. 142, 143, &c.

JURISPRUDENCE. See Law.

JURY, Juratores, or Jurati, (from jurare, to swear,) a certain number of men who are sworn to inquire into and try such matters of fact as may be referred to them, and to declare the truth upon such evidence as shall appear before them. They are sometimes called the inquest, from their being appointed to inquire into the truth of certain facts.

The trial by jury, both in civil and criminal causes, is of great antiquity in these kingdoms, and has always been justly considered as a most valuable institution for securing the life, liberty, and property of the subject.

Juries are of different kinds. 1. The Grand Jury is an institution peculiar to England. It generally consists of 24 gentlemen of the best figure in each county, chosen indifferently by the sheriff, who are sworn to the number of 12 at the least, and not more than 23, in order that 12 may be a majority. The sheriff of every county is bound to return a grand jury to every session of the peace, and to every commission of oyer and terminer, and of general gaol delivery. Their office is to inquire, present, do, and execute all things, which, on the part of our Lord the king, shall then and there be commanded them. Before they proceed to business, the grand jury are instructed in the articles of their inquiry, by a charge from the judge who presides upon the bench. They then withdraw to sit and receive indictments, which are preferred to them in the name of the king, but at the suit of any private prosecutor; and they are only to hear evidence on behalf of the prosecution. For the finding of an indictment is only in the nature of an inquiry or accusation, which
is afterwards to be tried and determined; and the grand jury are only to inquire upon their oaths, whether there be sufficient cause to call upon the party to answer it. After hearing the evidence, if the grand jury think the accusation groundless, they write on the back of the bill, "Not a true bill!" and then the party is discharged without farther answer. If they are satisfied of the truth of the accusation, they indorse upon it, "A true bill," and the indictment is then said to be found. But to find a bill, there must at least twelve of the jury agree. The indictment, when found, is publicly delivered into court.—2. The Petit Jury, so called to distinguish them from the grand jury, are persons who try the prisoner, and either find him guilty, or acquit him. The petit jury consists of 12, and their verdict must be unanimous.—3. The Common Jury are the jury returned by the sheriff, according to the directions of the statute 5 Geo. II. c. 25, which appoints, that the sheriff shall not return a separate panel for every separate cause, as formerly; but one and the same panel for every cause to be tried at the same assizes, containing not less than 40, nor more than 72, jurors. The names of these jurors being written on tickets, are put into a box or glass; and when each cause is called, the 12 persons, whose names shall be first drawn out of the box, shall be sworn upon the jury, unless absent, challenged, or excused.—4. A Special Jury is distinguished from a common jury. Special juries were originally introduced in trials at bar, when the causes were of too great nicety for the discussion of ordinary freeholders; or when the sheriff was suspected of partiality. He is, in such cases, upon motion in court, and a rule granted thereupon, to attend the prothonotary, or other proper officer, with his freeholder's book; and the officer is to take indifferently 48 of the principal freeholders, in the presence of the attorneys on both sides, who are each of them to strike off 12, and the remaining 24 are returned upon the panel.

In Scotland, in criminal trials, a number of jurymen, not exceeding 25, is cited. Of this number, fifteen are chosen by the judge to sit upon each trial, the prisoner being allowed to object to any of them upon good grounds. Clergymen and surgeons are exempted from the duty of jurymen, and butchers are excluded from the office.

Trial by jury, in civil causes, had gone very much into disuse in Scotland; but it has lately been revived by the institution of a particular court for trying issues in civil cases by jury.

JUSTICES OF THE PEACE are persons appointed by the king's special commission, under the great seal, to keep the peace within certain limits.

The nature and extent of the office, powers, and duties of a justice of the peace are determined by the commission, and by several statutes which have created objects of his jurisdiction. To attempt a detail of these various objects would lead us into a wide field of discussion. Our limits will only admit of our making a few general observations.

In England, every person who acts as a justice of the peace must have a certain qualification; but in Scotland, no such qualification appears to be requisite. The institution of justices of the peace in Scotland is of comparatively modern date. Its introduction was attended with considerable difficulty, and the office was for some time exercised under several restrictions. But these restrictions were removed by the articles of union, which placed the office on the same footing in Scotland as in the sister kingdom. But, in the Scotch commission, there is not a custos rotulorum as in England; and the distinction of the quorum has never been introduced in Scotland.

The jurisdiction of the justices extends to the preservation of the peace; to the cognizance of certain felonies and delinquencies; to the execution of various penal statutes, particularly regarding rural economy; to a numerous and important class of questions relating to the revenue; and to certain civil actions committed to them by the small-debt act.

A commission of the peace may be recalled at any time by the king; and it falls by the death of his majesty, although, from expediency, it is continued for six months longer, unless recalled by his successor. See Lamard's Eirenarchia; and Burns', Williams', Hutchison's, and Tait's works on the office of a justice of the peace.

JUSTIN (Justinus), a Roman historian of some eminence, who lived, as is generally thought, in the second century, during the reign of Antoninus Pius; but this is uncertain. He composed, in elegant Latin, an epitome of the history of Trogus Pompeius. This work is still extant, in 44 books, and is entitled, Historiarum Philippicarum et totius Mundi Origina et terrae Situs ex Trogorum Pompei excertatrum, Libri xlv. It comprehends the actions of almost all nations; from Nitus, the founder of the Assyrian empire, to the Emperor Augustus. It would appear that Trogus called his work the Philippic History, because it treated chiefly of the Macedonian empire, founded by Philip, and concerning Philip and his successors. The original work of Trogus, however, is unfortunately lost and the epitome of Justin is therefore the more valuable, because it is sometimes the only, sometimes the principal, authority for a number of interesting passages of ancient history.

Professor Heeren, of Gottingen, has written two memoirs on the subject of this history, in the first of which he explains the general plan of the great work of Trogus Pompeius, and, in the second, he reviews each of the 44 books, according to Justin's extracts, and investigates the sources from which the narrative appears to have been derived.

The best editions of Justin are, the Delphin edition, in 4to.; and Cun notiis variisrum et Gronovi, in 8vo.

JUTHIA, or Jutia. See Sylia.

JUTLAND, one of the most considerable provinces of Denmark, is situated between 55° 24' and 57° 40' of north latitude, and between 1° 20' and 10° 20' of east longitude from Greenwich. It is a large peninsula; surrounded on all sides by the sea, except on the south; where it is bounded by the dyke of Sleswick. It is 180 miles in length from north to south, and 75 from west to east at its medium breadth. The coasts, both on the east and west, are indented by numerous gulfs and inlets, which form safe and commodious harbours; and the gulf of Lymfiord particularly, which is navigable and full of islands, stretches across the province from the Cattegat to within three miles of the German Ocean. It is divided into four districts, namely,—1. Aalborg in the north of the province, of which the principal towns...
Jutland.

are Aalborg, a trading town on the south coast of Lymfold gulf; Schagen, at the northern extremity of the peninsula; Hioring, 30 miles north-west of the Cape Nyssinga, a little trading town on the island of Mors. - 2. Wiburg, containing a town of the same name, the capital of the province, an ancient inland town, with 2000 inhabitants; Mariager, a small place on a gulf of the same name; Skive, on the southern border of the gulf of Lymfords; and Hobroe, a pleasant trading town. - 3. Arhus, along the east coast, containing a trading town of the same name, with 4300 inhabitants; Randers, an old trading place on the river Guden, containing 4600; Eboltoft, Horses, and Scanderborg, small trading towns along the coast. - 4. Rypen, the most considerable district of the province, extending along the western coast between Sleswick and the gulf of Lymfold, containing Rypen, a tolerably well built town at the mouth of the Nilisar; Holdiing, an ancient royal residence; Fredericia, or the Little Bel, where we see the toll; Warde, Rinkoping, Holstbroe, Hierting, and Jelling, all of which are small places more like villages than towns.

The northern shores of Jutland present a long line of sandbanks, fatal to mariners. and covered with the remains of shipwrecked vessels; and the eastern coast is bordered with the most picturesque succession of rocks. The country in general is low, sandy, and naked; most fertile towards the south; and on the east side covered with extensive forests of oak, fir, birch, &c. There appear in every part of the peninsula numbers of earthen tumuli, frequently about 20 feet high, and 500 in circumference at the base, evidently constructed by art, and found indiscriminately in the most desert and in the best cultivated tracts. The inhabitants are unable to give any account of their origin; but they are considered as having most probably been erected in honour of deceased chieftains, and as indicating a high degree of population in ancient times. There are many small lakes and marshes, but few vesseis, in the province; and these few are, for the most part, only trifling rivulets, or wintry torrents. Almost the only river deserving the name is the Guden, which rises near Wiburg, becomes navigable at Randers, and falls into the Cattegat Sea. Several excellent springs are found in the peninsula; but, towards the north coast the water is brackish and unpalatable. There are no mountains, and the hills, which are composed of gravel or sand, are seldom above a few hundred feet in height.

On the west coast, from Rypen to Lemvig, there is a good deal of alluvial soil, which may be drained and recovered. On the east coast, the mould is rich and vegetable. Through the middle of the province runs a sterile sandy ridge, producing nothing but heath and coarse grass. Around the northern extremity, also, are extensive tracts of deep and barren sand, which are often scattered by the wind over the more cultivated districts. To prevent the progress of these desolations, the *arum*, *carnation*, or bent grass, (the roots of which have so powerful an effect in fixing the sand of the soil, while its leaves cover the surface from the wind,) is carefully sown in these sandy regions, and various kinds of other shrubs are planted for the same purpose, and heavy penalties enacted for their protection.

The state of agriculture in this province is extremely low; and there is a great want of vernacular publications on rural economy. Land is let, and the taxes on it levied according to the number of tons of herd corn; that is, the barrels of rye-seed, which may be sown according to the use and customs of the country. In many places, the old custom of all the farmers dwelling in a village, and cultivating the land by runrig still prevails; but the royal domain lands, which are of great extent in this province, are now subdivided into distinct farms, with proper steadings on each, an example which is generally and rapidly imitated among the landed proprietors. Several attempts have been made by government to introduce an improved husbandry; and, in 1720 particularly, about 20 French families were established in Fredericia, where they have increased to the number of 500 persons, and, by their skilful industry, have converted into a garden the environs of the town, which were formerly covered with heath and sand. Some Scotch farmers have recently settled around Aalborg, and several native proprietors have attempted, by engaging Scotch servants, to introduce the agricultural improvements of North Britain; but great obstacles are encountered in the obstinacy and prejudices of the people. That common practice consists in forcing from the land one crop of rye, barley, oats, or potatoes after another, as long as it has strength to yield two seeds for one; and then to let it lie for years to recruit its productive powers, as it may. A little lime (which abounds in Jutland) is occasionally used as manure; but the soil is in general too light and sandy to admit of this stimulating application; and composts of moss, lime, and dung, are beginning to be employed in its stead. There is an absolute want of enclosures, and draining is almost unknown. Green crops are not cultivated to any extent, excepting potatoes, which are annually gaining ground. Rye and oats are the principal crops; but barley, peas, and beans, are also raised in considerable quantities. It is estimated, that the ordinary produce of a Scotch acre, in a good season, would be sixteen bolls of potatoes, or six of barley, or five of oats, or from four to seven of rye. There are large plantations of tobacco, particularly among the French refugees at Fredericia. The implements of husbandry are extremely imperfect.

The carts have four wheels; but the bodies, which are long narrow boxes, do not contain above half as much as a one-horse English cart. They are drawn by two horses, which are driven at a trot, or hard gallop; and sometimes three or four of them are yoked abreast, and squeezed most awkwardly through the narrow roads. These animals are a hardy, firm, powerful breed, resembling the Suffolk punches, from 13 to 15 hands high, fit for every useful work, but better adapted for the draught than the saddle. Great care is taken by government, to prevent the intrusion of small or ill-shaped stallions into the country; and every encouragement is given to promote the improvement of the breed. Those reared in the north of the province, are more remarkable for strength than beauty; but, like all the Danish breed, they excel in boldness of chest and contour of buttoc. The cows of Jutland are almost all branded, resembling in many respects the Lancashire breed, and yield a great quantity of milk. Great numbers of hogs and cattle are raised on the extensive pastures of the province, and form a considerable article of exportation. The sheep of Jutland, next to those of Zealand, are the best in Denmark. The indigenous race are a small hardy breed, like the white-faced Scottish sheep; but, in consequence of the sandy soil, and scanty nourishment, both their flesh and wool are coarse. The Spanish breed has been introduced in several places; but they are found to degenerate in all respects. Both cows and sheep are fed, during winter, on chopped straw and meadow hay, mixed with a little barley; and,
during that season, the country is poorly supplied with butcher meat, which is then chiefly imported from Sleswick and Holstein. The butter is excellent and well tasted; but the cheese is described as of the worst kind. A few goats are found in the heathy grounds; but are prohibited in most other parts of Denmark Proper. On the east coast, the swine are very small, and easily fed; but, on the west, they are of a considerable size, and a good deal of lard is exported from the province. Wild fowl, particularly of the aquatic tribe, are common in the country; and pheasants are found in the forests, even of this northern region.

The fisheries of Jutland are remarkably productive, and furnish a principal source of employment to the inhabitants, particularly on the west coast, where the fisheries are singularly intrepid. The numerous gulfs, which penetrate the province, abound with fish; and their waters are so moderately salt, that several kinds of fresh water fish, especially carp, are taken on their banks. Lynmouth is peculiarly productive, and furnishes multitudes of herring and eels. The principal sorts taken on the coasts and inlets, are cod, flounders, bret, and salmon; great quantities of which are exported to the isles, and southern provinces of the kingdom, and the last mentioned fish generally in the state of kipper. Considerable beds of oysters are also found on the coasts, sufficiently rich to supply an exportation; and a little alkali is made from the sea-weed by the inhabitants of the maritime districts.

The country people of Jutland spin a considerable portion of their wool, and knit the yarn into stockings for exportation, to the annual value of 16,000 rix-dollars. They also manufacture for their own use a kind of coarse cloth, which, like the highlanders of Scotland and Wales, they delight to render as gaudy as possible, by weaving together various coloured stuffs, particularly blue, red, and yellow. There are several manufactories of woollen cloth in the province; and one at Aalborg has sometimes exported this article to the value of 60,000 rix-dollars per annum. In several villages, particularly around the town of Varde, a kind of black pottery is made of a fine bluish clay in their neighbourhood, and exported to a considerable amount, chiefly for Hamburg and Holland. At Gerumlund, a few miles from Aalborg, are large works for preparing potash, alum, white-lead, and soap. There are also manufactories for hats, gloves, and fire-arms at Aalborg; and at the same place, a gentleman, who had been in England, has recently established one for stockings, but is said to experience considerable difficulties, from the apathy and sluggishness of his workmen.

The numerous gulfs which penetrate the province, tend greatly to facilitate the inland trade; but the mouths of the different harbours are not only cleared of the mud and sand, which are apt to accumulate, especially when the ports are situated at the entrance of rivers. The staple commodity of Jutland is grain, chiefly rye and oats, with which 500 or 600 vessels clear out annually from Aalbourg alone, for the Danish isles and Norway.

Jutland contains above 400,000 inhabitants, on a surface of above 6,900 square miles. The natives of the province are not a handsome race; but the men, though generally in-kneed, and slender limbed, are tall, and tolerably good-looking. The women, who are remarkably fair-haired, are not so handsome in proportion as the men, but uncommonly good-humoured and obliging. The dress of the lower class among them is extremely unbecoming, and tends to detract from the beauty which they do possess. "They are not only wrapped up, but literally screwed or twisted in, from the hips to the nose, in innumerable volumes of cloth and linen; and, below the waist, they are of such a tremendous bulk, that, at a distance, they look like so many hogsheads;" (Mackintosh). The men dress much more suitably; but generally wear wooden shoes, of a great weight and clumsy shape, which give them a hobbling duck-like walk; which is said greatly to increase the difficulty of drilling them in the army, and which they are apt to retain even after being accustomed to shoes and boots. There is a general appearance of ease and comfort among the peasantry; and the price of labour is generally high, though the workmen are extremely sluggish, and do not perform two-thirds of what an English labourer would do with ease. In 1809, at Aalborg common labourers received two shillings a day, and tradesmen frequently five, or even six; but, it must be admitted, that a time of war may have contributed to produce this high rate of wages. The language spoken in the province is, of course, the Danish; but persons of rank and education, and, in general, all the middling classes in the larger towns, speak German, and a few understand English and French. See Playfair's Geography, vol. iii.; Mackintosh's Travels through Denmark, vol. i.; and Tableau des États Danois, par Cauteau. (q)

JUVENAL, DECIMUS JUNIUS JUVENALIS, the celebrated Roman satirist, was born at Aquinum, a town of the Volsciens, about the year 54 of the Christian era. Of his parentage, education, and the circumstances of his life, very little can be related with certainty. He was the contemporary of Martial, the epigrammatist, and is said to have been bred to the study of eloquence, which he seems to have cultivated rather with a view to his own amusement than from any intention to prepare himself either for the schools, or the courts of law. He appears to have been well advanced in life before he betook himself to poetry, and produced those satires, which have carried his name and reputation down to our times. The first sheets of his satire seem to have been directed against Paris, a young pantomime dancer, and the favourite of Domitian, who was then at the head of the government. His compositions were, at first, secretly handed about among his friends; but becoming bolder by degrees, he incurred the severe resentment of Paris, who prevailed upon the emperor to send the author into a sort of honorable banishment to Egypt. This account, however, is doubted. That Juvenal was in Egypt is certain; but whether he was sent thither as a punishment, or sent from motives of personal safety, or of mere curiosity, cannot be ascertained. The punishment, however, if he suffered any, had no other effect on him, than that of increasing his hatred of tyranny, and turning his indignation on the emperor himself, whose vices became, from that period, the object of his keenest reprobation.

In the year 95, when Juvenal was in the 54th year of his age, Domitian banished the philosophers from Rome; and to this period Mr. Gifford inclines to fix Juvenal's journey to Egypt. Nerva, who succeeded Domitian, recalled the exiles; and, from this time, there is little doubt that Juvenal was at Rome, where he continued his studies in tranquillity.

This is all that can be collected respecting the particulars of his life. He appears to have been easy in his
Juvenal. circumstances. His little patrimony, which he never diminished by extravagance, was sufficient for all his wants.

Juvenal lived in an extremely degenerate age; and he appears to write with all the energy of virtuous indignation at the vices which surrounded him. His satires are chiefly distinguished by a lofty severity, eloquent declamation, and vigorous and glowing language. He is accused of being too rhetorical, and of betraying a degree of slovenliness, or want of care, in some passages. Some have brought a more serious charge against him—that of indecency. Yet when we consider the monstrous vices against which his indignation is directed, we may cease to wonder at the strength of his expressions. His great aim appears to have been to alarm the vicious, and, if possible, to exterminate vice, by rendering depravity utterly loathsome.

The satires of Juvenal, sixteen in number, have been frequently translated into English. The two first versions were made by Barten Holyday, and Sir Robert Stapylton; the two latest and best by Mr. Gifford and Mr. Hodgeson; to which the reader is referred for further information on the subject of this article. (z)
KADIAK, Kodiak, or Kutchevak, is an island in the Northern Pacific Ocean, separated by Shelikof's Strait from the origin of the peninsula Alaska, near the entrance of Cook's Inlet, off the north-west coast of America. This is the largest of all the northern islands, stretching across the ocean between the Asiatic and American continents. It extends above 100 miles in length, from north-east to south-west, and is about 50 wide in the broadest part. Its figure is extremely irregular. In many places it is penetrated by spacious bays and deep inlets, which are guarded by long promontories; and towards the middle it seems almost divided into two islands. The interior is mountainous, or consisting of alternate hills and valleys interspersed with plains, and a portion of the coast is high and precipitous. Some of the latter, as well as the lower hills, consist of schistus, but the most lofty are chiefly granite, covered with very thin soil; and a large proportion of the island is barren.

Kadiak lies in an ungenial climate; and, in general, the snow remains on the ground until the end of April. Sometimes, however, the cold is not intense, and the winter is shorter, but either rain or snow prevails: Summer is also very wet and foggy. The island is subject to earthquakes, which are frequently violent. It is supposed, that the lofty mountains on the coast of North America shelter Kadiak from that extreme cold experienced in the same latitudes. Hence the animal and vegetable productions are more copious, and in greater variety, than in the Aleutian islands to the east.

Fine timber grows, though not abundantly, in forests on the north-east coast of the island, consisting of larch, fir, aspen, and other trees; but principally of different species of pine. Roots and berries are so plentiful, that both are collected in great quantities, for winter provision. Raspberries are very large and white. The same roots growing in Kamtschatka are found here, though the sarama, which is a considerable article of subsistence, is of inferior quality. Barley was first sown in 1804, and produces long straw but small ears. Pease and beans produce during summer, but do not ripen for winter. Potatoes thrive well.

Fish are numerous in the straits, the surrounding seas, and mouths of the rivers. Those most commonly caught for food, are herring, cod, and salmon; which are in such multitudes, that hundreds may be caught in a short time merely with the hands. Herring grows to the immense weight of 612 pounds avoidupois. Whales are extremely frequent in the vicinity. Phocæ are now diminished, from being the objects of uninterrupted pursuit; and the sea otter, which proved so profitable a capture for years, is almost extirpated. Bears often swim across the straits from Alaska, and are either shot or caught in traps. Probably some species are indigenous in the island; and their flesh, from the scarcity of cattle, is the only kind used in it. These animals are said to go into the river when full of fish, and dexterously catch them with their paws. But they eat only the head, and, in biting it off, throw the remainder ashore. The beaver, gluton, ermine, marmot, various species of foxes, the lynx, and rein-deer, are seen here. Black cattle have been introduced from the Russian settlements, and are yet anxiously preserved, to augment the stock for breeding. Sheep were brought hither in 1804. There are some goats, and numbers of hogs, which last are fed on fish. Land birds are not common in this country, but water fowl appear in vast multitudes. Insects are scarce: Bugs, however, have been brought from the vessels anchoring near the island; and innumerable cockroaches came from one of those employed in the Russian Voyage of Discovery in 1805 or 1806, which afterwards entirely vanished.

The inhabitants of Kadiak are generally designated inhabitants, Aleutians; a tribe which they intimately resemble in figure, physiognomy, and manners, and possibly belong to the same origin. They are of low stature, broad visage, with jet black eyes, eye-brows, and hair. Their language seems to bear very little analogy to that of the Aleutians, which might lead us to infer that they originated from the American continent; or the Aleutians may have separated from the common stock at a more remote period.

The natives clothe themselves in a large frock made of dress of fur, or the skin of sea-fowl; which latter is worn with the feathers outside during the day, and turned inwards at night. It is nearly of the same shape for both sexes. The lower part of their dress consists frequently of one piece, terminated by boots. Formerly the rich clothed and decorated themselves with the skins of sea and river otters; but tobacco, and other things, having now become necessary of life, they are obliged to acquire them in exchange for their furs. They are extremely fond of ornaments, especially beads, which they wear in great profusion, either on their clothes, or suspending them from their ears or the ends of a bone thrust through the septum of the nose. Amber is held in as high estimation as diamonds are in Europe. Some natives are punctured, but not regularly tattooed, like the inhabitants of the southern islands; and they often paint their faces in streaks, with red ochre and train oil. Several of the females have a hideous perforation of the under lip, as is seen among those of the Aleutian islands: It is, however, less common at present; and the fashion of tattooing different conspicuous parts of the body has also declined. All their native usages, indeed, are undergoing a rapid modification, from the settlers residing in Kadiak.

The dwellings of these people are partly sunk in the
ground, having a small door made of framed seal skin
fronting the east, a fire-place in the middle; and a hole
in the roof, which serves the double office of admitting
the light, and affording an exit to the smoke. The sides,
partitioned off for sitting and sleeping places, are cov-
ered with grass mats, more coarsely fabricated than
those of the islands to the west. A small apartment,
used as a vapour bath, is attached to each dwelling,
where any degree of temperature is obtained, by the
steam of water poured on heated stones.

The food of the natives resembles that of the Aleutian
islanders, and consists of fresh or dried fish, blubber,
whale and seal oil, the flesh of seals and bears; roots,
and berries preserved in oil. In time of scarcity, which
does not occasionally occur in winter, and is almost unavoidable
during spring, they live entirely on shell fish. Their
establishments are, therefore, formed near some large
hunting groves; and some will allow themselves to be baptised
three times, for the sake of getting a shirt.

Before their late subjugation, they were a very warlike
people, and alike averse to the invasion and to the professed
friendship of strangers. "If you mean to preserve
your lives," they replied to the conciliatory words of the
Russians, "retire instantly from our shores, and do not
again disturb our possessions." They advanced to battle,
sheltered by a portable breast-work, twelve feet broad
and eighteen inches thick, composed of interwoven osiers
and sea-weed. Besides this they had wooden shields,
which are now laid aside. Their arms are the bow and
arrow, darts, and lances. They poison their arrows
with a preparation from henbane, so as to inflict a mortal
wound. But at present, their weapons seem to be
directed more against wild animals, than against ene-
mies of their own species. They shoot salmon very
dexterously while leaping out of the water; and employ
darts and lances, painted with poisonous slate, for kill-
ing the whales. The different tribes were formerly enga-
ged in almost incessant war. Their prisoners suffer
treatment, especially from the women; and the female
part of them are all slaves, who are sold by one tribe to another for trinkets and utensils. Long after
Kadiak was discovered by Europeans, the natives were
exceedingly averse to have any dealings with them,
and such was the firmness with which this determination
was evinced, that three Russian vessels were su-
cessively obliged to withdraw.

The chief occupation of the men, is making boats and Occupa-
tions, weapons, which are used in hunting and fishing: while
the women are employed in sewing the skins together,
with which the boats are covered; in drawing tendons
from the legs of animals, for joining them; and in fab-
bricating slings and fishing-hooks. All the thread em-
ployed consists of sinews, and some of it is as fine as
silk. It is fashioned into the most beautiful twistd and
braid ed; and many specimens of sewing would do credit
to the most skilful Europeans. Collecting roots and
berries for winter store, is also the province of the fe-
males. The hunting excursions of the natives are for the benefit of the Russians, who reward them with cloth,
ammunition, beads, toys, run, tobacco, and snuff, for
which they have an immoderate propensity. They are
likewise taken on board American vessels touching
here, along with their boats and implements for fishing
and hunting, and are thus received to the coast of Califor-
nia, where seals and sea otters are to be caught. Cargoes
are generally completed in two seasons, when the Rus-

sian American Company receive a certain proportion of the
furs, as a compensation for the assistance of the na-
tives. Though the whole are educated in the art of
hunting and fishing, the capture of whales belongs al-
most exclusively to certain families, and is handed
down to those children who promise to be most expert
at it. Their boats, or small shallop, are for one, two,
three persons, the smallest being 14 feet 6 inches long

108
K AD I A K.

409

by 2 feet 4 inches wide, and the largest only 4 inches broader, and 26 feet 7 inches in length. The large baidarkas, which the Russians have appropriated, can carry 70 men.

Their sports and pastimes are analogous to those of the Oonalashkans, and the pursuits which they follow uncontrolled, are divided according to the different seasons of the year. Hunting and fishing continue until the end of October, when they return to their winter dwellings. November is spent in visiting, and in dancing with masks and painted faces. They dance with a knife in the right hand, and a rattle made of hoops, to which a number of the red beaks of the sea parrot are suspended, in the left, producing an effect like castagnets. Their music is the tambourine, and their songs are warlike. The men are so fond of gaming, that they often lose all their property. Compared with the Oonalashkans, the inhabitants of Kadiak betray a considerable inferiority in every thing. But they are scarcely to be viewed as the same people with those who dwelt here even in the preceding century: Their customs are abrogated, and their numbers are greatly reduced.

These islanders are particularly indolent and inactive; they sit on the beach, gazing for hours together at the sea: no conversation prevails among them; and so little spirit for improvement, that ages may elapse, without their taking advantage of the benefits held up before their eyes.

The population of this island is very small, compared with its size; and it is doubtful whether it ever was great. How could numbers find subsistence under a rigorous climate, where agriculture was utterly unknown, and the only supplies obtained arose from the uncertain produce of the chase or fishing? Yet there can be no question that the population has declined. In the year 1695, by an accurate calculation, it was found to amount to about 4000 souls.

The opinions of the natives concerning their origin, are extremely extravagant. They believe that one of their original parents was a dog, the other a female of rank, and that their ancestors were whales, which peopled the island.

It is affirmed by some authors, that the Russians were acquainted with Kadiak in the year 1750. It was visited in 1762, by Stephen Glotoff, in the course of his voyages to the more remote Aleutian islands; and, in 1783, Gregory Shelikoff formed a settlement upon it. At that time, and previously, the inhabitants were called Kanagist, or Konaghi, though now it is said they denominate themselves Soo-oit. According to Shelikoff's account, a body of not less than 4000 opposed his landing; and, having afterwards had an encounter with them, he took above 1000 prisoners. Later narratives affirm, that his opponents did not exceed 400, instead of 4000. With much difficulty he succeeded in appeasing the natives, and by moderate measures induced the inhabitants of this and the neighbouring islands, to the number of 50,000, to acknowledge the authority of his nation. But, notwithstanding his endeavours to varnish over the conduct of the Russians, they are represented as having forcibly reduced the natives to obedience; having usurped their possessions; and either he, or his successors, made themselves masters of all their property, even to their large boats, leaving them only small ones. He is accused of horrible atrocities, such as hanging a number of the miserable islanders in a line, to try how many of their bodies a rifle ball would pass through. It is undoubted that devastation has ever followed the footsteps of the Russians in the Pacific Ocean, and where they have established themselves, the natives are found in a state of abject slavery, daily diminishing in numbers.

Kadiak is the chief Russian settlement in the Northern Pacific, and the great depot of all the furs from the neighbouring islands, and the coast of America. On the north-east coast, there is a small town called Alexandria, with an excellent harbour, defended by a small fort. The houses are built of logs, and thatched with grass. Most of the windows are covered with the divided intestine of seals well oiled, and some with tule. There are a church, a school with about 50 native scholars, and a barracks for the Russian convicts, storehouses, and other buildings. When Shelikoff took possession of Kadiak, and subjugated the natives, he obtained a number of the daughters of the chiefs as hostages. About 200 were in the settlement in 1790; but the number seem to have decreased as the danger has lessened. Alexandria is the residence of Governor, who has the control of the colonies on the coast of America. Measures have been taken for the instruction of the rising generation in reading, writing, accounts, and mathematics; but the means of providing subsistence for the pupils has been omitted. While remaining at home with their parents, they followed a similar course of life; by withdrawing them from its scarcity has ensued. A late traveller sagely remarks, that being educate and taught accomplishments after the European fashion, in a few years there will not be a young Aleut remaining who will go barefooted winter and summer, defying the cold, in pursuit of whales, sea-dogs, sea-lions, and sea-otters. What will the Company then do with their learned Aleutans?

The settlements in the Northern Pacific are instituted for the benefit of a company of merchants in Petersburg. A number of fur-hunters, many of them said to be abandoned characters, are in their employment; and the proceeds of the subordinate officers,would soon bring the colony to ruin, were they not controlled. They have been accused of wantonly putting the natives to death in a barbarous manner. The stewards and overseers order as many of them as they choose for whatever services are required in hunting or fishing; and after tillage was introduced, they were compelled to draw the plough. The Russians, their wives, and children, are thence held in abhorrence; and, whenever an opportunity offers, they are massacred in retaliation of the injuries inflicted by them. The prosperity of the settlement, therefore, advances slowly, whereas the highest benefits would result from adopting a wise and liberal system. Lat. 57° N. (c)

KAEMPFER, ESCHELBERT, a learned German traveller and naturalist, was born at Lemgo, a town of the county of Lippe in Westphalia, on the 16th of September, 1661. He discovered an early attachment to the study of natural history, medicine, and various languages. After having completed his elementary education at different schools, he studied, during four years, at the university of Koningsberg in Prussia. His desire of travelling into foreign parts, induced him, in 1688, to embrace the opportunity of accompanying the Swedish embassy to Persia, in the capacity of secretary; and he remained in that country for some years after the embassy returned to Sweden. Although he had as yet obtained no medical degree, he accepted the situation of a physician in Georgia...
which, however, he soon afterwards relinquished, in order to visit other distant countries. With this view, he went on board the Dutch fleet, which was then cruising in the Persian Gulf, as a naval surgeon; and after visiting a number of the English and Dutch settlements, he came to Batavia in 1689. In the following year, he went, as physician to the embassy of the Dutch East India Company, to Japan, where he remained more than a year. In the beginning of 1692, he set out on his return to Europe; obtained the degree of Doctor of Physic at Leyden, in 1694; and then returned to his native country, where he was appointed physician to the Count Frederick Adolphus of Lippe.

During the course of his extensive travels, Kaempfer, actuated by an insatiable curiosity, had studied with great attention the natural, and political history, manners, and customs of the different countries which he visited; and brought home complete journals, drawings, and various curiosities. He now began to digest his materials, and to communicate his discoveries to the public, in a work entitled, Amamiolates exoticae politico-medici, Lemgo, 1712, in 4to. of which, however, only five fasciculi appeared, with plates. At his death, which took place in November 1716, he left behind him a great mass of manuscripts and drawings, and particularly an History and Description of Japan. These treasures were purchased by Sir Hans Sloane, who caused a translation to be executed of the work upon Japan, which appeared at London in 1727, in two volumes 4to. A copy of the German manuscript of this book was afterwards discovered at Lemgo, and published by Kaempfer's countryman, Dohm, in the years 1777 and 1779, in two volumes 4to, with many additions.

The extensive knowledge, acute observation, and love of truth, which are displayed in the works of Kaempfer, have acquired for their author a considerable portion of celebrity. These works consist of his History of Japan; the Amamiolates exoticae; an Herbarium Ultragaeticum; a dissertation de Mogiostatis divisione; and his Inaugural Theses, on taking his degree at Leyden.

KAESTNER, ABRAHAM GOTTHELF, an eminent German mathematician, was born at Leipzig, on the 27th of Sept. 1719. His instruction had been conducted privately, under the direction of his father, and some of his other relations, with so much success, that in his tenth year, he was enabled to attend his father's lectures; and, at the age of twelve, he became a regular student at the university. At that period, his attention was principally directed to the study of jurisprudence, although, by his own account, he had a great predilection for philosophy and the mathematics. His diligence was so great, and his progress so rapid, that, in his sixteenth year, he became qualified for the degree of Bachelor in Law; and, at eighteen, he took the degree of Master in the philosophical faculty. Soon after, he commenced his career as an academical teacher, and delivered private lectures for seven years; when he was appointed an extraordinary professor of the mathematics, in 1746. In 1756, he succeeded Segner, as ordinary professor of natural philosophy and the mathematics at Gottingen. He obtained the title of aulic counsellor in 1765, and continued in this situation during four and forty years, until the period of his death, on the 20th of June, 1800.

Kaestner's greatest merit consisted in a happy talent for exhibiting the principles of mathematical science in a luminous and intelligible form. His "Elements of Arithmetic," and other elementary treatises on different branches of the mathematics, are extremely valuable. Their merit was so conspicuous, that they gradually, almost entirely superseded the compendia of the celebrated Wolff, which had previously been universally adopted in the German universities; and contributed greatly to facilitate and diffuse the study of mathematical science. His separate treatises are distinguished by the same acuteness of thought, and perspicuity of arrangement. Among these we shall only mention his "Observations on Mining, with an introduction to the method of measuring heights by means of the barometer," which was published in 1775. Kaestner also translated several works from other languages into German; such as Hallot's "Art of Dyeing," Smith's "Optics," and Lulof's "Introduction to the Knowledge of the Globe. The Transactions of the Royal Swedish Academy of Sciences were partly translated by him, and partly by others under his inspection.

Kaestner, however, did not confine himself within the province of the mathematics, but frequently displayed his talents in other departments of literature. He particularly distinguished himself as an epigrammatist, and made himself both esteemed and dreaded by the sallies of his wit; in which he is thought to have sometimes been too fond of indulging himself.

His last great work, the "History of the Mathematicians," published at Gottingen, 1795-1800, in four volumes, although valuable as an index to the literature of the science, betrays evident marks of the age and declining talents of the author.

**KALEIDOSCOPE.**

Kaleidoscope *is the name of a new instrument, invented by Dr. Brewster, for the purpose of creating and exhibiting an infinite variety of beautiful and perfectly symmetrical forms, and is derived from the Greek words καλός, beautiful, οὖς, a form, and στεφανός, a crown, to see.

This instrument in its simplest form, consists of two reflecting surfaces, as shown in Fig. 1, placed between the eye and certain objects, by the combination of which the picture is to be created; but as the reflectors may have an infinite number of positions with respect to each other, as the eye may have an infinite number of positions with respect to the common section of the two planes, and as the object may also have an infinite number of positions with respect to the reflectors,
it is necessary to ascertain the effects which are produced under these various circumstances, and to discover if there are any determinate positions of the reflectors, the object, and the eye, which enable the reflectors to form and carry to the eye of the observer a picture mathematically symmetrical, and in which all the reflected images shall have as nearly as possible the same intensity of light.

Sect. I. On the Effects produced, by varying the relative Position of the two Reflectors.

Let AB, BO, Fig. 2, be a section of the two reflecting planes shown in Fig. 1, and let us consider the aperture AOB as a section placed before the mirror AO. By the principles of catoptrics, a similar image AO b will be formed behind AO; and for the same reason, a similar image BO a of the aperture will be formed behind the other mirror BO. But the reflected images AO b, BO a, may be considered as new objects placed before the reflectors BO and AO; and therefore similar and similarly situated images of these, viz. b'OA a', A OB, will be formed behind the mirrors. In like manner, these images being considered as new objects, other images of the aperture AOB will be formed at b'Oa', a'OB, and a'OOb', b'Oa', till a complete circle is formed by their combination. If the angle AOB is such as to make exactly 360°, when multiplied by any of the even numbers 2, 4, 6, 8, &c. then the circle MAN will be composed of an even number of sectors, each of which is exactly equal to OAB; but the last sector a'OOb' will consist of two halves a'OON, b'ON, the first of which is half of the image of a'OOb' formed by reflection from AO, while the other is half of the image of b'OOn', formed by reflection from BO; and, in this case, the last sector is bisected by the common section MN of the two reflecting planes. If, on the other hand, the angle AOB is such as to make exactly 360°, when multiplied by any odd number 3, 5, 7, 9, &c. each image of the aperture will be complete by itself, and the line MN will separate the series of images formed by AO from the series formed by BO.

When the angle AOB, after being multiplied by an even or odd number, is either greater or less than 360°, the last reflected images on both sides of MN will be incomplete, and the circular field will be composed of a certain number of complete images of AOB, and of two incomplete images. Hence AOB will always represent the number of sectors of which the circular field is composed. When the quotient is a whole number, the images will be exactly equal and complete; but if it consists of an integer and a fraction, the integer will represent the number of complete sectors, and half the remainder will represent in degrees the magnitude of the incomplete sectors. If AOB, for example, is 17°, then 360° = 21 17/20; that is, the circular field will be composed of 21 complete sectors, and 2 incomplete sectors, the angular magnitude of each of which is equal to one-half of 17°, or 8° 45'.

If, instead of supposing the angular aperture AOB to be the object, we place any object whatever between AO and BO, the images of it will be formed according to the principles which we have explained; and the picture created by the combination of these images, will be complete or incomplete according as the angle AOB is an integral or fractional part of the circle.

There is an exception, however, to the generality of this result, when the inclination of the reflectors is an odd aliquot part of a circle; that is, when AOB is an odd number. In order to explain this with sufficient perspicuity, let us take the case where the angle is 72°, or 1/5th part of the circle, as shown in Fig. 8. Let AO, BO, be the reflecting planes, and m n a line inclined to the radius which bisects the angle AOB, so that O m is = O n, then m'n', n'm, will be the images formed by the first reflection from AO and BO, and n'm', m'n the images formed by the second reflection; but by the principles of catoptrics, O m = O m'O' = O n', and O n'O' = O n, consequently since O m is by hypothesis greater than O n, we shall have O m' greater than O n', that is, the images m'n', n'm' will not coincide. As O m approaches to an equality with O m', O n' approaches to an equality with O n, and when O m = O n, we have O n' = O m', and at this limit the images are symmetrically arranged. In like manner it may be shewn, that when the rectilinear object m n bisects the angle AOB, the images of it will bisect all the other four sectors, and consequently are symmetrically disposed round the centre of the circle; and in general, when the object has such a form or such a position that its parts are similarly situated with respect to both the mirrors, a symmetrical picture may be produced, when the angle formed by the reflectors is an odd aliquot part of a circle; and therefore, since all irregular objects are composed of lines not similarly situated with respect to both the mirrors, we may conclude, That in order to form a perfectly symmetrical picture, from the combination of any objects with irregular outlines by successive reflections between two inclined reflectors, the inclination of the reflectors must be an even aliquot part of 360°.

Sect. II. On the Effects produced by varying the Position of the Eye.

If we consider the aperture ABO, Fig. 1, or any object lying in a plane passing through ABO, as the object which undergoes successive reflections, it is obvious that it may be viewed by placing the eye in any point of the quadrant comprehended between OC and OE. When the eye is placed at a small distance from C, it will be a little above the plane of the circular field formed by repeated images of AOB, and therefore this field must appear a very eccentric ellipse. As the eye advances from C towards E, the ellipse becomes less eccentric, the symmetry of the combined images increases, and when the eye comes to E, the ellipse becomes a perfect circle, and the eye being placed in a line perpendicular to its centre, observes all the images symmetrically arranged round the centre O. In the production of perfectly symmetrical forms, therefore, the position of the eye is necessarily limited to the point E, or rather to a point so situated, that the line A'O = AO (Fig. 1) may be just seen by the eye; that is, that the line joining the point A' and the eye may just pass within the point E.

This limitation is however necessary, for very different reasons. When the eye is placed near C, the rays are incident almost perpendicularly upon the mirrors; and it is well known, from the experiments of Bouguer, that the loss of light by reflection, is in this case extremely great both in the case of metals and polished glass.

From this cause, the intensity even of the first reflect-
ed image is greatly inferior to that of the sector \( \triangle AOB \)
seen by direct vision; but if the number of reflections is 16, 18, or 20, or even above 8 or 10, the last reflected image is scarcely if at all perceptible, even when a pretty strong light is thrown upon the aperture. If the picture consequently had been symmetrical and answerable to the eye in so far as the arrangement of its parts was concerned, it would have lost all its beauty from the extreme inequality in the light of the reflected images of which it is composed. When the reflectors are made of glass, or of glass covered on one side with black varnish, this difference is so very striking, that the circular field can scarcely be completed. By very powerful illumination, indeed, the last image may be rendered visible; but the difference of the intensities of the sectors remains the same, and therefore the imperfection of the picture cannot be corrected even by the application of the strongest lights.

As the eye advances from \( C \) to \( E \), the angles of incidence increase, the loss of light diminishes, and the difference in the intensity of the reflected images is the least possible when the eye arrives at \( E \). In the case of blackened glass, the last reflected images are sufficiently bright, when the number of sectors is 12 or 16. Hence it follows, that in order to obtain a perfectly symmetrical picture from the images formed by reflection, and to procure as much equally as possible in the light of the different images, the eye should be placed in the plane of both the reflectors, or as near as possible to the angular point at \( E \).

Sect. III. On the Effects produced by varying the Position of the Object.

If the object is placed within the reflectors at any point \( D \), between their object end \( O \) and their eye end \( E \), a perfectly symmetrical picture will obviously be formed from it; but the centre of this picture will not be at \( O \), the centre of the luminous sectors, but at the point \( D \), or its projection \( d \). Figs. 1 and 2, where the object is placed, so that we shall have a circular luminous field enclosing an eccentric circular pattern. Such a position of the object is therefore entirely unfit for the production of a symmetrical picture, unless the object should be placed so as wholly to exclude the view of the circular field, formed by the reflected images of the aperture \( \triangle AOB \).

As the point \( D \) approaches to \( O \), the centre of the symmetrical picture will approach to \( O \), and when \( D \) coincides with \( O \), the centre of the picture will be at \( A \), and all the images of the object placed in the plane \( \triangle AOB \) will be similarly disposed in all the sectors which compose the circular field of view. Hence we may conclude, that a perfectly symmetrical pattern cannot be exhibited in the circular field of view, when the object is placed between \( O \) and \( E \), or any where within the reflectors. If the eye could be placed exactly at the angular point \( E \) so that every point of the line \( EO \) should be projected upon \( O \), then the images would be symmetrically arranged round \( O \); but this is obviously impossible, for the object would, in such circumstances, cease to become visible when this coincidence took place. But independent of the eccentricity of the pattern, the position of the object within the mirrors prevents that motion of the objects without which a variation of the pattern cannot be produced. An object between the reflectors must always be exposed to view; and we cannot restrict our view to one-half, one-third, or one-fourth of it, as when we have it in our power to move the objects across the aperture, or the aperture over the objects.

Another evil arising from the placing of the objects within the mirrors is, that we are prevented from giving them the proper degree of illumination which is so essential to the distinctness of the last reflections. The portions of the mirrors, too, without the objects, or beyond \( D \) and \( O \), are wholly unnecessary, as they are not concerned in the formation of the picture. Hence it follows, that the effects of the Kaleidoscope cannot be produced by any combination of mirrors in which the objects are placed within them.

Let us now consider what will happen, by removing the object beyond the plane passing through \( \triangle AOB \). In this case the pattern will lose its symmetry from two causes. In the first place, it is manifest, that as the eye is necessarily raised a little above the point \( E \), and also above the planes \( AOE, BOE \), it must see through the aperture \( \triangle AOB \) a portion of the object situated below both of these planes. This part of the object will therefore, appear to project beyond the point, or below the plane where the direct and reflected images meet. If we suppose, therefore, that all the reflected images were symmetrical, the whole picture would lose its symmetry in consequence of the irregularity of the sector \( \triangle AOB \) seen by direct vision. But this supposition is not correct; for since the image \( m, n \)
Figs. 1, seen by direct vision only, with the first reflected images \( m', n' \), it is clear, that all the other images will likewise be coincident, and therefore that the figure formed by their combination must lose its symmetry, and consequently its beauty.

As the object must necessarily be placed above a line perpendicular to the plane \( \triangle ABO \) at the point \( O \), it will see a portion of the object situated below that perpendicular continued to the object. Thus, in Fig. 1, if the eye is placed at \( e \) above \( E \), and if \( MN \) is the object placed at the distance \( PO \), then the eye at \( e \) will observe the portion \( PO \) of the object situated below the axis \( POE \), and this portion, which may be called the aberration, will vary with the height \( eye \) of the eye, and with the distance \( OP \) of the object.

Let us now suppose \( E, e \), and \( OP \) to be constant, and that a polygonal figure is formed by some line placed at the point \( Q \) of the object \( MN \). Then if \( PQ \) is very great compared with \( PO \), the polygonal figure will be tolerably regular, though all its angles will exhibit an imperfect junction, and its lower half will be actually, though not very perceptibly, less than its upper half. But if \( Q \) approaches to \( P \), \( PO \) remaining the same, so that the figure bears a considerable ratio to \( PQ \), the polygonal figure will lose all symmetry, the upper sector being decidedly the largest, and the lowest sectors the smallest. When \( Q \) arrives near \( P \) the aberration becomes enormous, and the figure is so distorted, that it can no longer be recognised as a polygon.

The deviation from symmetry, therefore, arising from the removal of the object from the extremity of the reflectors, increases as the object approaches to the centre of the luminous sectors or the circular field, and this deviation becomes so perceptible, that an eye accustomed to observe and admire the symmetry of the combined objects, will instantly perceive it, even when the distance of the object or \( PO \) is less than the 20th part of an inch. When the object is very distant, the defect of symmetry is so enormous, that though the object is seen by direct vision, and in some of the sectors, it is entirely invisible in the rest.
The principle which we have now explained, is of primary importance in the construction of the Kaleidoscope, and it is only by a careful attention to it that the instrument can be constructed so as to give to an experienced and fastidious eye that high delight which it never fails to derive from the exhibition of forms perfectly symmetrical.

From these observations it follows, that a picture possessed of mathematical symmetry, cannot be produced unless the object is placed exactly at the extremity of the reflectors, and that even when this condition is complied with, the object itself must consist of lines all lying in the same plane, and in contact with the reflectors. Hence it is obvious, that objects whose thickness is perceptible cannot give mathematically symmetrical patterns, for one side of them must always be at a certain distance from O. The deviation in this case is, however, so small, that it can scarcely be perceived in objects of moderate thickness.

In the simple form of the kaleidoscope, the production of symmetrical patterns is limited to objects which can be placed close to the aperture AOB; but it will be seen in the sequel of this article, that this limitation may be removed by an optical contrivance, which extends indefinitely the use and application of the instrument.

Sect. IV. On the Effect produced by varying the Length of the Reflectors.

Before we proceed to investigate the effects produced by a variation in the length of the reflecting planes, it will be necessary to consider the variation of the intensity of the light in different parts of the reflected sectors. In the direct sector AOB, Fig. 2, the intensity of the light is uniform in every part of its surface; but this is far from being the case in the images formed by reflection. In Fig. 1, take any two points m, n, and draw the lines m n, o n, perpendicular to AB, and meeting O in a and p. Let O E, Fig. 4, be a section of the reflector AO seen edgewise, and let O p, O n, be taken equal to the lines m n, o n, or the height of the points a, p, above the plane of the reflector AO. Make O R to O E, O R is to O E, the constant height of the eye above the reflecting plane, and O r to O E as O n to E r, and the points R, r, will be the points of incidence of the rays issuing from p and n; for in this case O R is equal to the length of the line O E, and O r is equal to E r. Hence it is obvious, that if E r is less than E r, and that the rays issuing from p, by falling more obliquely upon the reflecting surface, will be more copiously reflected. It follows, therefore, that the intensity of the light in the reflected sector AOB is not uniform, the lines of equal brightness, or the isopolar lines as they may be called, being parallel to the reflecting surface AO, and in every sector parallel to the radius between the given sector and the reflecting surface by which the sector is formed. The intensity of the light in different points of the same sector, as well as in the different sectors, is affected by the polarisation which the light experiences by successive reflections; an effect which is produced, though in a different manner, when the reflectors are metallic. In plates of glass, the pencil in the last reflected image a""O b'"', Fig. 2, is polarised in a plane perpendicular to MN, or in the same manner as if it had been reflected at the polarising angle from a vertical plane parallel to MN.

Let us now consider what will take place by a variation in the length of the reflecting planes, the angular extent of the field of view remaining always the same. If AOE, AOE', Fig. 5, be two reflecting plates of the same breadth A O, but of different lengths, it is manifest that the light which forms the direct sector must be incident nearer the perpendicular, or reflected at less obliquity in the short plate than in the long one, and therefore that a similarly situated point in the circular field of the shorter instrument, would have less intensity of light than a similarly situated point in the larger instrument. But in this case, the field of view in the short instrument is proportionally enlarged, so that the comparison between the two is incorrect. When the long and the short instrument have equal apertures, which will be the case when the plates are AOE, AOE', then similarly situated points of the two fields will have exactly the same intensity of light.

There is, therefore, no peculiar advantage derived in theory, from increasing the length of the reflectors beyond the distances at which their extremities can be distinctly seen by the naked eye. In practice, however, the difficulty of constructing a perfect instrument increases with the length of the reflectors. The additional risks of breaking and bending, and the additional difficulty of forming a good junction, render it advisable to limit the greatest length of the planes to six, seven, or eight inches.

Sect. V. On the Construction and Use of the simple Kaleidoscope.

When two reflecting planes are placed in a tube, according to the principles explained in the preceding section, and the eye applied to one end of it, it will perceive at the other end a circular field composed of as many luminous sectors as the number of times that the inclination of the plates is contained in 360°.

If we now fix upon the edges AO, BO, Fig. 1, some pieces of differently coloured glass, so as to project within the aperture AOB, the portions of the glass included in the aperture will be included in all the images of the apertures; the images of these portions in the inverted sectors, will join those in the direct sectors, and the whole will be arranged into a fixed symmetrical pattern, far surpassing what can be produced by the hands of the most skilful artist. If we now turn the tube to different parts of the room, the light will fall in different directions upon the fragments of coloured glass, and a variation of the patterns will thus be produced to a very considerable degree from fixed objects. This was the first state in which Dr. Brewster constructed the kaleidoscope; and it was not for some time afterwards that the idea of varying the pattern by the motion of the objects occurred to him.

In executing the kaleidoscope in this new form, Dr. Brewster first placed the coloured glass, or other objects, between two plates of the thinnest glass, and holding this object plate in the hand, it was moved in various directions across the angular aperture of the instrument. The instrument was still further improved, by sliding the object plate in a groove, as in the magic lantern, by placing the objects in a cell at the end of the reflectors; or by giving the object plate a circular form, so as to have a rotatory motion round the axis of the tube. By these means, the power of the kaleidoscope, and the beauty of the pattern, were inconceivably increased; and from being a mere toy, it now promised to be an useful and amusing instrument.

The kaleidoscope in this simple form, is shown in
In using the simple instrument, which we have just described, the observer is often disappointed at not being able to produce a perfectly symmetrical pattern from opaque objects, from objects which are necessarily at a distance from the instrument, or from those which have such a magnitude that they cannot be introduced at the aperture AOB. The power of the instrument, indeed, in its simple form, is limited to transparent objects, or to the outlines of opaque objects held close to the aperture. A method of removing this limitation, and of extending indefinitely the use and the application of the instrument, soon suggested itself. It occurred to Dr. Brewster, that if MN, Fig. 7, were a distant object, either opaque or transparent, it might be introduced into the picture by placing a lens LL at such a distance before the aperture AOB, that its image might be distinctly formed upon the plane passing through AOB. By submitting this idea to experiment, he found it to answer his most sanguine expectations. The image formed by the lens at AOB became a new object, as it were, and was multiplied and arranged by successive reflections in the very same manner as if the object MN had been reduced in the ratio of ML to LA, and placed close to the aperture.

The compound kaleidoscope is therefore fitted up as shown in Fig. 7, with two tubes AB, CD. The inner tube AB contains the reflectors as in Fig. 6, and at the extremity C of the outer tube CA is placed a lens which may be taken off or put on at pleasure. The focal length of this lens should always be much less than the length of the outer tube CA, and should in general be such that it is capable of forming an image at the end of the reflectors, when AB is pulled out as much as possible, and when the object is within three or four inches of the lens. When it is required to introduce into the picture very large objects placed near the lens, another lens of less focal length should be used, and when the objects are distant, and not very large, a lens whose principal focal length is nearly equal to the greatest distance of the lens from the reflectors should be used.

When this compound kaleidoscope is used as a simple instrument for viewing objects held close to the aperture, the tube AB is pushed in as far as it will go, the cell with the object plate is slipped upon the end C of the outer tube, and the instrument is used in the same way as the simple kaleidoscope.

In applying the compound kaleidoscope to distant objects, the cell is removed, and the lens LL substituted in its place. The instrument is then directed to the objects, and the tube AB drawn out till the pattern appears perfectly symmetrical.

When the object is about four inches from the lens, the tube requires to be pulled out as far as possible, and for greater distances it must be pushed in. The points suited to different distances can easily be determined by experiment, and marked on the inner tube, if it should be found convenient. In most of the instruments there is, near the middle of the tube O M, a mark which is nearly suited to all distances beyond three feet. The object plates A, B, C, &c. held in the hand at a distance greater than five or six inches, may be also used when the lens L is in the tube. The furniture of a room, books and papers lying on a table, pictures on the wall, a blazing fire, the moving foliage...
of trees and shrubs, bunches of flowers, horses and cattle in a park, carriages in motion, the currents of a river, moving insects, and, in short, every object in nature may be introduced by the aid of the lens into the figures created by the instrument.

In order to mark with accuracy the points on the tube AB, suited to different distances, the instrument should be directed to a straight line inclined like AB, Fig. 8, to the line bisecting the angular aperture AOB, and brought near to the centre O of the field. The perfect junction of the reflected images of the line at the points m, n, &c. so as to form a star, or a polygon with salient and re-entering angles, will indicate, with great nicety, that the tube has been pulled out the proper length for the given distance. In this way a scale for different distances, and scales for different lenses may be marked on the tube.

When the length of the reflecting plates is less than the distance at which the eye sees objects with distinctness and without exertion, which may often be the case, it is of great advantage to have a convex lens placed at the eye end B of the reflectors. This lens should in general have a focal length greater than the length of the reflector, though the pattern will be seen with extreme distinctness when these two lengths are the same.

The compound kaledoscope, in the form now described, will be found nearly sufficient for all the purposes of amusement; but for the take of those who may wish to have a greater variety of object-plates, it is fitted up in a very elegant manner, with plated work, in a box which contains the instrument, the case, the lens, twelve object plates, and a mirror box for the purpose of holding fragments of coloured glass, or other objects.

Although a skilful artist will have no difficulty in sketching a pattern from the preceding instrument when held in his hand, yet it is obviously of great advantage to place the instrument on a stand, as shown in Fig. 7, where the quasivertex motion is obtained by a ball and socket, and where the instrument is capable of being raised or depressed by two drawing tubes which rise out of the outer tube MN. With this instrument, the patterns created either from near or distant objects can be rendered steady, so that the observer can either copy them with the utmost care, or apply to the end of the instrument the camera lucida, invented by Dr. Wollaston. Some of these instruments with stands are accompanied with a spare tube for giving a different pattern by means of reflectors placed at a different angle.

The kaledoscope, in the different forms in which it has been described, is fitted up in such a manner that it may be taken to pieces and freed from the dust which is apt to collect upon the reflectors. In order to do this, unscrew the brass end N of the outer tube MN, and the tube OM being pushed in, its object end will be exposed to view. When the ring of leather which keeps the reflectors together is slipped off, they may be taken out, and carefully wiped with a piece of clean wash leather. When this is done, their extremities must be placed in the cell from which they were removed, and fixed there, either by the cork wedges, or the other means which are adopted for this purpose, the greatest care being taken to put the same edges in contact. The leather ring being being slipped upon the reflectors, they must then be placed in the tube OM as before. A little practice will render this operation extremely easy to any person of ordinary ingenuity. The greatest care, however, must always be taken to make a fine point, or to keep the edges of the reflectors close together at that part which forms the centre of the field of view, and to have no pressure upon the reflectors, which is capable of bending them; for when this is the case, the beauty and symmetry of the pattern is greatly injured.

Different ways of fixing the reflectors so as to be easily separated and replaced at the proper angle, have been adopted in different instruments. One of the most convenient is to suppose the reflector in a groove cut out of a solid cylinder of wood of nearly the same diameter as the interior diameter of the tube AB. This grooved cylinder goes tightly into the small tube which carries the angular aperture and plane glass at A; and after a slip of wood, or any other substance, is placed along the open edges of the plates, to keep them at the proper angle given by the groove, the whole is slipped into the tube AB, where it remains firm and secure from all accident.

**Sect. VII. On the Construction and Use of the Poly-angular Kaledoscope, in which the Reflecting Planes can be fixed at any Angle.**

In all the preceding instruments, the reflecting planes are fixed at an invariant angle, which is some even aliquot part of 360°; and therefore, though the forms or patterns which they create are literally infinite in number, yet they have all the same character, in so far as they are composed of as many pairs of direct and inverted images as half of the number of times that the inclination of the reflectors is contained in 360°.

It is therefore of the greatest importance, in the application of the kaledoscope to the arts, to have it constructed in such a manner, that patterns composed of any number of pairs of direct and inverted images may be created and drawn. With this view, the instrument may be fitted up in various ways, with paper, cloth, and metallic joints, by means of which the angle can be varied and fixed; but one of the most convenient methods is shown in Fig. 8, which represents the instrument as made by Mr. Bate, optician, London.

This instrument is composed of two cones M, N, connected together by a middle piece or ring below R, into which they are both screwed. These lines enclose two highly polished metallic reflectors AO, BO, one of which BO is fixed to the same ring below R, to which the two cones are screwed, and is so adjusted by screws that its reflecting surface passes through the axis of the cones and rings. The other reflector AO is fixed to the outer ring R by an arm passing through an annular space or arch of a little more than 90° cut in the circumference of the inner ring, and while its reflecting surface is adjusted so as to pass through the axis of the cones and rings, its outer edge OMNE is finely ground to a perfectly straight line, free of all roughness; and this edge is so adjusted by screws that it coincides with the axis of the cones and rings. The lower edge of the reflector AO comes a little below the same axis, so that the edge OE of the reflector AO just touches a line in the reflector AO, which coincides with the axis of the cones and rings, and forms a junction in every part of the two meeting edges.

If we now fix the outer ring R into the ring of a stand ST, so as to be held fast, and turn the cone MN with the hand, we shall give motion to the reflector BO, so as to place it at any angle we please, from 0° to 90°; and during its motion through this arch, the junction of the two reflectors must remain perfect, if the touching lines are adjusted, as we have described them, to
the axis of motion, which must also be the axis of the cones and rings. If, on the contrary, we take away the stand, and, holding the instrument in the hand by either of the cones M, N, turn the ring R with the other, we shall give motion to its reflector AO, and produce a variation in the angle in the same manner as before.

In order to enable the observer to set the reflectors at once to an even aliquot part of a circle, or so as to give pairs of direct and inverted images, the most convenient of the even aliquot parts of the circle are engraved upon the ring R; so that we have only to set the index I to any of these parts, to No. 20 for example, and the reflectors will then be set at an angle of 18°, and will form a circular field with twenty luminous sectors, or a star with ten points, and consequently a pattern composed of ten pair of direct and inverted images.

As the length of the plates is only about 5 inches, it is necessary for some eyes to have a convex lens placed at E. A brass ring containing a plane glass screws into one of the rings CD, and there is an object plate accompanying the instrument, and containing fragments of differently coloured glass. This object plate consists of two plates of glass, one ground and the other transparent, set in brass rims. The transparent one goes nearest the reflectors, and the brass rim which contains it screws into the other, so as to contain between them the coloured fragments. A loose ring surrounds this object plate; and when this ring is screwed into the circular rim CD, the object plate can be turned round so as to produce a variety of patterns, without any risk of its being detached from the outer cone.

Some of the preceding instruments have been fitted up also with plates of glass ground perfectly flat and highly polished, which reflect a great deal of light, and are less liable to be injured by the operation of removing the dust, or by other causes. Flint glass, from its high reflective power, is preferable to any other. The polyangular kaleidoscope, as made by Mr. Bate, with glass plates, is constructed on different principles from the one now described. The reflectors are placed in a cylindrical tube, and the motion of the movable reflector is produced by a contrivance extremely simple and ingenious. A full account of this instrument will be found in Dr Brewster's Treatise on the Kaleidoscope.

The kaleidoscope appears in its most perfect form when the preceding instrument is constructed with an outer tube containing one or more lenses, for the purpose of creating patterns from distant objects. One of the lenses intended for objects at a greater distance than 10 or 12 feet, should have its focal length nearly equal to the greatest distance between the lens and the end of the reflector, in order that these objects, if small, may be introduced into the aperture as large as possible. The other lens, intended for objects at a less distance than 10 or 12 feet, or for distant objects of a very great size, should have a focal length a little greater than one half the focal length of the other lens. By combining these lenses, the effect of a more convex lens will be obtained, which may often be useful, when we wish to see objects held very near the instrument.

Sect. VIII. On the application of the Kaleidoscope for Projecting the Pictures which it creates upon a wall.

The pictures created by the Kaleidoscope are visible only to one person at a time; but it is by no means difficult to fit it up for the express purpose of exhibiting it at the same time to a number of spectators. The necessary limitation of the aperture at the eye end of the instrument, is however very hostile to this species of exhibition, and renders it necessary that the objects should be as transparent as possible, and very strongly illuminated.

The apparatus requisite for this purpose is shewn in Fig. 9, where FG is the kaleidoscope, having its reflectors inclined at an angle of 22°, 27°, 30°, 35°, 45°, 50°, or 90°; for if the angle is made smaller, the last reflections will not be easily seen. The objects out of which the picture is created are placed in the object plate DE, and are illuminated by means of a lens AD, which concentrates upon them the direct light from the lamp or candle C, and also the light reflected from the concave mirror M. At the eye end of the kaleidoscope is placed a lens L, close to the end of the reflectors. This lens should have a focal length about an inch less than the length FG of the reflectors, in order that the image of the pattern created at F, may be thrown upon the wall W, at a convenient distance from L.

When the instrument is thus fitted up, an enlarged image of the pattern will be seen upon the wall W, and this image will undergo every possible transformation, and exhibit to the spectator every variety of tint and form by the motion of the object, either through a groove or round the axis of the instrument. The same effect may be produced by the light of the sun; but in this case the mirror MN is unnecessary.

One of the polyangular kaleidoscopes, as made by Mr. Bate, has been fitted up in this manner, for exhibition at the lectures on natural philosophy delivered at Guy's Hospital, by that eminent chemist, William Allen, Esq. F.R.S. The light is derived from an oxygen lamp, which produces the most intense illumination.

Sect. IX. On Annular and Rectilineal Kaleidoscopes.

As it is often of considerable importance in the ornamental arts to have patterns for circular and rectilineal borders, the kaleidoscope may be fitted up to accomplish these objects. If the two reflectors AC, BD are placed in the manner shewn in Fig. 10, so that AO is the centre to which they converge, any objects placed at the end of the reflectors will give an annular pattern, forming part of a circle whose radius is AO. As the point of convergence O recedes from CD, the circle of which it is a portion increases in magnitude; and when O is infinitely distant, the reflectors have a parallel position, as shewn in Fig. 11, when the pattern which they form becomes exactly rectilinear. A portion of the pattern is seen of sufficient length to enable the artist to form the most correct opinion of its effect. A very ingenious instrument has been constructed for this purpose by Messrs. P. and G. Dollond, of which a complete drawing and description will be found in Dr. Brewster's Treatise on the Kaleidoscope. Two metallic mirrors are placed at an angle of 50°, so as to form a kaleidoscope for giving circular patterns in the usual way; and, by a particular contrivance, these same mirrors may be thrown into the positions shewn in Figs. 10, 11, so as to give rectilinear patterns, and annular patterns of any radius.

Sect. X. On Polycentrical Kaleidoscopes.

Hitherto we have considered the effects produced by the use of two reflecting planes; but it must be obvi-
ous from the principles already explained, that very singular effects will be obtained from the combination of three or more reflectors.

Kaleidoscopes may be constructed, by combining four equal reflectors in the form of a hollow square, or five reflectors in the form of a hollow rectangle; but though they exhibit regular figures from the angles being even aliquot parts of 360°, yet they are by no means interesting. All polygons of a greater number of sides are incapable of giving regular forms, as their angles must exceed any even aliquot part of a circle. It is, therefore, only from a combination of three reflectors that we can expect any pleasing and useful effect.

Since the angles at which the three mirrors are placed must be all even aliquot parts of 360°, such as 90°, 60°, 45°, 30°, 30°, 25°, 22°, 20°, &c. the quotients of 360°, divided by 4, 6, 8, 10, 12, 14, 16, 18, &c. we must select any three of these even aliquot parts which make up 180°, as this must be the sum of the angles at which the reflectors are placed.

Now it is obvious that this condition will be complied with, when the angles are

90° + 45° + 45° = 180°
90° + 60° + 30° = 180°
60° + 60° + 60° = 180°

The polycentral kaleidoscopes are therefore limited to five different forms, viz.

1. Four mirrors forming a square.
2. Four mirrors forming a rectangle.
3. Three mirrors at angles of 90°, 45°, and 45°.
4. Three mirrors at angles of 90°, 60°, and 30°.
5. Three mirrors at angles of 60°, 60°, and 60°.

**Sect. XI. History of the Kaleidoscope.**

As this instrument has excited great attention, both in this country and on the continent, we have no doubt that our readers will take some interest in the history of the invention. In the year 1814, when Dr. Brewster was engaged in experiments on the polarisation of light by successive refractions between plates of glass, which were published in the *Philosophical Transactions for 1815*, and honoured by the Royal Society of London with the Copley Medal, the reflectors were in some cases inclined to each other, and he had occasion to remark the circular arrangement of the images of a candle round a centre, or the multiplication of the sectors formed by the extremities of the glass plates. In repeating, at a subsequent period, the experiments of M. Biot on the action of fluids upon light, Dr. Brewster placed the fluids in a trough formed by two plates of glass cemented together at an angle. The eye being necessarily placed at one end, some of the cement which had been pressed through between the plates appeared to be arranged into a regular figure. The symmetry of this figure being very remarkable, Dr. Brewster set himself to investigate the cause of the phenomenon, and in doing this he discovered the leading principles of the kaleidoscope. He found that, in order to produce perfectly beautiful and symmetrical forms, three conditions were necessary.

1. That the reflectors should be placed at an angle, which was an even or an odd aliquot part of a circle, when the object was regular, and similarly situated with respect to both the mirrors; or the even aliquot part of a circle when the object was irregular.
2. That out of an infinite number of positions for the object both within and without the reflectors, there was only one position where perfect symmetry could be obtained, namely, by placing the object in contact with the ends of the reflectors.
3. That out of an infinite number of positions for the eye, there was only one where the symmetry was perfect, namely, as near as possible to the angular point, so that the circular field could be distinctly seen; and that this point was the only one out of an infinite number at which the uniformity of the light of the circular field was a maximum.

Upon these principles, Dr. Brewster constructed an instrument, in which he fixed permanently across the ends of reflectors, pieces of coloured glass, and other irregular objects, and he shewed the instrument in this state to some members of the Royal Society of Edinburgh, who were much struck with the beauty of its effects. In this case, however, the forms were nearly permanent, and a slight variation was produced by varying the position of the instrument, with respect to the light. The great step, however, towards the completion of the instrument remained yet to be made, and it was not till some time afterwards that the idea occurred to Dr. Brewster of giving motion to objects, such as pieces of coloured glass, &c. which were either fixed or placed loosely in a cell at the end of the instrument. When this idea was carried into execution, the kaleidoscope in its simple form, was completed.

In this state, however, the kaleidoscope could not be considered as a general philosophical instrument of universal application; for it was incapable of producing beautiful forms unless the object was nearly in perfect contact with the end of the reflectors.

The next, and by far the most important step of the invention, was therefore to remove this limitation by employing a draw tube and lens, by means of which beautiful forms could be created from objects of all sizes, and at all distances from the observer. In this way the power of the kaleidoscope was indefinitely extended, and every object in nature could be introduced into the picture, in the same manner as if these objects had been reduced in size, and actually placed at the end of the reflectors.

When the instrument was brought to this state of perfection, Dr. Brewster was urged by his friends to secure the exclusive property of it by a patent, and he accordingly took out a patent for 'a new optical instrument for creating and exhibiting beautiful forms.' In the specification of his patent, he describes the kaleidoscope in two different forms. The first consists of two reflecting planes, put together according to the principles already described, and placed in a tube, with an eye-hole in the particular position which gives symmetry and a maximum uniformity of light, and with objects such as coloured glass, placed in the position of symmetry, and put in motion, either by a rotatory movement, or by their own gravity, or by both combined. The second form of the instrument, described in the specification, is, when the tube containing the reflectors is placed in a second tube, at the end of which is a convex lens which introduces into the picture objects of all magnitudes, and at every distance, as has been already described.

After the patent was signed, and the instruments in a state of forwardness, the gentleman who was employed to manufacture them under the patent, carried a kaleidoscope to shew to the principal London opticians, for the purpose of taking orders from them. These gentlemen naturally made one for their own use, and for the amusement of their friends; and the character
KALEIDOSCOPE.

The next supposed anticipation of the Kaleidoscope was an instrument proposed by Mr. Bradley in 1717. This instrument consists of two large pieces of silvered looking-glass, five inches wide, and four inches high, jointed together with hinges, and opening like a book. These plates being set upon a geometrical drawing, and the eye being placed in front of the mirrors, the lines of the drawing were seen multiplied by repeated reflections. This instrument was described long before by Kircher, and did not receive a single improvement from the hands of Bradley. It has been often made by the opticians, and was principally used for multiplying the human face, when placed between the mirrors; but no person ever thought of applying it to any purpose of utility, or of using it as an instrument of rational amusement, by the creation of beautiful forms. From the very construction of the instrument, indeed, it is quite incapable of producing any of the singular effects exhibited by the kaleidoscope. It gives, indeed, a series of reflected images arranged round a centre; but so does a pair of looking-glasses placed angularly in an apartment, and so do the pieces of mirror glass with which jewellers multiply the wares exhibited at their windows. It might therefore be as gravely maintained that any of these combinations of mirrors was a kaleidoscope, as that Bradley’s pair of plates was an anticipation of that instrument. As the similarity between the two has been maintained by ignorant and interested individuals, we shall be at some pains to explain to the reader the differences between these two instruments; and we shall do this, first, upon the supposition that the two instruments are applied to geometric lines upon paper.

1. In Bradley’s instrument, the length is less than the breadth of the plates.

2. Bradley’s instrument cannot be used with a tube.

3. In Bradley’s instrument, from the erroneous position of the eye, there is a great inequality of light in the sectors, and the last sectors are scarcely visible.

4. In Bradley’s instrument, the figure consists of elliptical, and consequently unequal sectors.

5. In Bradley’s instrument, the unequal sectors do not unite, but are all separated from one another by a space equal to the thickness of the mirror glass.

6. In Bradley’s instrument, the secondary reflections are entirely removed, and therefore no confusion takes place.

7. In Bradley’s instrument, the defects in the junction of the plates are all rendered visible by the erroneous position of the eye.

The reader will observe, that in this comparison the two instruments are supposed to be applied to geometric lines upon paper, and that this was the only purpose to
which Bradley ever thought of applying his mirrors; yet the kaleidoscope is in every respect a superior instrument, even for that inferior purpose, and gives true symmetrical forms, which the other instrument is incapable of doing.

In the comparison which has now been made, we have degraded the kaleidoscope, by contrasting its effects with those which Bradley's instrument is capable of producing, for these effects are not worth the looking at. When we attempt to employ Bradley's instrument to produce the effects which have been so much admired in the kaleidoscope, namely, to produce beautiful forms from transparent or opaque coloured objects contained in a cell, and at the end of the reflectors, it fails so entirely, that no person has succeeded in the attempt. It is indeed quite impossible to produce by it the beautiful and symmetrical forms which the kaleidoscope displays. Had this been possible, Dr. Brewster's patent might have been invaded with impunity by every person who chose to manufacture Bradley's instrument; but this was never tried, and for the best of all reasons, because nobody would have purchased it.

We trust that no person, who wishes to judge of this subject with candour, will form an opinion without having actually seen and used the instrument proposed by Bradley. Let any person take Bradley's plates, and, having set them at an angle of 30° or 22¼°, place them upon a cell containing fragments of coloured glass, he will infallibly find that he cannot produce a picture of any symmetry or beauty. The disunion of the sectors, the darkness of the last reflections, and the enormous deviation from symmetry, towards the centre of the figure, will convince him, if he required conviction, that the instrument is entirely useless as a kaleidoscope. To those, however, who are not capable, either for want of time, to make such a comparison, we may present the opinion of three of the most eminent natural philosophers of the present day, viz. the celebrated Mr. Watt, Professor Playfair, and Professor Pictet.

"It has been said here," says Mr. Watt, "that you took the idea of the kaleidoscope from an old book on gardening. My friend, the Rev. Mr. Corrie, has procured me a sight of the book. It is Bradley's Improvements of Planting and Gardening. London 1731, part 2d. chap. 1st. It consists of two pieces of looking glass, of equal bigness, of the figure of a long square, five inches long and four inches high, hinged together, upon one of the narrow sides, so as to open and shut like the leaves of a book, which, being set upon their edges upon a drawing, will shew it multiplied by repeated reflections. This instrument I have seen in my father's possession 70 years ago, and frequently since, but what has become of it I know not. In my opinion, the application of the principle is very different from that of your kaleidoscope."

The following is Professor Playfair's opinion:

Edinburgh, 11th May, 1818.

"I have examined the kaleidoscope invented by Dr. Brewster, and compared it with the description of an instrument which it has been said to resemble, constructed by Bradley in 1717. I have also compared its effect with an experiment to which it may be thought to have some analogy, described by Mr. Wood in his optics, Prop. 13 and 14.

"From both these contrivances, and from every optical instrument with which I am acquainted, the kaleidoscope appears to differ essentially both in its effect and in the principles of its construction.

"As to the effect, the thing produced by the kaleidoscope is a series of figures presented with the most perfect symmetry, so as always to compose a whole, in which nothing is wanting and nothing redundant. It matters not what the object be to which the instrument is directed, if it only be in its proper place, the effect just described is sure to take place, and with an endless variety. In this respect, the kaleidoscope appears to be quite singular among optical instruments. Neither the instrument of Bradley, nor the experiment or theorem in Wood's book, have any resemblance to this; they go no further than the multiplication of the figure.

"Next, as to the principle of construction, Dr. Brewster's instrument requires a particular position of the eye of the observer, and of the object looked at, in order to its effect. If either of these is wanting, the symmetry vanishes, and the figures are irregular and disunited. In the other two cases, no particular position, either for the eye or the object, is required.

"For these reasons, Dr. Brewster's invention seems to me quite unlike the other two. Indeed, as far as I know, it is quite singular among optical instruments; and it will be matter of sincere regret, if any imaginary or vague analogy, between it and other optical instruments, should be the means of depriving the Doctor of any part of the reward to which his skill, ingenuity, and perseverance, entitle him so well.

John Playfair,
Professor of Natural Philosophy in the University of Edinburgh.

P.S.—Granting that there were a resemblance between the kaleidoscope and Bradley's instrument, in any of the particulars mentioned above, the introduction of coloured and moveable objects, at the end of the reflectors, is quite peculiar to Dr. Brewster's instrument. Besides this, a circumstance highly deserving of attention, is the use of two lenses and a draw tube, so that the action of the kaleidoscope is extended to objects of all sizes, and at all distances from the observer, and united, by that means, to the advantages of the telescope.

"J. P."

Professor Pictet's opinion is stated in the following letter:

Sir,—Among your friends, I have not been one of the least painfully affected by the shameful invasion of your rights as an inventor, which I have been a witness of lately in London. Not only none of the allegations of the invaders of your patent, grounded on a pretended similarity between your kaleidoscope and Bradley's instrument, or such as Wood's or Harris' theories might have suggested, appear to me to have any real foundation; but, I can affirm that, neither in any of the French, German, or Italian authors, who, to my knowledge, have treated of optics, nor in Professor Charles' justly celebrated and most complete collection of optical instruments at Paris, have I read or seen any thing resembling your ingenious apparatus, which, from its numberless applications, and the pleasure it affords, and will continue to afford, to millions of holders of its matchless effects, may be ranked among the most happy inventions science ever presented to the lovers of rational enjoyment.

M. A. Pictet,
Professor of Nat. Phil. in the Academy of Geneva.

To Dr. Brewster.
The propositions in Harris' Optics relate, like Professor Wool's, merely to the multiplication and circular arrangement of the apertures or sectors formed by the inclined mirrors, and to the progress of a ray of light reflected between two inclined or parallel mirrors; and no allusion whatever is made, in the propositions themselves, to any instrument. In the proposition respecting the multiplication of the sectors, the eye of the observer is never once mentioned, and the proposition is true if the eye has an infinite number of positions; whereas, in the kaleidoscope, the eye can only have one position. In the other proposition, (Prop. XVII.) respecting the progress of the rays, the eye and the object are actually stated to be placed between the reflectors; and even if the eye had been placed without the reflectors, as in the kaleidoscope, the position assigned it, at a great distance from the angular point, is a demonstration that Harris was entirely ignorant of the positions of symmetry either for the object or the eye, and could not have combined two reflectors so as to form a kaleidoscope for producing beautiful or symmetrical forms. The only practical part of Harris' propositions is the 5th and 6th scholia to Prop. XVII. In the 5th scholium he proposes a sort of catoptric box or cistula, known long before his time, composed of four mirrors, arranged in a most unscientific manner, and containing opaque objects between the specula. "Whatever they are," says he, when speaking of the objects, "the upright figures between the specula should be slender, and not too many in number, otherwise they will too much obstruct the reflected rays from coming to the eye." This shews, in a most decisive manner, that Harris knew nothing of the kaleidoscope, and that he has not even improved the common catoptric cistula, which had been known long before. The principle of the instrument, and the positions of symmetry, were entirely unknown to him. In the 6th scholium, he speaks of rooms lined with looking-glasses, and of luminous amphitheatres, which have been described and figured by all the old writers on optics.

The persons who have pretended to compare Dr. Brewster's kaleidoscope with the combinations of plain mirrors described by preceding authors, have not only been utterly unacquainted with the principles of optics, but have not been at the trouble either of understanding the principles on which the patent kaleidoscope is constructed, or of examining the construction of the instrument itself. Because it contains two plain mirrors, they infer that it must be the same as every other instrument that contains two plain mirrors, and hence the same persons would, by a similar process of reasoning, have concluded that a telescope is a microscope, or that a pair of spectacles with a double lens is the same as a telescope or a microscope, because all these instruments contain two lenses. Anastronomical telescope differs from a compound microscope only in having the lenses placed at different distances. The progress of the rays is exactly the same in both these instruments, and the effect in both is produced by the enlargement of the angle subtended by the object. Yet surely there is no person so senseless as to deny that he who first combined two lenses in such a manner as to discover the mountains of the moon, the satellites of Jupiter and Saturn, and all the wonders of the system of the universe, was the author of an original invention. He who produces effects which were never produced before, even by means which have been long known, is unquestionably an original inventor; and upon this principle alone can the telescope be considered as an invention different from the microscope. In the case of the kaleidoscope, the originality of the invention is far more striking. Every person admits that effects are produced by Dr. Brewster's instrument, of which no conception could have been previously formed. All those who saw it, acknowledged that they had never seen anything resembling it before; and those very persons who had been possessors of Bradley's instrument, who had read Harris' Optics, and made his shews: boxes, and who had used other combinations of plain mirrors, never supposed for a moment, that the pleasure which they had derived from the kaleidoscope had any relation to the effects described by these authors.

No proof of the originality of the kaleidoscope could be stronger than the sensation which it caused in London and Paris. In the memory of man, no invention, and no work, whether addressed to the imagination or to the understanding, ever produced such an effect. A universal mania for the instrument seized all classes, from the lowest to the highest, from the most ignorant to the most learned, and every person not only felt, but expressed the feeling, that a new pleasure had been added to their existence.

If such an instrument had ever been known before, a similar sensation must have been excited, and it would not have been left to the ingenuity of the half learned and the half honest to search for the skeleton of the invention among the rubbish of the 16th and 17th centuries.

The patent kaleidoscopes are now made in London, under the sanction of the Patentee, by Messrs. P. and G. Dollond, W. and S. Jones, Mr. R. B. Bate, Messrs. Thomas Harris and Son, Messrs. W. and T. Gilbert, Mr. Bancks, Mr. Bettle, Mr. Thomas Jones, Mr. Blunt, Mr. Schmalcalder, Messrs. Watkins and Hill, and Mr. Smith. In Birmingham by Mr. Philip Carpenter; in Bristol by Mr. Beilby; and in Edinburgh by Mr. John Ruthven. An account of the different forms in which these ingenious opticians have fitted up the kaleidoscope, and of the new contrivances by which they have given it additional value, will be published in Dr. Brewster's Treatise on the Kaleidoscope, now in the press.

KAMMA. See Russia.
KAMMENI, the Great and Little, or Burnt Islands, are two islands in the Grecian Archipelago, which derive their name from their calcined appearance. The first of these, or the Great Kameni, was called Kiera by the ancients. In the year 1475, another island suddenly appeared above the sea, and was distinguished by the name of the Micri Kameni. On the 23rd of May, 1707, a new islet appeared about a league from Santorin, between the Great and the Little Kameni; and as a very particular account of this remarkable phenomenon has been given by an eye-witness, we shall not scruple to lay an abridged account of it before our readers.

"On the 18th of May, there had been felt at Santorin two slight shocks of an earthquake. No great attention was paid to them at the time; but there was reason to suppose that the new islet was beginning to detach itself from the bottom of the sea, and to rise towards its surface. Some Greeks belonging to Santorin having seen the first points of the growing island, imagined that these might be the remains of some ship-
wreck, which the sea had brought during the night. When they discovered that, in lieu of pieces of a floating wreck, these were black and calcined rocks, they returned, quite frightened, publishing every where what they had seen.

"Though the fright was general in the whole island of Santorin, yet some of the inhabitants came to a resolution of making observations on the very spot. Having landed, curiosity induced them to proceed from rock to rock; they found everywhere a sort of white stone which might be cut like bread, and a quantity of fresh oysters adhering to the rocks; a circumstance very uncommon at Santorin. While these Greeks were amusing themselves with eating the oysters, they all at once felt the rocks move, and the ground tremble under their feet: terror soon made them abandon their rest, in order to jump into their boat, and row away as hard as they could pull. This shock was a motion of the island, which was increasing, and which, at that moment, visibly rose, having, in a very few days, gained nearly 20 feet in height, and twice as much in breadth. One day, a rock very remarkable from its size and figure, having issued from the sea, 40 or 50 paces from the middle of the island, sunk at the expiration of four days into the water, and appeared no more. These different commotions violently shook the Little Kammeni, and on its summit was remarked a long fissure, which had not been seen there before. During this time, the sea of the gulf several times changed its colour: it first became of a dazzling green, then of a reddish hue, and at last of a pale yellow, and constantly emitted a great stench.

"On the 10th of July, smoke was seen, for the first time, to issue, not from the part of the island that appeared, but from a chain of black rocks, which rose all on a sudden sixty yards from that spot, and from a part of the sea where no bottom had been found: this, for some time, formed as it were two separate islands, one of which was called the White Island, and the other the Black Island, on account of their different colours; but which, ere long, were again united to each other, yet in such a manner that those black rocks which last sprung up became the centre of the whole island.

"Neither fire nor smoke was ever seen on the White Island; yet it continued to grow larger; but the Black Island increased for more quickly. Every day were seen to arise big rocks, which sometimes were joined to the island, and sometimes were very remote from it; so that, in less than a month, were reckoned as many as four little black islands, which in four days formed but one. It was likewise remarked that the smoke had greatly increased, and that, no wind blowing at the time, it ascended so high that it was seen from Candia, from Naxia, and from other distant islands. During the night, this smoke always appeared fiery to the height of fifteen or twenty feet, and the sea was covered with a reddish substance or froth in some places, and yellowish in others. So great a degree of refraction spread through all Santorin, that the inhabitants were obliged to burn perfumes, and to kindle fires in the streets. This infection lasted only a day and a half. A very fresh south-west wind dispersed it; but, in driving away one evil, it introduced another. It carried this burning smoke over a great part of the best vineyards of Santorin, the grapes of which were almost ripe, and which, in one night, were all scorched. It was likewise remarked, that wherever this smoke was carried, it blackened silver and copper, and occasioned the inhabitants violent headaches, accompanied by strong nausea. At that time, the White Island settled and sunk all at once upwards of ten feet.

On the 31st of July, it was discovered that the sea cast forth smoke, and boiled up in two places, the one at thirty, and the other at sixty yards from the Black Island. In these two spaces, each of which formed a perfect circle, the water appeared like oil on the fire. This lasted upwards of a month, during which were found a great many dead fishes.

"The following night was heard a hollow noise, like the report of several cannon fired at a distance; and almost immediately issued from the middle of the crater two long sheets of fire, which ascended very high, and were directly extinguished.

"On the 1st of August, the same hollow noise was heard repeatedly. It was followed by a bluish black smoke, which rose in the form of a pillar to a prodigious elevation.

"On the 7th of August, the noise was similar to that of several large heaps of stones falling all at once into a deep well; and after having lasted several days, changed into another considerably louder.

"On the 21st of August, the fire and smoke diminished considerably; but, at break of day, they resumed more strength than they had before possessed. The smoke was red and very thick, and the fire which issued from so fierce, that the sea round the Black Island smoked and boiled up for a month.

"On the morning of the 22d, the island was become much higher than it was the day before. A chain of rocks, of nearly fifty feet, had greatly increased its breadth. The sea was again covered with that reddish foam already mentioned, which emitted every where an intolerable stench.

"On the 5th of September, the fire opened itself a passage at the extremity of the Black Island, at the same time inclining towards Therminus. The fire issued thence for some days only, during which less came out of the great crater.

"Thrice there arose from the great crater, as it were, three of the largest sky-rockets, of a fire the most brilliant and the most beautiful. On the following nights it was quite another thing. After the usual reports of the subterraneous thunder, all at once were seen going off, as it were, long sheaves sparkling with a million of lights, which, following each other, ascended to a very great height; then fell again in showers of stars on the island, which thence appeared quite surprising.

"On the 9th of September, the two islands, the White Island and the Black one, by dint of increasing each in breadth, began to meet and to form but one body. After this junction, the extremity of the island to the south-west increased no more either in length or height; whereas the other extremity to the west did not cease to lengthen very perceptibly.

"Of all the openings, there were two only which emitted any fire. Sometimes the smoke issued with impetuousity from all together, sometimes only from one or two; one while with noise, another without, but almost always with a whistling, which might have been taken for the various sounds of the pipes of an organ, and sometimes for the howling of wild beasts.

On the 12th of September, the subterraneous noise, having to spread between four openings, was never so frightful, nor so frequent as on that day and the following ones. The loud and repeated claps, similar to the general discharge of a numerous and heavy train of artillery, were heard ten or twelve times in the course of twenty-four hours; and, a moment after, there issued from the great crater stones of an enormous size, quite red hot, which were thrown to a great distance, and lost in the sea. These loud claps were always accompanied by clouds of ashes, some of which were carried
in eddies as far as Anasis, an island twenty-five miles distant from Santorin. These ashes had the figure and the grain of fine powder; but, thrown into the fire, they produced only a few slight crepitations, without emitting flame.

On the 18th of September, there was at Santorin an earthquake which occasioned no damage. The island was considerably increased by it, as well as the fire and smoke, which, on that day and the following night, opened new lines and new passages. Till then, so many fires together had not been seen; nor had such loud reports been heard: their violence was so extraordinary, that the houses of Scaro were shaken by it. Through thick volumes of smoke, which appeared like a mountain, was heard the loud noise of an infinite number of huge stones, which whizzed in the air like large cannon-balls, and fell afterwards on the island and into the sea, with a crash which made all who heard it shudder. The little Kammeni was several times covered with these burning stones, which rendered it quite resplendent.

On the 21st of September, the little Kammeni being thus quite in a blaze, after one of those furious shocks just mentioned, there thence arose three large flashes of lightning, which traversed all the horizon of the sea. At the same instant, there occurred so great a shaking of the whole new island, that the half of its great crater fell in, and there were huge burning stones, of a prodigious size, which were driven to the distance of upwards of two miles.

On the 24th of September, the fire resumed all its strength, and the island became more formidable than ever. Among the claps, almost continual, and which were so violent, that two persons, speaking to each other, could with difficulty make themselves heard, there suddenly occurred one so dreadful, that it made every body run to the churches. The big rock, on which Scaro is built, tottered, and all the doors of the houses were forcibly thrown open.

"Every thing continued in the same state during the months of October, November, and December 1707, and January 1708. Not a day passed without the great crater making an explosion at least once or twice, and most frequently five or six times.

"On the 10th of February 1708, about eight o'clock in the morning, there was at Santorin a rather violent shock of an earthquake. In the course of the night, there had been one much lighter, which induced the opinion, that the volcano was again preparing some terrible scene. Large rocks of a frightful mass, which till then had appeared only even with the water's edge, rose very high; and the boiling up of the sea increased to a great excess. The subterraneous roarings lasted day and night without intermission. The great crater burst even five or six times in a quarter of an hour, and gave reports which, from their repetition, from the quantity and the bigness of the stones that flew about, from the shaking of the houses, and from the great fire that appeared in open day, surpassed every thing that had preceded.

"The 15th of April was remarkable, among all the other days, from the number and the fury of those terrible shocks; so that, for a long time, seeing nothing but fire, fiery smoke, and large pieces of rock, which filled the air, all the inhabitants of Santorin thought that the island was blown up. Half of the circumference of the great crater which had fallen in, and in an instant, again became higher than it was, by the heap of ashes and big stones by which it was repaired.

"From that day till the 23d of May, every thing continued nearly on the same footing. What was particularly remarked, was, that the island constantly increased in height, and scarcely increased any more in breadth. The great opening, or large crater, rose very high; and from the melted substances which cemented its fabric, was gradually formed, as it were, a great pasty, with a very broad slope.

"On the 15th of July, some persons belonging to Santorin wished to have a near view of the new island. They took care to provide themselves with a boat well caulked, and the inside were filled with oakum strongly chincned. They went with eight to that side of the island where the sea did not boil up, but where it smoked very much. Scarcely had the inquisitive party reached this smoke, than they all felt a suffocating heat, which affected them. They put their hands into the water, and found it scalding; they were as yet, however, only within five hundred yards of the land. There not being a probability of their proceeding farther that way, they turned towards the point most distant from the great crater. The fire, which was still there, and the sea, which boiled up with fury, obliged them to take a long circuit. They landed on the Great Kammeni, whence they had the convenience of examining the real length of the island, and particularly the side which they had not been able to see from Scaro. The island might then be two hundred feet in its greatest height, a mile and upwards in its greatest breadth, and about five miles in circumference.

"After this examination, the observers again felt a strong desire to approach the island, and to land at the place called the White Island. When they were within two hundred yards of it, they perceived that, by dipping the hand into the water, the more they approached, the warmer it became. They hove the lead; all the line, which was nine-and-five fathoms long, was employed, without finding any bottom. While they were deliberating whether they should advance farther, or turn back, the great crater began to play with its usual crash and impetuosity. The wind carried over the boat the thick cloud of ashes and smoke, which made them think of rowing off very quickly. On arriving at Santorin, it was discovered that the great heat of the water had melted almost all the pitch from the seams of the boat, which began to open on all sides.

"Till the 15th of August, of the same year, 1708, the island vomited fire, smoke, and burning stones, always with a great noise, yet less than that of the preceding months.

"This account of a judicious eye-witness, is to be found in a rather scarce collection, entitled "Les Mémoires des Missions de la Compagnie de Jésus dans le Levant."

"After the author of the account had quitted Santorin, the new island risen from the sea in the gulf, between the Great and the Little Kammeni, continued for a long time to cast forth flames, a thick smoke, and large masses of stones, but the explosions became less frequent and less violent, and at length ceased.

"The new island is about a league in circumference. All round, but very close to it, the depth of water is from thirty to thirty-five fathoms: farther off, no bottom is to be found. From the rocks of the island it is frequently detached a quantity of fragments of pumice-stone, which, floating on the surface of the sea, are driven on the coasts of the islands of the Archipelago. The quantity of these light productions of volcanoes, thrown up by the new island, was so considerable during the beginning of its astonishing appearance, that the sea of the Archipelago was covered with them, and several harbours were choked up to such a degree, that no vessel, however small, could get out, unless a passage were cleared for her by means of poles."
The Little Kammenen, where are seen six craters by which the volcano vomited forth the subterraneans that compose it, is equally naked and barren; but the Great Kammenen, more ancient, is covered with a thin stratum of a dust, which allows a few herbs to grow in it. See Somnini's Travels.

KAMTSCHATKA, a large peninsula in the southeastern extremity of Siberia, is situated between 155° and 165° East Long. from Greenwich, and extends from 51° to 62° of North Latitude. It is bounded on the west by the sea of Okotsk, or Kamtschatka; on the east and south by the Pacific Ocean; and on the north by the country of the Koriaks, from which it is separated by an isthmus about 40 miles broad, lying between the gulfs of Olutorsk and Pengersk. From this junction with the mainland to its most southern point, it stretches about 600 miles; and is nearly half that distance in breadth, from the mouth of the Tegil to that of the Kamtschatka river, in the latitude of 55°, but becomes gradually narrower towards each extremity, terminating on the south in a low promontory, called Cape Lepatka.

Kamtschatka was first discovered by the Russians about the year 1699; but the natives preserve a tradition of a much earlier visit from that people. They point out the spot where a few strangers from Russia settled, and intermarried in the country, after later times murdered in a quarrel with the natives; and this account is supposed to describe the fate of a ship's crew belonging to a small squadron, which sailed from Kolyma about the middle of the 17th century. The whole peninsula was finally subdued by the Russian arms in 1711; but, for some time, added little to the trade or wealth of the empire, except a small tribute of furs. After the discovery, however, of the adjoining islands, (see Aleutian, Bering, and Fox Islands,) the supply of furs was greatly increased, and Kamtschatka became an important station of Russian commerce with the east. The peninsula is divided into four districts, forming one government, and protected by a force of 500 men.

The peninsula of Kamtschatka is traversed through its whole length, and divided into two parts of nearly equal extent, by a chain of mountains, which form a part of the same line with those of the Kurile and Japanese islands. In these mountains are several volcanoes: one on the summit of Kamtschatka, the highest of the whole ridge; another on a neck of land, between the river Kamtschatka and Tolbalichek; and a third to the north of Awatska bay, called Awachinsky, which frequently emits immense volumes of smoke, ashes, and flame. There are several hot springs in the country, which never freeze; and two extraordinary wells, where the water boils with prodigious force, sending forth at the same time a dense vapour and dreadful noise.

From the mountains, many rapid streams descend to the coast. The principal rivers are the Tegil, which falls into the sea of Penckine, in 58° North Latitude; the Bolchais-reka, or Great River, which flows from a large inland lake, and falls into the sea of Okotsk, in 52° 45' North Latitude; the Awa-cha, flows into the bay of Peter or Paul, on the east side of the peninsula; and the Kamtschatka, the only navigable river in the country, which, after a long course towards the north and north-east, joins the Eastern Ocean in 56° North Latitude. The most considerable lakes are Nerpitcha, near the mouth of the Kamtschatka; Kronotsky farther south, above 60 versas long and 40 broad; and the Kurilskoy, near the southern extremity of the peninsula. On the eastern side are several large bays, and especially that of Awatska, in 52° 44' North Latitude, about 25 miles in circuit.

The principal oystocks, or towns, are Bolcherezetsk, the settlements of the governor, containing about 300 inhabitants, and situated on the west coast, in a swampy plain, at the mouth of the Botchais-reka; Peterpaulowska, or Peter and Paul, containing about 50 houses, and situated in the bottom of Awatska bay, on the east coast, about 135 miles distant from Bolcherezetsk; Nishine-Kamtschatka, about 20 miles up the river Kamtschatka, a considerable mart for the inland traffic of the country, defended by a fort, and containing 150 houses. Several forts are planted along the coast, in the vicinity of which a few houses are found; but the inhabitants are thinly scattered over the country, in solitary huts, or small hamlets, scarcely deserving the name of villages.

The appearance of the country is mountainous, as the Aspect and varied with low heath and stunted trees; but the valleys afford every evidence of considerable natural fertility, and might, by proper cultivation, be made capable of raising many valuable productions. They produce grass five feet in height; and abound in wild roses and flowers of the finest perfume. The climate has hitherto been considered peculiarly adverse to all agricultural improvements; but later writers have given a more favourable representation of its capabilities; and Kruseenstern particularly affirms, that it is not inferior to that of any northern country under the same latitude. On the coast, and in the southern districts, frequent fogs and drizzling rains, which are very injurious to the growth of grain and vegetables, prevail to a great degree even in the summer months; but the northern, and especially the middle districts, present a more fruitful soil, and possess a more genial climate. The winter is long and severe; and dreadful hurricanes, which bring on thick and heavy showers of snow, occasionally prevent all operations out of the house, and all travelling from one place to another. The snow begins to appear in October; and no thaw takes place till April or May. There are generally heavy rains in spring and autumn; but the summer months, June, July and August, and even September, "have just as many pleasant and cheerful days," says the last mentioned navigator, "as in any other place under the same latitude;" and the mouth of Jimne," he particularly adds, "was as beautiful as it could possibly be in the most favoured climate.

Even in the middle of May, wild garlic, celery, and prodigious numbers of wild angelica may be gathered for use; and every kind of cultivation may be commenced in the month of June. Several useful vegetables grow naturally in the summer months, particularly wild pease, wild garlic, celery, purslane, angelica, and arana; but, either from ignorance or prejudice, the natives, and even the Russian soldiers, rarely collect them as articles of food. Towards the end of summer, there is a great plenty of raspberries, strawberries, huckleberries, and several other kinds, which are often boiled to a jam for preservation through the winter. Every kind of vegetable and corn may be raised in the inland districts, especially rye and barley; and even on the southern coasts, the gardens of the Russian officers produce potatoes, cabbage, carrots, and every kind of sallad and pot-herb in sufficient abundance. The soil is so productive, that at Bolchezetetsk, where the climate is rather more unsavourable, potatoes produced more than thirty-fold; and in other places, without the least attention, rye returns eightfold, and barley twelve-fold. Hemp has been cultivated with great success; and the different kinds of Sie-
Kamtschatka.

Kamtschatka.

berian corn might be advantageously introduced. But agriculture is much neglected by the inhabitants, whose time is considerably interrupted by the services which the government requires, and is also more profitably employed in hunting sables, than raising corn. The prosperity of the country seems to demand some positive encouragement to be given to the cultivation of the soil, to counteract the more immediate profits of the fur traffic.

Animals.

The animals most common in this country, are reindeer, the argali or wild sheep, the bear, beaver, fox, otter, hare, sable, ermine, marmot, wolf, weasel, wolverene. There are not above 600 head of cattle in the whole country, though pasture is abundant in summer, and plenty of natural hay might be collected for winter use. Sheep and goats might also be easily reared; but the scarcity of corn precludes entirely the breeding of hogs. There are a few horses at the settlements, which belong to the government, and are entrusted to the care of the Cossacs. They are employed in conveying merchandise, and other effects of the crown, or for the occasional service of travellers. Dogs are the prevailing quadrupeds in Kamtschatka, and are peculiarly serviceable to the inhabitants, every individual of whom possesses at least half a dozen of those useful creatures. They resemble the shepherd's dog of Europe, and are fed chiefly on the offal of various animals, or the discarded fish which their masters cannot use; but, in summer, they are left entirely to provide for themselves, when they range over the country along the banks of lakes and rivers, always returning, at the approach of winter, with the greatest punctuality, to their respective proprietors.

There are no poultry in the country, as there is so little corn for their support, and no means of preserving them from the prowling canine race among the villages. Almost every kind of northern sea-fowl frequent the coasts and bays; and the inland lakes and rivers are plentifully stored with wild ducks, wild geese, and swans. Wild fowl are remarkably abundant in the country, especially wood-cocks, snipes, and grouse, hawks, falcons, bustards, and various kinds of eagles, some of which are of a prodigious size.

Fowl.

The coasts and rivers are full of excellent fish, cool, herring, trout, flat-fish, and especially salmon of every species, and of the finest quality. There are great quantities of crabs and crayfish, and a great variety of amphibious sea animals are found on the coasts, particularly seals, which pursue the shoals of salmon into the rivers and lakes that have any communication with the sea. Whales also are frequently seen and taken in the adjoining seas, and supply the inhabitants with various useful articles. The flesh is eaten, and the fat preserved for cooking and for burning. The skin is made into shoe-soles, belts, and straps for various purposes. The bones are made into knives, chains for the dogs, and protecting covers to the bottom of the sledges. The whiskers are employed to sew the seams of the canoes, and to make nets for the larger kinds of fish. The nerves and veins are employed in making snares; and the intestines are cleaned, dried, and blown like bladders, to contain oil and grease.

Fish.

The natives of Kamtschatka are considered as a different race from the other inhabitants of Siberia, and as having proceeded originally from Mungasia, beyond the river Amur. Both in their language and persons, they are said to bear some similarity to the Mungals. They have a swarthy complexion, black hair, a round face, prominent cheek bones, small sunken eyes, thin eyebrows, large mouths, and thick teeth. They are of short stature, and broad between the shoulders, with slender legs and arms, and hanging bellies. They appear, however, to have occupied the peninsula at a very remote period; and have not traditionary memorials of their emigration, but believe that they were created on the spot which they now inhabit. Their first acknowledged discoverer was a Cossack named Volelim, of the Anadirek, with orders to engage the assistance of the Korics, in discovering and rendering tributary the countries to the east of theirs. With 60 Russians, and the same number of Cossacks, he penetrated, in 1699, to the centre of the peninsula; and built the Verchneiostrog on the river Kamtschatka, where he left a small garrison, and returned to Jakutsk with a great quantity of tributary furs. Proceeding with these to Moscow, he was appointed commander of Jakutsk as a reward for his services; and appointed to return to Kamtschatka with sufficient reinforcements, to complete the conquest of the country, and form proper settlements among the natives. In consequence of the oppressive character of the commissaries, to whom the government of the country was entrusted, and the undisciplined conduct of the troops, continual revolts, which were suppressed by cruel massacres, occurred in every part of the peninsula during the first fifteen years of its subjugation to the Russians; but, with the exception of slight insurrections at Bolcherelesk, it has been in a perfectly peaceful state since the middle of last century. Before the Russian conquest of Kamtschatka, the natives are said to have lived in a state of complete natural equality, subject to no chief, law, or tribune; but merely rendering a tacit respect to the old men, or to those who were most distinguished for their bravery.

The government established among them by the Government Russians, when considered as of a military character, is remarkably mild and equitable; and the tribute exacted from individuals, though rendered heavy by a change of circumstances, was very inconsiderable as originally established. In every ostrog a magistrate is elected by the inhabitants, who is named tayon, and whose authority resembles that of a starost, or elder, in the Russian villages. This person has power to settle all inferior disputes, and to inflict corporal punishment to the extent of twenty lashes; but all intricate cases, and flagitious offences, are referred to the governor of Kamtschatka. The tayon bears another name in Kamtschatka, being the title of those who execute the orders of his superior, and fills his place in his absence; while, in like manner, the eldest Kamtschadale in the village assumes the office of jessaul, when the actual holder of that station is not present. The tayon, besides attending to the internal regulations of his ostrog, collects the sables paid by the inhabitants as tribute, and carries them sealed up to the town, where they are examined and valued in the presence of certain magistrates, by a person authorised by the crown; and the surplus above the duties is paid in money to the tayon, to be proportionally divided among the inhabitants. The annual taxes of a Kamtschadale, exclusive of the capitation tax, amounts to three rubles; but these being paid in sables, and the government valuation of these articles being considerably lower than the price of the merchant, he may be considered as paying at least double that sum. The capitation tax also, being levied always in Russia according to the last census, which is taken only every twenty years, bears hard upon the decreasing villages of Kamtschatka, many of which are now diminished from 30 to 40 to 8 or 10 households, who must nevertheless make up among them the old capitation assessment upon the whole ostrog. This error, however,
is said to have been recently rectified; and more attention has, in many respects, been paid by the government, to promote the prosperity both of the natives and Russian settlers. Free schools have long been established in many of the ostrogs; and all the inhabitants have been led to adopt the Christian religion. But by the most recent accounts, it appears that most of the Greek priests sent among them, are very inattentive to the duties of their office, and have very generally forfeited the respect of the natives. No correct estimate can be formed of the population of the country. When first subdued by the Russians, it was described as full of inhabitants; but, in 1763, many thousands were swept away by a small-pox; and, in 1770, the number of persons who paid tribute was only 3000. Kruzenstern states, that in 1800 and 1801, 5000 or 6000 perished by another epidemic disorder; and, supposing one-fourth of the number to have been householders, liable in payment of tribute, this would reduce the above number of taxable persons to one-half, viz. 1500, and (allowing to each a wife and three children) the whole population, to between 7000 and 8000 souls. Their number has been rapidly decreasing, even without the aid of epidemics; and apprehensions are entertained, that the native race of inhabitants will soon become extinct. One principal cause of this progressive desolation, is to be sought in the pernicious effects of ardent spirits, which have hitherto been made the chief article of barter for their furs, and in the use of which the Kantschadal village is utterly incapable of practising the smallest self-denial. The agents of the American Company, and the other merchants, have long been in the habit of traversing the country to other wares than a quantity of the worst kind of gin. As soon as one of them arrived at an ostrog, he treats his host with a glass of the liquor, who, as soon as he has swallowed one mouthful, which he receives for nothing, instantly begs for another, for which, however, he must pay perhaps with one of his best sable; and so on for a second and a third, till he begins to be intoxicated, when the trader contrives to give him spirit mixed with water, still charging higher for every glass, as the unhappy peasant becomes the more urgent in his demands for more of the poison. The usual result is, that the merchant carries off the whole stock of furs in the house, as the price of the spirits drunk; and that the infatuated Kantschadal finds himself deprived of all his wealth, without having provided the powder and shot, and the other articles, which are indispensable for his support. The debilitating effect of the liquor on his frame, the depression of spirits into which he sinks, and the want of those comforts, which, by his misconduct, he has lost the means of procuring, speedily exhausts his strength, and sinks him prematurely to the grave. The governor, however, has recently prohibited the traders from carrying spirits into the country; and by such regulations only, can the natives be preserved from extirpation. They are, in other respects, a very estimable race, "not easily to be surpassed," says Kruzenstern, for kindness of heart, fidelity, obedience, hospitality, perseverance, and attachment to their superiors." In spite of their extreme poverty, they are patterns of honesty. "In this respect," says the last mentioned voyager, "it is impossible to exceed them; and it is as rare to find a cheat among the Kantschadales as a man of property." Travellers, on their arrival at any ostrog, usually give their money, papers, and valuables, even their stock of brandy, tea, sugar, tobacco, &c., into the hands of the tayon; and there is no instance of any one having been robbed to the smallest extent. In many respects, the Russian settlements could not exist without the services of the natives. They serve as guides through the country, and as carriers of the mail, which they are required to do without pay; and, of their own accord, they engage to lodge every traveller, and to supply his dogs with provisions, without demanding any remuneration. In every ostrog, there is a supply of fish set apart for this purpose. They are more barbarous in their manners than in their minds, and have made very little progress in the arts of civilized life. They never inhabit the towns built by the Russians, but reside in small villages scattered over the interior districts. These ostrogs rarely contain more than fifteen or twenty inhabitants.

The Kamtschatka hamlets are surrounded by an earthen wall, or by palisades, (as the Russian name ostrog imports,) and contain two sorts of habitations, one kind, called balagans, for summer, and another, named yoursts, for winter. The balagan is constructed, by erecting nine posts in three regular rows, at equal distances from each other, and about thirteen feet in height. About ten feet from the ground, rafters are laid from post to post, and firmly fastened with strong ropes or thongs; and upon these rafters are laid joists, which being covered with turf, complete the floor of the apartment. Upon this platform, a roof of a conical figure is raised by means of strong poles, fastened to the rafters at one end, and meeting together in a point at the other. The whole is covered with a thatching of coarse grass, except an opening in the centre, to serve the purpose of a chimney. There are two low entrances directly opposite to each other, to which they ascend by means of a ladder or staircase, which is merely a large beam or tree, with rough notches on the upper surface, by way of steps, with one end on the ground, and the other resting on the corner of the door. When they wish to intimate that there is nobody at home, they merely turn the tree, with the steps downwards. In the lower part of the balagan, which is left open, they dry their fish, and other articles, intended for winter stores; and sometimes employ the upper apartment as a magazine for holding their provisions. Their dogs, also, are frequently tied to the posts below, and find their kennel under the floor of the building. In forming a yourst, or winter habitation, an oblong square hole is dug in the earth to the depth of six feet, and of such dimensions as the number of families intended to occupy it may require. Strong wooden posts are then fixed in the ground at equal distances, on which are extended the beams for supporting the roof, the rafters of which rest with one end on these beams, and the other on the ground; and the interstices between them being filled up with wicker work, a covering of turf is laid over the whole. The external appearance of these dwellings resembles the roof of an ice-house, or a round squat hillock. A hole in the centre of the roof, serves the purpose of chimney, window, and door; and the inmates pass through it by means of notched trees, as already described. There is another entrance on one side level with the ground, appropriated for the use of the women, and through which none of the men could go out or in without incurring ridicule and disgrace. The inside of this subterraneous abode forms only one apartment, with the fire-place on one side, and the utensils and provisions on the other. Broad platforms of boards are extended along the sides; and, being well covered with mats and skins, serve the purpose of seats and beds. These houses are generally kept so warm,

asa to be intolerable to a stranger; and the hotter they are made, the greater honour is supposed to be done to their guests. They reside in these winter recesses from the middle of October to the middle of May. Instead of these yurts, isbas have been introduced by the Russians; and the natives have been prohibited, especially in the southern districts, from constructing their accustomed subterranean habitations. The isbas resemble the dwellings of the Russian peasantry, except that they are seldom so large in Kamtschatka. The walls are formed, by piling long trees (smoothed only with the hatchet) horizontally upon one another, and filling up the interstices with clay or moss; the roof is shaped like a spouting form, like the thatched cottages of Europe, and is covered with coarse grass, rushes, or sometimes with boards. Each of these log-houses has three apartments, one of which may be considered rather as a kind of entrance, which extends the whole width and height of the house, and serves as a receptacle for the sledges, harness, and other bulky articles. This place communicates with the principal apartment, which occupies the middle space, and around the sides of which are fixed broad benches, used both as tables and beds. From this there is a door into the kitchen, where a large stone or oven is fixed in the wall, which separates it from the middle apartment, so as to warm both rooms at the same time. In each apartment are two small windows, the panes of which are made of fish skins, or gullets of sea wolves, or the bladders of various animals; but sometimes in more opulent dwellings of plates of tale. Above the kitchen and middle room are lofts or garrets, to which there is access, by a ladder placed in the entrance.

The clothing of the Kamtschadales consists of an upper garment resembling a waggoner's frock, which in summer is made of nankeen, or of skin without hair, but in winter of deer or dog skin, with the hair preserved, and worn innermost; a close jacket of nankeen, or other cotton stuff; a shirt of thin Persian silk, of a red, blue, or yellow colour; a pair of long breeches, or tight trousers, made of leather, and reaching nearly to the ankles; boots of goat, dog, or deer skin, tanned in summer, but, in winter, with the hair turned inwards; and a fur cap with two flaps, which are usually tied up round the head, but, in cold weather, are brought down to cover the neck and shoulders. Their richer dresses, and robes of ceremony, consist of an upper garment resembling that already described, with gloves, cap, and boots, made up of finer furs of different colours, cut into triangular pieces, and neatly joined together, with trimmings of coloured leather threads, and edgings of velvet or sea otter's skin.

The principal food of the Kamtschadales is fish, and especially salmon, which, with little exertion, they can procure in great abundance during the whole summer season, from the middle of May to the end of September. The greater part of this provision is dried or smoked, and stored up for winter use, when it is either eaten like bread, or pulverized and formed into paste and cakes. In preparing the fish for drying, they first take off the belly piece, which is esteemed the best, and is carefully smoked; next a slice along each side of the back bone, which are merely dried in the air; and the remainder, consisting of the back, ribs, and head, are generally deposited, after drying, as provision for the future. When the fish is not dried, but used for immediate subsistence, it is prepared by boiling, or broiling, and sometimes by placing a heap of it on stakes over a large fire, so that it is partly roasted and partly smoked, so as to prove a very savoury kind of food. But the most favourite mode of preparing it, is to bury it, as soon as caught, in a hole lined with grass, and leave it there till it becomes sour, or rather perfectly putrid; and in this state it is eaten with the utmost relish, as the most luxurious repast. The roes of the fish, dried or sourd, afford also a very favourite dish. Several kinds of vegetables, roots, and berries, collected by the women in harvest, form a considerable part of the winter provisions. The berries, made like jam, are used as a general sauce to the dried fish; or are mixed with fish roe, or whale and seal fat, by way of binderings; or are made into a cooling drink for ordinary use. There are two vegetables, particularly, which deserve to be noticed among these articles of subsistence, namely, the sarana, or liliurn Kamtschatienne, and the sweet grass, or heracleum Sibericum. The former affords a bulbous root wholesome, nourishing, and agreeable, which may be boiled like potatoes, or baked in an oven, and then pounded into the form of meal or flour, which is mixed in all the soups, and most other dishes. The latter, resembling sedge, about six feet in height at its full growth, with a hollow stalk, and a white, sweet, pungent down on its leaves and stem. The stalks, after being split and freed from the pith, are dried for future use, and are boiled when wanted to be mixed with other dishes; but the plant has, in later times, been chiefly employed in distillation. In preparing it for this purpose, the stalks are freed from the downy substance, (in scraping off which the women are obliged to wear gloves, as the sap is so acrid as to ulcerate the skin,) placed in small heaps till they begin to heat; and, after being dried, are laid up in sacks of matting, where, in a few days, they become covered with a sweet saccharine powder, which exudes from the hollow of the stem. When taken out for distillation, they are steeped in hot water in a close vessel, where a violent fermentation takes place; and then the whole mass of herbs and liquor put into a copper still, yields a spirit called raka, as strong as brandy, in the proportion of 25 pints from 72 pounds of the plant. They make several decoctions from various other plants; and drink, without any kind of mixture or preparation, the liquor which flows from a dwarf-birch, and which they procure by simply tapping the tree.

The furniture of the Kamtschadales consists only of a few of the most necessary cooking utensils; and the place of chairs, beds, tables, is supplied by the benches, covered with skins and mats, around the walls of the apartments. Several of their instruments are neatly made; and others sufficiently coarse. A hollow stone filled with fat, with a bit of rag as a wick, constitutes the lamp, the smoke and smell of which are intolerably pungent. From a coarse kind of grass, which grows plentifully along the coast, they make a strong matting to cover their floors, beds, &c.; and from the same materials they form baskets, bags, sacks. From a plant growing in the marshes, and resembling cyprioides, they gather a sort of down, which they card like wool, with an instrument made of the bones of the sea-swalow; and with this soft substance they swathe the new born children, and also make a kind of wedding, to give additional warmth to different parts of their own clothing. From the nettle, which they cut down in August, and hang around their houses to dry, they form a useful kind of hemp, which they spin into thread with a spindle, and manufacture into cordage, for fishing nets and other purposes. For
Boats and sledges.

The principal other articles which they must still provide for themselves, are boats and sledges. The former are of the most wretched description, being nothing more than the trunk of a tree hollowed out, and resembling a trough more than a boat. They are easily overset in the currents of the rivers, or by striking against any obstruction during the rainy season, and are often abandoned, without any instance of persons being drowned by such accidents on the Kamtschatka and Awatscha rivers. In the northern districts, where timber cannot be procured, the boats are made of still more slender materials, namely, of the skins of sea animals sewed together with whale's whiskers, and caulked with moss or beat nettles. This vessel is seldom able to carry more than two persons at one end, who make use of poles instead of oars to guide it down, or push it up the stream. Sometimes a kind of float, or raft, resting upon two of these boats, is employed to convey the heavier articles. The sledge of the Kamtschadas is formed like an oblong basket, with the two extremities rising in a curve, and is made of very thin wood, with the sides of open work, ornamented with straps of different colours. This basket, or frame, which is about three feet in length, and scarcely above one foot in breadth, is placed upon two parallel planks, longer than the sledge, and three or four inches broad; which serve as supports, or skates, and in time of thaw have long pieces of whole-bone fastened to their bottom with leather thongs. These planks bend upwards in front, and meet the poles which support the seat of the driver, which is elevated three feet from the ground, and covered with bear skin. The whole machine is remarkably light, sometimes weighing only about ten pounds. To these vehicles the dogs are harnessed by means of a leather strap, which passes under the neck, resting on their breasts, and is joined to the sledge by traces. The animals being yoked in couples, are also fastened together by straps passing through their collars; but a single one goes foremost as a leader, and is always the best trained, and most intelligent in understanding the signals and sounds of the driver. There are always five, or at least four, dogs yoked to each sledge, which are able to draw two persons, or the driver and his over-weight of baggage; but they may be employed in a much greater number; and Krusenstern mentions a governor in the country, who used to travel in a sledge like a small house, drawn by 100 dogs. The animals are trained to this service by being fastened, when young, to elastic stakes, while their food is placed beyond their reach; so that, by continually pulling in order to obtain a meal, they acquire strength, and the faculty of drawing. They learn to obey the voice of the driver, in setting off, stopping, turning to right or left; but those that are well trained, are guided rather by signals than sounds. For this purpose, the driver carries in his hand a curved stick, which he employs also to preserve the sledge from being overset, and which is sometimes pointed with iron, to take a firmer hold of the ice; while the other end is provided with iron rings, which serve as bells to encourage the dogs. He turns them to the left, merely by striking this stick upon the ice; or to the right, by striking the poles of the sledge; or stops their progress, by placing it between the snow and the front of the vehicle; or corrects them, when inattentive, by throw-
A single hunter will engage in this attack; but more frequently in company with others. As they seldom fire till the animal be within fifteen yards of the spot where they are stationed, they have rarely time for a second discharge; and, if they should not have succeeded in disabling him, they must receive his furious onset with their spears; and, unless fortunate enough to inflict a mortal thrust, not unfrequently fall a sacrifice to his vengeance. The bear is most apt to make these assaults upon the huntsman in the beginning of spring, when he comes famished from his winter retreat, and in autumn when in quest of the female; but, at other times, he more commonly takes to flight when wounded, and is traced by the blood to his retreat.

By very recent accounts, it appears that, from a failure of fish on the coast, the bears became so ferocious during the winter of 1816-17, as to attack and devour many of the natives, and also to destroy one another.

They are employed in fishing at different periods during summer, but particularly in May for herring; in June for salmon; and in the remaining months for sea-wolves. In killing the latter, they employ harpoons, and large nets, made of leather thongs, with wide meshes; but for other fish they have smaller nets of pack-thread, which they purchase from the Russians, or of their own cordage manufactured from nettles. They shoot and hawl their nets in the sea and large lakes in the usual manner; but in rivers they commonly stretch one across, and hawl another down the stream. They sometimes erect also a line of stakes and branches of trees, so as to afford only one or two small openings for the passage of the fish; and in these are placed baskets, constructed in such a way, that the fish having entered cannot retreat.

Besides these occupations, the Kamtschadales have their amusements of dancing, singing, and relating of love stories. Their dances are merely pantomimical representations of the motions and gestures of the different animals which they pursue in the chase, but especially of the bear. The performance consists in a succession of unwieldy motions, or rather difficult distortions, of the body, imitating the clumsy gestures of the bear in various situations, especially of the young ones sporting around the dam—of the male fawning on his mate—and of the agitation which any of them exhibit when hard pressed by the hunters. The body is generally bowed forwards, the knees bent, and the arms employed in imitating the motions of the animal, whom they delight to copy. Even his cries are introduced in the course of the drama; and, throughout the whole performance, a kind of forced grunt, or guttural sound, resembling a continued hiccup, is uttered by the dancer, in unison with the time of the air sung by the musicians, or rather by the whole company present. The song is nearly as unvarying in its notes, and unmeaning: its words, as the dance; and both to European spectators are extremely tedious and uninteresting, while the natives discover a degree of exacy in the spectacle, which seems incompatible with the indolence of their habits.

The Kamtschadales are considered as naturally a healthy, though not a long-lived race; and few persons are found among them, who have been deformed from their birth. They are rarely afflicted with the scurvy, which proves so destructive to the Russian settlers; and their exemption from that disorder is ascribed to the liberal use which they make of wild garlic and various acid berries, as a part of their diet. Consumptions are not unfrequent; but the most common diseases are boils, wens, and other tumours of a similar description, which are cured by incision or extirpation, by means only of such instruments as a knife, or even a sharp stone. One of the remedies, which they employ in almost every disease, and especially as an application to all kinds of sores or wounds, is called bear's-root, which they steep in brandy, and to the use of which they are said to have been first led, by observing that the animal, whose name it bears, was fond of eating it, and of rolling himself upon it when he was wounded.

The natives of Kamtschatka were formerly held in great subjection by their doctors, who were called shamans, and who conjoined the arts of magic and medicine. These persons were distinguished by having their garments decorated profusely with mystic rings, and other symbolical metal figures, which made a jingling noise upon every motion of the body; and, by carrying a kind of kettle drum, with which they announced their approach, and accompanied their incantations. They acted the parts also of priests; and, amidst the most extravagant gesticulations, resembling the ravings of the Pythian priestess, uttered their prescriptions and revelations in the name of their idol Koutka. Even the slender religious instruction which the Kamtschadales have received from the Russians, has abolished their confidence in these impostors; and the chaman art is now confined to a few old women, who practise their sorceries with great secrecy. But, though the natives have adopted the Christian religion, they are said to know little more of it than the ceremony of baptism; and the priests sent among them are either utterly incapable of teaching the people, or are in general more attentive to commercial gains than to clerical duties. There are eight principal churches in the peninsula; and all the clergy are subordinate to the archbishop of Irkutsik, from whom they must receive ordination, and an appointment to their cure.

The language of Kamtschatka, is said to be extremely guttural in its sounds, and difficult to be pronounced. The dialects and accents, also, are very various; almost every ostrog having its own peculiarities of speech. The following selection, from a vocabulary by the French traveller, M. De Lesseps, may furnish some idea, at least of its uncouth form:

Commerce. — Formerly the Kamtschatdals received their principal articles of commerce from the Japanese; but of late, the Dutch, and particularly the Russians, have supplied the daily diminishing demand of the country. They imported from Europe different kinds of coarse cloth, serges, knives, silk and cotton handkerchiefs, red wine, tobacco, and sugar; from Siberia, iron and copper utensils, fire-arms, wax, hemp, rope-yarn, nets, tanned rein-deer skins, and the common Russian clothes; from Turkey, different sorts of cotton stuffs; and from China, silk and cotton cloths, tobacco, coral, and needles. The exports from Kamtschatka consist entirely of furs and skins, particularly of the beaver, marten, fox, and otter, all of which pay a duty of ten per cent.

The state of the Russian settlements in Kamtschatka, though founded more than a hundred years ago, was, in 1805, when visited by Krusenstern, in every respect wretched and unpromising. The finest bays were entirely deserted and uninhabited; and not a single boat was to be seen in the beautiful harbours of St. Peter and St. Paul. The shores were strewed with stinking fish cast up by the sea, among which crowds of half-starved dogs were wallowing and fighting. Not one well-built house was to be seen, nor even a beaten path, that might lead safely to the town. A few planks, laid across the small brooks which flow through the valley, served the purpose of bridges. No garden, or meadow, or plantation, or even inclosure of any kind, indicating the least cultivation, was to be seen. The town itself consisted of a few huts, mostly in a decayed state; and, as the inhabitants are generally absent during the day time, scarcely a single person was to be seen; and no other living creature, except half a dozen cows feeding near the houses, and innumerable dogs resting in holes, dug by themselves as a shelter against the flies. As timber, necessary for the construction of proper dwellings, is extremely scarce, and procured only with great labour from the interior of the country, only two houses were observed by Krusenstern, which could be considered as superior to the rest; yet the best of these, the ornament of Kamtschatka, possessed by a person holding the rank of major in the army, had all its windows extremely small, and patched with broken glass, and contained no other furniture than a table, wooden stool, two or three broken chairs, two or three tea-cups, one glass, a few broken knives and forks, and some pewter spoons. "Poverty, or rather misery," says Krusenstern, "was apparent in all the houses. All the necessaries of life, particularly bread and salt, are extremely scarce, and extravagantly dear; and, except where a cow is kept, which few are able to do, even the children have no better nourishment than dried fish and coarse black bread. Nothing is to be found readly, except spirits, and perhaps tea and sugar. The want of gun-powder prevents the colonists from supplying many of their wants; and the greater profit derived from hunting sables than from cultivating the soil, discourages all attention to the pursuits of agriculture, and even of gardening. The want of women in the settlement, and the difficulty of maintaining a family, are obviously most unfavourable circumstances for the increase and the morals of the population. Formerly, also, it was the practice of the Russian government to send those officers to Kamtschatka, whose conduct had not been strictly correct, and whose appointment to such a distant station was regarded as, at the same time, a species of punishment. These persons usually became regardless of their own character, as well as tyrannical in their treatment of those whom they were intended to benefit. Much of this injudicious system has now been amended, and various means adopted for the encouragement of the settlement, as well as for the civilization of the natives. All the latter accounts concur in proving the capabilities of the country to be much greater than had hitherto been understood; and its prosperity once commenced, though slow in its progress, may be expected to be permanently increasing. See Lesiep's Travels in Kamtschatka; Cook's Last Voyage; and Krusenstern's Voyage Round the World, (q)

KANT, IMMANUEL, the celebrated German metaphysician, and author of the Critical or Transcendental Philosophy, was born at Königsberg, in Prussia, on the 22d of April, 1724. It is said that his paternal ancestors were descended from a Scotch family of the name of Cant, and that he was the first who changed the initial letter of his name to K. His father exercised the humble profession of a saddler in the suburbs of Königsberg; of whom, and especially of his mother, who appears to have been a woman of some talents, and great piety, Kant uniformly spoke with feelings of the warmest affection. Although in poor circumstances, his parents seem to have resolved, that their son, Immanuel, should enjoy all the advantages of a liberal education; for, after having been taught to read and write at the hospital school of the suburbs, he was sent to the Collegium Fridericianum; an institu-
tion which was then in high repute as a seminary of
philosophy. At this school, he contracted an intimate
friendship with the celebrated philologer Ruhnkenius,
which may naturally be supposed to have had a salu-
tary influence on the studies of both. It is rather a
remarkable circumstance, however, that at this early
period, the inclination of Kant led him to devote his
attention principally to philology, while the mind of
Ruhnkenius was chiefly directed, by an apparently na-
tural disposition, to philosophy. In their maturer years,
as is well known, these dispositions were precisely re-
versed.

In his old age, Kant dwelt with peculiar pleasure
on the recollection of his early philological studies,
and delighted to have an opportunity of reciting pas-
sages from his favourite classical authors.

In his youth, Kant had the misfortune to lose both
his parents, who had scarcely the pleasure of witness-
ing the dawning talents of their son. The liberality
of some friends of his family, however, still enabled
him to prosecute his studies; and after having com-
pleted his school education, he repaired to the univer-
sity of his native town. Here he applied with ardour
to the mathematical, philosophical, and theological sci-
ences; and his pecuniary means being extremely slen-
der, he contrived to support himself, in part, by assist-
ing other young men in the prosecution of their studies.
After he had finished his university course, he engaged
for some years as a private tutor in several families,
particularly that of a M. de Hullesen, at Arnstorf;
and during this period, he embraced the opportuni-
ties which his retirement afforded him, of collecting a vast
store of knowledge, in almost every department of
science.

Having attained his thirtieth year, and already dis-
tinguished himself as the author of several philo-
sophical tracts, exhibiting great depth of thought, and ori-
ginality of genius, he resolved to devote himself to the
profession of a public teacher. With this view, he returned
to the university, and took the degree of doctor, ac-
cording to the usual forms, in the year 1755. A short
time thereafter, he began to deliver lectures on logic,
metaphysics, mathematics, and natural philosophy; to
which, at a subsequent period, he added the law of na-
ture, moral philosophy, natural theology, and physical
geography. Although his talents were now well known
and justly appreciated, yet he remained in this situation
fifteen years, before he obtained a professorship; which
was, at length, conferred upon him in 1770. From this
period, he continued to discharge his duties, as a pub-
lic teacher in the university of Koningsberg, with fidel-
ty and success, until a few years before his death. He
never changed, nor wished to change his place; riches
and honours seem to have had no attractions for him;
and he is known to have declined several advantageous
proposals that were made to induce him to transfer his
talents to other universities. He died on the 12th of
February, 1804, in the 80th year of his age.

Professor Kant was a man of a very cheerful and so-
cial disposition; and his manners were genteel and affa-
ible. He had none of that awkwardness or reserve,
which is generally held to be characteristic of the scho-
lar and the philosopher. He loved company, and was
both inquisitive, and fond of communicating his own
opinions upon all subjects. His moral character was
unimpeachable; and he appears to have been much
esteemed in the circle in which he moved.

Kant was well advanced in years, before he attempt-
ed to accomplish that reform in metaphysical science,
which he seems to have long meditated. In several of
his earlier productions, however, he evidently appears
to be dissatisfied with the previous theories; and in his
inaugural dissertation, in 1770, De mundi sensibilis at-
que intelligibilis forma et principiis, he exhibited some
of those peculiar views, which were afterwards more
fully developed in his great work, the Critik der reinen
Vernunft. This work was published in 1781. For se-
veral years, it attracted no attention; and the publish-
er, it is said, was on the point of destroying the sheets,
as waste paper, when a sudden demand rapidly carried
off the whole impression. From that period, the phil-
sophers of Germany were divided into professed parti-
zans, and determined antagonists of the doctrines of
Kant; and a multitude of publications issued yearly
from the press, for the purpose of confirming or refut-
ing them.

Of a theory which produced so great a sensation in
that country where it was first promulgated, and which
is still considered by many as having completely de-
stroyed the old metaphysical systems, some account will
naturally be expected in this work. However difficult
the task, we shall endeavour to exhibit such a concise
statement of the peculiar doctrines of the critical phi-
losophy, drawn up from an attentive perusal of the writ-
ings of Kant, and of his most eminent commentators, as
shall, we trust, in some measure, gratify the curiosity
of our readers.

According to the opinions of the greater number of
philosophers, previous to Kant, there existed a science,
in which the principles of purely speculative reason
were applied to objects beyond the sphere of the sen-
sible world. The cultivators of this science were
agreed as to its reality; however widely they might be
at variance with respect to the degree of certainty
which they ascribed to its principles, the extent of
their application, and the nature of their proofs. A
great mass of heterogeneous materials had been gath-
ered together, wrought up into a systematic form,
and presented to the world as the result of abstract
scientific investigation, upon subjects the most inter-
esting to humanity. But, however rich in materials,
and extent of territory, the teachers of this sublime
philosophy had not been very careful to investigate the
foundation upon which the system was constructed,
orracter the precise limits within which its doctrines
could be legitimately applied. Controversies accord-
ingly ensued; these tended to produce uncertainty
and doubt; and various contradictory opinions were successively broached upon some of the
most important subjects of metaphysical inquiry.
An ingenious individual, by a well directed objec-
tion to one element of this system,—the principle of cau-
sation,—produced a sensation in the philosophical world,
which has yet scarcely ceased to be felt. We allude,
of course, to the celebrated sceptical philosopher, Da-
vid Hume. Against him it was in vain to contend
with the old principles, because it was precisely these,
the accuracy of which he disputed. His principal an-
tagonsits, however, instead of boldly meeting him upon
his own ground, abandoned the field; left the whole
science of metaphysics in jeopardy; and made their
appeal to another tribunal,—that of common sense.
Here their triumph was easy and complete; for, al-
though they entirely failed to rescue the science itself,
whose very existence was at stake, from the dangers to
which it was exposed, they, at least, for a time, con-
tried to gain the ear of the public, and to throw the
arguments of their opponent into the shade of impopu-
larity and neglect. The lightness and plausibility of
the empirical philosophy, indeed, could not fail to
give it a decided advantage over the more abstruse
and more rigorous philosophy of the schools. The
oracles of the former, experience and common sense,
were much more accessible to the multitude than the
ability, instead of strict demonstration, was more easily
supplied; and all disputes were soon disposed of, or
thrown aside as mere verbal controversies. The arbit-
rary language, which this philosophy introduced,
rendered it easy for many to become the inventors of
theories; and the analogical reasoning which it adopt-
ed, drew all arts and sciences within its sphere, and
gave it a spacious, though false appearance of universal
application.

In the meantime, the science of metaphysics, once
held in honourable estimation, and dignified with the
proud title of Queen of the Arts, was repudiated and
deserted, treated with scorn or neglect, and left to
complain like Hecuba:

Modo maxima rerum,
Tot gentes antiquae poenae,
Nunc trahor exaul longa.—Ovid.

This science, indeed, might have been irretrievably
lost, and entirely superseded by the air speculations
of popular theorists; had not a philosopher arisen,
endowed with an extraordinary power of intense re-
fraction, a spirit of profound and patient investigation,
and a metaphysical acuteness and perspicuity in the
discovery and development of abstract truths, of
which the world has seen no example since the days of
Aristotle; a man who, to great natural talents, added
the most various and extensive acquired know-
ledge. "Our age," says Garve, himself no mean
philosopher, "has witnessed the labours of one of the
most indefatigable philosophers, who have at any pe-
riod cultivated the territory of the sciences. Whatever
opinion we may entertain of the results of the Kantian
system, as tending to enlarge or set bounds to human
knowledge, it is impossible for us to withhold from its
author that high respect which is due to the unrivalled
application of superior powers of thought, and those
thanks which we owe him for such an exercise of those
powers as comprehends the whole field of philosophy."
(ESSAYS, vol. ii.) Kant thought he perceived those
defects, which had brought metaphysical speculations
into disgrace; and he devoted the labour of a whole
life to a total reform and re-establishment of his fa-
vourite science. The difficulties attending such a
task, however, were many and obvious. From a sys-
tem of doctrines, which had given way upon the first
rude shock of scepticism, he could expect little assistance
or support. It was necessary to begin the pro-
cess of meditation de novo; to subject the cognitive
faculty to a new critical analysis; to determine the
nature and conditions, the objects and extent of its ex-
ercise; and to fix the precise limits of its legitimate pro-
vince. In several of his works, he has given us very
interesting hints on the motives which induced him to
undertake this laborious task, and on the principles by
which he was guided during the progress of his in-
vestigations. The sceptical objections of Hume first
roused him from his dogmatical slumber, and gave a
new direction to his inquiries in the field of specula-
tive philosophy. He was far from assenting to the
conclusions which Hume drew from his premises,
which appeared to him to result from a too limited
view of the subject in question. Had Hume enlarged
his views, and exhibited the problem, of which his ob-
jections embrace only a part, in its whole extent and
bearings,—had these objections, in short, comprehended,
as they ought to have done, the whole of meta-
physical science, it seems to be the opinion of Kant,
that he would most probably have been led, by his
natural sagacity, to the discovery of principles similar
to those which are developed in the critical philos-
ophy.

Kant was now led to investigate the causes of the
different fate which had hitherto attended the science
of metaphysics, when compared with the successful
result of the inquiries of philosophers in other depart-
ments of science. The principles of logic, he observed,
had been incontrovertibly established, and the science
completed, as early as the days of Aristotle. This ad-
vantug, he ascribes, in a great degree, to the narrow
limits of this science: Logic having nothing to do
with objects and their differences, but being solely oc-
cupied with the abstract forms peculiar to the under-
standing. The science of mathematics had likewise
been cultivated with success from the earliest times.
Physical science was much more slow in its progress
than the speculative science, which was by far more
isolated. Metaphysical science, —a science of speculative reason quite isolated, which
soars beyond experience, and is conversant in the re-
gion of ideas,—this science, in which reason is her
own disciple, has not hitherto been so fortunate as
to have acquired the possession of any systematic prin-
ciples, which are recognized as of general application.
On the contrary, its field has been, as it were, the
arena, on which various champions have exercised their
prowess, but where no triumph has been gained, which
was attended with any permanent advantage. How
has it happened, that no sure footing has yet been found
for this science? And by what hint can we profit, in
order to institute an investigation, with the prospect of
better success than that which has attended the efforts
of our predecessors? The remarkable revolutions which
were accomplished in mathematics and natural philos-
ophy, afford us examples worthy of imitation, in so far
as their analogy with metaphysical science will permit.
Hitherto, it has been generally held, that all our ideas
must be accommodated to the objects of our experience;
but all attempts to extend our knowledge a priori, upon
this supposition, have proved entirely abortive. Let
us try, therefore, says Kant, whether we shall not suc-
cceed better in our efforts to solve the problems of me-
taphysics, by assuming, contrariwise, that the objects are
accommodated to the nature of our cognitive faculty;
a supposition which accords much better with the pos-
sibility of our possessing any ideas a priori, i. e. before
the objects are given. This method is similar to that
of Copernicus; who, when he found that he could not
explain the motions of the heavenly bodies upon the
old hypothesis—that the stars revolved round the spec-
tator—tried whether he could not succeed better, by
assuming, that the spectator revolved, and that the stars
remained at rest.

Such was the preliminary train of thought, which
suggested to the mind of Kant the elements of that
system, which he afterwards developed in his great
work, the Critik der reinen Vernunft; a work which,
whatever may be the ultimate fate of the theory it in-
KANT.

Kantian philosophy, will long remain as a monument of the vast intellectual powers of its author. In order to convey to our readers some notion of the principles which this theory proposed to establish, it will be necessary for us to present them with a short abstract of the process of reasoning, adopted by the author in the work to which we have alluded. This abstract, indeed, can be but a mere skeleton,—our limits will admit of nothing more; but we think it will exhibit the peculiar doctrines of the Kantian system, in a much clearer point of view than the method which some have taken, of selecting a few of the detached principles and definitions of the critical philosophy, of which the application and consistency cannot possibly be perceived, without biting them in connection with the whole theory. With the view of rendering the following outline more generally intelligible, we have endeavoured to divest it, as much as possible, of all technical phraseology.

That all our knowledge commences with experience, is a fact which cannot admit of a doubt. But it does not follow from thence, that all our knowledge is derived from experience, as its only source. For it may be, that even those notions which we derive more immediately from experience, are made up of that which we receive through the medium of our senses, and that which our cognitive faculty, called into exercise by our sensual impressions, produces of itself; which latter addition it is difficult to distinguish or separate from the original matter, without long and constant habits of reflexion.

If experience, in a philosophical sense, be the perception of objects as existing in a certain connection, we must have a faculty of perceiving simply, and a power of representing and understanding them, in this necessary connection. The former we call sense; the latter intellect, or understanding. All that we perceive, must be presented to our senses under certain conditions, without which our percipient faculty cannot be exercised. These are the necessary conditions of all perception,—as the eye is the necessary condition of all vision; and, as such, they are not first called into being with the objects, but must have existed previously, otherwise the objects could not have been perceived. These conditions are space and time; the former of the external, the latter of the internal sense, and of all our perceptions whatsoever. All that is perceived by the senses, must be perceived under these conditions; which must, therefore, be necessary, and have existed previously to all perception, although first evolved, or, if we may use the expression, called into activity by external objects. That which is perceived under these conditions, however, is yet no experience: it must be represented, or conceived by the mind, as existing in a necessary connection. This depends upon the operation of judgment. A judgment is an operation of the understanding, by which two representations,—those of subject and predicate,—are immediately combined with each other. Of such combinations there are four species; indicating the relation of the subject to the predicate, of the predicate to the subject, of both together, and of both to the consciousness. To every judgment, one out of these four classes of forms must apply; each must be determined according to these four modifications. If all thought (or conception) depends upon the faculty of judgment, so does all conception of objects. Through the above mentioned forms of the judgment, therefore, we derive the possibility of conceiving objects. Objects may be conceived in as many modes as there are forms of judgment. Objects in general, therefore, may be conceived, 1. as one, as many, as all; 2. as something, as nothing, as limited; 3. as substance or accident, as cause or effect, as common; 4. as possible, as real, as necessary. All that is conceived, must be conceived under these forms. But these forms, as we now view them, are not applicable to any objects. To say that something is possible, real, &c. has no meaning, unless something is added which renders these notions sensible. This something is time. That something is possible, then, means that something can exist at a particular time; and so of the other forms of thought. But even these forms of thought, thus rendered sensible, are still empty and without meaning, unless objects are given us, to which they may be applied. The forms, possible, real, &c. convey, of themselves, no information whatever. I must have something given me, which I can call possible, real, &c.; in short, I must have objects to subject to the operation of thought. But objects can only be given me through the medium of perception; therefore the forms of thought can only be used with reference to objects of perception. As the form of our perceptions renders these perceptions possible; so likewise do the forms of thought render it possible for us to represent these perceptions in a certain connection. They are, therefore, both a priori; the objects of perception, i.e. our experience makes them real.

Hence we derive the following important results. It is in experience alone, that we can have true and real knowledge. All the objects which I would know, must be perceived under the forms of sense, and conceived under the forms of the understanding; and, as such, they are our own particular phenomena, i.e. objects of experience. Whatever objects cannot be perceived under the forms of sense, are incapable of being conceived under the forms of the understanding; such, therefore, are called noumena, or things in themselves. These noumena, or things in themselves, cannot be subjected to the forms of sense; and, therefore, we cannot conceive or know them at all. The possibility of experience is the first principle of all our speculative knowledge. Whatever we cannot perceive under the forms of sense, and represent in that necessary connection, which is determined by the constitution of our understanding, is absolutely beyond the sphere of our knowledge. That which is so perceived, and subjected to the forms of the understanding, is known. That which is thus known is true. Our perceptions correspond with the objects: for the objects can only excite these, and no other perceptions in us; because, from the constitution of our nature, we are susceptible of no other impressions.

What becomes, then, of our boasted speculative knowledge from pure abstract reason? Things in themselves are not cognizable; yet, to convey information with regard to these, was the professed object of metaphysics. Now, if we can acquire any such speculative knowledge, it must necessarily have its origin in the nature of our reason. But in what does reason consist? In the faculty of drawing conclusions. A rational conclusion is the deduction of knowledge from some principle—of the particular from the universal—of the conditional from the condition. In the principle of every conclusion, there is a relation between the condition and the conditional. This relation may be threefold: as that of the subject to the predicate; of the principle to the consequence; of the whole to the parts. But here
we have nothing except the mere form of the conclusions. From hence does reason derive the contents, i. e. the matter? The former may be quite accurate, and yet the latter entirely suppositious. Reason cannot begin this matter in itself; for it can produce nothing but the mere form. Is it innate? Impossible. Matter is an object; and objects cannot be innate in the mind.

Reason, therefore, must derive it from some other quarter; and from whence but from the understanding? The understanding furnishes the matter, that is, its judgments and notions. Reason works up these materials, by taking two notions, to which it seeks a third; which third notion is assumed as unconditional; or, if not, then the further conditions must be sought, even to the last possible. This notion of the unconditional is originally peculiar to reason, and indispensable to its exercise. Now, if the judgments and notions of the understanding are the materials of reason, and if these, as we have already shewn, are only the marks of certain relations existing between the objects and our cognitive faculty, then the working up of these materials, the combination of these judgments and notions, can give us no further information with regard to the objects; consequently, we can neither obtain nor extend our knowledge by means of reason alone. The objects, therefore, with which the science of metaphysics has been conversant, are not cognizable. They are nothing but ideas of reason; that is, certain representations of the unconditional, of the highest unity and totality, which spring from the essence of reason; which serve to render the field of experience a comprehensible whole; and are, therefore, merely conditions of the exercise of our reason, and not real external objects.

What sort of a science of metaphysics, then, can we possibly have? We have already shewn, that there are in the mind certain forms of cognition given a priori, through which alone our knowledge of objects is possible. The exposition and development of these forms —of the forms of perception, of our notions, and ideas—the essential and a priori determined characteristics of all that can be known, and of all that can be thought or conceived, comprehended under rules and general laws, will give us a science of metaphysics, certain in its principles, and secure against all objections. And here we find the limits affixed to our cognitive faculty. On the one hand, it has been shewn, that we can have no science of supersensible things; and, upon the other, that all the laws of the understanding are not derived from mere accidental acquired experience, and consequently neither necessary nor certain; but that they are real laws, resulting from the nature of our understanding, indispensably necessary to all possible experience, and affording a knowledge of given objects true and unclouded.

Such is the metaphysical theory of Kant, as developed in the Kritik der reinen Vernunft. Notwithstanding our anxiety to exhibit at once a comprehensive and familiar view of this theory, we fear that much of what we have said on the subject will not be very intelligible to those, who have not previously been, in some degree, conversant with the principles of the transcendental philosophy. We have, however, purposely avoided rendering it still more obscure, by entering into any discussion of the more abstruse doctrines peculiar to this theory; such as the possibility of synthetic judgments a priori, the critical notions of space and time, the deduction of the categories, &c. These doctrines—upon which the stability of the whole system mainly depends, and which, therefore, been treated at great length in the works of Kant and his commentators—we must leave to the study of such as are desirous of becoming more minutely acquainted with the principles of transcendental metaphysics. The results of the Kantian theory may be stated, we conceive, in a few words. The first principles of our speculative knowledge are mere subjective forms, i. e. forms derived from the constitution of the thinking being; first, the forms of sense, or pure perceptions, (space and time); and secondly, the forms or notions of the understanding, (the categories). These intellectual forms, or notions, however, only acquire reality by their application to our perceptions, with reference to possible experience; and, therefore, we can have no speculative knowledge of things beyond the sphere of experience.

Having dwelt so much on the speculative part of the critical philosophy, we have left no room to enlarge upon the subject of its practical principles, or those which relate to the theory of morals. Our practical reason, according to Kant, is autonomic; it determines merely the form of the will, and postulates freedom as a necessary condition. The moral law appears as an absolute imperative, and dictates, with rigid necessity, universal legality as the general rule of all rational vocation, without regard to any motives resulting from pathological feelings. The ideas of freedom, immortality, and Deity, which are placed entirely beyond the reach of speculation, receive from practical reason reality and certainty, not as objects of theoretical knowledge, but of rational faith.

Besides the critical investigation of speculative and practical reason, and of the faculty of judgment, which he considered as merely preparatory to a new metaphysical system, Kant, towards the latter end of his life, executed some detached parts of the system itself, with great originality, scintillations, and consistency. Some time before his death, he meditated a work, which was intended as the key-stone of his whole system, and which was to have been entitled, The Transition from Metaphysics to Physics, in which he proposed to demonstrate the general application of his principles. The decline of his faculties, however, prevented the execution of this meditated work.

In this country, the writings of Kant appear to be very little known; and consequently, his character as a philosopher is very imperfectly appreciated. Those whose curiosity has prompted them to inquire into the merits of his system, have generally been content to receive their information at second hand, through the medium of expositions and translations, not always very perspicuous or very faithful. Hence it is not uncommon, to hear the name of the author's the critical philosophy associated with those shallow pretenders to science, who have occasionally started up, and contrived to impose upon the world, and to acquire an ephemeral reputation, by the display of crude, inconsistent, and absurd theories. We shall, therefore, conclude this article with the testimony of two authors to the merits of Kant, whose names are both celebrated in the literary annals of their native country; who had both studied the writings, and enjoyed the personal acquaintance, of the eminent metaphysician in question; and who are the less liable to the suspicion of partiality, because they are both known to have been hostile to the principles of his system. The first relates principally to the merits of his theory; the latter, to his character as a man and a philosopher.

"The distinctions," says Garve, "which Kant has drawn between the beautiful and the sublime, in his
The critical review of the faculty of judgment, harmonize extremely well with what he has said, in his moral writings, of the dignity of man. Indeed, it must be considered either as a happy throw of genius, or as the result of a most comprehensive power of thought, that, in those works of Kant which treat of the most widely different subjects, we always find that his notions are perfectly consistent, and even mutually tend to support each other. And again, "Our age, in respect to the progress which it has made in the sciences, will be particularly distinguished by posterity, as having, in different branches of knowledge, brought us nearer than ever to that Socratic wisdom, of acknowledging our ignorance, and the limits of our possible acquirements. For this clearer indication of that which we do not and cannot know in speculative science, we are indebted to Kant; and this merit will assuredly remain to him, even if the efforts which he himself has made to enlarge the province to which he had set bounds, or to fill up the chasms he discovered in science, should not ultimately be found to stand the test of future investigations." (Garve's Miscellaneous Writings, vol. ii. p. 415.)

Herder, in a work entitled Briege zur Beförderung der Humanität, expresses his opinion of Kant in the following terms: "I have enjoyed the happiness of being acquainted with a philosopher, who was my preceptor. In the bloom of his life, he possessed the gay hilarity of a youth; which, I believe, still attends him in his old age. His open forehead, formed, as it were, for thought, was the seat of undisturbable cheerfulness and joy. The language that flowed from his lips was rich in thought; wit and humour were always at his command; and his lectures were the most instructive converse. With the same spirit with which he reviewed the doctrines of Liebnitz, Wolf, Baumgarten, Crusius, and the like others, he prosecuted the investigations of Kepler, Newton, and the experimental philosophers; he took up the new writings of note which appeared from time to time—Rousseau's Emilius and his Heloise, &c. as he did every new discovery in natural philosophy—subjected them to the test of criticism, and always returned to the simple and unprejudiced knowledge of nature, and the moral worth of man. The history of man, of nations, and of nature, natural philosophy, mathematics, and experience, were the sources from which he drew his knowledge, and enlivened his conversation; nothing that was worth knowing was indifferent to him; no cabal, no sect, no advantage, no ambition of a name, had the smallest charm for him, when compared with the extension and development of truth. He encouraged, and even agreeably forced, his pupils to exercise their own powers of thought; for despotism was a stranger to his mind. This man, whom I name with the highest gratitude and respect, is IMMANUEL KANT. His image is before me, and I contemplate it with pleasure.

The following is a list of the writings of Kant:

Gedanken von der reihen schätzung der lebendigen Kräfte, Koningsberg, 1746, 8vo; Allgemeine Naturgeschicht und Theorie des Himmels, 1755; Principiorum primorum cognitionis metaphysica nova dilucidatio,--a dissertation, or thesis, on taking his doctor's degree, in 1755; Einzig möglicher Beweis grund zu einer Demonstration der Daseyns Gottes, 1763; Beobachtungen über das Gefühl des Schönens und Erhabenen, 1764; Träume eines Geistersehers, Riga, 1766; De mundi sensibilibis atque intelligibili forma et principii, Konigsberg, 1770,--a dissertation, or thesis, on obtaining his professorship; These, with a number of other tracts, in which the author discovered an intimate acquaintance with the principles of the sciences, and great depth and originality of thought, were collected and published by Tieftunk, in 3 vols. 8vo. Halle, 1799.

In the following works, his peculiar views of metaphysical science were more fully developed.

The biography of Kant has been attempted by various individuals among his countrymen; but a concise account of the life, and delineation of the character, of this philosopher, with a perspicuous view of his doctrines, is still a desideratum. (2)

KAROLIN. See PORCELAIN.

KARAK, or GARAK, the Icarus of Arvian, is an island on the eastern coast of the Persian Gulf. It is about seven miles long, and four breadth, or, according to Captain Goodfellow, it contains twelve or thirteen square miles. At the north east end is a bay where there is a good anchorage, and which is commanded by a strong castle, built upon the extreme point. The island was uninhabited till the year 1760, when it was surveyed by a Dutch gentleman, who reported his observations to the government at Batavia. He was immediately sent back, with several ships laden with articles necessary for building the castle and the town, and with a great quantity of European and Indian goods. Having completed their establishment, they proceeded on an active trade for six or seven years. A Persian prince, who lived at Bandareak, took possession of the island, and built several vessels, with which he carried on the trade of a pirate for some time. The Persians, however, succeeded in getting the island into their hands. The inhabitants, who, when the Dutch possessed the island, amounted to about 2000 or 3000, amount at present only to 300 or 400. They live by gardening and fishing, and manufacture a small quantity of cloth for their own use. The greater part of the island is very rocky; but the eastern side, which is lower than the rest, is capable of cultivation. It is well supplied with water from wells. Sir John Malcolm proposed to our government, in 1808, to take possession of the island, in order to get a complete command of the commerce of the Gulf of Persia. It is situated in East Long. 50° 10', and North Lat. 29° 11'. See Millburn's Oriental Commerce, vol. i. p. 127; and Macdonald Kinney's Geographical Memoir of the Persian Empire, p. 18, 168.

KARATSAKH, or KARATSCHOLI, a tribe of Tartars dwelling at the foot of Elbrus, the most lofty mountain of the great ridges of Caucasus. The name Karatschali, is said to signify the Black Rivulet, and by some other tribes, the people of this tribe are called Black Circassians. Their abodes are on the rivers Chursuk, Kuban, and Teberdeh, towards the northern base of the mountains bounded by the Abascians on the west; and from the same people they are divided by various mountains on the north and east. Lamberti conjectures, that the appellation Black Circassians, has been given them from the dark and cloudy nature of their country.

The personal appearance of the Karatschali is in general handsome; they are well shaped, their features appear...
are remarkably delicate, they have large black eyes, and a fair complexion. They bear a strong resemblance to the Georgians, and none are ever seen with the broad flat face, and oblique eyes, which denote the blood of the Mongols. The men wear woollen garments like the Circassians, resembling a close surtout: the women, on going abroad, dress in cloth and furs; but, in the warmest weather, have only a light under garment of white cotton. When of more advanced age, a white handkerchief is worn over the head, but the younger females have a cap of silver lawn, and plait their hair, which is tied with a white ribbon, and falls down their backs after the Circassian fashion.

The houses of the Karatschai are built of fir, with very small windows; they have no fire-places, and are kept extremely clean. They sleep on carpets and pillows, resting on wooden bedsteads, little elevated from the ground. The principal utensils consist of a variety of copper kettles, which are brought by the coast of the Black Sea from Natalia.

As the territory inhabited by this tribe is fertile, abundance of wheat, barley, millet, and tobacco are obtained by cultivation; and plenty of game is found among the woods. The Karatschai keep many sheep, asses, mules, and horses, the last of small size, but strong and spirited, and admirably adapted for travelling among the mountains. On growing old and unserviceable, the tail and mane are cut off, and they are turned out to feed in the woods, where they become very fat, and being killed, the flesh is dried for winter provisions. The Karatschai make a kind of beer resembling English porter, another beverage called basma, and they also distil a little brandy from wheat and barley; but the former is chiefly used, strong liquors being forbidden by their religious precepts. Formerly they were very fond of pork, now it is held in abstinence, and the person touching a hog is deemed impure. They are indebted for this inconvenience to the labours of a Turkish missionary, who converted them to the Mahometan religion about the year 1782. The Karatschai were formerly pagans; they are entire strangers to Christianity, and being of the Sunnite faith, entertain an inveterate antipathy against other sects. They hold the principles of the Koran in strict observance, deeming it a great crime to omit the fasts and prayers prescribed by it. They are, however, exceedingly superstitious, believing in malevolent demons which haunt the mountains; and of which they relate numberless stories. Divination is also in vogue, especially to anticipate the success of the chase. Forty-one pebbles, peas, or grains of corn, are disposed in a certain arrangement, and, from particular rules, conclusions are deduced. Should theomen prove propitious, they hasten to fulfill their object; should it be adverse, nothing can induce them to attempt it.

On the decease of an individual, the women howl, heat their breasts, and tear their hair. The men attend the funerals, lash themselves on the forehead, and mangle the lores of their cars with their knives. But, on returning from the funerals, their grief is drowned in copious tears of their.

Parents generally seek out a suitable match for their son; as it is not customary for him to communicate his design of marrying to them, lest they should disapprove of his choice, and prevent the match. When they have decided, the parties are betrothed, but the marriage is deferred six months, or a year; nor during all that time are they permitted to see each other. Neither can the youth enter into conversation with the parents of the female until the union has been actually completed; and it is even judged indecorous that he should sit in their presence. Previous to marriage, the parents of the bride receive a kotin, or present, which is called the price of blood; and if the bridegroom be wealthy, he sends her a complete dress, which she puts on when conducted to him in the evening by a train of youths. On the wedding-day, an entertainment is given by each at their respective dwellings, but only to those of their own sex, excluding the other; and festivities ensue for three days, accompanied by particular dances, performed by the youthful of both sexes. In general, the Karatschai have only one wife; some among them, however, have two or three, with whom they live in perfect felicity; and, contrary to the practice of other mountaineers, treat them with kindness and affection. The common people live with their wives, who are permitted to see and converse with strangers. Among the higher ranks, each wife has a separate habitation; no one may approach her, except her husband, whose visits are never in the day-time, but only at night. Should the wife of a person of high rank have no offspring, his male illegitimate offspring may succeed him, who becomes recognised and possesses all property; equally, as if they had been of lawful birth. Cases of seduction or adultery become a matter of public interest. The seducer is conducted to the mosque, and there tried by the elders of the tribe, who banish him from their territories. The father turns his disowned daughter, and the husband his adulterous wife, out of the house, nor is either ever forgiven; and sometimes the affair terminates in the death of the offender. The disgraced family then quit the country, to conceal their shame.

Three different ranks seem to be acknowledged among the Karatschai; first, princes; secondly, nobles; and thirdly, commons or peasants; but all are tributary to the Circassians, who are considered their only superiors. There are three families of princes, who are entitled to exact the attendance of the nobles in their equestrian excursions; and they may, besides, take the use of any person's horses, provided these be soon returned: but it does not appear that they derive any revenues from the tribe. They marry the daughters of the Circassian nobles, who take their daughters for wives reciprocally. Thus, on the whole, they should only be considered nobles of the highest rank. Neither do they seem to enjoy any real authority over the people, though they exert their influence among them. Important matters are discussed by an assembly of the elders in their mosque. Should a son be disobedient to his parents, he is placed at the door of the mosque, and seriously exhorted to reform. If the admonition proves ineffectual, his parents, after providing him with a few necessaries, turn him out of doors, which he is never again permitted to enter, and disown him; and should his conduct still prove reprehensible, he is expelled from the village for life. The Karatschai swear by the Koran to observe their agreements; and a violation of the bargain is attended with forfeiture of five or ten sheep to the village. After paying this penalty, the covenant is renewed; and no instance is known of its being infringed a second time.

Children are brought up in a strict and commendable manner. Many persons commit the education of their sons to the priest, or muulla, who instructs them in reading and writing, in which having obtained proficiency, they are appointed to chant the Koran in the mosque.

The Karatschai are the most polished and best disposed...
Karatchai, a seced tribe of any inhabiting the Caucasian mountains, and surpass all their neighbours in wildness of manners. The rich lend oxen to the poor; present them with donations; or find them such employment as enables them to subsist in comfort. Though easily exasperated, they are as easily pacified, and prone to acknowledge their errors. Treachery is so rare, as scarcely to be known to them even by name. Should a native be guilty of it, or a stranger find his way among them as a spy, he would literally be cut to pieces. To the Kabardin princes, their superiors, they pay the utmost respect.

The Karatchai dwell in a fertile country, from which subsistence can readily be obtained: they are industrious, and practise agriculture, but are incapable of manufacturing those articles which require skill. Their arms, which are guns, pistols, sabres, and daggers, they procure from the Circassians. All the cloth of their apparel is manufactured by themselves, and it is, besides, much esteemed throughout the whole of Caucasus. The females go little abroad, and are occupied in the manufacture of gold and silver thread, and in making clothes for the other sex. Their commerce is very limited. Furs of various wild animals, obtained in the woods and mountains, are either sold to foreign traders, or kept for carpets, whereon they kneel in prayer. A surplus of their woollen cloth, as also felts for carpeting and hoods, are exported to the Circassians, and a Turkish fortress now occupied by the Russians, called Tschuschukule, or Sochumkalah, on the coast of the Black Sea. Some tobacco, of which they are excessively fond, is disposed of to the neighbouring tribes, who export it to Russia. One of these is likewise supplied by them with lead and sulphur: great quantities of cornel berries, which grow in the woods, are preserved in honey, and sold to the Turks and Kabardians: but their own country being too cold for bees, they procure it from the latter for this purpose. From them likewise they get salt, and articles of Russian produce; and for their other commodities, are received in return, tobacco-pipes, which are in great demand, Turkish tobacco, otter skins, copper kettles, needles, thread, and silks, and cottons.

The Karatchai inhabit a village, sometimes called by the same name, and sometimes Elbrus, consisting of 250 houses, distant about ten miles from the southern base of the mountain, and thirty north-east of another mountain, called Dshuman-taw, at the confluence of the rivers Chursuk and Kuban. A tribe called Ursouly, dwelling on the elevated ridge of Tschalpach, belongs to the same people, and is ruled by a Kabardin prince. The whole nation seems limited to 4000 families.

Very little is preserved of the history of the Karatchai. Abulghasi Bahader Khan, the prince of Karazm, who bestowed so much attention on the history of the Tartars, is silent regarding them. But about the same period wherein he flourished, namely, the middle of the seventeenth century, they are mentioned in general terms by Lamberti, the Italian missionary. He remarks that they spoke the Turkish language, and expresses his surprise how they could have preserved it in such purity, amidst the variety of surrounding nations. In his time they were invaded by some of the mountainers, who being repulsed, a number of women in military accoutrements were found among the slain. Being brought to the prince of Mingrelia, he promised great rewards to the Karatchai, if they could take one of these Amazons alive. Both arms and accoutraments were seen by Lamberti, who gives a very minute description of them. Of later years, the inroads of the Russians among the Caucasian tribes, and the desire of their government to become more intimately acquainted with the territories over which they claim authority, have exposed some singular and interesting features in the history of the mountainers by which they are inhabited. (c)

karly, or carli, is the name of a village between Bombay and Poonah, where there are several excavations similar to those of Elephanta and Ellora. See Lord Valentia's Travels, vol. ii. p. 163; Moor's Hindoo Pantheon; and Mrs. Graham's Journal of a Residence in India.

KARMATHIANS. See CARMATHIANS.

KASAN. See KAZAN.

KASHNA. See KASSINA.

KASIDEANS, or ASSIDEANS, were a religious fraternity among the Jews, who bound themselves to adorn the porches of the temple of Jerusalem, and preserve it from decay. Seager maintains, that the Essenes were descended from them.

KASSINA, or CASHNA, is a kingdom of Africa, situated to the north of the Niger, between the kingdoms of Bornou and Tombuctoo. This kingdom has such a striking resemblance to that of Bornou in its soil, climate, and productions, as well as in its form of government, and in the manners of the people, that we must refer the reader, in those points, to an account of that kingdom.

There is a considerable difference, however, between the two kingdoms, in language, currency, and in certain articles of their commerce. The currency of Kassina consists of cowrie shells, of which 2500 are equal to 10s. 14d. Sterling. The merchants of Kassina supply all other nations with the salt which is obtained from the kingdom of Bornou. The lakes in which this valuable commodity is found, are 45 days march from Agadez, and are encircled by the burning sands of the Desert of Bilma. A thousand camels are employed in the caravans, which are engaged in this profitable trade. The other articles of commerce which the kingdom of Kassina affords, are gold dust, slaves, cotton cloth, senna, goatskins, ox and buffalo hides, and civet; and in exchange for these, they receive cowries, horses, red caps, check linens, coarse woollen cloths, baike, small Turkey carpets, Mesurata carpets, silks, tissues and brocades, sabre blades, Dutch knives, scissors, coral beads, small looking-glasses, and nuts, which communicate a pleasant bitter by infusion.

The rapidity of the Niger in its passage through the kingdom of Kassina is so great, that vessels are unable to ascend the current. In the proceedings of the African Association (1792), Agadez is said to belong to Kassina, but Horneman states, that it is the capital of an independent kingdom called Asen. The city of Kassina is 650 miles W. S. W. from Bornou, and 690 E. S. E. from Tombuctoo. It is situated in East Long. 11° 34', and North Lat. 14° 16'.

Katmandu. See KATHMANDU.

Katman. A Kaffir, an eminent female painter, was the daughter of an artist, and was born at Coire, the capital of the Grisons, on the 20th October, 1740. Her turn for painting was carefully cultivated by her father, who took her to Milan at the age of fourteen, and afterwards sent her to Rome, where she soon acquired the reputation which was due to her talents. In the year 1765, she came to England with Lady Wentworth, the wife of the British ambassador at Ve-
nice, and was there received in the most flattering manner. Her happiness, however, was distinet to be of short duration. The footman of a German count, who personated his master, contrived to get himself introduced at court, and persuaded Angelica to marry him. The deception, however, was soon discovered; and it was only by paying him £300, that he came under an obligation to return to Germany, and cease to molest her. She afterwards married an Italian painter of the name of Zucchi; and, after a residence of seventeen years in England, she returned with him to the Grecians. Some time afterwards she settled at Rome, where her house was the resort of artists and men of genius of all countries. She died at Rome, on the 5th November, 1807, in the 67th year of her age, and she was honoured with a splendid public funeral, which was under the direction of the celebrated Canova.

Kazan, or Kazan, is a city of Russia, and capital of a government of the same name, situated on the high bank of the river Kazanka, about five versts to the left of the Volga. It consists of a strong fort, built with stone—of a town, built of wood—and of several suburbs, one of which is inhabited by the Tartars. There are here several churches built of stone, and eleven convents. At one end of the town is a cloister, consisting of a church, the produce of which is bought by government at a fixed price, for the purpose of clothing the soldiers. It has also been long celebrated for its manufacture of Russian leather. In the convent of Scandova, which is situated about two versts from the town, on the river Kazanka, is a school for the education of the Tartars, who are instructed in the Russian and Latin languages, in the elements of philosophy, and in the principles of the Christian religion, in order to qualify them as preachers. Kazan is also the seat of an arch bishop. The garrison of the city consists of three regiments, for the use of whom there is a good hospital. The surrounding country is fertile in wheat, barley, oats, &c.; and to the north and east are extensive woods of fine oaks, which are conveyed to St. Petersburgh for ship-building. The city was consumed by fire in 1740 and 1752. Its distance from Moscow is 400 miles north, and from St. Petersburgh 600 south-east. It is situated in East Lat. 49° 3′, and in North Lat. 52° 45′.

Keft, Keph, or Copts, is a town of Egypt, situated on a canal made from the right bank of the Nile. At a village to the north of the town, are the ruins of a small temple. There is a lake about 300 paces long and 200 broad, to the east of the high ground of the old city, which seems to have been a reservoir for the supply of the town. Over the canal which rises to the south of this, are the remains of two bridges, one of which has five piers, but no arches; large stones being laid from one pier to another. Distance from Cairo 250 miles south, East Long. 32° 0′, and North Lat. 27° 59′.

Keill, John, a celebrated mathematician and natural philosopher, was born at Edinburgh in the year 1671, and studied in that university under the celebrated Dr. Gregory. In 1694, he entered Balliol College, Oxford, where he acquired considerable reputation, by reading private lectures on experimental philosophy. He succeeded Dr. Millington in 1700, as Sedleian professor of natural philosophy. In 1708 he was elected a fellow of the Royal Society. In 1709, he went to New England, as treasurer to the Palatines, and upon his return in 1710, he was chosen Savilian professor of astronomy in Oxford. About the year 1711, he was appointed by Queen Anne, decipherer to her majesty, an office which he held till 1716. Having been seized with a violent fever, he died on the 1st September 1721, in the 50th year of his age. The following is a list of the principal works of Dr. Keill:

An Examination of Dr. Burnet's Theory of the Earth, with some remarks on Mr. Whiston's New Theory of the Earth. Lond. 1698. A second edition of this work appeared in 1737.

An edition of Euclid, with two tracts on Trigonometry, and the nature of logarithms, 1713.

Introductio ad Veram Astronomiam, in 1701, which was afterwards translated into English.

His papers in the Philosophical Transactions, are:

4. Theoremata quaedam infinitiam materiae divisibilitatem spectantia. 1714. No. 357. p. 82.

Observations on Mr. John Bernoulli's remarks on the inverse problem of Centripetal Forces, with a new solution of the Problem, 1714. No. 358. p. 91.

See our life of John Bernoulli, for an account of our author's quarrel with that mathematician; and our article Fluxions, for an account of his dispute with Leibnitz.

Keith is the name of a town and parish of Scotland, in the county of Banff. The new town of Keith was founded in 1750, by the Earl of Findlater, upon a barren moor, which was let in lots of 30 feet by 70. Manufacturers speedily formed establishments, and the town gradually increased. Flax dressing, spinning, and weaving, afford employment to many of the inhabitants. In 1791, the population of the town was 1075. In 1800, the population of the whole parish was 2280; and in 1811, it was 3352. See Sir John Sinclair's Statistical Account of Scotland, vol. v.

KELAT. See MEXIKAN.

Kelp is the produce of the burning of certain Fucis, as particularly specified under that article, and rendered useful in the arts, by the quantity of soda and of neutral salts which it contains, being in the form of greenish or brownish masses approaching to black. It has become an object of great attention to individuals, from the value which the manufacture of it adds to those landed estates which have any great extent of sea shore adapted to the raising of the fucis; and by public bodies, especially the Highland Society of Scotland, it is cherished as an important internal resource, by which the wealth of the country is extended. This active body has made many laudable exertions for discovering the means of cultivating it to advantage, and of turning it to account in the other manufactories to which it is applied. In the first volume of their prize essays and transactions, we have, from the late Dr. Walker, an excellent account of the manufacture, in the state in which it existed at the time when the essay was written; together with valuable suggestions for improving its quality, and for enlarging the manufacture, by the cultivation of sea-weeds. We have also the subsequent extended observations of his successor, Professor Jameson, which were first published in his account of the mineralogy of the Scottish isles. Considerable precautions are required, both in the gathering, drying, and
burning of the fuci, in the treatment of the ashes, in their fusion, and the degree of exposure to the air during these processes, as the alkali is apt to be dissipated, by neglect or excess, in a variety of particulars. A knowledge of the most advantageous process in burning is still a desideratum; and, at the present moment, (1818,) the Highland Society holds out the promise of an honourable testimony of its approbation, to the author of the best satisfactory experimental account of that subject.

Till very lately, it seemed a matter of difficulty among manufacturers who purchase kelp, to assure themselves of the comparative value of different cargoes. The processes of chemists for estimating the amount of alkali contained in it had been various, and some of them appeared to imply a degree of trouble in the manipulation, which was too inconvenient, and perhaps too uncertain, for habitual application to mercantile use. To remove this disadvantage, was one object with the Highland Society, for which they offered two of their prizes. In consequence of which, we have two judicious essays on the subject, both deemed worthy of the proffered mark of encouragement, one by Dr. Frye, and another by Mr. Parkes. The first of these is most extensive in its objects, and in a form best adapted to direct application to practice. Meritorious new discoveries are sometimes inferior in utility, to the well executed task of rendering those available which are already made, pointing out the most judicious choice among many proposed expedients, and removing from the minds of those concerned all discouraging impressions of the difficulty of the subject. This essay has for one chief object the comparison of kelp and barilla; an important problem, as leading us to discover how far the domestic falls short of the foreign article, and what hopes may be encouraged of rivaling the latter in the market, without the aid of the questionable policy of a heavy duty, tending to exclude from our manufactures the employment of the cheapest article. We shall follow the order in which the subject is treated in the essay now mentioned.

The soluble part of any fair sample of kelp is separated by boiling it in water, after it has been duly comminuted. The proportion of it that was found in the experiments of Dr. Frye, varied from about one-third to two-thirds of the whole. The constituent parts of it are ascertained by two different processes; the one consists in the application of the different chemical tests to the whole in a state of solution, the other in making it yield its saline ingredients in a crystallized form by the process of evaporation. The effects produced on the vegetable colours show the presence of an alkali, either uncombined, or in union only with the carbolic acid. This is well known to be soda. A quantity of potassa likewise exists in it, and shows itself, by giving with sulphuric acid a precipitate which is soluble in the muriatic acid. There is no neutral salt with an earthy or metallic base. The existence of such a compound is excluded by the superabundance of free alkali, and this absence is confirmed by the employment of the tests, by which such base would be detected. The presence of sulphuric acid is shown, by a precipitate formed with the muriate of haryta, and which is not soluble in muriatic acid. The presence of muriatic acid is shown, by the insoluble precipitate the muriate of silver formed when it is treated with nitrate of silver. Other experiments were made, by which the following ingredients, besides the alkali, were found to be contained in 100 grains of the saline matter.

These were in combination with as much of the alkaline bases as was sufficient for their saturation. Experiments were made, to shew in what state of combination they existed, by observing what salts make their appearance in evaporation; but these are now superseded by the subsequent ingenious researches of Dr. Murray, on the analysis of mineral waters and the waters of the sea, (see the Transactions of the Royal Society of Edinburgh, vols. vii. and viii.) from which it appears, that the same solutions afford neutral salts differing in chemical constitution according to the process by which these formations are separated; and consequently, that all the knowledge that is within our reach is obtained, when the proportions of different acids and bases contained in any mixed solution are determined. These ingredients were the same in the saline matter procured from different specimens of kelp, though in various proportions.

The principal object which was wanted, was an easy method of ascertaining the quantity of alkali contained in different specimens of kelp. Mr. Kirwan had employed a solution of common alum, and judged of the quantity of alkali by the quantity of aluminous earth which the solution was found capable of precipitating from the sulphuric acid, to which in that substance it is united. By this method, he shewed in a paper contained in the Irish Transactions, that Curnamore kelp contained of soda, 3.497 per cent. And when deprived of sulphur by the action of carbonic acid, Strangford kelp, 1.25.

Professor Jameson made experiments on different kinds of kelp by the application of this test, and also by that which was first recommended by Dr. Black, viz. the neutralization of an acid of a given strength. In his experiments,

Dr. Frye very properly gives the preference to the method of Dr. Black, as simpler and more easily employed by all who have any interest in knowing the value of different cargoes; and the strength of the acid must be in the first place perfectly known. This is conveniently done by using sulphuric acid, the strength of which is readily ascertained by its specific gravity. A given weight of kelp reduced to powder, is mixed with a given weight of boiling water, allowed to remain in mixture several days, and frequently shaken. One half of the clear solution is poured off, and this is saturated with the acid, litmus paper being employed as the test of the point of saturation. The quantity of acid which it has required is ascertained by using a small measure divided into grains, in adding the acid in successive portions. The results of this test on 35 specimens are given, from which it appears that the proportion of alkali varies from 1 to 6 per cent. and that

the kelp, even at the same place, varies considerably, depending, no doubt, on the circumstances which occur during the manufacture. This last circumstance renders it of importance, that the purchaser should always be able to judge of its value. It is shewn in the same paper, that for want of some method for this purpose, high prices are sometimes given for very indifferent articles. £1 per ton was given for kelp containing 41 per cent. while £11, 11s. was given for an article containing less than one per cent. It is on this ingredient that the value of kelp to the soap-maker depends.

The following statement is given, of the composition of the insoluble part of kelp, as ascertained by experiment.

Compared with barilla.

The quantity of uncombined alkali in barilla, was found to be more uniform than in kelp, and the average about 11 per cent. The whole soluble matter amounted to from one-half to two-thirds. In all respects, the number and kind of ingredients in kelp and barilla are the same, with the exception of iodine, which is contained in kelp, but not in barilla.

The manufactures in which kelp is employed, are principally soap-making, bleaching, and glass-making. The soap maker and tleischer use the soluble parts alone; and these are only so far valuable to them, as they contain uncombined alkali, or can be made to yield it. After the soda is extracted, an additional quantity of this alkali may be procured from the sulphates. For this purpose the spent lees are mixed with saw-dust, or waste tanner’s bark, and a portion of lime is added; these are exposed to an intense heat, with the free access of air, in a reverberatory furnace.

—The effect of this process is to decompose the sulphuric acid, in consequence of which the alkali is set free; and though this alkali should consist partly of potassa, yet it is the soda that is obtained free, as the potassa evolved detaches it from the muriate of soda, by combining with the acid of this salt. The combustion of the carbonaceous matter employed produces a quantity of carbonic acid, by uniting with the oxygen of the sulphuric, and this carbonic acid combines with more or less of the alkali, set free from the more powerful acids. The sulphur obtained by the decomposition of the sulphuric acid, unites with the lime to form a sulphuret. The muriate of potassa, formed in this process, is obtained by evaporation, and purchased by the alum manufacturers. The remaining lees contain iodine, which may be separated copiously, by the processes described under our article Iodine, to which the reader is referred for a full account of that singular substance.

As the soluble matter is thus valuable, and it is of some importance to be able to determine the total quantity of it contained in a given portion of any particular kelp, Dr. Pyfe proposes, as the readiest method of doing this, to extract it from a given weight of the kelp, by means of a determinate proportion of water, and then to use the common means for determining the specific gravity of the solution. To assist this process, he gives a table of the specific gravities of solutions of different degrees of strength, varying from 1 to 20 per cent.

</table>

Two ounces of finely ground kelp may be put into a tall narrow glass; on this six ounces of water may be poured, and the height of the liquid marked on the glass. It may then be boiled gently for an hour, the whole returned into the glass, and a quantity of water added, till it rises to the mark. The specific gravity of a clear portion of this may then be ascertained, and, as six times the weight of water was employed, the proportion per cent. is to be multiplied by six.

When the whole quantity of soluble matter is ascertained, and also the quantity of uncombined alkali, or alkaline carbonate, it may be of use to determine the proportion of sulphuric acid, by treating it with a mixture of barytes, and weighing the precipitate afforded.

This will show what proportion of alkali may be obtained by the application of heat to the soap’s lees, mixed up with saw-dust, or other carbonaceous matter.

The insoluble residue of kelp, is used by the glass-makers for preparing the coarser kinds of glass. When obtained from the soap-boiler, it contains a quantity of lime, which it has added to it, and this earth has a considerable share in the formation of the glass. This residue also forms a valuable manure.

In the manufacture of crown glass, kelp is employed in the entire state, being subjected to the process of comminution, but to no chemical separation of its ingredients, except that the carbon and sulphur are driven off by the application of a strong heat, and this is done after it is mixed with the sand, which is to form the glass along with it.

The kelp procured from the Fucus Vesiculosus, is in comparison the largest quantity, and is generally in the highest esteem for its quality. The Fucus Nodosus affords a kelp of equal value, but in smaller quantity. The Fucus Serratus is in both these particulars less productive; and the Fucus Digitatus still less. The last forms the principal part of the drift ware, which is regarded as affording kelp of inferior quality, though to this there are occasional exceptions.

Kelp procured from fuci which have been exposed Effect of to rain during the process of drying, is found inferior rain, in its quality to that which has escaped such exposure.

Fuci cut when two or three years old, yield more Age of the kelp in proportion to its bulk, than when suffered to stand longer.

The alkali, free or carbonated, contained in kelp, is Origin of the product of the burning process; none being obtained from sea-weed by subjecting it to the action of boiling water. It is found, however, that the access of air is not necessary to the evolution of the soda, and that it is equally procured by strong heat applied to the weed, in close as in open vessels. The heat acts by the destruction of the sulphates, which is ef...
During the union of the Caroline matter of the weed with the oxygen of the acid, and has therefore exactly the same rationale with the process already mentioned, to which soap's leaves are subjected, by the artificial mixture with carbonate matter.

From some ingenious experiments of Dr. Fyfe, one valuable practical result was obtained, that the quantity of alkali in kelp may be increased, by sprinkling sea-water on the weed while it is drying. During hot weather, when it is nearly sufficiently dry, this might be done without much risk of a retardation to the manufacture, by the occurrence of the rains, to which our uncertain climate is so liable. Perhaps a similar sprinkling might be employed during the burning of the weed, especially when at any time the heat is too powerful, and the combustion too rapid.

KELSO, a market town of Scotland, in the county of Roxburgh, is situated on the north bank of the Tweed, at its confluence with the Tiviot. In ancient writings it is called Palco, and sometimes Kelcow, &c.; but its etymology is quite uncertain. Kelso extends about half a mile along the sloping ground, on the bank of the river; and the plan of the town is uncommonly striking and commodious. A spacious square, from which six streets diverge in different directions. Mr. Pennant, who visited Kelso in 1772, observes that it is built much after the manner of a Flemish town. He perhaps alludes not so much to the general aspect of the town, as to the awkward fashion which then too much prevailed, of placing the gables instead of the fronts of the houses towards the street. This clumsy contrivance has now given way to a better taste, and the square and principal streets contain many neat, and some elegant shops and dwelling houses, built of the beautiful freestone of Sprouston quarry. Slates are now substituted for thatch, which used to be employed in covering the older buildings. The square was for many years deformed by an oil and ruinous town-house, which was taken down several years ago. In March 1816, the foundation of a new and elegant one was laid, which is now nearly finished, (Jan. 1818.) The buildings, carried on by subscription, under the liberal patronage of the Duke of Roxburgh, contain, on the ground-floor a town-house, surrounded by arcades, which is intended for a market-house. The principal story, adorned with simple Ionic columns, and surmounted by a balustrade, contains the town-hall, and other apartments.

The greatest ornament of the town is the abbey, founded by David I. about the year 1128, of which a large part has resisted the ravages of time, and the desolations of border wars. This pious prince, before he succeeded to the throne, and while he was earl of Cumberland, had planted a colony of monks, of the order called Tyronensis, at Selkirk. These he attempted to establish at the ancient city of Roxburgh; but finding, as we are told, in the preamble of the charter, that they could not be properly accommodated there, he removed them to the church of the Holy Virgin, at Callow, (Kelso.) This church was delivered up to the monks, for this purpose, by Robert, bishop of St. Andrew's, in whose diocese it then was. In the deed of conveyance, he declares it "salutum et ab omni subjectione et exactione liberum," and allows the monks and abbots of Kelso to receive ordination, and other sacraments of the church of Rome, from any bishop they pleased in Scotland or Cumberland. For their accommodation, David caused to be built a magnificent abbey and monastery, in the Saxon style, by artists brought from various countries. By the charter of the re-establishment from the royal founder, which makes part of the chartulary deposited in the Advocates' Library, Edinburgh, as well as by other political and historical documents, it appears that its possessions, privileges, and immunities, were great. The abbey had its original charter of confirmation from Pope Innocent II. In the charter already mentioned, is to be found a bull of Pope Alexander III., allowing the abbey to wear a mitre, and other pontifical distinctions, and to be present at all general councils. Innocent III. granted some important privileges to the abbey, and in particular exempted the abbey from all episcopal jurisdiction. He and his clergy, notwithstanding their removal, retained the churches of Selkirk and Roxburgh, "and the tythes with the schools of Roxburgh." They had various churches granted to them at different times; among others, those of Sprouston, Makerston, Greenlaw, Hume, Keith, Gordon, &c. &c. The Tyronensis monks are said to have been particularly attentive to agriculture and the arts; and to have maintained within their monasteries husbandmen and mechanics, the profits of whose labour formed a part of the funds of the establishment. Many persons of distinction have held the office of abbot, among others James Stuart, natural son of James V. The rentual contained in the chartulary, is curious, but much too long for insertion in a work of this nature. Upon the forfeiture of Francis, Earl of Bothwell, admiral of Scotland, James the VI. granted the superiority of the abbey to Sir Robert Ker of Cessford, the ancestor of the dukes of Roxburgh. Although this venerable structure was in a great measure defaced and demolished, in consequence of the civil and religious struggles that prevailed, especially at the glorious era of the Reformaon, yet the principal part of it was probably early used as a Protestant place of worship; and in the seventeenth century, it underwent considerable additions and repairs, in order to fit it for a Presbyterian church. From this time it was the parish church, till the year 1771, when a false alarm being spread during public worship, that the building was falling, it was never again used. This alarm was more easily excited, as it was previously a popular fear, grafted on a traditional prophecy of Thomas the Rhymer, that the abbey would fall when it was at the fullest. (Vide notes to Scott's Minstrelsy of the Borders, vol. iii.) From this time the building was neglected, till the late duke William of Roxburgh caused an ugly modern aisle, and a part of the modern wall to be removed; and the present duke James had almost the whole of the modern deformities taken away, by which means the transept, and many windows and side arches of the original abbey are displayed. The style of the building is Saxon, with a slight mixture of Gothic. The central tower is about ninety feet in height. There is none of that exuberance of ornament, for the quantity and nicety of execution of which the neighbouring abbey of Melrose is remarkable, and there are no remains of niches for images or statues. But the arches are clustered with admirable strength and beauty, and those which support the lantern are truly magnificent. (See Civil Architecture, Plate CXVII. Fig. 2.)

During the border wars, Kelso is recorded to have been no less than three times burnt down by the English. It appears surprising, that religious houses, which exhausted so much of the wealth of the nation, and were deemed its greatest pride, should in so many
instances have been set down on the confines of two lands, which were the natural rivals of each other, and frequently engaged in the most inveterate hostility. But, is it not probable, that these establishments, which belonged to a religion common to both countries, were intended as moral bulwarks against military violence, and that while the ecclesiastics generally enjoyed security in the midst of public alarm, their consecrated enclosures were designed to afford a refuge to all who might be admitted; and even by softening the feelings, and about the consciences of invaders, might in some measure form a protection to the towns and villages in their sacred vicinity? Certain it is, that while castles and fortresses were often demolished, these sacred edifices, in general, remained secure, and that they suffered more from the zeal of the reformers, in a few years, than from all the conflicts of contending nations during many ages.

There are, in the parish of Kelso, the sites of two other religious houses; the one a convent of Franciscans, on that part of the beautiful peninsula formed by the Tweed and Teviot opposite Kelso, near which the farm house of Friars stands. About thirty years ago, a gothic arch, and some other fragments remained, but no vestige of them is now to be seen. The other religious building, called Maison Dieu, which has also disappeared, was a place of refuge and comfort for pilgrims, the infirm, and the indigent. It was situated a little to the south of the river Teviot.

The modern parish church is a very large octagon. Besides the established church, there are places of worship belonging to the Episcopalians, Cameronians, Burghers, Antiburghers, and Relief.

Population. The population of the parish was 4524, by the census taken in 1793; in 1806 it was 4624, and in 1811 4409. The population of the town was, in 1793, 3557; and in 1806, 3662.

There are two established schools, viz. the Latin and the English schools; and one, for the instruction of girls only, supported by subscription. Its chief contributors are the Duchess of Roxburgh, and Lady Diana Scott. A society, the members of which subscribe a penny a week each, was begun in 1815, for assisting indigent parents in the instruction of their children; this society sends its pupils indiscriminately to any of the schools.

Poor-rates have been established at Kelso for a long period. Till within the last twenty-five years, the heritors were used to pay their part of the poor-rates by regular assessment, and the inhabitants of the town gave theirs by a kind of voluntary contribution; but since that time the proprietors of houses have been annually assessed in the same way as the proprietors of lands. The whole assessment, ten years ago, including the expense of officers, &c., was £1,645. The assessment, for the current year, is £896, being at the rate of 3s. 3d. per pound on the real rental of lands and houses. The number of weekly pensioners on the roll, amount to 140, and the average allowance may be about 1s. 8d. per week. About forty or fifty other persons receive occasional or interim supply.

Corporation boxes. There are here several corporation boxes, and male friendly societies, some of them having a widow's fund attached to it, and called the " Gardener's Society." And a " Female Friendly Society" was instituted some years ago, which promises to do much good, and tends to mark the improving spirit of the age. A friendly, or Parish bank, is on the general plan of that at Linlithgow, was opened three years ago, and was the first that was regularly organised on this model in Scotland. These novel institutions tend to preserve a humane, social, and independent spirit, among the lower orders, and to kindly intercourse between them and their superiors, to whom they look for counsel and assistance in conducting them; and also to counteract some political evils of great and alarming extent.

Kelso, though it be the most populous town in the Government county of Roxburgh, is not the county town, but was erected into a burgh of barony, as is believed, in 1605. It is under the jurisdiction of a baron bailie, and fifteen stent-masters, or town-counsellors, of whom a majority (eight) are nominated by the duke, or his bailie; and the remainder by the five incorporated trades, and the merchant and butcher companies, one from each.

The small revenue of the town arises chiefly from an annual tax, or stent, levied on the inhabitants, chiefly according to their rents. The weekly market is held on Friday, in the square, where a great quantity of grain is sold, and entirely by sample; and whither merchants from Berwick often resort, to purchase for export. There are three markets held near Whitensuide, at which farm-servants of all descriptions are hired. More agricultural business is transacted regularly at Kelso, than at any other place between Berwick and Dumfries. The system of husbandry in this and the adjoining counties, is deemed a model for the country at large; and the farmers are men of great skill and enterprise, and not unfrequently of capital, though many have suffered severely from the pressure of the two last years. Kelso owes its support chiefly to this class, and their numerous dependants; its articles of trade and manufacture, of which shoemaking is the most extensive, being such as are consumed in the district. The Border Agricultural Society, which is very flourishing, though only of five years standing, holds its prize exhibitions, and sales of stock, in this place. A Horticultural Society, of a humbler nature, and supported chiefly by practical gardeners, was soon after instituted, and goes on well.

The town and neighbourhood are well accommodated. Libraries are supplied with literary information, by three subscription libraries; the oldest instituted about sixty years ago, under the name of " Kelso Library." There are also two newspapers; the Kelso Mail, instituted in 1797, by Mr. James Ballantyne, now of Edinburgh, and still published twice in the week; and the Kelso Weekly Journal.

A dispensary, for supplying the indigent of the town Dispensary, and country with advice and medicine, was instituted about forty years ago. The late excellent Mrs. Baillie of Mellerstain (Jerviswood), was its chief original promoter. A commodious building has been more recently erected for carrying on the designs of the charity; and there are in it rooms capable of admitting a few surgical cases. Fever-wards, on a small scale, are immediately to be added.

A handsome, and much-wanted bridge, was built over the Teviot about 25 years ago, a little above its confluence with the Tweed. The new bridge over the Tweed, called Kelso Bridge, was begun in 1800, to supply the place of one which had been swept away by the overflowing of the river in 1797. It consists of five noble elliptical arches, and is one of the chief artificial ornaments of the place. It was built by Mr. Murray, under the direction of Mr. Rennie. The expense, with the approaches, &c., amounted to about £18,000.
In the beautiful peninsula immediately opposite to Kelso, to the west, and at the extremity of the parish, stands the very last crumbling fragments of what was once Roxburgh Castle, so much celebrated in Scottish history. It was built on the north bank of the Teviot, on a mount rising about sixty feet above its level. The castle was defended by a deep moat, supplied with water from the river, in connection with which it would at any time have been easily insulated. Indeed, the streams of Tweed and Teviot approach so near above the castle, and then diverge, that it might be easy to convert it, and the whole adjoining ground, into an island; and this probably was sometimes done, for the defence both of the castle, and of the ancient town of Roxburgh, which stood near it. Camden says—"This castle was anciently called Marchidun, from its standing on the marches; and, for its natural situation, and outward fortifications, was exceedingly strong." Early in the twelfth century, we find it mentioned as a place of national importance; and it is at various intervals recorded as the arena of bitter and extensive hostility—as having often changed masters—and as the scene of the birth, imprisonment, marriage festival, and death of kings. James II. of Scotland lost his life while besieging this fortress, then in possession of the English. His forces and artillery were drawn up on the north side of the Tweed, opposite to the castle, in a part of what is now the Park of Fleur; and while trying a piece of wooden ordnance, it burst and killed him. A holy tree still marks the place where this disaster is said to have happened; and some of the older inhabitants remember the vestiges of a village which stood near the place, and was called Fair-Cross. The name is supposed by some to have originated in an exclamation of James' widowed queen, on seeing the body of the fallen monarch, "There lies his Fair corpse!" which, approaching in sound to the other name, and falling in with a favourite religious association, might easily give rise to the altered name. On the following day, James III. then only seven or eight years of age, was crowned at Kelso; and his gallant mother, animating the drooping spirits of the chiefs, by telling them they had still a king, and, shewing him to the army, routed them to new and more vigorous exertion. In a few days the castle was taken, and in a great extent destroyed. It underwent, however, a partial repair; and was again put into a fortified state by the lord protector Somerset, in the reign of Edward VI. It finally fell into decay, after the happy union of Scotland and England, which rendered such strong-holds unnecessary. Yet it is to be regretted, that the very spot where it stood should retain no mark of its former existence; and perhaps something might yet be done, at a moderate expense, to prevent the last lingering vestiges of its ruins from utterly disappearing.

The ancient town of Roxburgh, which stood in a situation of much peril, on a part of the sloping ground between the castle and the junction of the rivers, is recorded to have been a place of considerable extent and population, where courts of justice were held, at which the king sometimes presided. It was one of the four most ancient royal burghs of Scotland; and, though fragments of the foundation are sometimes turned up by the plough or spade, not the slightest external trace of it is visible. The church of St. James, which was in or adjoining to the city, was founded, according to the Chronicle of Mailross, (Melrose) in 1134. In attempting to trace its foundation, upwards of thirty years ago, a considerable quantity of wheat and barley were found in a charred state, on a tiled pavement; also some pieces of glass and brick, which exhibited marks of fire.

On the meadow still called St. James' Green, one of St. James's fair, the greatest fairs, and most ancient, in the south of Scotland, is annually held on the 5th of August. Of this fair, one half of the custom is drawn by the magistrates of Jedburgh; the other by the Duke of Roxburgh; and the jealousy of the inhabitants of Kelso for the honour of their superior, gave rise frequently, when the former came to maintain their privilege by "riding the fair," to tragi-comical squabbles, which are now succeeded by perfect harmony and peace. A part of the old church of Maxwell, which, as well as St. James', is in Kelso parish, was standing a few years ago; and, till lately, the ground adjoining the place where it stood was used as a place of seclusion. Several tombstones are still to be seen; but the plough, desecrating the spot, and, if not protected, they will speedily vanish.

Our limits permit us to add but little respecting the Scenery of Kelso, which renders it an object of high attraction to travellers. The town, viewed from the neighbouring heights, seems the centre of an amphitheatre formed by finely wooded rising grounds; and the lovely streams, (with their pretty islets,) having united their waters, flow powerfully, with many noble windings, through a richly cultivated vale. The princely mansion of Fleuris, which was built by Sir John Vanbrugh about the year 1718, with its fine terrace and park, command varying prospects of beauty and magnificence. But it is scarcely possible for language to describe the charms of the scene which opens on the traveller, as he approaches Kelso on the west, by the road passing Roxburgh castle. Mr. W. Wilson, a respectable artist of London, a native of this place, has made it the subject of some justly admired pictures. The approach also from the south by Maxwellheugh, is exquisitely diversified with objects of rural beauty, and possesses, indeed, all the softness and grace of an Italian landscape. The view from the library is also very fine; and the prospect from Kelso bridge of Ednam house, the abbey, and town; at a greater distance, Fleuris, Springwood Park, Wooden, Hendersyde, and, in the back ground, the romantic Eildon hills, &c. is most justly admired. (I)

KENDAL, or Kirkby in KENDAL, is a market town of England, in the county of Westmoreland. It stands in an agreeable valley on the west side of the river Kent, which is crossed by three bridges. The town consists of one spacious and well built street, having several narrow streets branching off from it at right angles; and of another main street, called Stramongate, in both of which the houses are chiefly built of hewn limestone, and covered with slate. The streets are well paved and lighted. On the east of the town flows the river Kent; and on the west is a long row of hanging gardens. The church stands at Kirkland, without the town. It is 180 feet long, and 99 broad. It has five aisles, and a square tower with eight good bells. There are also a meeting-house for Presbyterians, one for Quakers, two for Methodists, and a Roman Catholic chapel. The town hall is a "very elegant building," and the butcher market, which was built about twenty-three years ago, is neat and convenient. A new gaol, with cells underneath, has been recently erected.

The principal charitable establishments are, a free grammar school, on the west side of the church-yard, which is well endowed, and has exhibitions to Queen's...
College, Oxford; Sandes' hospital and charity school, founded in 1670, with convenient dwellings for eight poor widows; a blue coat school, in which 50 boys and 40 girls are clothed, educated, and bred up to the art of weaving; a school of industry, instituted in 1799; a dispensary, begun in 1782, and supported by voluntary contributions; and a large and airy workhouse at the west end of the town.

The ruins of Kendal castle stand on the top of a hill, on the west side of the town, composed of rounded stones, embedded in a black sandy cement. Part of two squares and two round towers lately remained, and the foundations were repaired, and the fossé round the ruins enlarged in 1813. Opposite to the castle is Castle-hall, which consists of a circular mount of gravel and earth, thrown upon a rock nearly 30 feet high. Round its base is a deep ditch, and a high dyke, fortified with two bastions on the east. In 1788, the inhabitants erected upon it a handsome obelisk, with an inscription, in commemoration of the Revolution of 1688. The government of the town is vested in a mayor, recorder, 12 aldermen, and 20 capital burgesses. There are here seven incorporated companies. A newspaper is printed in this town, and there is a respectable book club, and an interesting museum.

The principle manufactures of Kendal, are Kendal cottons, a sort of coarse woollen cloths, and linseys for the North American market. Great quantities of woollen stockings are annually knit. Cotton mills, and the weaving of muslin, were lately established. A marble manufactury employs several hands, and has its mills for sawing and polishing at Water-Crook. The marble is chiefly procured from Kendal Fell. The leather trade is also considerable; and there is a great supply of fruit from the numerous orchards. Hats, fish hooks, and wool cards, are also manufactured here.

The population of the town in 1811 was

See Nicholson and Brown's History and Antiquities of Westmoreland; and The Beauties of England and Wales, vol. xvi. p. 100.

KENT is a maritime county of England, forming the south-east angle of that kingdom. It is bounded on the north by the Thames and the German ocean; on the east, and part of its south side, by the straits of Dover and the British Channel; on the remainder of its south side by the county of Sussex; and on the west by the county of Surrey. Its form is nearly quadrilateral, or rather that of a trapezium. From Deptford, to the extreme point of the North Foreland, it measures about 65 miles, or about 129 minutes of longitude; and on the east side, from the North Foreland to Dungeness Point, it measures nearly 40 miles, between the latitudes of 50° 54' and 51° 23' 20". The circumference of its coast, if all the sinuosities be measured, is about 165 miles. Its area has been variously computed: Some raise it as high as 1,200,000 acres; while, according to others, it contains only 892,000. Mr. Boys' estimate is probably nearer the truth; he makes its area 893,000 acres.

Kent is divided into five large portions, called Lathes; these are subdivided into 63 hundreds, 15 liberties, 414 parishes, 2 cities, and 24 market towns. The two cities are Canterbury and Maidstone; the principal towns are Deptford, Woolwich, Gravesend, Sheerness, Margate, Ramsgate, Faversham, Deal, Sandwich, Dover, Folkestone, Hythe, Chatham, Maidstone, &c. This county sends 18 members to the House of Commons, viz. two for the shire, two for Canterbury, two for Rochester, two for Maidstone, two for Queensborough, two for Dover, two for Sandwich, two for Hythe, and two for Romney. There are fifteen deaneries in it; eleven of which are under the jurisdiction of the archbishop of Canterbury, and four under the jurisdiction of the bishop of Rochester. In order to facilitate the civil jurisdiction of the county, it is divided into two districts, East and West Kent. The former contains the lathes of Sutton-at-Hone and Aylesford, and the lower part of the lathes of Scray; and the latter contains the upper part of the lathes of Scray, and the lathes of St. Augustine and Sheppey. In each of these districts a court of sessions is held twice a year.

There are very few counties in England which have such strong claims to notice as the county of Kent. Its size, inferior only to Yorkshire, Lincolnshire, Devonshire, and Northumberland; its extent of sea coast; the rivers by which it is bounded or watered; its vicinity to the metropolis; its dock-yards; and the great variety of its agricultural produce—all combine to render it a county of great interest. Nor are its picturesque beauties of a low order. Its general aspect is, indeed, very striking and pleasing; and in some parts, especially near Maidstone, Tunbridge, and Sittingbourne, the scenery is uncommonly fine. The surface of the country, generally speaking, is much varied. The whole of it, with the exception of the marshes and the wealds, may justly be regarded as a cluster of small hills. Among these there are two chains higher than the rest, called the upper and lower, which run through the middle of Kent, in general about eight miles distant from one another, in a direction from west to east. The northern chain is composed principally of chalk and flints; the southern, of iron and ragstone.

In tracing the sea-coast of Kent, we shall begin on the confines of Sussex. As soon as we cross the Rother, we pass from the latter to the former county. This river formerly emptied itself at the town of Old Romney; but, in the reign of Edward I. a great storm changed its course to Rye. Dungeness, which consists of low
Kent.

The county of Kent is one of the shires of England, lying between the Thames and Medway, and divided by the latter river into two natural parts, the upper and lower Medway, each of which has a different character. The upper Medway is more fertile and productive, and contains a larger portion of the county.

The southern part of the county is the Kentish Romney Marsh, which is a large tract of low-lying land, covered with marsh and swamp, and bordered by the sea on the south. It is an important agricultural district, yielding a large amount of wheat and barley.

The eastern part of the county is called the Kentish South-East, and is characterized by its chalk hills and downs, which rise in many places to a considerable height above the sea-level. The downs are inhabited by a hardy and industrious peasantry, who make excellent farmers and graziers.

The western part of the county is called the Kentish West, and is distinguished by its fertile valleys and rich pastures. It is a great agricultural district, yielding a large amount of grain and livestock.

The county of Kent is bounded on the north by the county of Essex, on the east by the sea, on the south by the county of Sussex, and on the west by the county of Surrey. It is divided into two parts by the Medway, which forms a natural boundary between the upper and lower Medway.

The county of Kent is one of the most important in England, both agriculturally and industrially. It is a great granary, and yields a large amount of grain. It is also a great sheep-rearing district, and the wool is of excellent quality. The county is well supplied with water, and has a large number of canals and rivers, which are valuable for navigation and for the supply of water.

The county of Kent is well supplied with public buildings, and is served by a good system of roads and highways. It is also well supplied with public libraries and schools, and is a centre of education and culture.
Kent.

adjacent sea. The depth of this well is 281 feet, and the supply of water is nearly as great as that derived from the well at Sheerness.

Climate.

The most prevalent winds in this county, are the north-east and the north-west. The former comes in the winter and spring months, and is generally accompanied with severe frost. This wind is much more piercing and injurious in the east than in the west of Kent, the latter being farther from the sea, better enclosed, and protected by a ridge of hills. With respect to rain, Kent may be esteemed a comparatively dry country. It is also very healthy; except near Sheerness, and the other low marshy grounds.

In describing the various soils of this county, we shall follow Mr. Boys in his agricultural survey, and divide it into eight districts, viz. 1. Isle of Thanet; 2. The upland farms of East Kent; 3. The rich flat lands in the vicinity of Faversham, Sandwich, and Deal; 4. The hop grounds of Canterbury and Maidstone; 5. The Isle of Sheppey; 6. The upland farms of West Kent; 7. The Weald of Kent; and 8. Romney Marsh. The soil of the area of Romney Marsh, is a light loam on a chalky bottom, highly fertilized by manure and judicious cultivation. The soil of the marshes is a clay, mixed with sea sand and small shells. The soils in the second district vary very much. They consist principally of chalk, loam, and clay, intermixed with flint, gravel, and sand. The stiff clays are principally found on the hills near Dover; and the flint soils in the valleys near that town and Maidstone. The flat lands in the vicinity of Faversham, Sandwich, and Deal, consist of a rich sandy loam, in which the sand prevails in different proportions, and a stiff wet clay. The fourth district, or hop grounds, which extend from Maidstone and Canterbury, and thence to Sandwich, consist, for the most part, of a rich deep loam, with a subsoil of a deep brick earth. The Isle of Sheppey consists, for the most part, of a deep, stiff, strong clay. This also forms the subsoil of the marl sand in the isle, but it is there covered with a rich, black vegetable mould. The upland farms of West Kent, consist of a great variety of soils. In this district is the range of chalk hills, which runs from near Westerham to the sea coast at Folkestone. The soil on the top of these hills, is a cold flinty clay. The Weald of Kent, which stretches along the south side of the county, from Romney Marsh to Surrey, consists principally of clay, of different degrees of tenacity and fertility. The soil of the last district, which comprises Romney Marsh, upwards of 43,000 acres, has been almost wholly deposited by the sea, and consists of fine, soft, rich loam and clay, intermixed with sea sand of very considerable depth.

Kent is by no means celebrated for its mineral productions. A few circumstances, however, may be noticed here, as appertaining as much to the soil, or nearly so, as to the mineral productions of the country. At the west end of the Hanger Wood, in the parish of Charlton, is a chalk pit, in which echini, and other fossils, are found; and on the road to Woolwich, there is a very large and deep sand pit. In this pit, **the first stratum is gravel, which varies according to the surface of the ground from 5 or 6 to about 15 feet in depth, beneath are various strata of clay, gravel, loam, and marl running parallel, being altogether about 30 or 40 feet deep, which cover a bed of sand about 43 feet in depth. In the marl are found prodigious numbers of extraneous fossils. This vein is about 6 or 8 feet thick, and the shells in it are so numerous, and lie so close, that, according to Woodward, the mass is almost wholly composed of them, there being only a very little marl interposed.** Of these shells there is a great variety, both of univalves and bivalves. The most extensive and important chalk pits in Kent, are at Northfleet and Greenhithe, near the banks of the Thames, a little above Gravesend. These chalk pits are connected with the range of chalk hills, which forms the boundary of the marshes nearly all the way from Cliff to Caroling. The depth of these chalk pits is from 100 to 150 feet perpendicular. An immense number and variety of animal remains are found here. Teeth of different species of sharks have been met with; infinite numbers of the various species of echini, some of which are most curious and elegant in their form; and contain chalk of the purest quality. A very beautiful species of corn ammonis is very frequent. The forms, and the very substance of the shells, are preserved through the multitudes of ages in which they have been deposited; the coleran alone is discharged. Some have been entirely pervaded with flint, which assumes the exact figure of the shell. The chalk and flint of these pits is burnt for lime, either on the spot, or where it is to be used. The flints are exported in vast quantities, even to China; and the potteries of Staffordshire consume many thousand tons annually. In some parts, these pits are many feet below the level of the Thames. In the manor of Betersden, there were formerly quarries of marble much esteemed, and used for the ornamental parts of building; but it is now little used. It is of the grey turbinated kind, and bears a good polish.

The Kentish rag-stone abounds on the southern shore of the Medway, near Maidstone. It is used for troughs, gravestones, repairing the sea walls on the coast, strengthening the piers of bridges, paving roads, particularly in the Weald; and lately, much has been used to mend the roads near London. As it is calcareous, it is also burnt into lime; and, as the lime is very pure and strong, it is often sent in small casks to the West Indies to refine sugar. It is also used for stucco work. It may be mentioned, that in the year 1418, 7000 cannon balls were made by the orders of Henry V. from the Kentish rag-stone. The cliffs, in the isle of Sheppey, abound in pyrites, from which copperas was first made so early as 1579. These cliffs are rented by the copperas makers, who employ the poor inhabitants to collect the pyrites. The action of the waves is continuously washing them out, or loosening them from the cliffs. Many hundred tons of copperas are now exported annually. Other fossils are likewise found in the cliffs of this isle; large nodules of petrified wood, as well as a vast number of different kinds of fruit; and animal remains, such as the thighbones, tusks, and grinders of an elephant, two species of tortoises, &c.

The only mineral water of any celebrity in Kent, is Mineral water of Tunbridge Wells. It is a chalybeate, and nearly equal in strength to that of the German Spa. The efficacy of this water in several complaints, aided by the purity of the air, and the beauty of the scenery near Tunbridge, attracts much company to it during the season. There is also a mineral water near Dulwich, similar in composition and quality to that of Epsom, but it is not used.

There are very few counties in England so celebrated for its agriculture as Kent. The bean husbandry of East Kent; the general arable husbandry of the Isle of Thanet; the hop plantations near Canterbury and Maidstone; and the cherry orchards in the vicinity of the latter place, as well as the wool husbandry of the
Kent.

Weald, have raised it to this eminence; but especially the sheep husbandry of East Kent, and the general husbandry of the Isle of Thanet. It is seldom easy to point out the causes, which improve or retard the agriculture of any district; but with respect to Kent, there can be little doubt that its excellent husbandry is, in some degree at least, owing to the peculiar tenure of its lands. The property is very much divided; there being few extensive possessions that are not intersected by other person's property. There are few copyhold or customary tenures. The yeomanry of Kent, so long and so justly celebrated, are rather increasing than diminishing. But what distinguishes Kent, is the tenure of gavel kind, which prevails over it. "The law of gavel kind comprehends the joint inheritance of all the sons to the estate of the father; and should the father survive, the inheritance devolves to his grandsons, if there are any, or else to his daughters." All brothers may jointly inherit the estate of a deceased brother; and nephews and nieces are, in their degree, entitled to the same division of property. Several acts, abolishing this tenure with regard to particular estates, have been passed; but all lands in this county are presumed to be subject to it, till the contrary is proved. Gavel kind lands do not escheat to the king, as lord of the manor, of whom they are holden, except in cases of treason; and by the law of gavel kind, a moiety is due to the widow of all the estates, possessed by the husband either at the marriage, or during her coverture. By this law also, the proprietor may alienate his estate at the age of fifteen, provided it is done by deed. The number of freeholds in the county is said to be about 9000, besides the large estates belonging to the dean and chapter of Canterbury and Rochester, and other corporate bodies. The size of farms varies very much. In some of the rich lands, they are so small as 10 or 15 acres; but where the land is poor they extend from 300 to 600 acres.

We have already seen, that the soils of the different districts into which Mr. Boys divides Kent, vary very much. This circumstance, together with local situation, &c., render the agriculture of each also different in a considerable degree. It will, therefore, be proper to give a brief view of the agriculture of each. 1. The general routine of the crops in the first district, or the Isle of Thanet, on its lighter soils, is fallow, barley, clover, wheats, with occasionally pease instead of a fallow; or beans, wheat, barley, on the richer lands. Canary, radish, mustard, spinach, and cabbage, are also grown. The arable husbandry is, in every point of view, excellent. It is remarkably well ploughed, flat, without furrows. The crops are kept extremely clean by hand and horse hoeing, and the produce is commensurate to the natural goodness of the soil, and the care and skill bestowed on the land and crops. The harvest generally begins about the first week of August. Sheep and cattle are fattened on the marsh lands. The condition of the farmers in this district, is such as might be expected from this character and account of its agriculture. They are intelligent, respectable, and in easy circumstances. On the chalk lands of the second district, or the upland farms of East Kent, sainfoin is extensively cultivated. On the loamy soils, the routine is barley, beans, wheat, or fallow, oats, clover, wheat; and on the stiff clays, fallow, wheat, beans, barley. The harvest is from 1½ to 18 days later than in the Isle of Thanet. In this district the woodlands are extensive, principally between Rochester and Dover, and on the chalk hill, that runs from Folkestone to Detling, they yield timber for ship-building, but principally hop poles. On the chalk soils, the prevalent woods are ash, willow, and hazel. On the stiff clays, oak, birch, and beech. The rich flat lands near Faversham, Deal, and Sandwich, which form the third district, are almost entirely arable. The lighter soils produce abundance of wheat, beans, barley, oats, and pease; the stronger, beans, wheat, and canary seed. On these lands, if very rich, wheat and beans are often grown alternately for a series of years, or canary seed is sown in place of wheat. The hop grounds near Maidstone, Canterbury, and Sandwich, which constitute the fourth district, are, as the name implies, almost entirely under hops. Round Canterbury, they extend to nearly 3000 acres. The best hops are grown here and in the vicinity of Sandwich. The most productive soils are a rich loam, with a subsoil either calcareous or of brick earth. The hops grown near Maidstone, are inferior in quality to those of Canterbury and Sandwich, caused by the inferior nature of the soil. In the neighbourhood of this town, there are extensive orchards of from 10 to 15 acres, planted with apples, cherries, and filberts. Sometimes these are grown in the hop plantations. These fruits are principally sent to London. The isle of Sheppey, which forms the fifth district, contains only one-fifth of its area arable land. Beans and wheat are grown alternately on the arable lands, which are very rich. The quality of the wheat is very good, its weight sometimes reaching 6½ pounds the Winchester bushel. On these lands, clover, oats, and barley are also cultivated. Lambs and sheep are fed on the upland pastures; the more forward sheep and cattle on the marsh lands. The quality of the soil on this isle, has been much improved, by applying cockle shells, great quantities of which are thrown up by the sea. On the upper and west side of the upland farms of West Kent, great quantities of timber and underwood are produced. Hops, fruit, corn, grass, timber, and coprice wood, occupy the borders of the Weald and of Surry. On the gravelly and sandy soils near Deptford and Blackheath, early green, pease, turnips, rye, winter tares, clover, oats, &c., are grown. There are a few dairies of small size. On the Downs, in this district, sheep are fed. The waste and common field lands are very extensive. Wheat, oats, barley, rye-grass, clover, turnips, and beans, are grown in the Weald of Kent, which is principally an arable and woodland district. The timber is very valuable; but the arable husbandry, and the crops, in consequence of the wet nature of the soil, the badness of the roads, &c., is far behind that of most other parts of Kent. The last district is Romney Marsh, and the marshes contiguous to it. These have long been celebrated for their uncommonly rich pastures. It is computed, that the number of sheep kept here, exceeds what are kept on the same quantity of ground in any other part of the kingdom. The arable lands, which, in consequence of the high price of corn, are more extensive now than they were formerly, are extremely productive of wheat, beans, and pease.

Besides this rapid and brief sketch of the agriculture of the various districts of Kent, it will be proper to notice farther particulars of the crops generally cultivated, with reference to the county at large; but previously, the implements used in its agriculture must be noticed. Of these, by far the most important and singular is the Kentish turn-wrest plough. To those who have never seen it, but who have been accustomed to
the small and light plough, used in Scotland, Yorkshire, Norfolk, and Suffolk, it must appear a most ponderous and unwieldy instrument. It consists of a beam of oak 10 feet long, behind which is a foot 3½ feet long. The share is of hammered iron, and weighs about 32 pounds. The chep, to which the share is fitted, is five feet long. The upper end of the wheel rests on a carriage with two wheels, 3 feet 2 inches high. The great advantage of this singular plough is, that it goes well among flints and rocks. Indeed, when drawn, as it often is, by 5 or 6 horses, it will force its way through the most flinty and obdurate clay, even when barned, by a hot summer: it also, as being a turn-wrest, ploughs the land without furrows. In East Kent, four horses are generally yoked in them, and they plough an acre and a half in a day. In the western part of the county, six horses cannot plough more than an acre in a day, owing to the subborness of the soil. No other implement used in the agriculture of Kent deserves particular notice.

From what has been already stated, it appears that the crops most commonly grown in Kent, are wheat, barley, beans, oats, and peas; also hops, canary seed, radish seed, turnips, and clover. Kent is well known for the excellent quality of its wheat. Inferior to that of some parts of Essex, it is not surpassed, and scarcely equalled by any other English wheat brought to the market. Many sorts are sown. That which produces the finest sample, and brings the highest price, is grown on the rich sandy loams, and is called the White or Egg-shelled Wheat. On the wet and cold lands, wheats is sown in October; but the general time for the county is in November. While growing, it is carefully weeded. The harvest is from the first to the third week in August. On the richest soil, under good management, five quarters are no uncommon crop; but twenty-two bushels are supposed to be the average of the county. The Isle of Thanet is celebrated for its barley, and indeed gives name to one species of Kent grain. Barley is sown from Candlemas to the middle of May; it is weeded when growing, and reaped on the dry soils about the third week in July; on the late soils, not till the beginning of September. Seven quarters per acre have not unfrequently been grown, but the average is about 25 bushels. A great variety, both of the horse and garden bean, are grown in Kent. All of them are either drilled, or dropped by hand in furrows in February or March, and most carefully hand and horse-hoed; they are reaped in August or September; from two to six quarters per acre are produced.

In the Kentish cultivation of oats, nothing particular occurs. Of peas there are several varieties, both for fattening hogs, &c., and for culinary purposes: they are all drilled in February or March; hand and horse-hoed, and reaped from July to the middle of September; the produce is from ½ to 5 quarters per acre. Canary seed is drilled, and, when growing, hand and horse-hoed repeatedly; it is later in ripening than corn, and in order to detach the seed from the husk, is often suffered to lie inwards, till December, without suffering any injury. The produce is from three to five quarters. Radishes, for seed, are sown in furrows, in March; frequently and carefully hoed; reaped in October; and frequently remains out in the field till Christmas. The produce is from eight to twenty-four bushels per acre: the London seedsmen buy it. Spinach for seed is sown early in March, hoed and weeded; and, when the crop is in full bloom, the greater part of the male plants are drawn out. The produce is from two to five quarters per acre. Kidney beans are much cultivated near Sandwich, and in the isle of Thanet, for the London seedsmen; cresses and white mustard are also sometimes grown for the same purpose. Potatoes are grown in almost every part of Kent, but principally for home consumption. The cultivation of turnips, though extending, is not so good as that of many other crops: On the poor lands in the earlier part of the county, coleseed is much grown. Clover, red and white, are also in pretty regular rotation, especially on the lighter soils. On the chalk land of the east part, there is much sainfoin. On the poor stiff soils, in the western parts, near Surry, speed is found to be a profitable crop. There is little madder grown now. As hops are grown extensively and regularly only in the hop district, it is unnecessary here to notice the cultivation of this plant.

In East Kent there is a very small proportion of Meadow natural meadow; but, in the Weald, a vast quantity of excellent hay is produced: In general, however, the hay meadows of Kent are much inferior to those of many other counties. There are no dairy farms of any great extent. The chalky hills of East Kent afford excellent downland, and sheep walks. Besides the marsh lands of Romney, which extend to 40,000 acres, there are, on the borders of the Stour, about 27,000; and on those of the Thames, Medway, and Swale, about 11,500 acres; the whole of which is employed in breeding sheep, or in fattening their cattle.

The most extensive garden grounds are near London, about Deptford, and Gravesend; almost all kinds of vegetables are grown in them. The orchards near Maidstone have been already noticed, as well as the woodlands of East Kent, and the Weald.

With respect to the modes of improving land, paring and burning has been long practised: the usual mowing and improving mowers are judiciously and liberally applied: weeding growing crops is performed in a careful manner, especially in East Kent, and about Maidstone; but irrigation is little practised.

The cattle of Kent are of various breeds, there being no breed peculiar to the county. Those fattened in the marshes are from North and South Wales; and the dairy cows are selected from the droves brought from thence, except in West Kent, where the cows are of the Staffordshire and Sussex breed, as well as the Welsh, and in the Weald of Kent, where the Sussex kind are used both for the plough and the dairy. The Romney breed of sheep is one of the most valuable in Sheep, the kingdom, and has long been deservedly famous. They become very fat at a very early age, and produce a very large fleece of very fine wool; in this latter respect they are superior to the new Leicester, and little, if at all, inferior to them in the former respect: at two years old the fat wethers generally weigh from 22 to 28 lbs. per quarter; and their fleeces about 8 or 9 lbs. each. Romney Marsh is calculated to produce 20 lbs. of wool to the acre, and as the land at shearing time carries more than four sheep per acre, the annual growth of wool, in the marsh, will exceed 4000 packs. On the upland, and in most other parts of Kent, the Dorset, Wilts, and South Down sheep are kept; in East Kent, the Romney, also in Shepey, but here they are of an inferior sort. The horses mostly employed, are a cross between the old Kentish cart mares and stallions, from the midland counties: those that have been bred in the isle of Shepey, from time
immemorial, are somewhat smaller than such as are employed in other parts of the county.

The manufactures of Kent are few and unimportant. Silk, which was long manufactured at Canterbury, is now giving way to cotton. The first mill for making white paper, was erected near Dartford, but the most extensive paper mills are now at Maidstone and Dover. There are salt-works near Sandwich, and in the isle of Grain; large copperers works at Whitstable and Deptford, and in that part of the Weald which borders on Sussex, there are furnaces for casting iron. The gunpowder mills at Deptford and Faversham carried on a very extensive business in time of war. At Craigford there are large works for bleaching and printing; calicoes, sacking, and hop-bagging, are made in different parts of the county; but the woollen manufacture, which formerly raised to wealth and eminence many Kentish families, no longer exists in any extent or importance. One of the largest flour mills in the kingdom, is in Canterbury on the Stour; it is upon a most excellent construction, and grinds 500 quarters of corn weekly.

The other fisheries of Faversham and Milton, and of the Sivas of the Medway, are celebrated for the quantity and quality of the oysters they produce. From Faversham and the adjacent parts, the Dutch have sometimes loaded 100 large hoys with oysters in the year. The Medway was formerly celebrated for its salmon and sturgeon, but little of either is now caught. At St. Margaret's Bay, between Dover and the South Foreland, large quantities of small but very delicate lobsters are caught.

The principal commerce of Kent consists in sending corn to London, by the Medway and Thames, in hoys, carrying from 300 to 500 quarters each. They return with grocery goods, &c.

The money raised for the poor, in the year 1776, was £6,832; the average of the years 1783-4-5, was £112,994; and in the year 1803, the poor-rates amounted to £213,989, the maintenance of each poor person being £5, 2s. 9d.; there were 41,632 relieved; the rate for the population was fourteen shillings a head. There were 150 friendly Societies, and four in each 100 of the population members of these societies.

The population in the year 1700, was 125,800; in the year 1762, 190,000; and, in 1801, 317,800. The returns in 1811 were as follows:

Houses inhabited, 62,063
Families occupying them, 72,265
Houses building, 628
Houses uninhabited, 1671
Families employed in agriculture, 27,077
Families in trade, manufactures, &c, 37,595
All other families, 21,192
Males, 183,500
Females, 189,355
Total, 373,095
Population in 1801, 317,800
Increase, 55,295

Kent, Kentucky.

The history of this county is perhaps as interesting and important as that of any other county in England; but our notice of it must be very short. The Cantii inhabited it at the Roman conquest; they are supposed to have been a Roman colony. When Caesar invaded it, it was divided into four principalities. It was included in Britannia Prima. The Romans appear to have paid particular attention to the defence of its shores; and for that purpose they erected forts, which were under the direction of a particular officer, called Count of the Saxon shore. When the Anglo-Saxons obtained possession of England, Kent formed one of their kingdoms, which was founded in the year 454, and ended in 823. The Saxon kings of Kent discharged the office of Counts of the Saxon shore, in their regal capacity; and when England was formed into one kingdom, this post was revived in the Lord Warden of the Cinque-ports. Boys' Agriculture of Kent; Marshall's Southern Counties; Beauties of England and Wales, vol. vii. and viii.; Campbell's Survey of Great Britain. (w. s.)

KENTUCKY, one of the United States of North America, derives its name from the river Kentucky, by which it is traversed, and lies between 36° 30' and 39° 10' North Lat., and between 82° 50' and 89° 20' West Long. It is about 300 miles long, from north to south; its greatest breadth is 180 miles, and its least width 40. Its superficial extent is about 50,000 square miles. On the whole of its northern side, it is bounded by the Ohio, through a length of 645 miles. This river separates it from Indiana territory for 525 miles, and from the Ohio territory for 125. On the east it is separated from Virginia by the Cumberland mountains, and by Big Sandy river, for 80 miles. On the south it is divided from Tennessee by the parallel of latitude of 36° 30'; and on the west it is separated from Upper Louisiana, by the Mississippi, for 60 miles.

Kentucky was originally divided into two counties, Lincoln and Jefferson, and afterwards into 42; but it is now divided into 54, and sends 10 representatives to Congress. The south-east part of this state is mountainous. The principal mountains are the Cumberland mountains, which bound the state for about 80 miles on the south-east. The country below the mountains is hilly for some distance; but the great part of the state is agreeably uneven, and formed of gentle elevations. The whole country below the mountains rests upon an immense bed of limestone, from 1 to 20 feet thick, but usually about eight feet below the surface.

The soil of Kentucky is in general good. It is either black, or tilled with a brighter or deeper vermiculose or resembles dark ashes. Wheat was at one time the principal grain that was cultivated; but no more of it is now raised than is consumed in the state. Much rye is raised for the distilleries. Maize is cultivated to a great extent. Hemp has lately been the principal article of produce. An ordinary crop is about from 700 to 1000 weight the acre. Barley, oats, flax, cotton, and tobacco, are raised; and it is said that 50, 60, and even 100 bushels of grain have been produced upon an acre. Of wheat, or rye, 30 bushels is the ordinary produce. Kentucky is well covered with timber. The principal trees are the elm, the beech, the ash, the juniper, the sugar, the coffee, the papaw, the hackberry, and the cucumber.

The mineralogy of this state has not been much examined. Iron is found in various places. It is well fitted for hollow ware, but not for malleable iron. A valuable gold mine has been discovered between Cumberland river and Green River. Copper, sulphur, copper, and alum, have also been obtained. Nitre is obtained from the earth in the caverns on Green River. Coal is found in abundance, and in some places there is an appearance of potters' clay. An immense quantity of marble, of a greyish cast, finely variegated, and susceptible of a high polish, has been
found on the banks of the Kentucky river. On the banks of Kentucky and Dick's river are solid perpendicular rocks, rising to the height of 300 and 400 feet. Some of these are of common limestone, and others of white marble, curiously chequered with strata of singular irregularity. These lofty banks are covered with groves of red cedar trees, and the rivers have the appearance of deep artificial canals. Caves of enormous length have been discovered in the limestone rock.

The most celebrated of these is the Mammoth Cave, situated in the lower part of Kentucky, called the Green River Valley. This cave consists of one great trunk, with numerous and irregular ramifications, and the total length of it appears to be about ten or eleven miles. A great quantity of saltpetre is manufactured from the earth in its interior. The following is the only account of this remarkable curiosity which has been published:

"About a quarter of a mile from the mouth is a mummy, lately deposited there from a neighbouring cave, and intended for Peale's Philadelphia museum. It is grey headed, the teeth much worn, but round, and the flesh entirely dried up. It is supposed to have been a queen, from the number of trinkets found with it, consisting of needles, head-dresses of various kinds of feathers, necklaces of deer hoofs, beads, mockasins, paint, a whistle, a bear's jaw-bone, a hawk's claw, and a rattlesnake’s skin, with rattles. These were enclosed in a pack, (or wallet used by Indians for transporting goods,) they being first enclosed in a fine wrought indispensible, afterwards in one of a coarser texture, and then in the pack, which, with the body, was wrapped up in two dressed skins, and the whole again enclosed in a mat or coarse wrapper. The visage seemed quite venerable, and the whole presented a truly antique appearance. I examined the ears and nose; but did not discover aught, whereby to conclude that either had ever been decorated with trinkets, from which circumstance, it may be presumed, they were not in vogue, when regal dignity, and perhaps power, were vested in the body. The nails on the hands and feet were perfect; and the feet small in proportion to the body, which was of a large stature.

"Proceeding on, I entered the haunted room, (so called,) in which is an arm-chair formed of petrified rock, and one and a quarter mile from the mouth of the cave. Near to this is a spring of water falling from the arch above, remarkably clear, and pleasant to the taste, having an agreeable sweetish flavour. In another branch is a heap of petrifactions, resembling furnace embers, a pond, &c."

"A strong current of cold air issues from the cave, perceptible at the mouth before descending. The current sets in during the winter season; but the temperature within is not affected by the change, it being uniform throughout the year. Human tracks, imprinted on the sand, and from four to twelve inches in length, are to be seen in some of the rooms; and pieces of cane or reed strewn along the paths, having, in all probability, been formerly used for lights by those who frequented, and not improbably inhabited the place. In many places are large pillars of petrification, formed by water dropping from the arch, and which seem to support it. One (or rather part of one) is called the Bell; it is four feet long, and extends half way down to the bottom of the cave, the height of the arch in this place being about eight feet. A sound is occasioned by striking it with a stone, similar to that produced by striking a cannon of pretty large calibre with a piece of wood. The height of the arch varies in different places. In some it is estimated at fifty feet; and in others, a person is obliged to stoop almost to the ground to pass along. The arch, in many places, has a beautiful appearance, being that of a plastered ceiling. In one or two places which I particularly noticed, and where the passage is wide, it presented a strong resemblance to a spacious circular room. The effect was produced by the light of lamps, which showed distinctly the white and smooth petrifactions above, and which was gradually lessened by the shades becoming darker, as the power of the light was lessened upon the more remote parts, and until the eyes, by following them, were carried to silent darkness. The descent (a small ascent in some places excepted) is generally gradual as you advance onwards. The most rapid is down a rather steep hill, of about 40 feet in height. By stamping occasionally, I discovered that I passed over several vaults, or probably other rooms or branches. The subterraneous sound produced by stamping, was not terrific, as I had been led to believe, before I made the experiment."

In Plate CCCXLIII, we have given a representation of this remarkable cave, which will be understood from the following references to the engraving.

1. Mouth.
2. Indian mummy.
3. Right hand chamber.
4. Mountain room; the entrance is from the top of the mountain.
5. Little room, with a spring and two piths.
7. Sand room.
8. Part of the haunted room.
9. Sick room.
11. Springs.
12. Horn room.
13. Pit 100 feet deep, and water falling several hundred feet.
14. Part of the deserted chamber, which runs under the salt room.
15. Deserted chamber.
16. This room runs under the deserted chamber.
17. A large spring falls several hundred feet.
18. Glauber salts (sulphate of soda) found here.
19. Mockasen room.
20. A large room or pit above 50 feet deep.
21. Salts.
22. Ground room.
23. Basket room.
25. Weeping willow. This room runs about a quarter of a mile, and then returns to the same place.
26. Two springs in two large sink holes.
27. Beekman's room.
28. Miller's room.
29. Hell's gate.
30. Devil's chamber, supposed to be ten miles from the mouth.

When the mummy was brought to New York for exhibition, it was examined by Dr. Samuel L. Mitchell, who has given the following account of it in a letter addressed to the Earl of Buchan, and published in the 26th volume of the Transactions of the Society of Antique Antiquaries. It was a perfect mummification. All the solids were preserved as entire as in an anatomical preparation, or rather as dried bacon. The posture was..."
Kentucky

Kentucky. squatted, with one hand embracing the right knee, and the palm of the other put under the left buttock. It was enclosed in four distinct wrappers. First, a mantle of cloth and feathers, exactly like those worn at this day by the chiefs of Wakush and Owhybee. Second, a shawl of cloth, manufactured after the manner now practiced by the natives of the Sandwich and Fegee islands. In both these, the material of the cloth is neither flax nor hemp, nor the product of any vegetable known in America as an indigenous plant; and the preparation, the twist, and the manner of connecting the threads, is wholly unlike any fabric of the present indigenes, or the European emigrants. Dr. Mitchell, and the most distinguished persons of New York, were decidedly of opinion, that there was a wonderful similitude between these cloths, and various cloths brought from the Pacific islands, with which they compared them. The hair of the mummy is a brown sorrel, or dark chestnut, and not either a sandy or a black. Thirdly, the next wrapper was a deer-skin, whose hair had been cut away by a sharp instrument, that had left incisions on the hide, exactly like those on the pelt of a beaver by a hatter's knife; and, fourthly, the outside envelope was a deer's skin that had been simply dried, without any cutting, or marks of any kind.

Dr. Mitchell conversed with Mr. Gratz, the proprietor of the great cave, who confirmed the account we have given of its extraordinary length, windings, and saline contents. Mr. Gratz was persuaded that the chambers of this cavern had been formerly used as places of refuge. He had found heaps of moccasons, or coverings for the feet, all worn more or less, and thrown by like old shoes, and the materials and workmanship of these were completely different from those practised either by the red or the white men.

There are in this state five celebrated hot springs, or licks, namely the higher and lower blue springs on Licking river, from some of which streams of brinish water are said to issue.

The climate of Kentucky is moist, though it is said to be salubrious, except in the vicinity of ponds and low grounds. In the winter, and early in the spring, the ground is generally very muddy, and colds, rheuma-

tisms, and inflammatory fevers, then prevail. The extremes of heat and cold are unknown. In 1798, the maximum heat was 99° of Fahrenheit. In the spring and fall of the year, the weather is delightful. A wind from the south-west blows during half that time. The very cold winds are all from the north and west. The winter generally lasts about two months, and is so mild, that cattle subsist without fodder.

The principal rivers are the Mississippi, the Ohio, the Rivers Big Sandy, the Tennessee, the Kentucky, the Green river, and the Licking river. The Kentucky rises in the south-east of the state, and runs through a north-west course of 280 miles, where it empties itself into the Ohio, by a mouth 250 yards wide. It has a rocky and irregular course, through banks generally rugged and precipitous. In the winter tides, it is navigable for boats of a considerable size for 180 miles; but at Frankfort they can pass only during half the year. Green River rises in Lincoln county; and, after an irregular westerly course of 280 miles, runs into the Ohio, 120 miles below Louisville. It is at all times navigable for loaded boats for 80 miles. Licking river runs into the Ohio, by a mouth 150 yards wide, after a course of 180 miles. It is navigable about 70 miles.

The principal towns in this state, are Lexington and Towns.

Frankfort. Lexington stands on an agreeable plain, about 120 miles in circuit, which is half encircled by Kentucky river for a course of 30 miles, so that it is nowhere more than 20 miles from the town. It is the seat of several flourishing manufactories; and contains a handsome presbyterian church, a church for the Baptists, one for the Episcopalians, a college, and 4926 inhabitants. The seminary, which is called the Transylvania university, is under a board of 21 trustees, and has a president, 5 professors, and a teacher of French. The number of students, exclusive of those of medicine, is about 70. The library contains 1500 volumes; and the annual revenue is about 2700 dollars. Frankfort, which is the seat of government, is situated on the east bank of the Kentucky, about 30 miles from Lexington. It has a population of 1090 inhabitants.

The following Table contains a view of the manufactuf-

tures of this state in 1810.

| Total value | 5,098,998 |

| Commerce. The principal articles of export, which are hemp, wheat, and tobacco, are carried down the Ohio and Mississippi to New Orleans; and the imports are brought up these rivers from the same place. The amount of exports, in 1801, was $26,673 dollars. The legislature of Kentucky, called the general assembly, meets on the 1st Monday of November, and consists of a senate and a house of representatives. The members, who are limited to 35, are chosen by districts, and retain their seats for four years; and one-fourth must be
relected annually. A member of the senate must be
years old, and a citizen of the United States; and he
must have resided six years in the state, and the last
year in the district. The members of the house of repre-
sentatives, who are limited to 100, are elected on
the first Monday of every August. They must be 24
years old, and citizens of the United States; and must
have resided the two preceding years in the state, and
the last of them in the county or town which they re-
present. The governor, to whom the executive go-
vernment is entrusted, is elected by the people once in
two years, and must be out of office at least seven years
before he can be chosen again. He must be an Amer-
ican citizen, and 35 years of age, and must have resi-
ded in the state for the six preceding years. The lieu-
tenant-governor is similarly chosen, and must have sim-
ilar qualifications. He is president of the senate. If
the governor dissents from any bill, it cannot become
a law unless it is again agreed to by a majority of both
houses.

Baptists, Presbyterians, and Methodists, are the lead-
ing sects in Kentucky; the Baptists being the most, and
the Methodists the least numerous. There are a few
Catholics, who have a bishop at Bardstown, and still
fewer Episcopalians. The Presbyterians have fifty
ergymen, whose doctrines are, with a few exceptions,
strictly Calvinistic.

This part of America was well known to the India
traders many years before it was colonized. A map of
it was made from their description in 1752; and it was
afterwards explored in 1754 and 1769. It was again
explored by Col. Daniel Boon in 1770. The first fa-
ily settled in it in 1771. In 1777, it was erected into
a separate county by Virginia, and a separate district
in 1782. In 1786, it was entirely separated from
Virginia; and on the 1st June 1792, it was received
into the union. The first settlers were harassed by
the Indians, till General Clarke, in 1778, took their
posts, as well as those of the French and English.

The population of Kentucky was, in
1790 . . . . . . . . . 73,977
1800 . . . . . . . . . 120,955
1810 . . . . . . . . . 400,511

The distance of Philadelphia by land to Kentucky,
is between 700 and 800 miles.

See Morse's American Geography, 5vo, Boston, 1817,
p. 292. The Medical Repository for February 1815,
published at New York, vol. ii. p. 391; and The Tran-
sactions of the Society of the Antiquaries of Scotland,
vol. i. p. 61, 62, &c. Edinb. 1818. Very copious infor-
mation respecting this state, may also be found in Mi-
chaux's Travels to the Westward of the Alleghany
Mountains, chap. 16. 17, &c.

KEPLER, Jovius, a celebrated astronomer, was born
at Weil, in the duchy of Wurttemberg, on the 27th Dec.
1571, and was the son of Henry Kepler, a respectable
officer in the army, whom misfortunes had reduced to
indigent circumstances. Notwithstanding this reverse
of fortune, he was desirous to give his son the best edu-
cation in his power; and though young Kepler was
sent to different schools, and placed under different
masters, yet his avidity for knowledge was so great,
that he made the most rapid proficiency in his early
studies. He was sent in the year 1589 to Tubingen;
and in 1591, he studied mathematics at the university
of that city, under the celebrated Maestinus, who had,
in his early life, made an oration in favour of the Coperni-
can hypothesis, which is said to have turned the attention
of Galileo to the true system of the universe. He was
first admitted to the degree of bachelor, and afterwards
to that of master of philosophy; and after studying the-
ology, he undertook the duties of the ministry for a short
time. His passion for science, however, induced him
to withdraw his views from the church, and to devote
his whole leisure to his favourite studies. In 1594, he
was invited to Gratz in Styria, to fill the mathematical
chair in the university of that city; and it seems to
have been after he accepted of the appointment, that
he embodied those speculations respecting the analogies
and harmonies of nature, which he published at Tubin-
gen in 1596, under the title of, Prodomus dissertatio-
num cosmographicarum, continens mysterium cosmogra-
phicum de admirabilibus orbium celestium, deque
causis ceptarum numeri, magnitudinis, motuumque perio-
dicorum genuine e propriis, demonstratur per quinque
regularia corpora geometrica. To this work is added a
paper by Rheticus, on the Copernican system, and ano-
ther by Maestinus. In order to discover why the plan-
ets were six in number, and why the dimensions
of their orbits were such as Copernicus had described
them, he studied the properties of numbers and plane
figures with success. It, however, occurred to him,
that while the plane regular figures may be infinite in
number, the number of regular solids was limited to
five; and he attempted to discover a relation between
their dimensions and the distances of the planetary
orbits. A cube, for example, if inserted in the sphere
of Saturn, would, he supposed, touch by its six planes
the sphere of Jupiter; and, in like manner, the other regu-
lar solids would determine the intervals of the other
orbits. When Kepler was afterwards asked by Thomas
Lansius to which of his own works he gave the prefe-
rence, he replied, that when he discovered the sublime
secret of the five regular bodies, he valued it more than
he would have done the possession of the whole electo-
rate of Saxony.

Kepler sent a copy of his work to the celebrated Ty-
cho Brahe, who had been too long familiarised with ce-
estial observations, to place any value on such wild spe-
culations. He wrote to Kepler, and urged him " first to
lay a solid foundation for his views by actual obser-
vations, and then by ascending from these, to strive to
reach the causes of things." This advice, which con-
tains the whole substance of what is called, the Bacon-
nian philosophy, no doubt induced Kepler to renounce
these visionary speculations, and thus to lay the foun-
dation of those substantial discoveries, to which he was
afterwards conducted.

In the same year in which that work appeared, Ke-
pler married a lady of a noble family; but in the year
1598, he was persecuted for his religious principles,
and was driven from Gratz. He was, however, recalled
by the states of Styria; but as he did not think his
situation sufficiently secure against future molesta-
tions, he accepted of a very pressing invitation from Tycho
to settle in Bohemia, and to assist him in his calcula-
tions; and he accordingly removed thither with his fa-
mily and books in the year 1600. During this journey,
he was seized with a quartan ague, which lasted eight
months.

Tycho introduced Kepler to the acquaintance of the
Emperor Rudolph, which led to his appointment as ma-
thematician to the emperor, a title which he retained
under the successive reigns of Matthias and of Ferdi-
nand. Notwithstanding this kindness, Kepler com-
plained of an unwillingness on the part of his friend,
either to promote his interest, or to make him acquaint-
ed with his discoveries and improvements. The death,
of Tycho, however, in 1601, put an end to those feel-
ings of discontent, which might soon have ripened into
a serious quarrel.

The mind of Kepler was deeply tinged with the er-
rors of astrology. In 1602, he published at Prague,
his Nova Dissertatione de fundamentis Astronomia-
certioribus, ad cosmostheoriam spectans, in which he speaks
of the possibility of predicting future events by the as-
pects of the planets. And in another work on the same
subject, which appeared at Frankfort in 1610, entitled
Tertium Interium, he exhorts theologians, physicians,
and philosophers, but principally Philip Feschius,
to take care that they do not injure their own interests,
by rejecting the errors of astrology; and he attempts

to shew, that an influence may be communicated from
the planets to the earth, through the medium of the
light which they reflect.

In 1605, he published at Frankfort, his Paralipome-
na ad Paulinus, quibus Astronomiae pars Optica tradi-
tur, potissimum de artificio observatione et estimatione
diametrorum, delibera inquirendum e Solis et Luna. This
work contains the method of calculating eclipses, which is in
use at the present day. In 1605, he published at
Prague, his Epistolae ad rurum celestium amatorem uni-
versos, respecting the eclipse in the month of October
1605; which was followed in the same year, by his
Epistolae de Cometa 1604, &c., which was the prelude to
his great work on the star in the foot of Serpentarius.

In 1606, he printed at Frankfort, his Syntagma Chronologicum;
and in the same year, appeared his work, entitled, De
Stella Nova in pede Serpentarii et qui sub ejus eorun
de novo init trigramo igneo, Libellus Astronomicus,
Physicus Metaphysicus, et Astral-gicis disputations uedos
e et paradoxis plenius. In 1608, Kepler published at Halle,
a history of the new comet of 1607, with a discourse on
the nature and motion of comets, and their indications.

Looking at the sun in a camera obscura, he main-
tained that he had seen Mercury on the sun's disc.

He published the same error at Leipsic, in 1609, in a pam-
phlet entitled, Phenomenon singularum seu Mercurius in
a Ephemeredes fact 1616, he acknowledges
his mistake, and congratulates himself on having been
the first that observed the spots of the sun. His fa-
mous work, entitled Astronomia nova, seu Phyla-
ica celestis tradita commentariorum de motibus stellae
Martin ex observationibus Tyeconis Brame, appeared
at Prague in 1609. This work, as we have already shewn,
(see our article Astronomy, Vol. II. p. 596,) conducted
its author to the great discovery of the true form of the
planetary orbits. In 1611, appeared his Dissertatione
cum Nuncio Siderei nuper ad mortales missa a Galilei,
in which he announces to Galileo, the great satisfaction
which his discoveries had given him. He expresses his
hope, that he may discover other satellites round Saturn
and Mars. He states his astonishment, that telescopes
had not been made formerly, particularly after what
Baptista Porta had said of them in his Magia Naturalis;
and, in addition to many interesting observations, he
conjectures that Jupiter had a motion of rotation about
his axis.

In 1611, he published at Augsburg, his Dioptrica;
item etiam prefationem Io Penta Galilaei in Opticis Eucli-
dicit; De usu Opticarum in Philosophia. This work was
reprinted at London, in 1653. Descartes is said to
have borrowed freely from it. When Descartes was
charged with this, he acknowledged that Kepler was
his first master in optics, and that he understood more
of the subject than all his predecessors. In the same
year appeared his Strena, seu de Nive sexangula, in
which he seems to have been the first that discovered
the tendency of water to crystallise in angles of 60°.

In 1615, Kepler published his Elogia chronica ex
epistolis doctissimorum aliquot virorum et suis mulitul;
and in the same year at Lintz, his Nova Stereometria do-
torum minivorum, which he, is said to have composed,
in consequence of a revenue officer making a false
measurement of his wine at the time of his marriage.
His Ephemerides Nova Mot. Celest. ab anno 1617,
appeared at Lintz in 1617.

On the 15th May 1618, Kepler has left it on record,
that he discovered the beautiful relation between the
squares of the periodic times and the cubes of the dis-
ces of the planets. In the same year, he published at Lintz,
his Epitome Astronomica Copernicanae in septem libros
conscripta. This work contained only the three first books;
the fourth appeared in 1622, and the three last in 1621.
In 1619, he published at Lintz his Harmonices Mundi
libri quinque, geometricos, architeconicos, harmonicos,
psychologicos, astronomicos, cum appendice continens
ratis cosmographicum; also his treatise De Coelestis Li-
belli tres astronomicos, physicos, astrologicos. Ejusdem
Cometary physiologia nova et paradoxos; and another
work entitled Prognosticon, &c., or the Prediction of Mis-
fortunes for Governments and Churches, principally from
the Comet and the Earthquake in 1618 and 1619. The
first of these works, viz. the Harmonices, is dedicated to
James VI. of Scotland. Kepler attempts to shew, that
there is a resemblance between the distances of the hea-
venly bodies, as seen from the sun in their aphelion and
perihelion, and the division of the musical octave;
though this part of his book is in very respect absurd,
yet he appears from this work to have studied music as
a science, and also to have been practically acquainted
with it. The discovery of the four satellites of Jupi-
ter, seems to have first pointed out to him the error
which he had committed.

In 1624, appeared at Marburg, his Chilias Logarith-
morum, to which a supplement was added in 1625, when
he also published his Hyperastides, &c. in quibus doce-
untur praatantissima de parallelobus, deque novorum siderum
in sublima athea discursibus repellitur et confirmatur.

After the death of Tycho, the emperor Rodolph com-
manded Kepler to complete the astronomical tables
which had been begun by his friend; but he was not
able to bring his labours to a termination till the year
1627, when they at last appeared at Ulm, under the
title, Tabulae Rudolphinae, quibus astronomicae scientiae,
temorum longitudinae descripta, nomenclaturae astrola-
piae, anno 1654, exinde observationibus siderum accuratissimiae
post annum precipues 1572, serio auctae, tandem trad-
ducta in Germaniam, inque Aulum et nomen Rodolphii
imp. anno 1598. The delay in the publication of this
work, arose from the difficulties which Kepler experi-
enced in obtaining the pecuniary means which were
necessary for carrying it on. The emperor Rodolph
had given orders in 1609, that, besides the expense of
the edition, the arrears of his pension, amounting to
2000 crowns, and also 2000 crowns more, should be
paid; yet it was not till two years after that these orders
were executed. Under the emperors Matthias and Fer-
dinand, he experienced the same difficulties; but after
the year 1621, Ferdinand paid all his arrears, and all
the expences necessary for completing the work.

As soon as these tables were completed, Kepler solici-
ted, and obtained the emperor's leave, to take up his re-
Commenlaria among Latin Kepleri made heavy integrity.

The De Letters Epistolse and meridnm zealous dreadful.

As we have already given a brief view of Kepler's discoveries in our History of Astronomy, and in the part of that article which treats of Physical Astronomy, we have directed the reader's attention, in the preceding sketch, principally to the events of his life, and to the titles and general object of his various works. The abstracts which we have given, short and imperfect as they are, are not uninstructive.

It is a very difficult matter to form an estimate of the true character of Kepler's genius. The ingenious absurdities with which he began his career, were a very unfavourable omen of his future success. But he seems, from his infancy, to have been impressed with the conviction, that there were analogies or laws to be discovered with regard to the distances of the planets; and every view which presented itself to his ardent fancy, seems to have been embraced as the real law of the universe.

The advice of Tycho, however, seems to have given a right direction to his inquiries; and the observations of the illustrious astronomer on the planet Mars, and on the other planetary bodies, presented him with the tests by which his speculations could be tried. But while we admire those brilliant discoveries to which Kepler was thus conducted, it is impossible to restrain our indignation against those wild and almost insane speculations, in which he afterwards chose to indulge. That he was a believer in astrology it is impossible to doubt; and though, in order to save his reputation, La Lande has affirmed that Kepler published his reveries merely in order to procure a sale for his books, by flattering the prejudices of the vulgar; yet, in drawing the character of this great man, we should be unwilling to apologise for his superstition, by such a heavy imputation upon his integrity. The physical notions of Kepler respecting the planets, are still more ridiculous than his astronomical convictions. In his Harmonice Mundi, (tab. iv. cap. vii.) he endeavours to prove, that the earth has a sympathy with the heavens, and, by a natural instinct, perceives the position of the stars. He maintains also, that the earth is a vast animal, breathing out the winds from holes in the mountains; and that all the planets are animated, and have muscles proportioned to their bulk, by means of which they move through absolute space.

He even supposes, that the faculty of the earth is terrified at the approach of a comet, that it "sweats out a great quantity of vapour through terror, and that hence arise great rains and floods."

In the year 1634, appeared a posthumous work of Kepler, entitled, J. Keplerii Sommum, seu opus posthumum de Astronomia Lunari, in which he treats of the phenomena which will be seen by the inhabitants of the moon and the other planets. Kepler himself died during the printing of this work; and his son-in-law Bartschius, who took the charge of the impression, did not live to complete it. Lewis Kepler, the son of our author, who was a physician at Königsberg, was with difficulty prevailed upon to finish an undertaking, during which his father and his brother-in-law had died.

Kepler left behind him many volumes of MSS. Hevelius purchased these from his representatives, and has given a list of them in the Philosophical Transactions for 1674, No. 102, with the following remarks:

"As to the MSS. of the celebrated Kepler, I purchased them all from his representatives for a certain sum, as well of those that have been published, as those that have never yet been published; among which are a great many letters that passed between him and other celebrated persons. Among these MSS. are found several well deserving to be published, not only many letters, but some works also; among which is his Hipparchus, which, though not quite digested, might be easily put in sufficient order for that purpose. I have also his MSS. Chronology; but I do not find a written account of his life, though there are numerous facts and traits, from which a clear account of it might be given."

These MSS. were, after the death of Hevelius, purchased from his heirs by M. Gottlieb Hanisch, a zealous mathematician.

With the view of giving them to the world, Hanisch was presented to the emperor Charles VI. and obtained from him a thousand ducats to defray the expense, and a pension of 300 florins during the life of the emperor. With this pecuniary aid, he published at Leipsig, in 1718, in one volume folio, Epistolae ad Ioannem Keplermann, mathematicum Coesarem, scriptae, insertis ad eadem responsionibus Kepleriani, quotquot hactenus recertiari potuerunt, opus novum, &c. cum Jo. Kepleri vita; quoque et annotationes Caroli VI. Roman Imp. Having spent all the 1000 ducats on this volume, and being obliged even to pledge the rest of the MSS. for 828 florins, Hanisch was unable to publish the rest of the MSS. He addressed himself to the celebrated Wolfius to no purpose, and was equally unsuccessful in his application to the Royal Society of London, and to other quarters. At this time, M. de Murr of Nuremberg, happening to be in London in 1761, made great efforts to acquire the MSS. and Dr. Bradley had almost determined to purchase them. In 1773, 4000 francs were asked for them; and some time afterwards, M. de Murr succeeded in purchasing them for the Imperial Academy of St. Petersburg. The following are the contents of the 23 volumes of MSS. four of which were published by Hanisch.

1. Hipparchus Kepleri, 279 leaves.

2. Kepleri Adversaria tabularum lunariam, &c. cum Calendario in annum 1603, 152 leaves.

3. De stellaris novis Kepleri annotata et observationes, aliorumque epistolae.

5. De genesi magnitudinum.

6, 7. 8. The letters which have been published and deposited in the imperial library.

9. Epistolae Kepleri, partly in Latin and partly in German, with many calculations.

10. Epistolae Davidis Fabricii ad Keplerum cum responsionibus 1601, 1609.

11. Litterae.

12. Letters which have been published.

Ker, Kerman.

15. Documenta observatarum et examinatarum eclip-
sium.
17. Note in Scaligeri et Petavii Doctrinam tempor-
orum.
18. Kepleri astronomica geneithica et genealogica
varia.
19. Discursus de anno lunari.
20. Kepleri Schedae authenticae Tabularum Rudol-
phinarum.
21. In 4to. Canon rectangulari sphericor inchoat. Me-
diorum motum lune correctio et costitution. Tabulara
Rudolphinarum emendationes. Tabula proportionalis,
sec canon hexacontion sive sexagenorum.
22. In 4to. De quadrantis libellus, along with
other detached pieces.

For a very full and able account of the discoveries
of Kepler, see Dr. Small's, Account of the Astronomical
Discoveries of Kepler. Lond. 1804. 8vo.

Kerbela. See Meshed Hossein.

Kerguelen's Land, or the Island of Desolation,
is an island in the southern Indian ocean, which
was first discovered in 1772, by M. de Kerguelen, who
afterwards visited it in 1773, and discovered some small
islands in its vicinity. In December 1776, Captain
Cook fell in with the same islands. One of them he
describes as about three leagues in circuit, and very
high. The other is of the same size, and situated one
league to the westward. These islands seem entirely
destitute of interest. They were almost completely
barren, and the few botanical and mineralogical obser-
vations which Mr. Anderson made upon them, are not
worthy of being repeated. The islands are situated
in South Lat. 49° 30', and East Long. 69° 30'. See
Cook's Third Voyage, vol. i. and Relation des deux voy-
ages dans les Mers Australes et des Indo-i, faites en

Kerman, anciently Caramania, (but not the Car-
amania of Asiatic Turkey) is a province of the king-
dom of Persia. It is bounded on the east by the pro-
cince of Seistan and Mekran; on the north by Seistan
and Khorassan; on the west by Pers, Lar, and Irak.
and on the south by Mekran and the Persian Gulf.
The large district of Burkind, in the south of Kerman,
is covered with mountains, which approach the sea
between Cape Jask and the fort of Cohyst, situated in
57° 20' East Long. They then suddenly retire behind
Minab, and do not again advance to the south un-
til beyond Gombroon. Their general name is the
mountains of the Silver Mines. The district of Nur-
mansheer is about 90 miles long, and from 30 to 80
broad. A range of mountains bounds it on the north
and south, those to the south being the highest, and
covered with snow during the greater part of the year.
The soil is fertile, and the country well peopled.

The province of Kerman contains no river of impor-
tance, and hence it abounds in deserts. The climate,
which is by no means salubrious, is in some parts very
cold, and in others very hot. Between Jask and Se-
reek, plantations of palms were numerous, and the
produce of wheat was considerable. On the coast road,
between Minab and Gombroon, are a number of villas-
ges, and a good supply of water.

The principal towns of this province, are Kerman,
Gombroon, Bumm, Regan, Darabjerd, Krook, Tehroot,
Mahim, and Rayun.

Kerman, or Serjan, as it is sometimes called, is the an-
cient Caramana, and was formerly one of the most opu-

cent and magnificent cities in Persia; but from its ha-
ving been exposed to destructive wars, it has now lost
its former splendour. In 1794, it was defended with
the greatest bravery for several months by Lutf Ali
Khan, until it was betrayed into the hands of his rival.
The city was given up for three months to the fury of
the soldiers—the walls and the public buildings were
levelled to the ground—great numbers of the inhabitants
were massacred—and 30,000 were banished into the
remote provinces of the empire. From this calamity
it can scarcely ever recover. It is situated in an exten-

Kran.
KERMANSHW, is the capital of a fruitful and extensive district of Persia of the same name, in the province of Iroak. It is the residence of Mahomed Ali Meerza, the eldest son to the king. It is situated in the southern extremity of a fine plain, through the centre of which runs the river Karasu. It contains no ancient ruins. It is adorned with many gardens, has fourteen fountains or public baths, four mosques, and yields an annual revenue of 15,000 tomauns a-year. Kermanshaw is a flourishing town, and contains about 12,000 houses. It is situated in East Long. 40° 38', and 34° 26' North Lat. See Macdonald Kinneir's Geographical Memoir of the Persian Empire, p. 132.

KERRY is the name of a maritime county of Ireland, in the province of Munster. It is situated on the south-west coast; and is bounded on the north by the Shannon, by which it is separated from the county of Clare; on the east, by the counties of Limerick and Cork; on the south-east by Cork; and on the south-west and west by the Atlantic Ocean. In consequence of two great projecting lands of territory, comprehending the baronies of Iveragh and Corca-goumin, the shape of the county is very irregular. Its extent, from north to south, is 67\frac{1}{4} English miles; its greatest breadth, from east to west, is 52; and it contains 1793 square English miles. This county is covered with mountains, in the midst of which are the celebrated lakes of Killarney, (see Killarney); and a great portion of it is thus rendered unfit for habitation, and incapable of being cultivated. The northern baronies, which contain much good land, are by no means level; and the cultivated fields and fine pastures are often interrupted by black and stoney hills, and occasionally by tracts of bog. The barony of Corca-goumin is the most western point of Europe. It is of a peninsula form, and is full of mountains, of which the high promontory of St. Brandon is the most conspicuous. The barony of Iveragh consists of a chain of rough mountains running into the sea; but it abounds with magnificent prospects, connected with the view of the ocean and Kenmare river. Glarerought is covered with very high and rugged hills, and is separated from the county of Cork by a ridge of rocky mountains, which is passable only at the Priest's Leap. The highest mountains in the county are those on the west and south of Killkenny. The height of

Kerry

KESHO. See TURKIN.

KESWICK is a small market town of England, in the county of Cumberland, situated 228 feet above the level of the sea, on the east side of the vale of Keswick, and near the lower end of Derwentwater, on the lake of Keswick. The town consists of a long street, protected from the north winds by the lofty mountain of Skiddaw; but contains no buildings of any interest. A cotton manufactory has been established here. Coarse woolen goods, carpets, blankets, kerseys, and some linens, are also made; but the town is principally supplied by travellers who come to visit the lakes. In
KEY

1793, the number of visitors was 1540. There are two private museums in the town, which are open for public inspection. The Druidical stones at Castlethorpe, about two miles to the south of the town, are worthy of being seen. In 1811, the population of the township was 353 houses, and 1683 inhabitants; of whom, 258 were returned as employed in trade and manufactures. The maximum quantity of rain that falls at Keswick is 84.605 inches, the minimum 34.306, and the mean 68.5. See West's Guide to the Lakes; and the Beauties of England and Wales, vol. iii. p. 229.

Kettering is a populous market town of England, in Northamptonshire. It is situated upon a small river running into the New. The town is but poorly built, but is gradually improving. The church, which has a nave, north and south aisles, a chancel, and a handsome tower and spire, is a tolerably good building. There is here a sessions-house, a well endowed free-school, an almshouse, and two dissenting chapels. The manufactures of the town consist of sorting, combing, spinning, and weaving tammies and lastings of different sorts. In 1811, the parish contained 713 houses, and 3242 inhabitants; of whom, 587 were returned as employed in trade and manufactures. See Bridge's History of Northamptonshire, and the Beauties of England and Wales, vol. xi. p. 194.

Kew is a village of England, in the county of Surry, celebrated for the royal palace built there by George III. and the magnificent gardens which belong to it. There is a fine stone bridge of seven arches thrown over the Thames, from a design by Paine. There is here one of the royal palaces, which is held on lease. It is a small house, in a bad style of architecture. His present majesty, however, began, in 1802, a new palace in the Gothic style, and of an embellished form, from the designs of James Wyatt, Esq. This palace is still unfinished. A very full account of the royal gardens of Kew, will be found in our article HORTICULTURE, vol. xi. p. 125.

KEY, in Music, is a term ambiguously used by most practical musicians. Sometimes by this term they mean a scale or system of intervals; at others, it implies the lowest or fundamental note of the system, as above; and, on other occasions, this term also designates one of the short levers on which the fingers act, in performing on organs, pianofortes, &c. Writers, who have aimed at greater precision in their terms and writings, have made the following distinctions, viz.

Key-note, called formerly ison or meso, the fundamental or bass note of every mode or scale of intervals, as above; each tune, or piece of music, usually begins with its key-note, and invariably ends with it; otherwise, as experience has shewn, the ear would not be satisfied, or the subject of the tune seem closed and ended. The moderns consider C as the principal or first key of the major mode; and by a series of modulations into its successive or consecutive fifths, above and below, they derive all the other key-notes. Mr. Liston first shewed how this modulation could be conducted, without departing from the harmonic relations of the first key-note, or C, by returning sufficiently often to one of the consecutive 3ds or 6ths of this first key-note; and thus he extended the scale to 59 notes in the octave; and Mr. Farey has now extended the same to 612 notes. See our article INTERVALS.

Key, or Mode, implies a system, or scale of intervals. The practical, and less correct writers on music, have often asserted, that a key or mode, whether major or minor, consists only of seven sounds, which, in the first or principal key, or mode major, are C, D, E, F, G, A, and B; and, in the principal minor key, or mode, are A, B, C, D, E, F, and G; but Mr. Liston, in pp. 59 and 61 of his Essay, shews that the major mode C is not complete, or capable of correct or euphonious performance in it, (such as violins and voices actually accomplish,) without 10 notes instead of 7; viz. C, D, D, E, F, G, A, A', and B. In like manner, in pp. 61 and 67, he shews that the first, or principal minor mode or key A, requires also 10 notes, viz. A, B, C, D, E, F, G, and A.

Combining, therefore, these two scales together, it thus appears that 12 notes are required instead of 7, as some still inconsiderately assert, for simply accompanying, or producing the harmonies to an ascending and descending bass octave, in the modes C major and A minor. It need, therefore, excite no surprise, that in modulating through all the keys or modes in use, so many as 59 notes become necessary; but rather, how so few notes should suffice, which is owing to so many of the notes answering in various keys.

Finger-keys, manual keys, or clavier, are the short levers of the keyed instruments, by means of which they are played upon; usually there are 12 of these to each octave; or, the compass consists of the instruments between the seven of them longer and broader than the other five, which are shorter and narrower, and stand up higher between the longer keys; according to the arrangement which is explained in our article FINGER-KEYED INSTRUMENTS.

The organ in the Temple church in London, has two of its short keys divided in their lengths, so as to produce two distinct levers or keys, by which means the fingers can act occasionally on 14 notes in each octave, instead of 12; we have read, or heard, of attempts formerly to divide more of the keys, one as early as 1683, by a Mr. Player, and thus to multiply the powers of the fingers in performance, as to improved harmony; but so many difficulties, and liabilities to mistakes, in the hurry of performance, were thereby introduced, that we believe these divided finger-keys nowhere remain in use, except two of them in the Temple organ scale, as already mentioned.

The late Dr. Robert Smith supplied the place of more finger-keys, in his improved harpsichord, by stops, to be moved by the hand, which put some means out of action by their keyless 12 finger keys, and brought others into action in their stead; and this mode remains yet in use in the Foundling-hospital organ in London, for four additional notes; but, within a few years past, Mr. Hawkes, and, since him, Mr. Loeschman and Mr. Liston, have effected these occasional shiftings of the notes, belonging or attached to the ordinary finger-keys, by means of pedals, or short levers, to be moved by the feet of the performer, which seems an improvement of very considerable importance in the practice of instrumental music. In March 1811, John Trotter, Esq. took out a patent for finger-keys of equal width throughout, in two ranges, for facilitating the transposition of music into any key, during its performance, as may be seen in the second series of the Repertory of Arts, vol. xxii. p. 197.

Kharasram, or Chorasam, is a country of Asia, bounded on the north by Turkestan, on the east by Great Bucharia, on the south by Khorasam, and on the west by the Caspian Sea. It is about 550 miles in length and breadth; and was once a powerful kingdom. The principal product of the country is cotton, lamb-furs, and a small quantity of raw silk. Cattle, furs, and hides,
KHO

KHANANDU. which they obtain from the Kirghese and Turcoman Tartars, are the articles which they export to Bucharia and Persia. Khiva is the capital of the district. It stands on a rising ground, on the west of the river Gihon. It has three gates, and a thick strong wall of earth, with turrets at short intervals, and a deep and broad ditch full of water. The houses are low, and built of mud; and the roofs flat and covered with earth. Khiva is 260 miles N. W. of Samarcand; and is situated in East Long. 58° 25', and North Lat. 41° 30'. See Hanway's Travels.

KHMATMUANDU, KHATMUANDU, CATMANDOO, JINGBOU, KATHIMOON, VINDAISE, and GONGGOOL-PUTTEN, or CASHI-THAMANDIE, signifying the Wooden Metropolis, are the different names which have been given to a city in the valley of Nepal Proper, and reckoned the capital of that kingdom, from being the residence of the Ghoorkali Rajah. It is situated on the eastern bank of the Bishenmutty, along which it stretches for about a mile. Its breadth is seldom greater than a quarter of a mile, and never exceeds half a mile. The houses are built of brick and tile, with pitched or pant roofs. Towards the street, they have frequently enclosed wooden balconies of open carved work, and of a singular fashion; the front pieces, instead of rising perpendicularly, projects in a sloping direction towards the eaves of the house. The roofs which, not excepting even the Rajah's residence, are of a mean appearance, are generally two, three, and four stories high. The streets are extremely narrow and filthy.

The most striking objects of Khatmandu are numerous wooden temples, not only in the town itself, but scattered over its environs, and particularly along the sides of a quadrangular tank, or reservoir of water, at a short distance from the north-east quarter of the town, called Rami-pokra. They resemble, both in their form and construction, the wooden mounds in other parts of India. Some of them are very large and high. Khatmandu likewise possesses several rich temples on a large scale, with two, three, and four sloping roofs, diminishing gradually as they ascend, and terminating generally in pinnacles. These pinnacles, as well as some of the superior roofs, are splendidly gilt, and have an agreeable and singular effect. The number of idols is about 27,333.

During the time of Jye Purkaus, Khatmandu was supposed to contain 52,000 houses, including, no doubt, the dependent villages, to the amount of 20 or 30, as the area of the city cannot hold more than 5000 houses. The population of the town is estimated at 48,000 by Colonel Kirkpatrick, and that of the capital and its district at 166,000, not including Doons-baise, Nookh, Nerjia, or any of the dependencies beyond the valley. The view of the town from the west bank of the river, with the bridge on the right hand, and the lofty Himalaya mountains in the back ground, is remarkably fine. The distance of Khatmandu from the Himalaya mountains is 40 miles; and it is situated in 85° 39' East Long, and 27° 33' North Lat. See the Asiatic Researches, vol. ii. p. 307.; Colonel Kirkpatrick's Account of the Kingdom of Nepaul, p. 158, &c., London, 1811.; and Dr. Francis Buchanan's Account of Nepaul, which is now in the press.

KHIVA. See KHAJAS.

KHOEE is a town of Persia, and the capital of a rich and extensive district in the province of Azerbaijan. It is the emporium of a considerable trade carried on between Turkey and Persia. It is said to be built on the site of Ataxata, the former metropolis of Armenia. It stands in a plain celebrated by the battle in 1514, in which 30,000 Persians encountered 300,000 Turks. It is reckoned one of the most beautiful and best built towns in Persia. The streets, which are regular, are shaded with avenues of trees; the walls are in good repair; and the ceilings of the houses covered with paintings in good taste, which are supposed to have been executed about the period of Shah Ismael. According to Captain Sutherland, it contains a population of 25,000. East Long. 45° 11', North Lat. 53° 30'. Distance from Tabreez 22 farsungs. See Macdonald Kinneir's Geog. Mem. of the Persian Empire, p. 154.

KHONSAR is a town of Persia, in the province of Irak, situated in a most interesting and romantic manner. It stands at the base of two parallel ranges of mountains, so very close, that the houses occupy the bottom, and at the same time the face of the hills to some height. Every house is surrounded by its own garden, so that the town is connected only by plantations. It is about six miles long, and about one-fourth of a mile broad. "The hills," says Mr. Kinneir, "afford an ample supply of water; and the appearance of the black and barren mountains, without a particle of vegetation upon them, hanging over these gardens, forms a contrast with the luxuriant and variegated ridge of the plantations, which can hardly be imagined by a person who has never visited this little paradise." The traveller, in approaching it from the west, passes over a road completely shaded on both sides, for about five miles, by every kind of tree which the country produces. There is no corn produced in the valley; but the abundance of fruit enables the inhabitants to procure every necessary in exchange for it. A kind of cider is made of the apples, but it does not keep above a month. The women are celebrated for their beauty and vivacity. The town contains about 2500 families, and yields an annual revenue of 5000 tomans. East Long. 59° 36', North Lat. 38° 2'. See Macdonald Kinneir's Geog. Mem. of the Persian Empire, p. 128.

KHOIRASSAN, or the Country of the Sun, is an extensive province of Persia, bounded on the north-east and east by the Oxus and the country of Bulikh; on the south by Cabul and Seistan; and on the west by Irak, Astarabad, and Dahistan. The northern and eastern parts are said to be a level country, covered with sandy deserts, and irregular ridges of lofty mountains. The climate is in some parts temperate, and in others cold. The wind called Bad-e-semmum, which blows for forty days every year in the deserts, is instantly fatal to those who are exposed to it. The soil, which is in general good, produces wine, fruit, corn, rice, and silk, in great quantities, and of the best quality; but, in consequence of the incursions of savage tribes, its princely cities have been demolished, its commerce ruined, and its fertile districts converted into solitary wastes. The cities of Meshed, Nishapour, Turshish, and Tabas, with their dependencies, belong to Persia; but the southern parts, including the city of Herat, are in the possession of the Afghans.

The different ridges of mountains appear to be connected with each other, and with the Hindoo Koh, and the range of Elburz. The mountains of Bamian and Goor, which separate Khorassan from Cabul, send out an immense branch to the south-west, as far as 34° of North Latitude, and 65° 20' of East Longitude. Turning suddenly to the north-west, it cuts the latitude of 3 L.
Rivers.

The Oxus, which is the chief river in the province, rises in the mountains of Pameer, and is said to form a junction with the Jaxartes, before it throws itself into the Caspian. The Oxus is described as navigable for more than 200 miles, in which distance there are many ferries, with from 8 to 10 boats each. The cultivated lands extend only about three or four miles from the river. The Tedzen, or the ancient Ochus, is next in size to the Oxus. It seems to have its origin near Seraks, and, after receiving many tributary streams, and particularly the Meshed river, it falls into the Caspian in North Lat. 38° 41'. Herat, or Hererood, (anciently the Aries,) rises a little to the north of Herat, and running southerly, is lost in the sands between that city and the lake of Serakh. The Murgab, anciently the Margus, issues from the mountains of Goor, and is also said to be swallowed up in the sands near Herat. The Ester, anciently Siderius, which is navigable for a short distance, is a considerable river, and gives its name to the province of Astaberd, where it flows into the Caspian.

The capital of the Persian division of Khorassan is Meshed; and Herat is the capital of the Afghan part of it. See Herat and Meshed; and Macdonald Kinneir's Geog. Mem. of the Persian Empire, for a fuller account of the province.

Kidderminster, anciently Chidecomister, is a market-town of England, in the county of Worcester. It is divided into two unequal parts by the river Stour. The town consists chiefly of two good streets, one of which runs parallel to the canal, and the road from Bewdly to Birmingham runs through the other, which is nearly a mile in length. The houses in the last street are the best; but both of them are well paved, and cleanly kept. The houses are, in many places, cut out of the solid rock. The church is a handsome Gothic structure, standing on a very commanding situation on the brow of a knoll, at the end of a street. The tower is uncommonly fine, the windows have a rich tracery; and externally, it is in excellent order. At the east end of the church is a handsome Gothic chapel, which is now converted into a free school. There are here no fewer than eight charity schools for boys and girls, to which several Sunday schools have lately been added. There are at Kidderminster 12 almshouses, a dispensary, and 25 friendly societies. The town-hall stands in the centre of the market-place, and performs the several functions of a council room, a market house, and a prison.

Kidderminster has long been celebrated for its manufactures. It was once famous for linsey-woolseys, then for friezes, and afterwards for tammies and flowered stuffs; but the carpet trade was not introduced till 1735; and in 1749, the woollen carpets with a cut pile were begun. About 44 years ago, there were here 1700 silk and worsted looms, 250 carpet looms, and about 5000 persons occupied in preparing the materials. The silk and worsted looms have been reduced to 700, while the carpet looms have increased to 1000. The Staffordshire canal passes through this town in its progress to Stourport. The government of the town is in the hands of a recorder, a bailiff, and the justices; and the corporation consists of 12 aldermen, and 25 common council men. There are three reading societies at Kidderminster.

In 1811, the population of this town was,

KIDNEY. See Anatomy, Vol. I. p. 287, and also Physiology.

Kidwelly is a town of South Wales, in Carmarthenshire. It stands on both sides of the lesser Gwendrach, which is crossed by a handsome stone bridge. The new township stands on the east bank of the river, and the old township on the west bank. The town was formerly surrounded with a wall, one of the gates of which is now standing. It once had a flourishing trade; but from the obstruction to the navigation of the river by a sand bank, its commerce has long been trifling. Engineers have, however, been employed, with every prospect of success, upon a new plan, for improving its harbour. Some iron and tin manufactories have been carried on here; and the neighbouring country abounds in coal and iron ore.

The parish church, which is a plain structure, stands in New Kidwelly. The castle, which occupies a bold rocky eminence on the west side of the river, has a grand and imposing appearance, and the remains are in a very perfect state. In 1811, the parish contained 312 houses, 389 families, and 1441 inhabitants. See the Beauties of England and Wales, vol. xviii. p. 369.

KIEL, a town of Denmark, in the duchy of Holstein, situated at the bottom of a bay of the same name, which forms a convenient harbour, resembling that of Palermo. The town contains three churches, an university, founded in 1630, and a college, established in 1768. In 1783, when Mr. Cox visited Kiel, there were 24 professors in the university, and about 300 students. The town is well built; and the castle, which is finely situated, has an observatory. The buildings, and the collections of the university, the hospital of St. George, and the manufactories of the place, are well deserving of being visited. Kiel is one of the most commercial places of Holstein. The trade has been much facilitated, by the junction of the two seas, across the duchy of Holstein, by the canal of Kiel and the river Eyder, which passes by Rendsburgh, and falls into the German Ocean at Tonning. This canal was begun in 1777, and was nearly finished in 1785. It will be able to navigate merchantmen of 120 tons burden.

KIEF. See KIOF.

Kidla, St. The name given to one of the western islands of Scotland, is situated about twenty leagues westward of North Uist. Its exact position has not been ascertained, but its latitude is about 57° 3', and its longitude somewhat more than 8°. The natives call it Herst, and it is also called Hirta. It is not easy to
discover the origin of the name St. Kilda. Among the numerous springs of fresh water, is one called Kilder; and the name Kilda being given to some springs of cold water in Iceland, it is not improbable, that the appellation of St. Kilda, may have originated from the abundance of springs in this island. Bede (Hist. Eccles. lib. 3. cap. 24.) and Camden (Brit. pp. 89, 906.) mention a religious woman named Kilda; who possibly may have wandered to this distant island, and left her name attached to it. That this remote and minute portion of the British empire was deemed worthy of attention from the zealous promoters of the Roman Catholic faith, appears from the names given to the ruins, still visible, of some small religious edifices. In St. Kilda are the remains of three, one called Christ's church, another St. Brianan's, and a third Columba's. In the island Boreray, a few miles westward of St. Kilda, there are the remains of a building, and of a crucifix. On a rock, forming the east side of the bay, at the head of which stands the village of St. Kilda, is a ruin called Dun-fir-Bholug, "the castle of the men of quifers;" and here also are remains of what have been supposed to have been altars. There is a similar appearance on the islands of Boreray and Soay. In the former island, is to be seen what is called Staller's House. It is built on four pillars, and between these are recesses, each distinguished by its name, viz. Simmirdran, Berruan, Radli, and Raistil. The whole is roofed with stones, and covered with earth. In a glen of St. Kilda, opening to the south west, is a structure similar to this, called the Female Warrior's House.

General aspect.

This island extends in length about two miles, and in breadth nearly one. It is precipitous on all sides but one, on which there is a bay opening eastward, having a narrow sandy beach at the extremity, uncovered at low water. As there is almost constantly a heavy swell breaking on the beach, it is necessary to land on a shelving rock on the north side, and in doing so there is frequently much difficulty. It is sometimes practicable to land among the rocks at the opening of the glen, on the opposite side of the island. Like many others, this island has a appearance of a portion of a more extensive country no longer in existence. Two mountains, joined together by a ridge, seem to have been broken, and a portion of each left. The rocks rising from the sea in the vicinity, appear also as the remaining halves of detached mountains; one side sloping, and the other presenting its lofty perpendicular face. The highest point of St. Kilda appears, from barometrical observations made by the writer of this article, to be 1453 feet above the sandy beach mentioned above. The mountain Canagra is the highest; and next the sea, it is perpendicular almost to the very summit. The rocks, called Boreray, Soay, Lavinish, &c. all present forms highly picturesque; and the whole group forms a scene truly magnificent.

The rocks are chiefly varieties of trap, granite appearing on the north side of the bay, near the landing-place; and not far from this, a large vein of greenstone intersects the granite. On the opposite side of the bay, small veins of granite intersect the greenstone. It may be supposed, that these are contemporaneous veins of felspar; but, to the best of the writer's recollection (his specimens having been lost) at the distance of eighteen years, these veins contain quartz as well as felspar, and have every appearance of true veins.

Agriculture.

Around the village, there are some patches of rich soil, on which, potatoes, and excellent crops of barley and oats, are raised, sufficient for the consumption of the inhabitants. The pasture on the mountains, together with that of the small islands next St. Kilda, feeds about a thousand sheep, and a considerable number of cows. There are a few horses on the island, used for carrying home fuel. The value of a sheep varies from two to four pecks of corn.

Sea-fowl, which abound here, contribute largely to Birds the subsistence of the inhabitants, and yield considerable profit from their feathers. The fulmar, Procellaria glacialis, breeds here in great numbers, and is the most valuable of the feathered tribes of this region. From its stomach it yields a supply of oil, and its flesh is a favourite article of food, both fresh and salted. This bird is never seen to feed; but it brings supplies to its young. The people descend the rocks, by means of ropes made of slips of cow hide; and with a noose of horse hair, rendered rather stiff by means of twisted quills, so as to be kept open, and fastened to a long rod, they catch the fulmar by the neck, which prevents it disgorging its oil, which it would otherwise do in self-defence. The mode of catching the birds, is generally similar to what we have described in our account of the Faroe Islands. The dogs are taught here to search for the puffin, among the loose stones and earth near the sea; they go out by themselves, apparently very fond of the sport, and bring the birds carefully home. The gannet, or solan goose, does not inhabit St. Kilda; but is found in great numbers on Boreray. The natives frequently take them with their fowling rods; but they are most successful when they attack them during the night, when all the birds are asleep except one or two, which are carefully avoided, because, if in the slightest degree disturbed, they would instantly take wing, and alarm the others. Approaching the birds which are asleep, the fowler puts his middle finger between the legs of one, and gently moves the feathers of its tail. On this, the bird utters a cry somewhat like the word birro, birro, and the others join in it. This is the signal for the fowlers that all is secure, and they proceed cautiously to seize and kill their prey; and almost always the whole number within reach are slaughtered, in defiance of the watchfulness of the sentinels.

From the first appearance of the village, a stranger might suppose that the island was very populous. A great number of huts are built for preserving the fuel, which is turf, and for the stores of dried birds. The number of inhabited huts is small compared to these. The inhabitants in number are considerably under a hundred. At the time when the writer visited the island, there were 97; 40 males, and 57 females, distributed in 24 families. According to Martin, the number, in 1692, was 200. Mr. Macdonald, the author of the Survey of the Hebrides, found, in 1705, 87 inhabitants; and, in 1809, the number was 103.

Like the people of some of the islands nearer the mainland, the natives of St. Kilda are very dirty in their persons; and a very indifferent nose may be sensible of their approach. Their huts are cleaned but once in the year, from the filth which is carefully accumulated in them, and which is preserved for enriching their fields. The straw is also removed from the roofs of the huts every spring, and spread upon the arable land.

The women of St. Kilda are constantly employed Manuac- with the distaff, and spin very good worsted, which is tured made into plaids and stockings. Every man is his own
KILDARE

Weaver, tailor, and shoemaker. They manufacture horn spoons; needles and fish-hooks out of nails and bits of iron, and brooches out of halfpence and buttons. They also make earthen pots of clay brought from the long island, and use them for boiling milk.

A few days after they are born, many of the children are seized with a peculiar distemper, which, for the most part, proves fatal. The same disease is common in the Westman Islands, on the south coast of Iceland, and is fully described in the appendix to Sir George Mackenzie's Travels in that country. The people of St. Kilda never connect themselves by marriage with those of the Long Island; and few of them ever leave their native spot even for a short time. They seem to be endued with talent for music and poetry; many of them, both men and women, composing songs with great facility, and exhibiting imaginations of no despicable cast. When they dance, all the party sing; and the tune goes round, every one singing a portion and stopping, while the next takes it up instantly where the other left off. This has a singular effect; but it appears greatly to enliven the dance.

A missionary is settled here by the Society in Scotland for propagating Christian Knowledge; and he is instructed to act also as schoolmaster, although, it is feared, the natives are not much troubled with his lessons. The language is a corrupt dialect of the Gaelic, probably a mixture of Scandinavian and Gaelic; and it would be of consequence to the poor people of St. Kilda, to be taught to read either Gaelic or English. Much remains to be done to improve their condition; and, we hope, that this short notice may excite the benevolence of some, who may be able to exercise it towards them.

It is pleasing to read the encomium addressed to the present proprietor, by Mr. Macdonald, the author of the Agricultural Survey of the Hebrides; and we are far from undervaluing the great exertions which Colonel MacLeod has made. Yet we may express a hope, that while the people of St. Kilda are taught to cultivate their soil to the best advantage, their minds will not be neglected.

MacAuley's account of St. Kilda is not very accurate. Martin's description is more correct; but as St. Kilda was scarcely known to exist in his time, the propensity to amplify, and to raise trifles into importance, pervades the description. We doubt not, however, that, making some allowance for these, our readers will be entertained by a perusal of a work now become somewhat scarce. See also Macdonald's Account of the Hebrides.

KILDARE, anciently Chili-dair, or the Wood of oaks, is an inland county of Ireland, in the province of Leinster. It is bounded on the north by Meath; on the east by Dublin, and Wicklow; on the south by Carlow; and on the west by King's county and Queen's county. It extends from north to south 401 English miles, and from east to west 262 English miles, forming an area of 389,198 English or statute acres, of which 1,035 are bog. There are no mountains in Kildare. The county is a flat plain, exhibiting a general appearance of desolation and misery, from the wretchedness of the cottages, and the want of settlements. The town of Curragh of Kildare, the celebrated turfy plain on which the races are held, is nearly 5000 acres in extent, affording pasture to an immense number of sheep. It consists of the softest turf, and lies on a fine dry loam.

The principal proprietors are the Duke of Leinster, who has 75,000 acres of what is called green land, or land fit for tillage and pasture, and all of which is let on determinable leases; Sir Fenton Aylmer, who possesses an immense tract of land, including 18,000 acres of bog; Mr. Latonche, and Mr. Wogan Brown, who have estates from £6000 to £7000 per annum. The farms in Kildare are generally of a larger size than in most parts of Leinster; other counties; and the leases, which formerly were for 31 years and three lives, are granted at present for 21 years and one life. Farms are often taken by partnership, and are frequently advertised to be let to the best bidder. The corn produced in Kildare is sent to Drogheda and Dublin. Wheat enters into the common course of crops; but the fallows are everywhere bad. Farming is pursued according to the English plan. The ground is tilled with oxen and horses intermixed, the former being placed first. Six are generally yoked together, three pair deep, with a plough of the most absurd construction. Fallowes are never ploughed more than thrice. Harrows are used only in seed time, and good rollers are unknown. Clover has been introduced. In the parish of Kilbourn, there are quarries of limestone; but lime is very little used as a manure, as it has always failed on exhausted soils. Limestone gravel is more valuable. Kildare has no determinate breed of cattle. The county is so much occupied with tillage and bogs, that cattle are no object. There are a few graziers, who exclusively fatten sheep purchased at Ballinasloe; but there is no peculiar breed in the county.

The following were the prices of labour and articles of provision, &c. in 1811:—Wages of a man, per day, labour, 1s. 6d.; ditto of a woman, 10d.; grazing a cow, per week, 5s. 3d.; grazing a horse, per week, 5s. 3d.; Kilkenney coal, per cwt. 1s. 6d.; lime, per barrel, 2s.; hay, per ton, £3; beef and mutton, per lb. 6d.; eggs, per doz. 5d.; cheese, per lb. 8d.; potatoes, per stone, 5d.

The county of Kildare is full of springs and rivulets; Rivers and canals. The river Barrow forms its south-west border, and receives the Green Southwards from Athy, where it meets the Grand Canal, it is a considerable stream, and is navigable, and is ornamented with many delightful retreats. The Liffey runs in a circular direction through the north-east part of the country; and the river Boyne rises in the Bog of Allin. The Grand Canal from Dublin crosses the Liffey on an aqueduct bridge; and near Clare there is a collateral cut to the Shannon. The county derives great advantage from the Royal Canal, which passes through the northern part of it.

The chief towns are Naas, the assize town, Athy, Towns. Monasteraven, and Kildare. Naas, situated on the great post road between Dublin and Munster, lies near the Grand Canal. Near the entrance of the town is one of the Danish mounds, or Raths, at the foot of which are the remains of a house of Augustines; and in the centre of the town are the remains of a monastery of Dominicans. Naas was once the residence of the kings of Leinster. Many of the houses testify the dreadful effects of the last civil war.—Athy stands on the river Barrow, and is a neat little town.—Kildare is pleasantly situated on a rising ground. There are here the remains of several religious houses; and there is a round tower, in good preservation, and built of white granite to about twelve feet from the ground. The rest of it is of blue stone. It is 130 feet high, and the door is 14 feet above the ground.

There is no borough in Kildare of sufficient extent to
KILKENNY.

Kilkenny. return a member to parliament. The county is represented by two members; and the political influence belongs principally to the duke of Leinster.

Population. The population of the county is estimated at 11,205 houses, and 56,000 inhabitants. The Catholics are to the Protestants in the ratio of 30 to 1. The proportion of Catholics to Protestants called on the grand jury, is as 40 to 41. See Beaufort’s Memoir; Rawson’s Statistical Account of Kildare; Wakefield’s Account of Ireland; and W. Shaw Mason’s Statistical Account of Ireland, vol. i. p. 447, for an account of the parish of Kilkenny in Kildare. See Mannorth, for an account of the Catholic college.

KILKENNY is an inland county of Ireland, in the province of Leinster. It is bounded on the south by the river Suir; on the east, by the Barrow; and is intersected by the Nore, which flows through its centre. Its greatest length, from north to south, from the Sugar-megy hills to the Suir, is 45 English miles; and its greatest breadth, from east to west, is about 24 English miles. Dr. Beaufort makes its superficial contents 492,464 English acres; but Mr. Tighe states, that from a survey lately made for the use of the grand jury, it amounts to 510,882 English acres.

General aspect. This county is mountainous; and though much furze is still seen on the hills, cultivation is making considerable progress. In consequence of the declivity of the county from north to south, which is about 500 feet, and from the rapidity of the Nore, which descends 13 feet in a mile, the water is carried off, and the county is dry. Kilkenny has also a favourable exposure to the southeast. There is little bog, or marsh land; and the substratum is limestone, brettie schistus, or porous argillite; and retentive clay in a very small part of the county. From these causes, the crops are earlier in general than in the tillage counties to the north. The soil is in general good. The northern parts are poor; but, by the judicious application of lime, and limetonne gravel, they may be rendered productive in corn and grass. The baronies of Ibercon, Idagh, and Iverk, are all cultivated. In the plains and valleys of the southern portion, the soil is more fertile. The banks of the Nore contain many delightful prospects and luxuriant fields.

In this county, the spring months of February and March are in general rainy and mild, the winds being mostly S. S. W. and S. April and May are drier, but northerly and north-west winds often destroy the blossoms on the fruit trees. June and July are frequently chilled by rains and cool westerly winds. In August, September, and October, there is a much greater proportion of north and easterly winds. In November, December, and January, there is rain, but little frost. The west winds prevail, in general, during two-thirds of the year.

The principal proprietors in Kilkenny, are Lord Bessborough, who has an estate of 17,000 acres, of which 2000 are let on leases for ever; Lord Clifton, who has an estate of 30,000 acres, with the towns of Graigue and Gowran; Lord Ormond, who has property won about £32,000 per annum; Lord Mountmorris, who has about 40,000 or 5000 acres; and Lord Desart, Lord Carrick, Mr. Tighe, and Mr. Bryan, who have each from £5000 to £6000 per annum. The leases are, in general, for three lives; and partnership leases are common. The land in Kilkenny is estimated as worth two guineas per acre. There are a great many dairies in Kilkenny, the most considerable of which are in the district called the Welsh mountains; which consists, in general, of dry land fit for tillage, and inclined by nature to grass, but perfectly unimproved, and almost uninclosed. The common cattle here, are a mixture of the Irish breed with some of the long-horned English. There are a few of the native breed. The breed of sheep is rapidly improving in this part of Ireland. The state of tillage in the county is the same as in Kildare, already described. Follows are here more attended to than in any other part of Ireland. The best farmers graze their stubbles till Christmas; give them a first ploughing before the end of January; even plough in spring; and never sow wheat till after three earths. Irrigation is practised in some parts of the county.

The following were the prices of labour and provisions in 1811:—Wages of a man, per day, 10s. 6d.; of a woman, 6s. 6d.; grazing a cow, per week, 5s. 5d.; grazing a horse, 7s. 7d.; Kilkenny coal, per cwt. 1s. 3d.; potatoes, per stone, 5d.; fresh butter, per lb. 1s. 4d.; hay, per ton, £5, 11s. 10d.; beef, per lb. 4s. 6d.; mutton, 5s. 6d.; eggs, per doz. 10d.; cheese, per lb. 1s. 1d.; fowls, per couple, 1s. 10d.; turkeys, 2s. 3d.

The granite hills of Wicklow terminate in Kilkenny. Minerals. The stone which usually joins the granite, is silicious schistus; and, lower down, argilaceous slate. A few beds of marl, and limestone gravel, are found near the foot of Brandon Hill. Many of the lower hills consist of siliceous breccia, which, when of a fine grain, is wrought for millstones. There are excellent quarries for flags on the north of the county, particularly at Shavhill. They are sent to Dublin, Cork, &c. under the name of Carlow flags, from their passing through the town of Carlow. The great collieries of Lord Ormond, at Castle Coomer, have been wrought for a century. They were discovered in 1624, but were first wrought by the father of the late Lord Wandesford. The coal contains 97.3 per cent. of pure carbon. In private houses it is by no means good; but for drying malt, and for forges, it is of great value. Forty thousand tons are raised annually at this colliery. The collieries extend four miles, and the number of colliers is 600. The coal is extracted at an expense of 10s. per ton; whereas, in some of the English collieries, they are delivered at the mouth of the pit for 8s. per ton. A great part of this coal is conveyed to Dublin by the canal, and is sent to various parts of Ireland, as back carriage for cars, which go into the neighbourhood. Manganese, iron ore, lead ore, and copper ore, have been found in the county. The iron ore was smelted at Castle Coomer while the timber lasted, but the forges have been given up more than eighty years ago.

There are many valuable marble quarries in the limestone district. The marble is black; and contains many quarries. Impressions of madrepores, of bivalve, and of turbinated shells. It contains 97 per cent. of carbonate of lime, 2 per cent. carbon, and 1 per cent. magnesia and iron. About 50 tons of it are exported annually. It is sawed and polished at a mill near Kilkenny.

The rivers of Kilkenny are remarkable both for their beauty and utility. The Suir, which separates for about sixteen miles Kilkenny from Waterford, has a winding and majestic course, and conveys the trade that passes between Waterford, Carrick, and Clonmel. It flows with great rapidity, and has a considerable width till it approaches Waterford, where it becomes

A very interesting account of the dairy farms in Kilkenny, will be found in Tighe’s Survey of Kilkenny.
KILKENNY—contracted between two rocks, beyond which there is a wooden bridge. The banks afford very beautiful prospects. It is navigable for large lighters from Waterford to Carrum, a course of about twenty-five miles. It is abound with excellent trout and salmon. The Barrow skirts, for about twenty miles, the eastern borders of Kilkenny. It is navigable to Carton, and thence communicates with the great canal. From the new bridge of Ross, to its junction with the Suir, it in general flows between very high land, and affords most romantic scenery. The Nore, or Newre, flows through the county for thirty-six miles. It receives many tributary streams, and is navigable for small vessels to Inistioge. The scenery from Kilkenny to Ros is very fine. The rivers in this county have been long famous for their salmon. The country people catch salmon with a snap-net suspended between two cots, which are small flat-bottomed boats governed by paddles. The fish thus taken, are sold chiefly at Ros and Waterford. On the Nare there are several weirs for the catching of salmon. Most of them are ebb weirs, open to the descending currents, and are fished only during the latter half of the ebb. In the Barrow there are no weirs; but the quantity of fish has been greatly diminished by the navigation and by mills.

Manufactures. There are no manufactures of importance in Kilkenny. The common farmers and cottars manufacture flax, stockings, linseys, and flannels, for their own use, but very little for sale, except in Ives. There was a school at Kilkenny, where 12 children were taught the art of making lace.

Towns. The towns in this county are Kilkenny, the capital, described in a separate article, Callan, Inistioge, Thomastown, Gowran, Knocktopper, Graigue, Durrow, Castle Comer, and Freshford. The county sends two members to parliament, and the political influence is in the hands of the Earls of Ormond and Desborough.

Antiquities. There are five round towers at Kilkenny, namely, St. Canice, Tullloherin, Kilree, Partagh, and Aghaviller. They all stand close to churches. Grany, or Grandisin Castle, situated on the banks of the Suir, is one of the most considerable remains of antiquity. As this county is one of the first in which the English settled, it is full of castles.

Population. In 1792, the population, as given by Dr. Buryfort, was 17,560, and 100,000 inhabitants. The population in 1800, as computed for the hearth returns, is 17,812 houses, and 108,000 inhabitants. There are 127 parishes, but only 31 churches. The Catholic population in 1800, seems to have been about 95,000. See Beaufort's Memoir; Tichie's Survey of Kilkenny; Wakefield's Account of Ireland; and W. Shaw Mason's Statistical Account of Ireland, vol. i. which contains a description of the parishes of Fiddown and Grange-Silve.

KILKENNY is a city of Ireland, and the capital of the county of Kilkenny. It is delightfully situated on the river Nore, over which there are two handsome stone bridges; and with the borough of St. Canute, or the Irish town, it forms a large town, which is considered as one of the neatest and pleasantest in the kingdom. The houses are decorated with the marble dug in the neighbourhood, and the streets of the town are paved with the same material. Many of the buildings are large and good. The most remarkable are the bishop's palace, the castle of the Earl of Ormond, and the celebrated college or free school, a theatre, an asylum for decayed house-keepers, &c.

The college, of which there is a fine view from the walks, on the banks of the river, was founded by James Duke of Ormond, in 1662. The present building was erected in 1784, at the expense of £5,000, granted by parliament. The number of students is about 70, of whom 50 are boarded in the house. The appointment of the master belongs to the provost and senior Fellow of Trinity College, Dublin. Ormond Castle is a magnificent and noble building, on the banks of the river, having its entrances flanked by two large and unequal round towers. The stables on the opposite side of the road, are very fine. The little cathedral is a fine gothic structure, with round towers. The theatre is small, but neat. It is private property, and is opened about a month annually. Amateurs of the first rank perform, the female performers being engaged from Dublin. The ruins of three monasteries, St. John's, St. Francis, and the Black Abbey, still exist. The windows of the latter are much admired. There are only two churches in the city, but there are several Roman Catholic chapels, each of which has congregations more numerous than both the churches. The city sends only one member to parliament. The Earls of Ormond and Desart are alternately the patrons.

The principal manufactures are those of starch, coarse woolens, and very fine blankets. The town contains 2870 houses, and 14,975 persons. West Long, 79'15', North Lat. 52' 38'. See the works quoted in the last article, and Carr's Stranger in Ireland.

KILLARNEY is a market and post town of Ireland, in the county of Kerry. It is neat and populous, and is situated on the side of the lake of the same name. The town contains many handsome houses, and an admirable public school for Catholic children. The venerable ruins of Muckross Abbey are in the neighbourhood of that town. They are half embosomed in a group of luxuriant and stately trees. A prodigious yew tree, about seven or eight feet in circumference, springs from the centre of a cloistered court, the roof of which it covers with its leaves and branches. The town is much frequented by the strangers who come to see the charming lakes of Killarney. The population of the town is about 5000. For an account of the lakes of Killarney, see our article IRELAND, vol. xii. p. 269; Young's Tour in Ireland; Smith's Survey of Kerry; Weld's Account of the Lakes; Carr's Stranger in Ireland; and Wakefield's Account of Ireland, vol. i. p. 66, &c.

KILLICRANKIE, BATTLE OF. See BRITAIN, vol. iv. p. 612. A full account of the battle will be found under the Life of GRAHAM, JOHN, Viscount Dundee, in vol. x. p. 387, 388.

KILMARNOCK is a large and flourishing town of Scotland, in the northern district of Ayrshire, 22 miles from Glasgow, and 12 from Ayr. It extends about a mile and a half along the banks of a small river of the same name, which flows into the Irvine at the southern extremity of the town. It is finely situated in the heart of a rich, extensive, and fertile tract of land, which abounds not only in all the products of agriculture, but also in rich mines of coal, an article so necessary to the growth of manufactures, and to the comfort of life. Such is the abundance of coal in the neighbourhood of this town, that, in the summer of 1817, they were laid down to the consumer at somewhat less than fourpence per hundred weight, and vast quantities are constantly shipped for Ireland, at the commonest harbour, which has lately been constructed at
Troon Point, by his Grace the Duke of Portland. This enlightened nobleman has connected the Troon harbour with the town of Kilmarnock, by a railway of ten miles in length, which not only affords an easy and expeditious conveyance for the coals from his estates, but promises one day to be highly beneficial to the town in a commercial point of view.

The appearance of the town is, in general, mean; the greater part of the houses being roofed with straw; a great proportion of them consisting of only one story; and many of the streets being narrow, and ill arranged. Great improvements, however, have lately been made, under the provisions of an act obtained for that purpose. Many commodious and elegant houses have been built; and such an alteration has been made upon the appearance of the place, that, in those parts which are adjacent to the cross, it may bear a comparison with most other towns of the same magnitude. Among the late improvements of the town, may be mentioned a handsome town-hall, and an elegant and commodious reading-room. The butcher market also deserves to be mentioned as an improvement, which is built upon an arch thrown across the river. A handsome academy has lately been erected here, which is furnished with teachers in Latin, French, English, and the various branches of mercantile education.

Kilmarnock is a borough of barony, and is governed by two bailies and a town council. Its original superiors were the noble family of Boyd, who possessed extensive estates in the vicinity of the town, and in the neighbouring country. To this family it gave the title of earls of Kilmarnock, which was forfeited in the rebellion of 1745. The superiority of the town, with a considerable part of the property which belonged to this family, is now possessed by the Duke of Portland, in right of the duchess. There are two churches in this town, one of which is a collegiate charge, and four or five meeting-houses, belonging to different denominations of dissenters. The population in December 1816, was 10,244.

As Kilmarnock is an inland town, its inhabitants must derive their subsistence chiefly from manufactures, various branches of which accordingly are here carried on to a considerable extent. Many of the inhabitants are employed in the weaving of cotton; but as there are scarcely any in this place who manufacture on their own account, the weavers are, for the most part, supplied with work by different manufacturers in Paisley and Glasgow. There is an establishment for calico-printing in the town of considerable extent, at which a good deal of work is done. The chief manufactures of Kilmarnock, however, are those of leather and wool. Here are two tan-works, one of which is extensive, and at which a large quantity of leather is tanned and prepared. A great quantity of shoes are made, chiefly for exportation to the American market; and during the late war, the army contractors were furnished with a considerable proportion of their shoes from this town. Here are several spinning mills, which are all employed in the manufacture of woollen yarn. A great number of Scotch bonnets were formerly made here; but this manufacture is now on the decline. Another woollen fabric, which was formerly made in great quantity, and which is still made to a considerable extent, is a kind of striped night-cap, which takes its name from Kilmarnock. Here also is fabricated a small quantity of coarse woollen cloth. But the most important branch of the woollen manufacture which is here carried on, and indeed the principal fabric of the town, are carpets. These, till of late, were made chiefly for exportation, and were considered of inferior quality. But the general stagnation of trade, drove the manufacturers into the home market; and they have now made such improvements in their modes of cleaning and dyeing, that they are able to compete with any other manufacturers in the kingdom. A great improvement has lately been made in the manufacture of carpets by an inhabitant of this place, who, by the invention of an ingenious machine, has greatly diminished the expense of weaving, and, at the same time, considerably improved the fabric.

It would exceed the limits, as well as violate the order of our work, to give a particular description of this useful machine, which appears to us capable of being extended to damask work, and various other branches of the weaving art. It is sufficient to state in this place, that one-fourth of the figure to be cast up, is formed by wires upon the surface of a barrel or cylinder, which is moved by the tredgles, and which, by means of small levers connected with the harness, determines the threads of the warp, which are to be drawn or lifted by each tread of the workman. This machine enables the weaver to dispense with the assistance of the draw-boy, who was formerly an inseparable attendant of every carpet loom; and it saves all the tacks, or lashes used in throwing up the figure, which often amounted to 40,000 yards, and six-sixths of the time consumed in cleaning the pattern, which frequently amounted to a fortnight. The inventor, whose name is Thomas Morton, has already made upwards of 150 of these engines, which are all employed in the carpet manufactories of Kilmarnock, Stirlings, Bannockburn, and Glasgow.

In the vicinity of this town, there are about 120 acres of nursery grounds, which not only supply the adjacent country with plants and shrubs, but furnish a great quantity for exportation.

**KILSYTH, BATTLE OF.** See Britain, vol. iv. p. 588.

**KINCARDINESHIRE, of The Marns,** is situated on the east coast of Scotland, between 56° 43' and 57° 5' of North Lat. and between 1° 47' and 2° 30' of West Long. from Greenwich. It is bounded on the east by the German Ocean, for the space of nearly 35 miles; on the north, by the river Dee and part of Aberdeenshire; and on the west and south by the county of Forfar, from which it is separated, almost through the whole boundary line, by the river of North Esk. It is of a triangular form, extending 32 miles in length from south west to north east, and 24 miles as its greatest breadth from north to south; and comprehends an area of about 380 square miles, or more accurately of 243,444 English acres.

This county, being much diversified in regard to climate, surface, altitude, and exposure, discovers a considerable difference of climate in its different districts. The vicinity of the Grampians, (which even in summer are never entirely free from snow,) the great proportion of its marshy and unreclaimed grounds, and the deficiency of hedges and plantations, are all unfavourable circumstances, which probably render the climate colder upon the whole, than the latitude should give reason to expect. The district situated on the north side of the Dee, though the most northern division, is considered as the most temperate, in consequence of its exposure to the south, and its shelter from the north; while the tract on the north side of that river is much colder and
KINCARDINESHIRE.

Latter in the several seasons. During the drought of summer, both sides of the Dee suffer more from heat than any other part of the county. Along the coast, the winter cold is more moderate, and agricultural operations may be carried on with less interruption during that portion of the year than in the more inland districts; but the chilling east winds from the German Ocean, prevent the seasons from being more genial, or the crops more early. In the central portion, usually called the How of the Mearns, which is well sheltered both from the north and the east, the climate is more temperate and equable than in any other division of the county, but is more liable to strong gusts of wind from the south-west quadrant, in which there is no intervening height in that direction for the space of sixty miles. In the Grampian tracts, the climate, during winter and spring, is excessively severe, unless in a few deep glens or vallies, which are uncommonly warm.

The following Table, communicated to us, and drawn up by Dr. William Young of Fawside, from his own observations between 1805 and 1816 inclusive, shows the state of the weather, on the east coast of the county, in North Latitude 56° 58', 500 yards from the sea, and 150 feet above its level.

There are only two lakes in the county worthy of notice, both of which are in the northern part of the Dee-side district. The one is the loch of Drum, in the parish of Drumoak, but partly lying within the limits of Aberdeenshire. The other is the loch of Leys, in the parish of Upper Banchory, the water of which is in general shallow, and capable of being drained, by deepening the channel by which it flows into the Dee. These lakes are nearly of equal extent, each being about three miles in circumference. Both of them are well stored with pike; and frequented by geese, ducks, and other aquatic wild fowls.

Kincardineshire is well supplied with rivers and small streams flowing in a multitude of directions. The principal of these are, 1. The Dee, reckoned the sixth river in Scotland in point of magnitude, which rises at the head of Braemar, and flows nearly due east, through a course of seventy-five miles, eight of which are within the shire of Kincardine, and fourteen more form the boundary line with the county of Aberdeen. It is a pure limpid stream, flowing over a light gravelly bed, and is well stored with salmon, trout, and occasionally with eels, which pass up the stream in immense numbers during the months of May and June, and return to the ocean in September and October. Its banks, almost everywhere clothed with wood, abound in the most picturesque scenery, and produce some of the largest natural firs in Britain, particularly near the source of the river, where many of these trees are from three to four feet in diameter, and from 50 to 60 in height below the branches. 2. The North Esk, which forms the boundary between the counties of Kincardine and Forfar, and has already been described in the account given of the latter in this work. 3. Bervie Water, a small river, but good trotting stream, rises in the centre of the county, among the braes of Glenberorie, about 12 miles west from Stonehaven, and falls into the sea at the town of Bervie. 4. The Cowie, a small river flowing from the foot of Kirkloch, through a winding course of 12 miles, and falling into the sea at Stonehaven. There are, besides, the Caron, reaching the coast at Stonehaven; the Fuch, rising in the forest of Birse; the Avon, which waters the vale of Strachan, or Strathavon; the Dye, which flows from the Grampians into the Fuch, at the church of Strachan; the Black Burn, which runs into the loch of Drum; the Canny, which falls into the Dee at Invercanny; and the Luther, which rises above the castle of Drumtochtly, and, passing the church of Fordoun, flows westward through the Hou into the North Esk.

The principal mountains in the county are the Grampians, which, proceeding across the island from Dumbartonshire, terminate on the north of Stonehaven, within about three miles of the sea. This elevated and dreary ridge of dark brown hills stretches through the whole breadth of the county from west to east, occupying a space of about 18 miles in length, and eight in breadth. These hills, at the eastern extremity, are only 500 or 600 feet in height; but rapidly rising into a range of lofty summits, they reach an elevation, in the west side of the county, of 3000 feet above the level of the sea. The more remarkable of these mountains are Mount Battock on the west, the highest in the neighbourhood, on the top of which the three counties of Forfar, Kincardine, and Aberdeen, join their limits; Cloachnabane, or the White-stone-hill, about six miles farther east, remarkable for a protuberance of solid rock on its summit, about 100 feet in perpendicular height, which appears from the sea like a watch-tower, and forms a decided land-mark to the coasting vessels; Kerloack, about four miles from the last mentioned, from the top of which a most extensive view may be commanded over the greater part of Aberdeenshire to the north, and southwards as far as the hills of Lammer Muir, in the Lothians; Cairnman, six miles more to the north-east, almost covered over its whole surface with large blocks of hard stone; Cairnmount, on the south front of the Grampians, about 2500 feet high, over which passes the public road from the Hou to Dee-side; Strathfenneala, also on the south, remarkable for its being cut off, on the north side, from the main body of the ridge by a narrow but pleasant cultivated vale. Besides the Grampians, there are the Garrock hills on the south, and the Arbuthnot hills on the east of the Hou, both of which are low ranges, never rising above 500 feet, and in most places cultivated nearly to their summits.

To the north of Stonehaven, and over the whole of Mineralo-

River.
Kincardineshire.

How, the stones consist chiefly of sandstone, pudding-stone, limestone, and rotten rock. Sandstone of a reddish colour is found in great abundance within the coast district, and is chiefly used in building, as being easily cut; but, in the south-east corner of the county, there is a quantity of beautiful white freestone of the closest texture, excellently adapted for ornamental architecture. Limestone is found in several parts of the county, but not in great quantities; and it is chiefly on the coast, where coal can most conveniently be conveyed, that lime kilns are wrought to any considerable extent. Plum-pudding stone comprises a principal portion of the precipitous rocks along the coast. In some places, consisting of small gravel, it is manufactured into millstones; and, in other situations overhanging the sea-coast, it contains stones of eight or ten inches in diameter, which often fall from their beds along the precipices, leaving a continued series of empty sockets, which are occupied as nests by the sea fowl. Of this kind are the noted rocks of Fowlis' heugh, about three miles south of Stonehaven, which form a range along the coast about a mile in length, and 200 feet in height. A kind of jasper, of a darkish red, streaked with white, occurs in small detached pieces, all over the low part of the county. Large rocks of this stone, and of other species, are found, and a great variety of soils, on the borders of the North Esk, where it issues from the Grampians. Specimens of asbestos are observed in the hills of Balnakattle, near Fettercairn. Pebbles of various kinds are found in almost every brook, and particularly in the decayed basaltic rocks along the coast. The Scotch topez, or cairngorm, is found among the Grampians of Kincardine; but not so frequently as in the hills, which are situated farther inland. No coal has been discovered in any part of the county; nor any metals, except in one very singular instance. Native iron, in loose detached pieces, from one-fourth of a pound to two pounds weight, is occasionally found among the soil of a field on the lands of Balnakattle, in the parish of Fettercairn; and, by merely being heated in a smith's forge, is made by the people on the farm into horseshoe nails, and other common articles. Some of the larger pieces yield five parts of pure iron out of six of the stone; but generally only about a third part. There are no iron works in the vicinity, nor the slightest appearance of iron ores, nor the most remote tradition of any having been found or used, except in this insulated spot.

The surface of this county is considerably varied. The district on the north side of the Dee, when seen from the south, presents a continued succession of woody hills, rising behind each other from the water side, and bounded at the distance of six miles by the lofty mount Fare. The tract on the south side of the same river is a narrow stripe, sloping rapidly from the mountains, so as to descend about 600 feet in the course of three miles, and checkered throughout its whole extent with cultivated soil, waste land, and wood. The Grampian district presents a rugged and dreary, but sublime, prospect, particularly from the south, whether beheld under the setting rays of the summer sun, or when invested with the spotless clothing of the winter snow. The How appears as a vast basin, surrounded by high ground on every side except the south-west, and exhibiting a rich scenery of cultivated fields, thriving plantations, and commodious country seats. The surface of the coast district, north from Stonehaven, is generally flat till it approaches the northern boundary; and, notwithstanding the greatest efforts of the people, is still dreary and sterile: but, around Stonehaven, it is highly cultivated, and beautifully diversified. Southwards from this town, the appearance is extremely various, without two miles conterminous of the same general aspect; but, through the process of tillage and planting, is likely to rival, in natural beauty and ornamental improvements, even the celebrated South Downs of Sussex. Supposing the whole county to be divided into 100 parts, 30 of these are occupied by high hills and barren heaths incapable of culture; and, of the other half, 8 are planted, 13 improvable and partially reclaimed, and 30 only in full cultivation.

The soil in the northern division, on both sides of the river Dee, consists chiefly of decomposed granite, intermixed with a portion of moss and decayed vegetables; and, though not naturally productive, is capable of melioration, by the removal of the large stones on the surface, deep tillage, and the application of lime. Very similar is the soil in that portion of the coast district, which lies north of Stonehaven, except that it bears a greater proportion of incumbent moss, almost all of which might be converted into the most productive arable land by the application of lime, but much of which is employed in furnishing dried peats as fuel. In the coast district, south from Stonehaven, there are great varieties of soils, from the moist, loamy loam to the poorest till, or most obliterate clay; but the loam is most prevalent, and in some places to a considerable depth. A peculiar soil exists in the vicinity of Bervie Water, full of round water-worn stones of every description, (even where the land is 200 or 300 feet above the bed of the river), rendering the ground troublesome in the tillage, but by no means injuring its productive powers. In the whole extent of the How, the soil is almost uniformly a productive loam, resembling in colour the red or grey sandstone, which prevails in the district; but, in the central hollow, there is a considerable portion of sterile gravel, little susceptible of improvement, which has been chiefly and successfully employed in plantations.

The wild animals found in this county are, the roe-deer, which breed in the woods on the south side of the Dee, but sometimes stray even into the How district; FOXES, which are numerous over the whole county, and particularly haunt the rocks along the coast; hares, which are incredibly numerous, and make great destruction of the turnip crops; the badger, otter, wildcat, weasel, pole-cat, fox, mart, occasionally; and even the hedgehog has recently appeared, though formerly never known to have been seen in the Mearns. Grouse on the hills, partridges in the low country, and sea-fowl on the rocky coast, are all equally abundant. Wild-ducks, snipes, and herons, are common in the marshy grounds. Wild-geese appear in large flocks in November. The rail also, and the grey and green plover, (the latter arriving duly about Candlemas), and even a few swans, are occasionally seen. The hunting hawk, or falcon, is still an inhabitant of the country, where it was anciently much renowned; and the golden-crested wren is a native on Dee-side. The draco-vo-lans, or flying dragon, has been seen in the woods, as large as to measure four inches between the tips of the wings.

Formerly, this county was united with Forfarshire, from which it was disjoined by Kenneth II. about the year 835; and, according to traditionary history, was given to his brother Morma, from whom it takes the toy name of Mearns. But it is observable that it is always
Kincardineshire.

denominated The Mearns, and is considered as deriving this designation from the ancient inhabitants, the Verniones of Ptolomy. In the Gaelic language, it is still called Mkearn, pronounced Vearn. It is divided into 16 entire parishes, and contains also part of Nether Banchory, Drumoak, and Edzell. Thirteen of these parishes, composing the whole of the districts to the south of the Grampians, form the presbytery of Fordoun, which is comprehended in the synod of Angus and Mearns. On the north of the Grampians, the two western parishes are attached to the presbytery of Kincardine O'Neil, and the more easterly to that of Aberdeen. In what regards the administration of justice, the whole county is considered as one district, of which the county town is Stonehaven, and is classed in one justiciary circuit with Aberdeen and Banffshire. But, in maritime matters, it is divided into two districts, one of which, north from Stonehaven, and inclusive of that town, is connected with the seaport of Aberdeen, and the other to the south with that of Montrose.

Antiquities.

The principal antiquities observable in this county are, a small artificial island, founded on oak piles, in the loch of Leys, on which are the ruins of an ancient edifice; tumuli raised over the slain in the battle of Corrichie, near the estate of Glassel; Fenella's castle, about a mile and a half west from Fettercairn; Green, or Queen, castle, on the end of the hill of Strathfenella; Kame of Mathers, about six miles north from Montrose; Whistleberry castle, about two miles north from Bervie; and Dunnotar castle, about a mile south from Stonehaven, all placed on the summits of lofty insular rocks on the sea shore; a Roman camp, remarkably entire, near the mansion house of Fordoun, and similar vestiges near Stonehaven and Ury, supposed to have been the encampments of Agricolae and Galgacus.

The state of property is similar to that of Forfarshire, to the account of which we refer our readers.

The valued rent of the county is £6,243.
The real rent in 1813 was nearly £84,900.

The number of freeholders is about 75. There is only one royal burgh in the county, namely, Bervie, which unites with Montrose, Brechin, Arbroath, and Aberdeen, in sending a representative to parliament; but Stonehaven, a burgh of regality, and Laurencekirk, a burgh of barony, are more populous and flourishing towns; and there are also many thriving villages in the county, particularly Fettercairn, Auchinblae, Drumblithie, and Johnshaven.

The population of Kincardineshire contained,—

In 1801, males 12,102
Females 14,245
26,347

In 1811, males 12,792
Females 14,859
27,581

Of these, about one half are engaged in agriculture, and the other half in manufactures, fisheries, &c.

The size, rent, and management of farms, the style of the houses, and the articles of produce, bear so great a resemblance to what has been stated under these heads in the description of Forfarshire, that we must again refer our readers to that article; but the following table, from Mr. Robertson's survey of the county, in 1807, will afford a concise view of the state of cultivation and crops at that period:

<table>

</table>

There is an equal similarity between the kinds of live stock reared in these two counties; and, in the same work, and at the same period, it is computed that Kincardineshire supported—

Cattle, comprising cows, oxen, calves, &c. 24,885
Horses of all descriptions 2,487
Sheep fed on the Grampians 21,565
Sheep fed on the lower grounds 3,392
Swine 478

The manufactures of Kincardineshire are extremely limited; and it is chiefly in the towns upon the coast that any articles are produced beyond what the wants of the vicinity require. In Stonehaven, Bervie, and Johnshaven, about one half of the population is supposed to be occupied in the manufacture of osnaburghs, sacking, canvus, and coarse linens; and there are a few spinning mills and bleachfields on a small scale. At Laurencekirk is an elegant manufacture of beautifully, varnished snuff-boxes; but the art is carefully kept concealed, and the few hands employed in it are not able to supply the demand for these articles.

The fisheries are by no means so numerous as might be expected in so extensive a line of coast, and have of late years considerably declined. The sea, or white fishery, is estimated to produce only about £6,000 yearly, and to employ about 300 hands, whose families included would make about 900 of a fishing population. The salmon fisheries, the most valuable of which are on the North Esk, let at nearly £2,000, and give occasional employment to about 130 hands.

The principal exports by sea are grain, about 50,000 tons of salmon sent annually to London, and a few tons of dried fish to Leith. The chief imports are coal, lime, foreign timber, flax. The shipping belonging to the different ports and creeks amounts only to about 800 tons burden, employing about 50 seamen; but a very great proportion of the traffic of the county is conveyed through the ports of Aberdeen and Montrose.

The roads of Kincardineshire in all directions are, generally speaking, commodiously planned and preserved in good repair. There are several bridges over the North Esk, one of which is mentioned in the account of Forfarshire; but a very fine one, lately built by subscription near Marykirk, is particularly worthy of notice.

A canal has frequently been proposed to be carried through the How of the Mearns, and the Vale of Strathmore, to join the Tay about four miles above Perth; and as the middle space, for about 50 miles, is almost an entire level, a few locks at the extremities only would be required. See Robertson's Agricultural Survey of Kincardineshire; Description of the Straths which occur in the Eastern District of the Grampians, by Lieutenant Colonel Imrie; Trans. Royal Soc. Edinburgh; and Statistical Account of Scotland. (7)

KING. See Government and Law.

KING'S BENCH, Court of (Bancus Regina), is the supreme court of common law in England. It is called the King's Bench, because the King used to sit there in person, and is still supposed to do so. This court consists of a chief justice, and three puisne justices; who are, by their office, the sovereign conservators of the peace, and supreme coroners of the land.

The Court of King's Bench is the remnant of the
KIN

Aula Regia; and although it hath, for some centuries past, usually sat at Westminster, yet it is not fixed to any certain place, but may follow the King's court wherever it goes; for which reason, all process issuing out of this court is returnable "ubi cunque fuerint in Anglia," as I find that, during the reign of Edward I, it actually sat at Roxburgh.

The jurisdiction of this court is very high and transcendent. It keeps all inferior jurisdictions within the bounds of their authority; superintends all civil corporations in the kingdom; commands magistrates and others to do what their duty requires, in every case where there is no other specific remedy; protects the liberty of the subject by speedy and summary interposition; and takes cognizance both of criminal and civil causes; the former in what is called the crown-side, or crown office; the latter, in the pleasa-side of the court. It has an original jurisdiction and cognizance of all trespasses, and other injuries, alleged to have been committed vici et armis; and by a fiction of law, whereby it is supposed that the defendant is arrested for a suit upon trespass, which, in reality, he has never committed, it has for ages held pleas of all personal actions whatsoever.

This court is likewise a court of appeal, into which may be removed, by writ of error, all determinations of the court of common pleas, and of all inferior courts of record. An appeal also lies from this court to the House of Lords, or the Court of Exchequer Chamber, according to the nature of the suit, and the mode in which it has been prosecuted. Blackstone's Comment. B. il. ch. 4. and Jacob's Law Dict.

KING'S COUNTY is an inland county of Ireland, in the province of Leinster. It is bounded on the north by Westmeath and Meath; on the east by Kilkenny and Queen's County; on the south and southwest by Tipperary; and on the west by part of Galway and Roscommon. It is separated from Galway by the river Shannon, and the Barrow and the little Brosna mark its boundary for a few miles. It received its name out of compliment to Philip II. of Spain, the husband of Queen Mary.

It is 39 English miles broad, contracting rapidly to the south, and it extends from north to south 43 English miles. Its superficial extent is 707 square English miles, or 458,370 acres.

The general appearance of the county is flat, the only mountains being the Sliabhthoors mountains, which divide it from Queen's county. This range extends 15 miles, and is traversed only by one pass, called the Gap of Glendive, which is only five feet wide, and is very steep and craggy, and difficult of approach.

The soil in the northern part of the county is chiefly argillaceous, and requires a great deal of lime. The rocks are a red argillic and freestone. In the central part the soils are a light sandy loam, a stiff yellow clay, a gritty shallow gravel, and a deep brown earth. The pasturage is here good; limestone prevailis, and the bottom is a stiff clay, which yields excellent crops. In another part there is a cold spungy clay soil, which passes where the declivity vanishes into a deep irreclaimable bog. The principal corn crops are oats and barley. Green crops have been raised in some parts, and artificial grasses, and the drilling of potatoes, have been introduced. The pastures support numerous flocks of sheep, the wool of which is excellent and abundant. Lime and limestone gravel, which is allowed to be the best manure, are found everywhere. The limestone gravel is often mixed with bog.

A great part of the Bog of Allen lies in this county, and it has been calculated that one-third of the county is bog land. Mr. Wakefield however informs us, on the authority of Mr. Bernard, that one half of the county is of that description.

The principal proprietors of King's County, are Lord Digby, who possesses the barony of Geshill, containing 10,822 acres. Lord Boss, Lord Charleville, Mr. D. R. Daly, Mr. Stepney, and Mr. Bernard, are the other proprietors. These individuals possess so much of the county, that the remaining landholders are scarcely sufficiently to make a grand jury. The tillage farms here are small, but grazing ones are of great extent. The rent of the county, without including bogs, mountain land, or towns, has been averaged at 35s. per acre.

Lord Digby grants no leases on lives, and lets only for 21 years. The other proprietors grant leases, in general, for 21 years and a life. Mr. Wakefield observed some of the best farms in Ireland, in this county.

The following were the prices of labour and provisions in 1811. Wages of a man, per day, 10d. Of a woman, 5d. Grazing a cow, per week, 1s. 2d.毯fing a horse, 1s. 7d. Kiln run in coal, per ton, 2s. 6d. Lime, per barrel, 1s. Hay, per ton, £3, 3s. 4d. Beef, per lb. 4d. Mutton, 5d. Eggs, per dozen, 6d. Cheese, per lb. 7d. Fowls, per couple, 1s. 2d. Turkeys, 2s.

The principal mineral productions that have been found in King's County, are manganese, iron ore in small quantities, ocre, marle, limestone, freestone, and potter's clay.

The principal rivers in this county are the Shannon, the Little Brosna, the Great Brosna, which falls into the Shannon after winding through a great part of the county. The principal loughs are Lough Pallis and Lough Annagh. The northern part of the county derives much advantage from the grand canal which passes through it.

The principal towns are Philipstown, Birr, or Parson's town, and Tallamore, of which Birr is the largest. Tallamore contains about 4000 inhabitants, of whom 2,500 are Catholics.

This county contains 59 parishes, and 15 churches. According to Dr. Bonsor, a population of about 74,500. Since the completion of the grand canal, however, the population has increased. See Bonsor's memorial of a Map of Ireland; Sir C. Coote's Statistical Survey, and Wakefield's Account of Ireland.

KINGHORN is a royal burgh of Scotland, in the county of Fife, situated on the coast of the Firth of Forth, nearly opposite to Leith, and on the sides of a dell opening towards the sea. It consists of a number of lanes composed of mean looking houses, heaped together without regard either to convenience or uniformity. King David I. invested it with the privileges of a royal burgh. Not many years ago were to be seen the ruins of a castle, which was one of the usual seats of our ancient Scottish kings. An old building, called St. Leonard's Tower, stands in the middle of the town, and is used as a court-house and a prison. Thread stockings have long been manufactured here; and machinery for spinning cotton and flax has lately been erected. A little to the west of the town there are two basaltic rocks, composed of parallel columns of different diameters, and about 12 or 14 feet high. There is also in the neighbourhood a medicinal spring, called the Kinghorn Spa, which is altogether neglected. In 1618, Dr. Anderson wrote a treatise on the nature of its waters. He says that it is impregnated with crystal, gypsum, and nitre, and recommends it as a powerful diuretic. The population of the town and parish, in 1811, was 329 houses, and 2204 inhabitants.
Kingston. KINGSTON, a sea-port town, and the principal seat of commerce in the island of Jamaica, is situated on the south side of the island, in 18° N. Lat. and on the north side of a bay or inlet of the sea, formed by the low neck of land, at the point of which the town of Port Royal stands. This neck of land is nine miles in length, and two miles in width, at the broadest part, fronting the city. The channel is deep enough to admit ships of any burden. A thousand may anchor in perfect safety; and vessels of considerable burden may lie alongside the wharves to deliver their cargoes.

Kingston was founded in the year 1693, after the almost total destruction of Port Royal by an earthquake the preceding year. The plan of it, drawn by Colonel Lilly, an experienced engineer, was a parallelogram, one mile in length, by half a mile in breadth, regularly traversed by streets and lanes, crossing each other at right angles, except at the upper part, where a large square was left; but the town has extended considerably within these few years, to the west, east, and north, so that this square is now nearly in the centre of the city. On the south side of the square stands the church, a large elegant building, with four aisles, and a fine organ. The tower, with a large clock, and the spire, are well constructed, and are a great ornament to the city. On the north side of the square are barracks of brick for 1000 men and their officers. The theatre is likewise on this side of the square; it was nearly thirty years without any performers, but it has lately undergone a thorough repair. It is neatly fitted up, and at present the inhabitants are amused by a tolerable company of performers. A free school was established in May 1759. There is likewise a poor-house and public hospital, and a very handsome church has been lately erected for those of the Presbyterian persuasion. The houses are in general built of brick, two stories high, the fronts being shaded by a piazza below, and a covered gallery above. Accidents from fire rarely occur here, the kitchens being detached buildings, and there are wells and pumps in the principal streets, and fire-engines and leather buckets in the court-house, and the inhabitants are obliged to keep a certain number of these buckets, according to the value of their house.

The well water in general is bad, at a few wells being fed by subterraneous streams from the Hope River or other mountain streams. The rest are brackish, and very apt to cause a dysentery in habits not much accustomed to it; but the inhabitants of this town observe that the same effect is produced by the water of Spanish Town, which is taken from the Rio Cotese, and undergoes filtration.

In the lower part of the town is the market-place, which is plentifully supplied with butcher-meat, poultry, fish, fruits and vegetables. Of the latter, besides those usually found in a tropical country, are many American and European, such as pease, beans, cabbage, lettuce, cucumbers, artichokes of the finest kind, carrots, turnips, radishes, onions, leeks, and other small salads. These are brought from the Liguanea mountains. There are also great quantities of the finest pine apples, which grow on the Long Mountain. Strawberries and apples likewise grow on the higher mountains, and grapes might be cultivated to any extent in the lower parts of the island.

Kingston was constituted a city in 1802. It is governed by a mayor, 12 aldermen, and 12 common councillors, a recorder, two solicitors, and a treasurer.

The population of the town is nearly 7500 whites, with 2500 strangers, 2500 free people of colour, 2500 free negroes; 8054 male, and 9900 female slaves, total 17,954; but as all may not have been returned, the number of slaves may be rated at 20,000, so that the population cannot be less than 85,000.

Kingston returns three members to the House of Assembly, and furnishes to the militia on the island two troops of horse, two companies of artillery, two battalions of infantry, nine companies in each, viz. six of whites, two of Jews, four of Mulattoes, three of quadroons, and three of free blacks, well appointed; the latter; one captain, three lieutenants. The Surrey assessors are held here three times in the year, January, April, and August.

The situation of Kingston is highly favourable, rising from the sea with sufficient acclivity to give it the command of the sea breezes, which blow regularly during the greatest part of the year, and likewise to have a view of the ships coming down the coast to the harbour of Port Royal, and up to the town. The heat of the night is tempered by a land wind. The plain on which it stands rises with a gradual ascent to the foot of the Liguanea Mountains, a distance of about six miles, and is covered with country residences of the admiral, and many of the inhabitants, and towards the mountains with sugar estates.

A hill, called the Long Mountain, crosses this plain diagonally, beginning near Rock Port, and extending to near the Liguanea Mountains. Over this towers the first range of mountains in great grandeur, to the height of 7000 feet, and covers to the height of 4000 feet with coffee plantations, villas, &c; and above this range are seen the Blue Mountains.

The city being situated on a dry soil, is not inundated by any stagnation of water, and it is thoroughly ventilated; but the slope upon which it is placed, is attended with one inconvenience, that it admits a free passage to torrents of rain, which descend the streets during the rainy season with such impetuosity, as to render them impassable for wheeled carriages, and carrying accumulations of rubbish and mud to the wharfs. It would be a great improvement to have the streets paved, and a cut made above the town, to prevent the torrents from pouring through the streets.

The thermometer, in the hottest part of the year, sometimes rises to 95°, and is seldom below 75°. Kingston is hotter by about 3° than Spanish Town, but is not so subject to storms of thunder.

The following return of imports and exports, from the 29th Sept. 1816, to the 29th Sept. 1817, laid before the House of Assembly on the 10th of November 1817, will show the scale of importance in which Kingston stands as a sea port.

Imports.—56,217 barrels flour; 2563 barrels, 4064 bags, 1085 kegs, bread; 1591 tiers, 396 barrels, 4476 bags, rice; 19,827 bushels, 1243 bags, 7804 barrels, corn and corn meal; 202 barrels, peas; 1481 hogheads, 5131 casks, 2553 boxes, 397 quintals, dry fish; 239 tiers, 28,757 barrels, 860 kegs, pickled fish; 1,805314 staves and heading, 8,561006 shingles, 7,672857 feet of lumber; 680 horses; 1998 miles; 202 assæ; 2806 cattle. No account is here given of the beef, pork, and herring, imported from Great Britain, Ireland, and North America. In 1816, 15,070 barrels of herring, about the same quantity of beef and pork, as also dry goods, iron, and hard-ware, to a great amount; wines, brandies, &c. &c. In 1817, 16,915 gallons of brandy and gin were entered at the Custom House.

Tonnage, from 29th Sept. 1815, to 29th Sept. 1816.

North of the tropic—from Great Britain and Ireland 35,162; America, 36,082. Within the Tropic—from the Spanish Main and neighbouring islands, 20,603,
drovers 1889, trading under the free port act, 12,520; total, 95,138—1470 horses, 4785 mules, 485 asses, 308 cattle imported.

KINGSTON-UPON-HULL. See Hull.

KINGSTON-UPON-THAMES, is a town of England, in the county of Surry. It is situated 11 miles from Westminster bridge, on the southern bank of the Thames, which is crossed by a wooden bridge to Hampton Wick. It consists of two principal streets, and several smaller ones. It is upon the whole well built; but the mixture of the modern and the ancient houses gives it an irregular appearance. The church is spacious and handsome, and has a tower with eight bells. There is here a free school, founded by Queen Elizabeth; a charity school for 50 boys, and an alms-house for 6 men and 6 women. In the market-place is the town-hall, built by Queen Elizabeth. The Lent assizes for the county of Surry are held here.

Kington was either a royal residence or demesne so early as the union of the Saxon heptarchy. Close to the north side of the church is a large stone, on which, it is said, the Saxon kings were crowned. Here was formerly the chapel of St. Mary, on the same side, adorned with the figures of the different sovereigns that had been crowned at this place. It fell in 1730, and buried in its ruins the sexton, who was digging a grave, his daughter, and another person. The sexton's daughter was dug out at the end of eight hours, and succeeded her father. The bridge over the Thames is said to be Mr. Lyson, to be the most ancient on the river, except that of London; and the corporation has a revenue for keeping it in repair. In 1811, the town and parish, including Ham, Hatch, and Hook, contained 716 houses, 738 families, and 4144 inhabitants.

KINROSS, a town of Scotland, and the capital of the county of the same name, is situated on a plain at the west-end of Loch Leven. It consists principally of one long street, which contains many excellent houses. This place was once celebrated for its manufacture of cutlery goods, but this branch of trade has greatly declined, and the inhabitants are principally employed in the manufacture of cotton goods, and of coarse linen, called Silexian, of which about 4,444½ worth were exported annually. The population of the town and parish in 1811, was 2214, of whom 287 were employed in trade and manufacture. See the following article.

KINROSS-SHIRE, one of the inland counties of Scotland, is bounded on the north and west by the county of Perth, and on the south and east by Fife-shire. It is situated between 56° 9' and 56° 18' of north lat. and between 3° and 1° of long. west from Edinburgh. Its greatest length from east to west, is about 13 miles, and its greatest breadth from north to south, about 11 miles. It is supposed to contain about 83,853 acres, or 42,956 Scottish acres.

The climate of this country is, upon the whole, mild and genial. It is well sheltered from the north winds, by the range of the Ochil hills which form its northern boundary. It is, however, much exposed to the westerly winds, as it is situated in a plain, which is prolonged on the west towards Alloa, and joins the Flow of Fife on the east. The grounds on the southern extremity are uneven but not hilly. The more level and hilly part of the county is elevated but a few hundred feet above the level of the sea.

There are few springs in this county remarkable for the quantity of water which they pour out, or for their medicinal qualities. But the fresh water lake, of which it boasts, has at all times been considered as one of the most picturesque and beautiful collection of water to be found in the lowland district of Scotland. The scenery on the south and east sides of the lake, composed of the Loonyms and Benartie, forms a very striking contrast with the level grounds which skirt the opposite margin, while the scattered islets relieve the eye in wandering over the surface of the water. There is here little that is very striking or bold, but a great deal that is soft and soothing.

The lake contains about 316,987 Scottish acres. Its Locheries, height above the level of the sea is supposed to be three hundred and nine feet, and its greatest depth above eighty-seven feet. It contains seven islands, the largest of which is called by way of eminence, the Auchin, and contains 28,444 acres. The next is the castle, 1,700 acres; the third is called Padlock Bower, containing 0,360; and the last, or Reed Bower, contains 0,160.

In this lake there are many kinds of fish, particularly Lochleven trout, pikes, perchels, and eels. The trouts belong to the different species, which have not been distinctly characterised. The salmon trout, (Salmo trutta), the river trout, (S. fario), and the char (S. alpinus), are well known, and termed in general Lochleven trout.

These trouts are considered as a great delicacy, and held in high estimation. They are sent regularly to the Edinburgh market, and likewise obtain a ready sale in the towns and villages in the neighbourhood. Attempts have likewise been made to keep them in ice. We have not the means of determining the number of fish which this lake might support. But when we consider the extensive marshes and shallow water on the margin of the lake, the numerous aquatic plants and shellfish which abound in it, and the consequent abundant supply of food, it might be regarded as one of the most suitable natural fish-ponds to be met with in Britain; and, under proper management, might be made more productive to the proprietors and the public.

We have stated that there is a great extent of shallows and marshy ground on the margin of the lake. Every intelligent traveller as he passes, expresses his astonishment that no measures have been adopted to reclaim the level of the lake, and thereby reclaim a large extent of improveable ground, to free the air from pestilential exhalations, and ameliorate the climate by preventing chilling evaporation. Upon inquiry, he finds that plans have been proposed, which, if carried into execution, would prove equally advantageous to the health and the resources of the inhabitants of Kinross-shire. By means of a cut three miles and a half in length, and at the estimated expense of £4604, the surface of the lake might be lowered five feet. By this 893,366 Scottish acres of ground might be acquired from the lake, besides enabling the neighbouring proprietors to drain their low wet grounds more effectually than the present level of the waters permits them to do. Were the surface of the lake lowered only two feet and half, 447,412 acres of ground might be reclaimed from the lake. To this proposed plan, the proprietors and tenants of the mills situated on the river Leven, a stream formed by the waters which flow from this lake, have hitherto offered objections. The most prominent of these which they have brought forward, and which they have made the ground of a protest against the proceedings is thus stated: "That the river Leven flows to the mills, in a winding course, through that flat piece of ground lying to the westward of Achmuid bridge, called the Carse, and turns or crooks of the river there oppose a natural barrier to the floods, that occasionally inundate the river, and of course prevent the dam-
dikes, sluices, and others, from being carried off by the
impetuosity of the current. We may, however, add,
that such overwhelming inundations as are here appre-
hended, can never happen, if the new cut be made of
proper dimensions. Besides, the additional quantity of
water gained, by the diminution of the surface of the
lake, and consequent reduction of expenditure by eva-
poration during the summer months, would secure for
the mills, fed by waters from the lake, a more uniform
supply during the dry season than they can hope to
receive in the present circumstance. As this patriotic
measure, which Thomas Graham, Esq. of Kinross, had
the merit of suggesting, and of urging with all his in-
fluence, would prove of incalculable value to the pro-
prieters of the lake and the grounds in the neigh-
bourhood, without injuring the interest of those who have
hitherto opposed it, we earnestly wish that it may be
soon executed.

This lake is chiefly supplied by three small streams.
The two first are termed Queichs or Cuichs, and are
denominated North Queich and South Queich, from
their position with respect to the town of Kinross.
They take their rise from the Ochils, to the north and
west, about six miles distant from the lake. The Gar-
ney takes its rise from the Cleish hills, on the south
side of the county, and pursues a winding course to-
wards the lake, into which it empties its black and
mossy waters to the south of Clashlich. Besides
these streams, there are numerous springs around the
margin of the lake, which likewise contribute to fur-
nish a supply. The quantity of water poured into the
lake by these feeders, and extracted by evaporation,
being subject to considerable variation, the surface of
the water in the lake is elevated or depressed, accord-
ing to these circumstances, about two feet and a half.
The outlet of this lake is towards the south-east, at
a place called the Gullet Bridge; and the waters which
flow from it give rise to the river Leven. This river,
in its course of nearly fourteen miles, passes through a
part of Fifeshire, and empties itself into the frith of
Forth at Largo bay. It gives motion to about 47 mills, at
which 5970 persons are employed; requiring a ca-
pital, in buildings, machinery, &c. of £176,220 Ster-
ling.

Eels.
The river Leven abounds with eels, particularly du-
ing the month of September, the period at which
these fish descend from the lake to the sea. They are
taken by means of nets placed in the river, and chiefly
during night. Few of these fish are consumed by na-
tives, but considerable quantities are sent to Edinburgh
and the inland districts.

Mineralogy.
The mineralogical structure of this county bears so
close a resemblance to that of Clackmannan, already
very fully described, that it would be superfluous here
to offer any remarks. In zoology, the most interesting
objects are the trouts which reside in the lake, and the
various species of aquatic birds which breed on the islets
or frequent their shores.

This county originally formed a part of Fifeshire,
from which it was disjoined about the year 1426. At
first it contained only the parishes of Kinross, Orrell,
and Portmok, but in 1685, the king and estates of par-
liament disjoined from Perth and Fife other lands in the
parish of Portmok, and in the parishes of Cleish and
Tulliebole, and annexed them to Kinross. At pres-
ent it consists of the parishes of Kinross, Portmok,
Cleish, Orrell, Tulliebole, annexed to Fossaway, and
part of the parishes of Abernethy and Armagask.

Population.
In the year 1811, this county contained 7245 souls.
It sends, alternately with the county of Clackmannan, a
member to parliament. The number of freetholders at
present on the roll amounts to twenty. The sheriff
court is held at Kinross, where are likewise the courts
of taxation, and all the state public meetings.

The population of this county is chiefly supported
by agriculture. The soil, though rather light, is well
adapted for all kinds of crops; and lime for manure is
obtained in abundance. If we consider the prox-
imity to fuel, the abundance of fresh water, it seems
rather surprising, that in this country there are so few
manufactures. Weaving is carried on in some places,
chiefly of coarse Silesian, and different sorts of muslin.
The objects of antiquity in this county are numerous
Antiquities
and interesting, and have been very faithfully described
by the industrious and intelligent Sibbald. The one
which attracts the greatest share of the travellers' no-
tice is the old Castle of Lochleven, situated on a small
island, already mentioned, at the north-west end of the
loch, and about half a mile distant from the shore. It
is said to have been the ancient habitation of Congal,
son of Donqart, king of the Picts. It has been the
scene of many memorable events in Scottish history.
In the year 1535, it was valiantly defended by Sir Allan
Wypont for King David the Second, against the Eng-
lish party then in Scotland. In this castle Queen Mary
Stewart was imprisoned on the 16th June 1567; resign-
ed the crown, with reluctance, in favour of her son
James VI. on the 24th July in the same year; and
escaped from her confinement there on the 3d of May
1568, by means of George Douglas, youngest son of
Sir Robert Douglas of Lochleven.

The ancient monastery of Portmok, on the north side
of the Leven near the lake, was founded by Eogach-
men, king of the Picts, and consecrated to the Virgin
Mary. This monastery is supposed to have been the
first place in Scotland, given by the Pictish kings, after
their conversion to Christianity, to the Culedees.

On the inch in Lochleven, anciently called St. Ser's
isle, are the remains of an old priory built by Achaius,
knight of the Scots, "in honorem et ad gloriem Dei
omnipotentis et Sancti Servani." In this isle the first
archbishop of St. Andrew's was interred. Scotland-
Well was a monastery of the "Fratera Sanctae Trinitatis
de redemptione captivorum," and founded by William
Malvoisin, bishop of St. Andrew's, who died in 1238.

As connected with the antiquities of this county, the
House of Kinross, the seat of Thomas Graham, Esq.
ought not to be passed over in silence, as it is said to
have been the first house of regular architecture in
Scotland. It was built by the celebrated architect, Sir
William Bruce, the proprietor, in 1685. See Statistical
Account of Scotland; Sir Robert Sibbald's History of
the Sherifdoms of Fife and Kinross; and Dr. Walker's
Essays on Natural History and Rural Economy.

KINSALE, which has been called the Plymouth of
Ireland, is a sea-port town in the county of Cork. The
town is situated at the mouth of the river Bandon, and
is built under Compass-hill. It is about a mile in ex-
tent. The chief street runs round Compass-hill, and
there are others above, which are connected with the
main street by steep lanes. The streets are narrow,
but they contain many good houses. There are six
parishes in the town and suburbs. The harbour is very
accommodations, and secure. The distance between Sandy
Cove Point and Prehain Point, which form the en-
trance to the harbour, is not half a mile, and between
them is a safe passage in four fathoms of water. There
is a light-house on a narrow point of land about five
miles southward. The river is navigable for large vessels
for nearly twelve miles above the town, but large ships
of war are prevented by a barrage coming into the basin.

A fort, to which the Duke of Ormond gave the name of Charles's Fort, defends the entrance to the harbour. It was begun by the Earl of Orrery in 1670, and cost upwards of £70,000. It stands at some distance from the river; it is garrisoned with a regiment of foot, and commands the harbour so completely, that vessels must pass within pistol-shot of it. When it was built, the old fort on the other side of the river was turned into a block-house.

This harbour was so much frequented, in time of war, with homeward and outward bound East and West India fleets, and also by large squadrons of our ships of war, that there was a provision in the leases, that the inhabitants should pay double rent in such a season. Kinseale sends one member to the imperial parliament. There are 12 burgesses, who elect each other. The political influence of the burgesses belongs to Lord de Clifford. There are two well-built villages, Cove and Scilly, on the opposite shore.

Kinseale is a town of great antiquity. It was incorporated by charter in the reign of King Edward III. Henry VIII. conferred upon the town a large standard, embroidered with the arms of England. When the Spaniards took possession of the town in 1601, the charter was forfeited; but after the place was reduced, and the Spaniards taken prisoners, it was restored. James I. landed here on the 19th March, 1608; but, in the autumn of 1600, the Earl of Marlborough took the old fort by storm, and obtained possession of Charles's Fort and the town.

There are at Kinseale about 400 boats, of about 20 tons each, called Hookers, which are employed in fishing, and which supply the markets of Cork, Kinseale, and Bandon. These vessels are good sea-boats, and are serviceable to ships in the way of pilotage. Four men are the general number for each boat, and they are exempted from impressment. Money traffic in Kinseale in 1672. Some of the penny pieces still remain. Population 10,000. Distance from Dublin 136 miles, south-west. West Long. 6° 35', North Lat. 51° 42'.—See our Ireland, vol. xii. p. 240.

KIOF, KIEF, or KIEV, is the capital of a government of Russia of the same name. It is situated on the Dnieper, and consists of three small towns, namely, the fortress of Pethersky and its suburbs, the old city of Kiof, and the town of Podol, otherwise called the low, or the new town. The fortress is built regularly on an eminence facing the south, and has a rampart of nine bastions in good condition, besides barracks for the garrison, magazines, officers' houses, some churches, and a beautiful and rich convent. The suburbs of this fortress are very large, and contain several churches and convents, of which the principal is that of St. Nicholas. The convent, which was founded in the 11th century, was called Pethersky, because the monks formerly lived in Pethers, a cavern in the mountain upon which it now stands. The vaults of the convent, which is like a labyrinth, and consists of cells and chapels, contain numbers of undecayed bodies, supposed to be the relics of saints. The old city of Kiof stands upon a rising ground facing the north. It is fortified and defended by several horn-works. The cathedral, which stands here, is the seat of the archbishop, tuteval of Kiof, and metropolitan of all Russia. Most of the houses belong to the cathedral, and to the convent of St. Michael. The new town is situated below old Kiof, on the plain, on the banks of the Dnieper. It contains several churches and convents, the hotel de ville, and the academical college, which is a large and well-built structure. East Long. 30° 56', and North Lat. 50° 22'.

KIRCHER'S TEMPERAMENT OF THE MUSICAL SCALE, is an irregulair doctrine, published in 1671, which has been strongly recommended to musicians; but the Rev. C. J. Smyth, one of the minor canons of Norwich cathedral, in the Phil. Mag. vol. xxxv. p. 449, after examining its pretensions, very decidedly condemns this system, as undeserving the pains that had been bestowed on it, and inferior to the Mean Tone system, and others which have been proposed. (c)

KIRCHER, Athanasius, a celebrated natural philosopher, was born at Fulda in 1601. At the age of 17, he began his studies under the Jesuits, and was soon distinguished by the rapidity of his progress, both in science and literature. When his studies were completed, he was appointed to teach philosophy, mathematics, Hebrew, and Syriac, in the university of Wurtzburg in Franconia; and he filled this situation with great credit till the year 1631, when he withdrew into France, during the war between Ferdinand II. and Gustavus, and spent some time in the Jesuits' college at Avignon. In this situation he published, in 1635, his Primus Gnomonice, a work which contains the description of many curious dials, a subject to which he had paid particular attention. In 1643, he published at Cologne his Magna sive de Arte Magnetica. Kircher was after this called to Rome, in order to fill the mathematical chair in the Roman college. After discharging this duty for 6 years, he undertook the professorship of Hebrew. In 1646, he published at Rome, in folio, his Ars magna Lucis et Umbra, a work which contains much interesting matter, but particularly an account of Kircher's attempt to imitate the burning mirrors of Archimedes, and a description of the magic lantern, of which he was the undoubted inventor. In order to ascertain the possibility of Archimedes having burned the galleys of Marcellus, he made a voyage to Syracuse, in company with his pupil and friend Schottus, in order to examine the harbour of that city. In 1650, he published his Musurgia Universalis, which he dedicated to Leopold, Archduke of Austria, and afterwards Emperor of Germany. This work occupies 2 vols. and treats principally of the theory and practice of music. In 1656, he published his Iter italici celesti quo mundi opificium per foti raptus integrum tatam explanatum novae hypothe. A second edition of this was published in 1660, to which was added the Iter italici terrestre seu Mundus subterra. Another edition of both these works was published in 1671, with additions and illustrations by Gaspar Schottus. Kircher died at Rome in the year 1660, in the 60th year of his age. Besides the works which he has mentioned, he published a work entitled Obeliscus Pamphilus, Obeliscus Egyptianus, in 4 vols. folio; Obeliscus Egyptianus, in 4 vols. folio; and Chino Illustre. His works extended to 22 vols. folio, 11 in 4to. and 3 in 8vo. He employed himself in collecting, for the Roman college, a cabinet of antiquities, consisting of medals, mathematical instruments, rare animals, minerals, &c. This collection was finished by Father Bonanni, who published a description of it, which appeared at Rome in 1707, under the title of Museo Kircherianum.

KIRKALDY, a royal burgh of Scotland, in the county of Fife, lies in the bosom of the bay of the same name. It stretches along the foot of a steep bank, and consists chiefly of one street, nearly a mile in length, with a few smaller streets and lanes opening on each side. The principal street is in general narrow, crooked, and inconvenient; but, in 1811, an act of Parliament was obtained for widening and paving the streets, lighting and watering the town, which, so far as the trustees have been enabled by their funds to go, has been attended with the most beneficial consequences, and there is now on each side of the street an excellent pavement for foot passengers. The town is lighted, and is well supplied with water. There have been a few substantial, and even elegant buildings, erected in the town and neighbourhood of late; but the houses are generally rather mean, and many of them awkwardly placed, with their ends to the street, without any regard to uniformity. The only public buildings worthy of notice are
Kirkcudbright is a town in Scotland, and the principal in the stewartry of the same name. It is the seat of the burgess courts, and is situated on the river Dee, about 6 miles above its confluence with the Solway Firth, in Lat. 54° 49' N. Long. 4° 45' W.; and is therefore about 31 leagues S. S. W. of Edinburgh, and 9 leagues S. W. of Dumfries.

In the valuable statistical account of Kirkcudbright, drawn up by Dr. Mutie, the name is supposed to have been derived from an ancient custom in the immediate vicinity of the town.

The name, Kirkcudbright, was used for the birth of the town, which had been dedicated to St. Cuthbert, and of which some vestiges still remain. It has, however, been ingeniously suggested, that the learned doctor is mistaken on this point, and that the name Kirkcudbright owes its origin to that of the ancient British fortress of Caeberban-torican, situated on Demore hill, about 4 miles distant.

Kirkcudbright was anciently a burgh of regality, and held of the Douglasses, lords of Galloway, as superiors. But, upon the forfeiture of the Douglas estates, James II. erected the town into a royal burgh, by a charter dated at Perth, Oct. 20, 1455; which was renewed and confirmed by a nowadarmus from Charles I., dated Holyroodhouse, July 20, 1633. This charter, in common with that of the other royal burghs in Scotland, involves the pernicious principle of self-election. It fixes that the town-council is to consist of 17 members, three of whom are magistrates, who are to meet annually at Machielburn, and vote out two or three of their number, and elect two or three new councillors in their place.

The pecuniary affairs of the burgh of Kirkcudbright have been extremely well managed. The whole property originally contained in the charter of James II. remains entire, none having been sold or disposed of. The town rental, and other revenues, amounted, in 1787, to £333, and the debt to £1734; and in 1816, the total revenue amounts to £1198, and the debt, including some funds mortgaged for charitable purposes, to £1682.
A salary of £150 is paid by the burgh to the principal teachers in the academy. And no assessment has ever been imposed on the inhabitants, either for lighting or paving the streets, for carrying any public work into effect, or for any improvements made on the town. The chamberlain's accounts are regularly audited, and an abstract is printed and circulated among the burgesses.

The harbour of Kirkcudbright is the best in the stewartry. At ordinary spring tides, the depth of the water in the river is about 50 feet, and at the lowest neap tides 18 feet. As there is no difficulty in navigating the river, it is well calculated for commercial purposes; but that the population of the stewartry is chiefly supported by agriculture, and as there is no internal communication with any of the manufacturing districts, foreign trade has scarcely any footing. The salmon of the river Dee is reckoned peculiarly excellent. The greater part is exported to Carlisle and Whitehaven.

Kirkcudbright has been vastly improved during the last 30 years. The streets, which are well paved and lighted, intersect each other at right angles. The houses are generally two stories high; and although those in the new streets, built by the societies, have a somewhat monotonous appearance, they are all neat, clean, and comfortable. There is no alternation of stately edifices and miserable hovels; but the general aspect of the whole town bespeaks at once the good taste and easy circumstances of the greater portion of its inhabitants. In 1816, a commodious new jail, in the Gothic style of architecture, was erected. One of the towers reaches to the height of 75 feet, and, viewed from a distance, the building has a magnificent and sombre appearance. One half of the expense of this jail was defrayed by the landlords of the stewartry. A large and elegant academy, containing a spacious room for the public subscription library, has also been erected in the course of the two last years.

The town is well supplied with butcher meat from a regular market, and provisions of all kinds are abundant and comparatively cheap. The water for the use of the inhabitants is conveyed in leaden pipes from a spring about 3 miles of a distant point.

There is here no bridge over the Dee, but passengers and carriages are ferried over in a flat-bottomed boat, into which the latter cannot be driven without much inconvenience, which is impelled along a cable stretching across the river. In stormy weather, however, or when there is an unusual current, this convenience is not without danger; and the erection of a bridge, so constructed as to admit of ships passing through, would certainly be a very great improvement. The intelligence and public spirit of the inhabitants, give us reason to hope, that this will be accomplished at no very distant period.

Nothing can be finer than the environs of Kirkcudbright. The rising grounds on each side the river, from Tongueland to the sea, are embellished with thriving plantations. And the policy of St. Mary's Isle, the family seat of the Earl of Selkirk, distant about one mile from town, is liberally thrown open to the public.

The ruins of the old castle of Kirkcudbright, built, in 1592, by M'Clellan of Lombie, ancestor of the present Lord Kirkcudbright, are still pretty entire. The town itself, appears formerly to have been surrounded by a deep ditch and wall.

The higher class of the inhabitants are, in general, extremely well informed. The range and compass of their conversation, is perhaps unequalled in so small a town; and contrasts remarkably with the unvaried sameness and vulgarity of that of the greater portion of their agricultural neighbours. They are distinguished for their hospitality and urbanity of manners; and a stranger will nowhere meet with more civility and attention. The lower classes are, for the most part, sober and industrious; and all ranks are uncontaminated with the contagion of cant and fanaticism.

In 1801, the population amounted to 2080; and in 1811, to 2760 individuals. The assessments under the property tax act, on lands, tenements, &c. within the burgh, for the year ending 5th April 1815, were fixed at £346, and on the profits of trade, &c. at £296.

As a considerable part of the late improvements in Kirkcudbright, have been a consequence of the operation of two building societies, and as the principle on which these societies have been organised is quite novel, and at the same time exceedingly simple and efficacious, it may not be improper shortly to elucidate it.

One of these societies consists of 60, and the other of 90 members; the regulations in both are similar, except that the monthly subscription of the one is greater than that of the other, and that the houses are also superior. At the commencement, a general plan, suitable for the greater proportion of the members, was adopted, and specifications made for securing the proper execution of the work. One guinea is paid by each member at entry, and afterwards a monthly subscription of 18s. 6d. in the one society, and 5s. in the other. When funds are in this manner raised, sufficient to build two or more houses, estimates are obtained, the contract executed, and a ballot takes place, to decide the right of property in the houses to be built that season. Each member is enabled to make additional improvements at his own expense, receiving from the society the contract price; and the contractors are also bound to execute all extra work at fixed rates. The member receiving a house, pays to the society, over and above his monthly contribution, five per cent, per annum, upon the sum expended in building his house, in name of rent; so that the interest of the capital laid out by the association, is annually added to the monthly subscription of the members, and by this means a progressively increasing rapidity in building takes place; and the society continues thus operating, until every member is furnished with a dwelling-house.

The cost of a house depends upon the price of materials and labour at the time, and fluctuates from £200 to £240. To equalize the payments of the members, the sums annually expended are all added together, and the total interest is paid in equal proportions, by those who have got their houses. The shares in each society are transferable; but the person purchasing a share, must be acceptable to a majority of the members, and must be responsible for any debts due by the original subscriber to the association.

The greatest number of the members composing these societies are tradesmen, and, independent of every other benefit attending the institution, a tendency to economise and accumulate capital is produced. In a short time, each individual has a considerable property embarked in the concern, and is cheered by the pleasing and comfortable prospect, that at no very distant period he will find himself the sole proprietor of a well finished substantial dwelling-house worth from £200 to £240, acquired entirely by the monthly savings of 18s. 6d. which, but for this association, might, in many instances, have been spent in an ale-house. These societies were organised in 1808.

But however correct and well founded, the principle on which these societies are instituted may at first sight
Lead mines were wrought extensively in the parish of Mimbeg, from 1765 to 1790, and the quantity produced during that period was considerable. At an early stage of the work, a tunnel was cut nearly a mile into the bowels of the earth; and the ore was brought in boats from the vein to the furnace for smelting, at the mouth of the tunnel. Since 1795, the quantity of ore extracted has been gradually diminishing, and the mine is now entirely abandoned. Of late years, attempts have been made to work a lead mine at Ruscoe, near Gatehouse; but hitherto without any adequate success. Coal has been discovered on the sea-coast, opposite to Whitehaven; but the seams are so poor that they are not worth working, and this necessary is entirely imported from England. Lime and slates were formerly all imported, but of late years excellent slate quarries have been opened in three different places in the stewart. Lime of an inferior quality has been found in the parish of Kirkberv.

The stewart of Kirkcudbright is watered by several Rivers fine streams. The Ken and the Dough rise on the borders of Ayrshire, and, after uniting, pass near New Galloway, and expand into the beautiful and romantic Loch Ken. The Dee falls into this lake, and gives its name to the refulent river, which falls into the sea five or six miles below Kirkcudbright. It is navigable for vessels carrying 200 tons to Tongueland bridge, about two miles above Kirkcudbright; and a little below the town it forms a spacious bay, termed the Manxman's Lake, where 100 vessels may lie in perfect safety, defended from the fury of the sea by a small island at the mouth of the river. The different salmon fisheries on the Dee let for about £900; per annum. The other rivers in the stewart are the Urr and the Fleet, navigable for small vessels to Dalbeatie and Gatehouse, about four miles from where they fall into the sea; and the Nith and the Cree, which have their sources in Dumfries-shire and Wigtownshire, and divide these counties from the stewart.

The climate of the lower district of the stewart, is climate rather moist in summer, but extremely mild in winter, where the snow seldom lies for any length of time. In the upper district, however, the frost is often severe; and heavy falls of snow frequently cause considerable losses to the sheep farmers. The climate has perhaps been ameliorated, by the improvements of the soil. Intermittent fevers, once very prevalent, are stated to have now entirely disappeared; and if any reliance can be placed on the ratio of the deaths to the whole population, given in the statistical account of the parish of Crossmichael, the chances of longevity are there greater than in any other district of the empire.

There are no extensive forests in this district; but Woods there are considerable tracts of copse woodland, amounting in all to about 4000 acres. The copsewood is generally cut at the end of 25 or 30 years, although the pressure of necessity sometimes causes this to be done at an earlier period. The value of this wood depends chiefly upon the quantity and the price of the oak bark which it contains, and upon its contiguity to the sea, and consequent facility of exportation. On an average, it may perhaps be reckoned at from £30 to £60 per acre.

The plantations made during the last 40 years, both Plantation with a view to revenue and ornament, have been very extensive. Those on the estate of the Earl of Selkirk, cover about 800 acres. They were chiefly executed under the superintendence of the late Lord Daer, and are universally allowed to have been designed with infinite taste. Being chiefly planted on the rising grounds
The stewartry is every where enclosed, generally with stone dykes of a very superior construction. These vary from four to six feet in height. They are generally built three-fourths of their height double, and then are covered with a flat stone projecting two or three inches on each side, over which are placed one or more stones, to the height perhaps of eight or ten inches, laid single. The best dykes, however, are those built with locked tops, consisting of flat stones laid on edge, in lieu of the single stones. This contrivance binds the top so firmly together, that it requires a considerable force to displace any one stone. Hedges, however, of late years, become much more common, especially in the moist lands requiring drainage.

The roads, which were formerly wretched, have been road astonishingly improved during the last 30 years. The new lines are laid out with considerable judgment; and notwithstanding the hilly nature of the country, are uncommonly level. As a proof of this, it may be mentioned, that in the great road from Dumfries to Newtonstewart, a distance of 52 miles, the acclivity, where greatest, is only one foot in forty. Some very expensive and elegant bridges have been lately erected. The principal arch of Tongeland bridge, near Kirkcudbright, measures 110 feet in span; and the entire expense of this bridge amounted to near £ 5000 Sterling.

By the act of 1796, the road trustees are invested with the power of assessing the landed proprietors to the extent of 50s. Sterling on every one hundred pounds Scots of old valuation, for the purpose of forming parochial roads, bridges, &c. Tolls having been established on the other roads, the greater part of them have been constructed from subscriptions advanced on their credit.

The rearing of black cattle, forms the great object of attention with the farmers of the stewartry of Kirkcudbright. The genuine polled Galloway breed, is reckoned one of the very best in the kingdom; but as a particular account of it has been given in the article Agriculture in this Encyclopaedia, it seems unnecessary again to notice its peculiarities in this place. The black cattle are almost all raised for the English market, and are sold periodically during the whole season; but the principal sale takes place in the month of September, when they are in the best condition. Those that are three years old, fetch from £10 to £15 a piece. They are reared on inferior upland districts, and are purchased at two years old by the graziers, who possess the rich old pasture land in the lower districts, at about £6 or £8 a piece. There are many instances, in which one Scots acre of the latter description of land, will feed a bullock sufficiently fat for the shambles in one season; and very large tracts only require about 14 acres for the same purpose. Cattle of one year old are denominated stirk, and sell at from £3 to £5 a piece.

A few sheep, of various breeds, are kept in the lower sheep district, though but little attention has been paid to the improvement of the race. The black-faced breed are universally kept by the sheep-farmers in the hilly district. They are rather smaller sized, and coarser woolled, than the sheep of Tweeddale and Cheviot. They endure cold and hunger to an incredible degree, fatten extremely well, and the meat is excellent. The dairy has always been a secondary object of attention with the Kirkcudbright farmers; and the quantity of cheese and butter, manufactured for the market, is but inconsiderable. A very considerable number of swine are raised in the stewartry, about one third of which are exported.

The Galloway breed of horses, long famed for their breed of superior spirit, and for their fitness to endure fatigue, are.
is now nearly extinct. The excellent roads that traverse every part of the country, admitting the employment of heavy carriages, and the increased demand for draught horses, occasioned by the extension of agriculture, have contributed to diminish this hardy race. In several parts of the district, however, they are still to be met with, and bring a high price. Such of the ordinary breed of horses, as have a considerable portion of the old blood, are easily distinguished by a smallness of head and neck, and a cleanliness of bone not usual in draught horses; they are generally of light bay or brown, with their legs black.

Cotton spinning was introduced at Gatehouse about the year 1788. Several mills, upon a very large scale, were erected for that purpose; and smaller establishments followed in different parts of the stewartry. These had a temporary success; but their distance from the regular markets for buying the wool, and selling the yarn, occasioning a great extra charge, the works were soon abandoned. The spinning and manufacturing of wool, has been frequently attempted in different situations in the stewartry; but although the raw material is got in the neighbourhood, these attempts have not succeeded. The want of coal, and of any interior communication with the more populous and merantile districts, seem to constitute an insuperable obstacle to the successful introduction of manufactures.

Except Kirkcudbright, New Galloway is the only royal burgh in the stewartry. Its situation at the head of Loch Ken, is sufficiently romantic; but, destitute of all commerce, and being surrounded by a poor country, it never was of any consequence, and is now reduced to about 650 inhabitants. The villages are Maxwelton, Castle-Douglas, Keltonhill, Dalbeattie, Gatehouse, and Creetown. Of these, Maxwelton is the most populous. But although it is situated on the southern side of the Nith, it can only be considered as a part of Dumfries. Castle-Douglas is neat and well built; but the want of manufacturing industry must prevent its having any great increase. The central situation of Keltonhill attracts a considerable number of farmers and cattle-dealers to its weekly markets; it is best known, however, by its two great annual fairs, at which an immense number of horses, chiefly Irish, are disposed of. Dalbeattie lies on the Urr, about four miles above its confluence with the Solway Frith. It is an improving village, with about 800 inhabitants. Gatehouse, delightfully situated on the Fleet, four miles above where it falls into Wigton Bay, owed its rise to the introduction of the cotton spinning. It is a very neat and well built village, with upwards of 1000 inhabitants. Creetown lies about 12 miles farther up Wigton Bay, and has nearly the same population as Gatehouse.

Farm servants receive from £11 to £22 per annum of wages, exclusive of their board in the farmer's house; and women servants from £5 to £8, exclusive of their board. Potatoes and oatmeal constitute a considerable portion of their food, but they generally have abundance of pork and mutton for dinner; and, in harvest, when the labourers in Lothian are half starved, those of Galloway fare extremely well. Cottagers are worse off than house servants; their whole wages, including house, meal, &c. probably amounts to about £30 or £35 per annum. The extra hands required in harvest, are generally engaged for its whole continuance, but in many instances harvest work is now performed by contract, at so much an acre. Four reapers are reckoned adequate to cut a Scots acre in a day, at the average rate of working. The following is a statement of the money price of day labour at St. Mary's Isle, near Kirkcudbright, in different years, viz.

The following Table of the Kirkcudbright Fair prices of the Winchester bushel of common oats and barley, for the same years as those included in the foregoing Table, will enable the reader to judge of the comparative real wages of labour in this district, at different periods, during the last half century, with considerable accuracy:

The rise in the money rate of wages in 1770, and its fall subsequent to 1772, appear to have been intimately connected with the establishment of the Douglas and Heron Banking Company at Ayr. The facility with which discounts were obtained from this bank, gave, in the first instance, an astonishing impulse to improvement throughout Galloway. But its failure in June 1774, only three years after it had commenced its operations, by ruining a great number of the most opulent and enterprising individuals in the stewartry, effectually checked this incipient progress. During the American war, improvements of every kind were at stand, and have only been carried on with vigour and success since 1790.

Owing to the ill success which has attended every attempt to introduce manufactures, the increase in the population of the stewartry of Kirkcudbright, during the last thirty years, has not been so great as might have been expected. Nor is this to be wondered at; agriculture has no doubt been vastly improved during that period; but this, in many instances, has been effected rather with a diminished number of labourers. The greater extension of farms, and the general introduction of machinery into the labours of the field, has enabled a much greater quantity of raw produce to be raised, with a comparatively small number of hands. The increase of population, though very considerable, has not therefore kept pace with the improvement of the soil. But owing to the absence of poor-rates, to the consequent spirit of independence, and the powerful operation of moral restraint amongst the poor, their situation is perhaps more comfortable in Galloway than in most other districts of Scotland. The total population of the stewartry, which in 1801 amounted, according to the census then taken, to 29,038 individuals, of all ages and sexes, had in 1811 increased to 33,684; of this number 28,328 lived in the country, and 5856 in towns and villages.

Landed property is more equally divided in the stewartry of Kirkcudbright than in most of the counties of Scotland. In 1810, Mr. Smith estimated, that there were in the stewartry, State of Scotland.
The quantity of land held under entail, is less in the stewartry than in many other districts; but this pernicious practice is gaining ground. There were 142 freeholders on the roll in January 1818.

The valued rent of the stewartry is £114,507, 29. 3d. Scots. In 1792, Mr. Niven estimated the real rent at £70,000 Sterling. The medium real rental of 1812, and 1813, as ascertained by the property-tax commissioners, amounted to no less than £201,745 Sterling.

Several remains of antiquity are to be met with in the stewartry. The magnificence of the ruins of Sweetheart and Dundrennan abbeys, attest the wealth and power of the clergy in remote ages. The baronial and feudal residue must at one time have been numerous; and the remains of Craignair Castle, believed to have been a favourite residence of John Baliol; of Threave castle, the residence of the Douglases, lords of Galloway, Kenmore Castle, Garrie's Castle, Cardonness Castle, &c. &c. are still more or less entire. The moat of Urr, is reckoned one of the largest artificial mounds in the kingdom.

The ancient history of Galloway is extremely obscure and perplexed. Previous to the invasion of Agriola, the Selgoue, a British tribe, in addition to Dumfries-shire and part of Cumberland, occupied the district lying between the Nith and the Dee; and the division of the stewartry to the west of the Dee, formed, with Wigtownshire, the territory occupied by another tribe, named Novante. During the Roman dominion, the greater part of the stewartry was included in the province of Novantiurn, whose capital Candia Case, supposed to have been built on the site of the present Whithorn, is mentioned by Ptolemy. After the subversion of the Roman power, Galloway was long a prey to every species of disorder. Successively overrun by the Cruithne or Picts, and the Angli, it still, however, preserved a kind of independent existence; and, according to Lord Hailes, so late as the 12th century, the lords of Galloway were merely feudatories of the Scottish kings. This opinion has been controverted by Mr. Chalmers, though, as it appears to us, on no very satisfactory grounds; but, at all events, it is certain that Robert Bruce confirmed the Gallovians in the possession of those special and ancient laws, of which Edward I. had attempted to deprive them. The first authentic mention of the lords of Galloway, occurs in the account of the battle of the Standard in 1138, when Ulric and Dovenald, invested with that rank, were both slain. They were succeeded by Fergus, commonly called the first lord of Galloway, whose descendants continued to enjoy this title, until the expulsion of the abbot Baliol, who had married the heiress of the family. Bruce then bestowed the lordship of Galloway on one of the branches of the house of Douglas, in whose hands it continued till 1455, when their estates were forfeited, and annexed to the crown.

Long subsequent to this era, Galloway, as well as the other districts of Scotland, continued in a very uncivilized and unsettled state. But the gradual decline of baronial influence, and the increasing authority of the crown, and of the public law, were ultimately attended with the happiest effects; and, in conjunction with the reformation, and the consequent destruction of the exorbitant powers of the clergy, paved the way for the rapid improvement that has since taken place.

The inhabitants of this district are a strong, active, and healthy race. The general diffusion of elementary instruction has enabled them to acquire extensive and solid information. But their dispersion over a large extent of country; the want of public meetings; of political privileges; and of all collision of political opinion; by depriving them, in as far as at least as matters of public interest are concerned, of all stimulus to mental exertion; occasions a morbid uniformity of character, and an extreme sameness and insipidity of conversation. These circumstances do not indeed affect the inhabitants of the stewartry, more than those of any of the other agricultural counties of Scotland. But they have a curse almost peculiar to themselves.

The extraordinary prevalence of cattle-dealing, and the kind of universal jockeyship to which it gives rise, is attended with the very worst consequences. It not only has a strong tendency to induce habits of dissipation, but is often accompanied with an extreme degree of vulgarity. The whole ideas of such persons are centered in cattle, and extend to nothing else. They frequent markets when they neither need to buy nor sell. And the most important tillage operations are neglected, or left to the care of servants, in order that the master may be able to attend a market where he cannot have any particular business. We do not mean to say, that in every instance this would be a just character of the Kirkcudbright farmers. On the contrary, many of them are men of enlarged minds, who manage their farms on the most approved principles, and who despise the kind of gambling and agitation indulged in by their neighbours. It is only a general outline that we are now sketching; and as such, we are afraid, it will not be found very accurate.—This article has chiefly been drawn up from private information; but several works, and, among others, Smith's Survey of Galloway, have been consulted. (J. R. M.)

KIRKWALL is the principal town of the Orkney Islands, of which a full account will be found under the article ORKNEY ISLANDS.

KIRRIEMUIR is a small town of Scotland, in the county of Forfar. It is situated on the south-west side of a hill, near a romantic glen, traversed by the small river Gairie. The parish church, which is tolerably neat building, is the only public edifice of importance. The town contains some good houses; but it is principally celebrated for its manufactories of Os- wurbs and coarse linen. In 1792, the amount of these articles manufactured in the town and neighbourhood was about £30,000. Kirriemuir is a burgh of barony of considerable antiquity. The baron bailie is appointed by Lord Douglas, the superior. In 1793, the population of the town was 1584 inhabitants. In 1811, the town and parish contained 955 houses, 1201 families, 643 families employed in trade and manufactures, and 4791 inhabitants, being an increase of 370 since the census of 1801. Distance from Forfar six miles, and from Dundee 20 miles.

KISHMA, Kishish, or more properly Jeziira Derum, or the Long Island, is an island of Persia, and the largest in the Persian Gulf. It is the Oaracta of the Greeks. It stretches for about sixty miles parallel to the Persian coast; but its breadth no where exceeds twelve miles. The channel by which it is separated from the continent is navigable for the largest vessels. It is about eight miles wide at the north point of the island, and less than three opposite to Old Lufl, from which it is said to wind among several wooded islands.
as far as Bassadore, the extreme point of the island. Kishma formerly contained 300 villages, but not one half of these remain. Dates, wheat, and barley are produced in sufficient quantity for the subsistence of the inhabitants, and it was formerly the granary of Ormuz. They breed cattle and sheep, and are much occupied in fishing. An independent Arab Sheik, who pays homage to the Imam of Muscat, possesses the island. He resides in the fort of Kishma at the eastern extremity of the island, but is not able to defend his subjects against the incursions of the tribes on the Arabian coast. The town of Kishma, situated close to the sea opposite the island of Larrek, is surrounded with a wall, and vessels may ride securely in the roads; but there is a break which is said to extend nearly two miles from a point southward of the town. The principal places in this island are the ports of Luft and Khan on the north-west coast, and Mion at the western extremity of the island. On approaching the port of Old Luft, which stands in North Lat. 26° 55', the tide falls about 12 feet, the soundings become irregular, and the bottom rocky. The harbour is however safe. On the south coast is an excellent harbour formed by the island of Angar. It is so completely surrounded by the two islands, which are only three miles distant from each other, that a ship can anchor close to either shore at all seasons. A line-of-battle ship may lie within half a mile, and small vessels within an hundred yards of the shore. The island of Angar is uninhabited; but Mr. Macdonald Kinneir observed upon it the ruins of a considerable town, and many reservoirs of water. It is covered with pits of salt and metallic ores, and also a soft rocky substance resembling lava. The hills are covered with shells of oysters and other fish, and abound in wild goats, sheep, and cattle, which are employed to take this island; but they failed in the attempt, and were obliged to make their peace with the inhabitants by considerable presents. On the west side of the island, there was a nest of pirates, who were destroyed by the English in 1809. The position of Kishma is in East Long. 50° 8', and North Lat. 26° 57' 30".

KISTNAH, or KRISTNAH. See INDIA, vol. xii. p. 63.

KLAUSTHALL is a town of Germany, in the principality of Grubenhang, and the kingdom of Hanover. It contains two churches, an orphan's hospital, a mint for coining money, and a small garrison. The town is open and regularly built, and derives its importance from the mines of the Hartz mountains in its vicinity. It is situated 1774 Paris feet higher than Gottingen; and the lowest point of the mine of Roschofer is only 248 of these feet below the level of the sea. The richest mines here are the Caroline, which is 630 feet deep; and the Dorothy, which is 612 feet. The Georgestollen is a remarkable conduit, nearly seven miles long, and 900 feet deep. It was begun in 1777 for the purpose of carrying off the subterraneous water of the mines. The Caroline mine, in the year 1780, produced every three months 54 crowns at each part of the mine, and the Dorothy mine 04. This is a smaller producer than formerly, when the Dorothy mine yielded, in 67 successive quarters, 110 crowns. In the year 1783, there were coined at Klausthall every week 600 marks of silver at the rate of 12 crowns the mark, which amounted to 374,000 crowns a year. At Ludwig Itchenbus is a very curious collection of all the machines either employed in mining, or that have been prepared for that purpose. Bosenhof is the Vauxhall of Klausthall and Zellerfeld. New Klausthall is the small town of Gittereke, which has several forges, and is remarkable as containing the ruins of Staufenburg, a chateau built by Henry Oiseleur; and also the place called Heinrichswinkel, where Henry was occupied in catching birds when the German deputies came to offer him the imperial crown. Population 8000. An account of the remarkable conduit called Georgestollen will be found in a work by M. Gotthard, written expressly on the subject, and entitled, Authentic Beschreibung vom Bau des Georgestollens. Wernigerode, 1801.

KLEIST, CHRISTIAN Ewald de, an eminent German poet, was born at Zeblin in Pomerania, in the year 1775. He studied law at Köningsberg, and afterwards went to visit his relations in Denmark, at whose desire he endeavoured to obtain a civil appointment; but his solicitations having proved unsuccessful, he resolved to devote himself to the military profession. Soon afterwards he entered into the Prussian service, and distinguished himself, in several of the great Frederick's campaigns, as a brave, enterprising, and accomplished officer. He attained the rank of major, and terminated his life at the battle of Krummdorf, on the 12th of August 1759, after performing the most gallant exploits. Being attached to the corps of General Fink, he attacked the flank of the Russians, assisted in storming three batteries, and received a wound in the right hand, which obliged him to hold his sword in his left. Having missed the commander of his battalion, he immediately put himself at its head, and led on the men, under a heavy fire of cannon, to the attack of the fourth battery. There he was wounded in the left arm, and compelled to carry his sword again in the disabled right hand. In 1782, he was appointed to the right leg was shattered by a grape-shot; and he fell from his horse with the exclamation, "My lad, don't forsake your king!" As the enemy now rushed forward in great numbers, his body could not be removed from the field. Some Cossacks having come up, stripped him naked, and threw him into a bog. In this situation, he was found by some compassionate Russian soldiers, who laid him on straw before a watch-fire, put a covering over him, and gave him some bread and water. He was again stripped of his covering by the Cossacks, and lay for several hours in a state of nakedness, until a Russian officer ordered him to be carried to Frankfort on the Oder, where he was delivered over to the care of medical men. He died of his wounds 11 days after.

Kleist was well advanced in years before he discovered any decided genius for poetry, and his talents were first called forth by an accidental impulse. The productions, however, which afterwards flowed from his pen, have secured for him a distinguished rank among the poets of his country. He composed various kinds of poetry—epic, descriptive, lyrical, and epic; but he excelled chiefly in the faithful delineation of rural scenes. His most admired poem is that entitled, "The Spring, or Vernal Season," which has been lately translated into English. See Kleist's Sämtliche Werke, with the author's life, by Körte, in 2 vols. 8vo. Berlin, 1803. (z.)

KLOPSTOCK, FREDERIC THEOPHILUS, a celebrated German poet, was born at Quicklingen, in the year 1724. Having received the rudiments of his education at home, he was sent to the public school of Quicklingen, where he distinguished himself by his intellectual powers, and excelled in bodily exercises. At the age of sixteen, he went to the college of his native place; where he made great proficiency in his classical studies, and acquired a taste for elegant literature. His
poetical genius already displayed itself in some pastoral; and even at this early period, he conceived the design of his great epic poem, The Messiah.

In the year 1745, he commenced the study of divinity at the university of Jena. But his thoughts were constantly turned towards the great work he had projected, of which he composed the three first cantos in prose. Afterwards, however, he resolved to adopt the versification of Homer and Virgil as his model; and having succeeded in his first attempts, he, at length, determined to execute the whole poem in German hexameters.

In 1746, he removed to Leipzig, where he became acquainted with a number of young men of poetical talents, who published their essays in an occasional paper, called the Bremische Beiträge, or "Bremen Contributions." In this paper were published the three first cantos of Klopstock's Messiah, with a number of his odes; which were received with such general approbation, as encouraged him to persevere in his poetical labours.

He left Leipzig in 1748, and went to reside at Langensalza; where, in consequence of a disappointment in love, he was, for some time, thrown into a state of mental dejection. About this time he published ten books of his Messiah, by which his reputation as a poet was completely established. The work, indeed, was hailed with rapture by the lovers of poetry and devotion; the critics looked upon it as forming an era in the poetical annals of Germany; and the author was generally regarded as the Homer of his native country.

In 1750, he made a journey into Switzerland, in consequence of an invitation from Bodmer to visit him at Zurich. Here he was received with great respect; and he appears to have formed a strong attachment to the country and its inhabitants; among whom he would, in all probability, have spent the greater part of his life, had not Baron Herrnstorff, who had conceived a high regard for the talents of Klopstock, invited him to Copenhagen, with the assurance of conferring upon him such a pension as would make him independent. He accordingly set out for Copenhagen, in the year 1751; and, in passing through Hamburg, he became acquainted with a young lady, Miss Moller, of amiable qualities and literary accomplishments, whom he soon afterwards married. The congeniality of their dispositions seemed to promise much happiness to both; but Klopstock was very soon deprived of his partner, who died in childbirth; and he lamented her death, and cherished her memory, to the last hour of his existence. He remained chiefly at Copenhagen until the year 1771; after which period he remained at Hamburg, in the capacity of Danish legate, and counsellor of the Margrave of Baden, from whom he enjoyed a pension. He died at Hamburg in the month of March, 1803, in the 73rd year of his age.

The general character of Klopstock was exceedingly amiable; and this, no less than his poetical talents, made him be regarded with sentiments of veneration by all those who enjoyed his acquaintance. His natural diffidence was so great, that he seldom felt at his ease in the presence of strangers, especially persons of rank.

As a poet, Klopstock has been justly placed among the number of those who have attained the very first eminence. His productions display a fertile imagination and a cultivated taste; and they abound in sublime imagery and pathetic sentiment. The Messiah—which extends to twenty cantos—is perhaps too long for a devotional poem. There is in it a piquancy of incident, which the inspiration of genius finds it difficult to supply; and it cannot be denied, that the sublimity of his conceptions frequently carries the muse of Klopstock into the obscure regions of mysticism. His lyrical effusions are remarkably spirited; yet not altogether free from the characteristic defect to which we have alluded. His dramatic pieces are also written with great spirit and force, but are not properly adapted for theatrical representation. (z)

KNARESBOROUGH is a town of England, in the West Riding of Yorkshire. It is situated on a rocky eminence on the north-eastern bank of the river Nid, which issues from the bottom of the Craven hills, and flows below precipitous rocks, in a beautiful glen. The town, which is tolerably large and well built, and contains many handsome modern houses, consists of two principal streets, and some smaller ones, along one of which runs the high road through Harrogate to Boroughbridge; while along the other street, which crosses it at right angles, runs the road from Ripley to Wetherby. On an abrupt bank, overlooking the river, are the venerable remains of a castle, built by Serlo de Burgh, baron of Tonsborough in Normandy. It contained nearly two acres and a half within its walls, which were flanked with eleven towers. Part of the principal tower still remains, and seems to have been built about the time of Edward III. It consists of three stairs above the keep, or dungeon. The roof of the dungeon is arched with stone, and supported by one round pillar, three feet in diameter.

The parish church is neither spacious nor elegant. It contains several handsome monuments, particularly of the Slingsby family. There is here a spacious marketplace, with a neat cross erected in 1719. Besides a free school-house, built by subscription in 1741, there is a dissenting chapel, built in 1778—a Quaker's meeting-house, built in 1701—and a good stone bridge over the Nid. The principal manufactures are coarse linens and sheetings; and a great trade is carried on in corn. Very fine liquor-gin is grown round the town. More than 1000 pieces of linen, each twenty yards long, have often been woven here in a single week. Knaresborough sends two members to parliament, and is governed by a bailiff, who is also the returning officer at the election. The right of election belongs to the possessors of 8 ½ burgage holds.

This town has long been celebrated for its fine medicinal spring, and was a place of great resort before Harrogate and Scarborough came into such repute. The Sweet Spa, or vitriolic well, discovered in 1620, is situated in Knaresborough forest, about three miles from the town. The Stinking Spa, or sulphur well, is very fetid, and is used only for bathing. It changes silver to the colour of copper. St. Mungo's Well is a cold bath, about four miles distant from the town. The famous Dropping, or Petrifying Well, is in the long walk on the south-west brink of the Nid, and opposite to the castle. It rises in the declivity of the hill, at the foot of the limestone rock, about forty yards from the banks of the river; and, after a course of twenty yards, it spreads itself on the top of a rock, from which it trickles down in about forty places, creating a musical kind of tinkling. The quantity of water delivered in a minute, is about twenty gallons. The rock, which is covered with plants, flowers, and shrubs, projects in a circular curve from the bottom to the top, so that its brow overhangs its base nearly fifteen feet. It is about 30 feet high, 43 long, and from 30 to 45 broad. The ground that receives the water before it forms the well, has been converted into a solid rock, through a distance of 24 feet; and the spring water, in running into the river Nid, has formed a rock some yards long.

The walk from the Dropping Well to the high
bridge, is remarkably fine, exhibiting a great variety of charming prospects. On the other side of the river, near Grimthorpe bridge, and at the foot of a perpendicular rock, is St. Robert's chapel, which is elegantly hollowed out of the solid rock. It is 10 feet 6 inches long, and 7 feet 6 inches high. The roof and altar are finely enriched with Gothic ornaments. Behind the altar is a large niche, where there was formerly an image. There are also three heads, supposed to represent the Trinity; and another, supposed to be that of John the Baptist, to whom the chapel was dedicated. On one side of the entrance, shaded with spreading ivy, is the figure of a warrior, cut out of the rock, in the act of drawing his sword to defend the entrance. The borough and township of Knaresborough contained, in 1811, 888 houses, 994 families, 837 families employed in trade and manufactures, and 4934 inhabitants. See Hargrave's History of the Castle, Town, and Forest of Knaresborough, 1798; and the Beauties of England and Wales, vol. xvi. p. 634.

KNELLER, Sir Godfrey, a celebrated portrait painter, was born at Lubeck about the year 1640, and was the son of M. Kneller, court painter of the Hanoverians, and had the benefit of Mansel's education. Having exhibited an early passion for painting, his father, though he had destined him for a military life, sent him to Amsterdam to receive instruction from Bol, and he had also the good fortune to be honoured with instructions from Rembrandt. He went to Italy in 1673, where he spent some time in Venice. In 1674, he came to England, without any intention of taking up his residence in this country; but having been accidentally recommended to Mr. Banks, a Hamburgh merchant, he took portraits of him and his family. The Duke of Monmouth having induced the king to sit to Kneller, his majesty, who was engaged to have his portrait taken by Lely, insisted that he should sit to both artists at the same time. Kneller executed his portrait with such expedition, that he had finished it before Lely's was dead coloured. This little event gained him reputation, and induced him to take up his residence permanently in England. Kneller was patronised by Chales II. James II., and William III.; and he had the honour of being one of the portrait-painters of the royal family. He was knighted in 1692, by William III. for whom he painted the portraits of Hampton Court, and who presented him with a gold medal and chain worth £300. He likewise took a portrait of George I., who raised him to the dignity of a baronet. In 1722, he was seized with a violent fever, of which he languished for a considerable time, and which carried him off in October 1723, in the 75th year of his age. A monument was erected to him in Westminster Abbey, for which he left £300.

KNIGHT-HOOD, ORDERS OF. In the article Chivalry, an account has been given of the origin of knighthood among the northern nations; of the ceremonies with which that dignity was in general conferred; of the obligations which it imposed; and of the powerful influence which the spirit of chivalry long exerted, and in all probability still continues to exert, over the people of Europe. One very important topic connected with the subject of that article remains to be discussed in the present work, viz. the origin, history, or influence of those separate orders of knighthood, as they were called, which had their rise, as is generally supposed, about the time of the crusades, and proceeded indeed from an union of the two principles of valor and devotion, which we should seek for in vain among the records of any other period.

The wars of the cross, which had originally been exci
ted by the eloquence of a priest, and recommended to all believers by the promises of a saviour, presented to the eastern world the strange spectacle of churches consecrating sword in hand, for the truth of the tenets in which they professed, and the destruction of infidels. The more hardly tribes of the west, had, indeed, been long familiarized with such spectacles. Although ecclesiastics, both regular and secular, were absolved by their tenure, from rendering military service in person, they were far from being always disposed to make use of their legal exemption from duties, to which they were so much inclined. They feared, or pretended to fear, the degradation of their foés, should the obligations of their tenures be fulfilled by mercenary hands. The chapter of St. Germain l'Auxerrois, accordingly, continued to furnish the Bishop of Paris with horse and straw for the army of the king, till the middle of the 11th century. Even the church had, long before the period of the crusades, sanctioned this military rage by their example. Leo IX. marched against the Normans at the head of an army, refused them peace, although they professed their readiness to comply with all his demands, continued, in some of all their entreaties, to ravage their country in the most cruel manner, with a force chiefly composed of landitti, and outcasts of every kind, who were glad to make their booty under so sanctified a standard. Benedict VIII. one of his predecessors, had violated, in a manner even more shameful, the precepts of that religion, of which he pretended to be the first minister. Not only did he arm all his bishops to fight with him against the Saracens, but after having overcome these infidels, and slaughtered a prodigious number of them in the field, he did not scruple to stain himself with the blood of their queen. He commanded her head to be cut off; and reserved for his own share in the booty, her ornaments of gold and jewellery. In Spain, nothing was more common than to see bishops following the king in his wars. When, about the end of the ninth century, the Normans made a descent on the coast of Galicia, they carried every where fire and desolation, and met with no check till they reached the territory of Roncesvalles, which was possessed by a Bishop of Covadonga. The state having called together the counts of the neighbourhood, advanced himself at their head, covered (as Ferrera expresses it) with the harness of charity—rushed upon the barbarians—slew their chief with his own hand—and forced them to seek for safety in their vessels. Not even the authority of the council of Constance could overcome the public applause of this valorous action; and, in spite of their fourth canon, which so expressly disapproves of all sacerdotal combatants, St. Rosinus still occupies his place in the calendar, among the most eminent of the holy.

The consideration of these facts, and of the state of manners of which they are the evident marks, will prepare us to inquire, with advantage, into the true origin of the orders of knighthood.

The ambitious desire of an ancient origin, is not less conspicuous among bodies of men associated for particular purposes, than it is among families. There is no pretence which it is not possible to believe its bishop; even those of Troyes and Clermont, the most insignificant in France, have long since added that epithet to their titles. Monks who make profession of humility, and renounce the world, are in this particular the vaineast of men. The Carmelites think they have made out a clear title and precedence, by taking Elijah or Mount Carmel for the patron of their
order. They were desirous to increase the antiquity of their order, even at the expense of making it Jewish rather than Christian. But the hospitaliers made light of this Jewish antiquity, and made bold to reckon among their founders Abraham, Lot, and Laban; for this last, although his character is none of the best, was, notwithstanding, according to them, a good knight hospitalier.

A letter, written by Maffei in the year 1712, was suppressed by papal authority, because that illustrious writer had succeeded in proving what he undertook, and had for ever put an end to all rational belief in the remote origin of orders of knighthood. The fable is, that Constantine the Great, after his defeat of Magnentius, received from heaven an express command to institute an order of knighthood for the defence of the Christian religion; and as this command was brought by an angel, who held in his hand a cross of gold, inscribed with the well known words omnimus vos, Constantine gave his knights the title of Equites angelici et Aureuli.

The only authority for the existence of Constantine's order is that of a pretended ancient—a stone dug up at Rome, which gives, moreover, a different account of its origin. On it appears Constantine seated on his throne, giving a collar to several knights; and the inscription relates, that the emperor, being cured of the leprosy, and baptised by Pope Sylvester, created, for the defence of Christianity, Milites Equites Aureatos. The leprosy and the baptism by Sylvester are now given up on all hands; and the use of the word milities has no great resemblance to the language of the fourth century. The real founder of the Ordo Constantinianum, was without doubt the Emperor Issac Angelus Conneus, who took the idea of it from the Franks, and in whose family the mastership so long remained.

The knights of St. George are an order of great antiquity, who have extended themselves from the east to the west. Their patron saint is now, however, supposed to be fabulous, as well as all their legends respecting their own very remote origin and exploits. St. George was, according to them, a Christian saint, who suffered martyrdom in Persia during the reign of Diocletian. But he is commonly confounded with that famous Arian bishop who was substituted in the room of Athanasius in the see of Alexandria. There is every appearance that they are in fact the same person: Both were born in Cappadocia, and both were called George. George, taking possession of his bishopric, entered Alexandria armed cap-a-pie, and on horseback; and the other is represented as combating the devil, in the shape of a dragon, on horseback also, and armed in the same fashion. George of Alexandria was massacred by the Pagans; so he also has his claims to the character of a martyr. The entire silence of all historians is sufficient to negative all belief in the legends of the order of St. George. These are not even in concord with each other. Their patron has suffered death in almost every possible way, and in each way upon equally good authority.

A martyr so exemplary could hardly have been omitted by all the fathers. It is true that the Emperor John Cantacuzenus made, as is recorded by himself, some knights in the church of St. George Palatine. But the very name of the saint is sufficient to prove that he had nothing in common with either George the champion of Cappadocia, or George the bishop of Alexandria. Notwithstanding, it appears, that the removal of some relics of this St. George the Cyprian to Italy, after the Franks had obtained possession of Constantinople, was the real origin of this order, the ensign of which has since become so popular. Of all these legends, we may well say—

Sunt epinor, tricorne et al quid nullius ietis.

In order to discover the true origin of the orders of knighthood, we must come down to the time of the crusades, during the 12th century. The piety of some merchants of Amalric, who traded in Judea, induced them to build a church in Jerusalem, which long after preserved its name of the Latin, originally conferred upon it on account of the language and rites of which its founders had made use. Near to this church they built an hospital, dedicated to St. John the Almoner, for the reception of the sick and the pilgrims who frequented the holy sepulchre. It is impossible to wish any better authority for these facts, than that of William of Tyre, who wrote in the same century. He asserts, that, as the founders had been Latin merchants, the monastery still retained the name of the Latin. He asserts, what is now to our purpose, that these hospitaliers, who had had so small a beginning, became by degrees wealthy, and that their first step was to withdraw themselves from the jurisdiction of the abbot of the Monasterium Latinum, till at length, their power increasing to a great degree, the Roman church emancipated them from the authority of the patriarch of Jerusalem. "Sic ergo de una modo incrementum habentes predilecti domus fratres prius e jurisdictione Abbatis se subtraxerunt, deinde, in immortalitatem multiplicata divitium, per ecclesiam Romanam a manu et potestate Domini Patriarchae sanci emancipati."

When the princes of the west entered the Holy Land, the hospitaliers took up arms in their cause. Some remained attached to the purposes of their institution, and took care of the sick. "Persons afflicted with leprosy were admitted into their body, that they might undertake the care of others in a similar situation; and the rule was, that the grand master himself should be a leper. But after all the sick persons in the hospital at Jerusalem had been massacred by the Infidels, the order was obliged to retire into Italy, and received from Innocent IV. a dispensation absolving them from the obligations of their original oath, together with permission to elect a grand-master of full and vigorous health. Those who were inclined for war, distinguished themselves by actions of valour, which soon attracted great reputation to their order. Such was the origin of the knights of the order of St. John of Jerusalem, the most ancient of all; who afterwards, under the names of knights of Rhodes, (which island they occupied from 1308 till A. D. 1522), more lately of knights of Malta, were of such signal service in representing the progress of the Ottoman arms.

The government which this order afterwards established was a mixture of monarchy and aristocracy.
The grand-master exercised the rights of sovereignty over the people of Malta and its dependencies. He coined money; and had the disposal of the priories, bailiages, and commanderies attached to the order. All the knights, of whatever rank they might be, professed obedience to his commands in every thing not contrary to the rules of the society, or the obligations of religion. In all affairs, however, which respect religion in the interests of the knights, an absolute authority was exerted by the grand-master, and the council in conjunction; the grand-master having no other prerogative than that of a casting vote. There were two councils.

The ordinary council consisted of the grand-master, the prior of the church, the conventual bailies, the grand priors, and the capitular bailies. The council complete was composed, in addition to these, of all the grand crosses, and of the two senior knights of each language.

These languages were those of the different nations of which the order was composed; and these were in number eight, Provence, Auvergne, France, Italy, Arragon, Germany, Castile, and England. Of each of these languages, there were knights of different kinds, as, 1. Equites Justice, who made proof of nobility at their entrance, of four descents in all other nations except Germany, where 16 quarters were held necessary. — 2. Equites Gratia, who made no proof of nobility, but had the order conferred on them on account of merit. These were, however, incapable of attaining the rank of bailie, grand prior, or grand-master. Besides these, there were serving brothers of two kinds; 1. those of arms, who took a part in all the customary duties of the knights; and, 2. those of the church, who were priests entirely devoted to the services of religion in the different churches of the order.

The influence of this order was extended through every part of Europe. Their achievements were conspicuous, and they were long regarded as the most essential bulwark against the Turks. Ashmole is of opinion, that at one time their power was so great that "they possessed in Christendom about 19,000 manors." * In England, their prior sat in Parliament as the first baron of the kingdom, by the title of "Prior hospitalis Sancti Johannis de Jerusalem."

The knights of St. John made profession of poverty, obedience, and chastity, according to the rule of St. Augustin, whose black habit they wore, originally with a plain white cross on the breast, but afterwards with one of eight points. In time of war they put the cross on a scarlet cassock.

The order is now merely nominal, and the cross is conferred by several sovereigns, who lay claim to the title of grand-master. Among others, Paul of Russia celebrated a mock election of himself, with the concurrence of a company of comedians, and sold the insignia.

Scarcely had the hospitallers succeeded in transforming their society into one, uniting within itself the profession of religion and that of arms, before certain canons regular of St. Augustin, who, during the reign of the Saracens, had been entrusted with the care of the holy sepulchre, became desirous of imitating their example. Baldwin accordingly granted them in this matter, and they assumed the title of knights of the holy sepulchre. They were conspicuous for their valour and fidelity during the time of the Christian kings of Jerusalem; but, on the loss of the Holy Land, took refuge in Perugia, and afterwards were incorporated with the knights of Rhodes. Their ensign was argent, a cross potent, or.

The origin of the order of the knights of the temple succeeded close on that of the sepulchre. Geoffrey of Templars, St. Omer, and Hugh de Paganis, were its founders. These, along with a few other pious persons, animated with the desire of serving God, and bearing with much patience the insults which the Turks poured on the pilgrims, established a society for the purpose of protecting the high-ways to Jerusalem. Guaimond, patriarch of Jerusalem, and king Baldwin, willingly granted them their approbation. They took vows of poverty, obedience, and chastity, and engaged to keep the high-ways free of robbers; to be hospitable to the poor, and to protect all who should be inclined to visit the holy sepulchre. Baldwin permitted them to build an hospital near the temple of the sepulchre, whence they derived their name; and they established themselves, in all respects conforming to the rule of St. Basil. The services which they rendered by their care, to the safety of the high-ways, soon spread their fame throughout Europe, and were the means of attracting to them great riches and splendid endowments. The wealth which they possessed was, indeed, in all probability, the chief cause of the destruction of their order, which was accomplished by the machinations of Philip the Fair, in the year 1312. A council was held at Vienne, at which the Pope, (Clement V.) king Philip, and Louis of Navarre, his eldest son, were present. There the Templars were accused of drunkenness, incontinence, and blasphemy, which crimes were confessed by many of the knights on being put to the torture. The council ordered all their possessions to be confiscated and bestowed on the knights of St. John of Jerusalem; but the kings of France, Arragon, Castile, and England, appropriated a great part of their possessions to their own use. The order contrived to get the decree of the council reversed, in so far as regarded Germany, where they remained long after, but with little power. Jacques de la Maude, their grand-master, was burnt in Paris along with many of the brethren; and the whole body were in England declared convicts and felons by a statute of the first year of Edward II.

In the same year with the creation of the order of Teutonic the Templars, took place that of the Teutonic order. A German nobleman, observing the inconvenience to which pilgrims of his nation were exposed in the hospitals at Jerusalem, where their language was unknown, erected an hospital in Jerusalem for their use. This hospital soon became rich by the liberality of its German visitors. Pope Celestine created these hospitallers into an order of knighthood, under the obligation of living according to the rule of St. Augustin, and continuing to fight against the Infidels during life. The emperor Frederic II. brought them with him into Europe, and proposed to them to occupy their arms in the conquest of Prussia. The infidelity of the people of that country was the pretence; but his real motive in this proposition, was nothing more than to get rid of a band of warriors whose unemployed valour began to incommode him. Being joined by the marquis of Turingen, they soon rendered themselves masters of Prussia, and built Marienburgh in honour of their patroness, the Virgin Mary. This country they possessed till A. D. 1625, when Albert of Brandenburgh, their last grand-master, became feudatory to Sigismund, king of Poland, who created him first duke of Prussia. From him the present royal family of Prussia derive their

* See Ashmole, Introduction to the History of the Order of the Garter.
right. The ensign of this order was a plain black cross on a white cassock.

In addition to these, there were, about the same time, founded various other orders of the same kind, which all distinguished themselves in their day by a diligent use both of the sword and the breviary; but few of these succeeded in obtaining any settlements in Europe after the failure of the crusading expeditions; and the few remaining knights were gradually incorporated into the orders of the Temple, or of St. John, or into the Teutonic order.

In Spain, however, the encroaching spirit of the Saracens kept alive the flame of devotion, and of patriotism; and the same cause which produced in the Holy Land the first religious orders of knighthood, gave birth to a variety of similar establishments in the kingdoms of Castile and Arragon. The four principal orders in Spain were those of Santiago, or St. James of Galicia; of St. Saviour in Arragon; of Alcantara; and of Calatrava. During the subsistence of the Moorish kingdom of Granata, the influence possessed by these orders was immense. The grand-masters controlled the sovereign in everything respecting the administration, either of foreign or of domestic affairs. The rich commanderies distributed throughout every province of the peninsula attracted the young nobles to enter into these orders; and nothing could exceed the insolence of their demeanour. By a dexterous piece of policy on the final expulsion of the Moors, Ferdinand, having his power already increased by the junction of the two kingdoms of Castile and Arragon in the persons of himself and his wife, contrived to have the grand mastership and principal commanderies united to the crown; an event which has, more than any thing else, contributed to the subsequent political degradation of the Spanish people.

There is little doubt, that the establishment of orders of men so constituted as to be liable to all those excitements of the imagination, which are inseparable from a retired mode of life, and at the same time to have full opportunity for putting all their romantic dreams into execution by their military profession and pursuits, must have exerted a powerful influence on the idle and high-spirited nobility of the 12th century. These orders laid hold of human nature by the strongest of all attractions; and the magnificent possessions which they so soon obtained, are a sufficient proof how well their founders had calculated their measures, when they broached the novel idea of enhancing the honour of chivalry by the enthusiasm of perpetual devotions, and the undiverted constancy of a life of celibacy.

One very singular effect of the establishment of these orders in Europe, cannot fail to attract the notice of every one who peruses the history of those times. The practice of duelling increased immediately to a most alarming degree. Distinguished valour was the only means of acquiring the rich rewards which these orders had in their power to bestow. The young knight, newly admitted into an order, had no ambition but that of making himself remarkable by some feat of arms. This ambition, which easily found a proper channel of displaying itself in the East, where they lived in a state of perpetual war, and amidst a succession of skirmishes, found no other vent, on their establishment among the peaceful kingdoms of the West, except in personal encounters. The capricious impatience of insult, at all times the characteristic of the northern nobility, was now tenfold increased in each individual by the desire of personal or social distinction. The protection, too, afforded to the absurd punitiosities of honour, and ridiculous ideas of satisfaction, by bodies so set apart as the religious orders, was more constant, as well as more powerful, than any thing they had ever before enjoyed. What had heretofore been a tolerated abuse, became now a commended and a constant rule of practice. Doctors and jurisconsults set about reducing to order the fanciful rules invented by illiterate braves, and Europe soon became acquainted with a new science—the science of knighthood, as it was called, or scienza cavalleresca.

The authors who were desirous of distinguishing themselves by a proficiency in this new science, went about the matter with all the coolness and precision so necessary in juridical writings. They entered into the most minute details concerning the nature of insults, the very mention of which can excite in us nothing but laughter. They examined them according to all the rules of logic, and arranged every thing which concerned them by the Aristotelic predicaments.

The various modes of giving and returning the lie, formed another most ample subject of decisions; for there were affirmative lies, and negative lies; lies universal, particular, conditional, absolute, positive, privative, certain, and doubtful. Each of these species had its subdivisions: there was one, "demente general pour la personne;" a second, "pour l'injure;" and a third, "regardant l'injure et la personne."

Honour was a thing very difficult to be defined; for they had to weigh exactly the cause efficient, the cause formal, the material, and the final; insomuch that there were twenty different modes of defining it, each supported by one set, and condemned by all the rest. It is not to be wondered at after this, that the business of duels was treated of in the most lengthy manner; it was necessary to hold the balance even among no less than fifty formulas of cartels. In a thousand situations, the challenge was to be accepted—in many, there were difficulties whether it should be accepted or refused. Out of the equality or inequality of conditions and of persons, arose an infinite variety of speculations and specialties. The very existence of such a science is sufficient to shew to what a dangerous extreme the derangement of the human faculties may be carried, under the grave shelter of academic formalities; into what a total absurdity of principle, and into what a lamentable, yet ludicrous, train of actions and manners must not they have fallen, who had learned to regard as oracles of wisdom, the hair-brained and drivelling professions of this chivalric science.

As an instance of the height to which this infatuation was carried, it may be mentioned, that, in the year 1450, Pozzo, one of the first jurisconsults of his day, published decisions touching this science, not only in Latin, but in Italian also, ("ut nemo rerum tam graviac ignorantiam simulare possit," ) by which his fame became extended throughout the whole of Europe. This author cited not only the maxims of the Greek and Roman writers as his authorities, but had the assurance to quote the martyrs and the fathers as defenders and practitioners of duelling. He asserted that God himself had sanctioned the duel between Cain and Abel. He entered into a serious disquisition as to which of the combatants ought to be held victor, in case one had lost an eye, and the other a nose. He sought out different expedients for saving the honour of a person who died after the challenge, but before the day of contest; but the one to which he gave the preference was this, that

KNOX

Knighthood a relation should occupy the place of the deacon, to prove that he had not died of fear. As he was a stickler for fighting on equal terms, he contended, that a robust and healthy appellant should be sweated, hied, and purged, till he had attained a degree of gracility and loveliness equal to those of the respondent. If one party wanted an eye, the other must wear a patch; if one was lame, the other must have a leg tied up behind, &c. &c. Pozzo is only one out of an enormous list of similar writers to be found in Ducange. In all of these authors we find forms of prayer proper for duels. The combatants uniformly prepared themselves by taking the sacrament. The religious orders attended all duels in pompous array; and their masters, priors, &c. were commonly appointed umpires of the fight.

The puerile influence which all this had upon the manners of Europe, is still but too apparent, in the subsistence of a practice which could only have originated in a barbarous and credulous age. The belief in the influence of predestination in all duels, (the only apology for duelling that could ever have had a shadow of reason on its side,) is now no more; and we therefore surmise our ancestors in the absurdity of our conduct, in the same proportion that we have the advantage over them in the justice of our opinions.

KNOX, John, the celebrated Scottish reformer, was born in the year 1505, in the village of Gifford, in the county of East Lothian. His father was descended from an ancient and respectable family, who possessed the lands of Knock, Ranaffy, and Craigends, in the shire of Renfrew; but the particular period when his paternal ancestors removed from the western to the eastern coast of the kingdom, cannot be exactly ascertained. His parents were so far affluent in their circumstances, as to be able to give their son a liberal education, (which was by no means common in that age); and, after acquiring the principles of the Latin language in the grammar-school of Haddington, he was sent, about the year 1524, to the university of St. Andrew's; at that time the most distinguished seminary in Scotland. The celebrated scholar Buchanan, (by whom he is always mentioned in terms of high respect,) was his contemporary and fellow-student; and their preceptor, John Mair, or Major, professor of philosophy and theology in the university, who had acquired in France more enlightened sentiments both in ecclesiastical and civil policy, than were generally prevalent in those times, appears to have early inspired these distinguished men with some of the leading principles, which they subsequently matured and advocated in the cause of the Reformation. Knox, in the mean time, applied to the scholastic studies of those days with great success; and, after being created Master of Arts, he taught philosophy (probably as a private lecturer in the university) with extraordinary celebrity. About the same time, he was advanced to clerical orders, and was ordained a priest before he had reached the age (25) which the canons of the church required. His studies, however, soon received a new direction, which led to a complete revolution in his religious sentiments, and future pursuits.

Having entered upon a fuller perusal of the ancient authors and earlier fathers of the Christian church, he was attracted by the simplicity of their method of investigation and communicating truth; and was especially engaged by the writings of Jerom and Augustine to a closer study of the sacred scriptures, as the only pure fountain of divine knowledge. From this time, (about the year 1525,) he renounced the study of scholastic theology; and was gradually led to a more comprehensive view of evangelical religion, but it does not appear that he professed himself a Protestant before the year 1542.

This change of sentiment first appeared in his philosophical lectures, in which he began to forsake the scholastic path, and to recommend to his pupils a more rational and useful method of study; and the suspicions of heresy which this innovation excited, were soon confirmed by his proceeding to repress the corruptions that prevailed in the church. Finding it impossible to remain in safety at St. Andrew's, which was wholly under the power of Cardinal Beaton, the most determined supporter of the Roman church, he retired to the south of Scotland; and, in a short time, avowed his fullness of the regent, by the conspirators against Cardinal Beaton, and where a number of his persecuted reformers enjoyed the free exercise of their religion. In this place, our reformer conducted the education of his pupils in the same manner, catechizing them in the parochial church belonging to the city, and continuing his expositions of scripture in the hearing of all who chose to attend; but he was soon constrained to take a more public part in the promulgation of protestant principles, in consequence of his election to act as colleague with John Rough, preacher to the garrison. His labours were so successful, during the few months that he preached in St. Andrew's, that, besides the garrison in the castle, a great number of the inhabitants of the town renounced popery, and made profession of the protestant faith, by partaking of the Lord's supper after the mode of the reformed churches. After the capitulation of the castle to a French armament in July 1547, Knox was conveyed to France along with the other prisoners; and, in violation of the terms of surrender, was confined on board the galleys, and exposed to all the ordinary rigours of such captivity, with the additional indignities which the Papists were accustomed to heap upon the heads of heretics. In the summer of 1548, when the galleys, in which these sufferers were confined, were stationed on the coast of Scotland, his health was so greatly impaired by the severity of his treatment,

* The ruins of the chapel at Langniddrie, in which he publicly catechized his scholars, and expounded them the scriptures, are still apparent; and the place is popularly denominated John Knox's Kirk.
that he was seized with a fever, which reduced him to the greatest extremity. But even in this state of depression, his fortitude of mind remained unsubdued, and he comforted his fellow prisoners with the most animating hopes of release. When free from fever, he relieved the tedious hours of captivity, by committing to paper a confession of his faith, which he found means to convey to his religious friends in Scotland, accompanied with an earnest exhortation, to persevere undaunted in the faith which they had professed.

After enduring a severe and tedious imprisonment of nineteen months, he was at length set at liberty, in the month of February, 1549, according to the modern computation; and immediately repaired to England, where he was immediately noticed by the English council, and sent down as a Protestant preacher to Berwick. During the two years that he continued in this place, he gained numerous converts from the errors of Popery; and triumphantly maintained, before Bishop Tontal of Durham, his charge of idolatry against the sacrifice of the mass. In 1551, he was removed to Newcastle; and, about the end of the same year, was appointed to the privy council one of king Edward's chaplains in ordinary. About this time he was consulted respecting the *Book of Common Prayer*, which was undergoing a revision; and was employed also in revising the *Articles of Religion*, previously to their ratification by parliament. In this commission he had the influence to procure an important change in the communion office, by completely excluding the notion of the corporeal presence of Christ in the sacrament, and guarding against the adoration of the elements, which was so much countenanced by the practice of kneeling at their reception. About the end of the year 1552, he was summoned to London, in consequence of certain charges against him by the popish faction; but was honourably acquitted by the council, and employed to preach before the court. He acquired much favour with the young king, who first procured for him a presentation to the vacant living of All-Hallows, in the city, and afterwards, with the concurrence of the privy council, offered him a bishopric; but he declined both of these promotions, in consequence of his disapprobation of many points in the worship and government of the English church. After the accession of Mary, he continued to preach for some time in the southern counties; but was at length reduced to the necessity of seeking safety by flight; and, having procured a vessel through the good offices of his friends, he landed at Dieppe, on the 28th of January, 1554. A short time before his departure from England, he married Miss Marjory Bowes, a young lady of honourable family, to whom he had become attached during his first residence at Berwick, but whom he was obliged to leave behind him in that city, with her mother.

One of his first cares, after arriving at Dieppe, was to employ his pen in writing suitable advices to those, whom he could no longer instruct by his sermons or conversation; and, with this view, he transmitted to England a practical exposition of the sixth psalm, and a long letter addressed to his former hearers in London, and other parts of the kingdom. He then travelled through France towards Switzerland, without any settled plans or prospects; and spent some time in conferring with the most eminent divines of the Helvetic churches, by whom he was treated with the most affectionate hospitality. After a short visit to Dieppe, for the purpose of receiving information from England, he repaired to Geneva, where he speedily formed an intimate friendship with Calvin, and fixed his ordinary residence during the continuance of his exile. About the end of the year, he published his *Admonitions to England*; and, though now nearly 50 years of age, applied himself to the study of the Hebrew language, which he had not previously enjoyed any opportunity of acquiring. While thus engaged in the prosecution of his studies at Geneva, and supported principally by remittances from his friends in England and Scotland, he was invited to become one of the pastors of a congregation of English refugees in Frankfort on the Maine, who had been permitted to use the place of worship allotted to the French Protestants in that city, upon condition of their conforming, as much as possible, to the mode of worship used by the French reformers. But a short time after his settlement in that office, Dr. Cox, who had been preceptor to Edward VI, having arrived at Frankfort with some other English exiles, they insisted upon introducing their own liturgy into the congregation; and employed such crafty machinations to render our reformer obnoxious to the German government, that he was obliged again to seek a refuge in Geneva. Soon after his return, he received such information from Scotland, as encouraged him to revisit his native country, where he landed in the month of August, 1555; and, after remaining some time with his wife and her mother at Berwick, he set out secretly to visit the Protestants in Edinburgh. Here he found a number of the reformers assembled from different parts of the country, with whom he continued longer than he had intended, preaching in a private house to successive assemblies with little intermission. He particularly exerted himself, and not without success, to accomplish a formal separation from the Popish church, by persuading the reformers to abstain from attendance on its public rites, to which they had hitherto conformed. He accompanied several of the Protestant gentlemen to their country residences, where he preached almost daily to the neighbouring nobility and gentry; and was, particularly, the guest of Sir James Sandilands, at Calder House—of the Earl of Glencarin, at Finlayston—and of Erskine of Dun, in Angus-shire, where the greater part of the gentlemen of the Mearns made profession of the reformed religion, and entered into a mutual bond, or covenant, for its furtherance and support. In consequence of these proceedings, he was summoned to appear before a convention of the clergy at Edinburgh; whither he repaired, before the day appointed, accompanied by Erskine of Dun, and several other friends of distinction; but his adversaries, afraid to encounter a meeting which they did not expect he would dare to give them, deserted the diet, and left him undisturbed in his daily instructions to large audiences, in the midst of the city. While he was thus employed in Scotland, he received letters from the English congregation at Geneva, urging him to become one of their pastors; and, after visiting his Protestant friends in the different places where he had preached, he repaired to that place with his wife and mother-in-law, in the month of July, 1556.

Here he spent two of the most peaceful years of his life, and enjoyed all the comforts of literary society, domestic happiness, and ministerial success. All these personal advantages he showed himself ready to forsake, upon receiving encouraging letters from Scotland; and actually set out, in the autumn of 1557, on his way to that country, when he was met on his journey by such unfavourable accounts, as determined him to remain some time longer on the continent. By his letters
KNOX.

However, and various publications, transmitted to his native country, he greatly contributed to encourage his friends, and to extend the reformed opinions; and, about the end of the year 1556, he received another, and more animating invitation from the Protestant lords of Scotland, to join them in their struggle for the religious liberties of the nation. In the beginning of the following year, our reformer took leave of Geneva for the last time; and having spent some time in France, landed at Leith on the 2d of May.

His arrival struck terror into the hearts of the Popish clergy, who instantly informed the queen-regent of the event, and procured the publication of a sentence of outlawry against him, which had been pronounced after his former departure from the kingdom. He nevertheless hastened, without a moment’s hesitation, to present himself voluntarily at Stirling, and to share in the defence and danger of the Protestant preachers, who were summoned to stand trial in that city. On his way, he preached at Perth against the idolatry of the mass, and of image-worship; when a priest having imprudently attempted, as soon as the audience was dismissed, to exhibit his images, and celebrate mass, the indignation of the mob was excited, and, in spite of all the exertions of Knox and the other preachers, the ornaments of the church were trampled under foot, and the monstaries of the place laid in ruins. The Protestant lords, having resolved to compromise publicly, the reformed worship wherever their authority extended, invited Knox to meet them at St. Andrew’s for this purpose; and there, in defiance of the archbishop’s threatening to cause the soldiers to fire upon him in the pulpit, he boldly preached in the cathedral several successive days, and engaged the magistrates and inhabitants harmoniously to abolish the Popish service and ceremonies. Accompanying the forces of the congregation, he soon appeared also in the churches of Edinburgh, where a similar reformation had taken place; and accepted the invitation of the Protestant inhabitants, assembled in the Tolbooth church, to become their minister. Being soon after obliged to leave the metropolis, in consequence of its occupation by the regent’s army, he undertook a tour of preaching through the kingdom; and, within less than two months, travelled over the greater part of Scotland, diffusing the knowledge, and strengthening the interests, of the Protestant principles wherever he went. He greatly excelled himself, by letters to Secretary Cecil, and even to Queen Elizabeth, to procure assistance from England; and was invited to meet the agents of that court upon the important business. He received their dispatches at Berwick, and hastened to lay them before a meeting of the Protestant leaders at Stirling; whom he was the principal means of urging to such a renewal of their applications, as at length proved successful in securing the powerful support of the English government. The management of this political correspondence devolved, for a time, chiefly upon his hands; but this was a task for which he had no relish, and he expressed great satisfaction when he was relieved from the burden, by the accession of the younger Maitland to the party of the reformers. “His zeal and activity exposed him to the deadly resentment of the Papists and the queen-regent. A reward was publicly offered to any one who should apprehend or assassinate him; and not a few, actuated by hatred or avarice, lay in wait to seize his person. But all this did not deter him from appearing in public, and from travelling through the country, in the discharge of his duty. His exertions at this period were incredibly great. By day he was employed in preaching; by night, in writing letters on public business. He was the soul of the congregation; was always found at the post of danger; and by his presence, his public discourses, and private advices, animated the whole body, and defeated the schemes employed to corrupt and disunite them.”

He had a principal share, along with some other ministers, in drawing up the Confession of Faith and First Book of Discipline; and one of the six ministers who assisted in the first General Assembly, in the year 1560. About the close of the year, he sustained a heavy domestic loss by the death of his valuable wife; and, in addition to his other cares, was left with the charge of two young children. By the arrival of Queen Mary, he was called to new vigilance and vigour in support of the reformed cause; and had even been personally denounced by his sovereign as the ringleader of her factious subjects, whom she would not fail to call to a strict account. A few days after her landing, she required his attendance in the palace; and held a long conversation with him, in the presence of her brother the prior of St. Andrew’s, apparently with the hope of awing him into submission by her authority, if not of confounding him by her arguments. “The bold freedom, however, with which he replied to all her charges, and vindicated his own conduct, convinced her that the one expectation was not more vain than the other; and the impression which she wished to make on men was left on her own mind.” It required all his energy to counteract the influence of her arts upon the Protestant nobles, and to keep alive the zeal of the nation; and some idea of his pulpit-orations may be formed from the words of the English ambassador, who said of him to Cecil, “the voice of one man is able, in an hour, to put more life in us than six hundred trumpets continually bursting in our ears.” His influence appears also from his having been frequently employed in “composing differences of a civil nature among the Protestant nobility, and acting as mediator with the town-council in behalf of the inhabitants who had incurred their displeasure. In the church of St. Giles, at that time the only place of worship in Edinburgh, he performed all the parts of ministerial duty, with the assistance only of a reader.” He preached twice every Sabbath, and thrice on the other days of the week. He met regularly once every week with the kirk-session for discipline, and with the assembly in the neighbourhood for the exercise on the scriptures. He attended, besides, the meetings of the provincial synod and general assembly; and, at almost every meeting of the latter, he received an appointment to visit and preach in some distant part of the country.” As he did not indulge in extemporaneous effusions, but devoted a part of every day to study, those labours must have been oppressive to a constitution already much impaired; and on this account the town council, with the approbation of the assembly, appointed the Rev. John Craig, minister of the Canongate, to be his colleague. His public services daily became more extensive and important, and he seemed to fill the office of a Protestant premier in the state, as much as the situation of a Presbyterian pastor in the church. During the rebellion excited by Huntly in 1562, he contributed most essentially by his journeys, preaching, and letters, to preserve the southern counties in a state of peace, while the vigorous measures of the council crushed the insurrection in the north. He maintained a public deposition in the course of the same year, in the town of
Maybole, against Quintin Kennedy, uncle to the Earl of Cassillis and Abbot of Crosraguel. He employed all his influence, without success, to induce the Parliament, which met in the summer of 1568, to ratify the treaty made in July 1560, and to secure the establishment of the Protestant religion. Having failed in this object, he laboured to prevent any further injury to the cause, by publicly protesting against the queen's marriage with any person of papish sentiments, and sustained unmoved all her indignation on account of this interference. He wrote a circular letter, (agreeable to his commission from the church,) to the principal gentlemen of the Protestant persuasion, requesting their presence in Edinburgh to counteract the oppressive measures of Mary against certain individuals, who had insulted her priest at Holyrood-house during her absence. This application was pronounced by the privy-council to be treasonable; and Knox was summoned to stand trial for the offence before an extraordinary convention of the counselors and other noblemen. In spite of all the artifices employed to prevail upon him to acknowledge his error, and throw himself on the queen's mercy, he boldly persisted to encounter the storm; and was triumphantly acquitted of the charge, as well as commended for his demeanour before the court.

In March 1564, he contracted a second marriage with Margaret Stewart, daughter of Lord Ochiltree, a nobleman of amiable dispositions, who had long been a familiar and steadfast adherent of the reformer. In the same year, he defended, against all the acuteness of Secretary Maitland, in a long conference before the General Assembly, the liberties of the pulpit, and the doctrine of the resistance to wicked and tyrannical rulers; and continuing, in full conformity with his avowed principles, to preach with the utmost freedom in the church of St. Giles, he gave so much offence to the king, (Lord Darnley,) that an attempt was made to inhibit him from preaching as long as their majesties resided in the capital. This was resolutely resisted by the town-council; but after the murder of Rizzio, and the banishment of many of the Protestant lords, he was obliged to withdraw from Edinburgh, and to reside in the queen's resentment, and embraced this opportunity of paying a visit to his two sons, who had been sent to reside with their mother's relations in England. He endeavoured to render this journey subservient to the great cause which engaged his whole heart, by carrying a letter from the Assembly to the bishops and ministers of England, interceding for lenity to such of their brethren as scrupled to use the sacerdotal dress enjoined by the laws. He returned to his charge about the time of the queen's flight with Bothwell to Dunbar; and was delegated by the General Assembly to repair to the west country, for the purpose of persuading the Hamiltons to join the confederated lords, in settling the distracted affairs of the kingdom. On the 29th of July 1567, he preached the sermon at the coronation of James VI. in the parish church of Stirling; and was among the number of those, who strongly urged the trial of Mary for the alleged murder of her husband, and adulterous connection with Bothwell. He did not fail, at the meeting of parliament at the end of the year, to urge the ratification of all the acts passed in 1560, in favour of the Protestant religion; and was appointed one of the commissioners for drawing out the particular points, which pertained to ecclesiastical jurisdiction, to be presented to next meeting of parliament. Our reformer had now reached that point, from which he could take a calm and deliberate view of the busting scene through which he had passed, and of the arduous struggle, which he had been so long engaged in, and which he had at length brought to a happy termination."—"He now congratulated himself on the prospect of being released from all burden of public affairs, and of spending the remainder of his days in religious meditation."—He even secretly cherished the wish of resigning his charge in Edinburgh, and of retiring to that privacy from which he had been drawn at the commencement of the Scottish reformation." But he had yet to undergo further trials of a public nature, and to see the security of the reformed religion endangered, and the peace of his country disturbed, by a civil war among the Protestants themselves. It is impossible to describe the anguish which he experienced at the assassination of the good regent Murray; and the grief, which he indulged on account of this mournful event, preyed so deeply on his spirits, as to inflict a serious injury on his health. In the month of October 1570, he had a stroke of apoplexy, which affected his speech to a considerable degree; and, though in a few days he was able to resume his duty of preaching, he never recovered from the debility produced by the attack. But, he continued in body, that he never went abroad except on Sabbath days to the pulpit; yet, whenever he saw the welfare of the church and commonwealth threatened, he entered into the cause with all the keenness of his more vigorous days.

His situation became very critical in April 1571, when Kirkcaldy, the governor of Edinburgh Castle, who had gone over to the queen's party, received the Hamiltons into the garrison; and their inveteracy against him was so great, that his friends were obliged to watch his house during the night. Intimations were often given him of threatened against his life; and, one evening, a musket ball was fired into the window of the apartment in which he was sitting. At the earnest entreaties of his friends, who declared their determination, if he should be attacked, to shed their blood in his defence, he reluctantly withdrew to St. Andrew's; where he continued with undiminished boldness to denounce the enemies of the reformed faith, and to denounce the encroachments made by its false friends upon the polity and revenues of the church. "While he was engaged in these contests, his bodily strength was every day sensibly decaying; yet he continued to preach, although unable to walk to the pulpit without assistance; and when warmed with his subject, he forgot his weakness, and electrified the audience with his eloquence."

During his stay at St. Andrew's, he published a vindication of the reformed religion, in answer to a letter written to a Scots Jesuit, called Tyrie; and seemed to have intended this work as a dying testimony to the truth, which he had long taught and defended. From the rapid decline of his health, in spring 1572, there was every appearance of his ending his days at St. Andrew's; but, in consequence of a cessation of hostilities, he was invited to resume his charge at Edinburgh, where he arrived about the end of August, and continued his public labours till the 9th of November following. On that day, he presided at the installation of Mr. Lawson as his colleague and successor, and now again left his own house. On the 11th of the same month, he was seized with a severe cough, which greatly affected his breathing; but was able to see and address his friends till within a few hours of his death. Persons of every rank came in great numbers to visit him during his illness, none of whom he suffered to go away without exhortations, which he uttered with such
KNOXVILLE. See TENNESSEE.

KNUTSFORD is a town of England, in Cheshire. It is pleasantly situated on the banks of a small stream, called Birken, which divides it into two parts, called High Knutsford and Low Knutsford. The town contains several good houses, and has a handsome modern church, with a very fine spire. The town is supposed to derive its name from Caesar's ford, as that king forded the river here after having obtained a victory in the neighbourhood. Races are held annually in the vicinity; and at that season the town is crowded with company. There are extensive cotton works in the town, and a silk mill, in imitation of the one at Stockport. Shag velvets, and the best sewing threads, are also manufactured. The flax, from which the thread is manufactured, is brought principally from Ireland, Russia, and Hamburg. The two townships of Upper and Lower Knutsford contained, in 1811, 497 houses, 529 families, 313 families employed in trade and manufactures, and 2537 inhabitants. See the Beauties of England and Wales, vol. ii. p. 286.

KOLIVAN, or KOLIVYAN, is a village of Russia, situated on the rivulet Bielaia, in the district of Kusnetz. The silver mines, for which it is principally celebrated, are between the river Oby and Irlish, near the mountains which separate Siberia from Asia. These were discovered in 1728, by Akin Khitichei Demidoff, and were for several years wrought as copper mines for his own private benefit. The secret was concealed till the year 1743, when he made the discovery to the Empress Elizabeth, who appropriated them to the crown. These mines are situated near Voskresensk, in the Mountain of Serpents; and receive the name of Kolyva Mines, because the ore was formerly smelted at that village. From the scarcity of wood, however, about Kolyva, newfounderlings have been erected at Barnaul, Novopaulovsk, and Susansk, to the north-east of Kolyva. The following is a state of the produce of the mines at different periods:

<table>
<thead>

<td>Since 1771</td>
<td>44,000 of silver, and 1,500 of gold.</td>
<td></td>
</tr>
</tbody>
</table>

The total produce, up to the year 1771, amounted to 400,000 lbs. of silver, and 12,720 of gold. The silver contains above 3 per cent. of gold.
KOLYMA, or KOLYMA, a great river of Siberia, which rises in the Virchaysky chain of mountains, and falls into the Frozen Ocean after a course exceeding 1200 miles.

The Kolyma is frozen over about the 20th of September, and the ice breaks up about the 2th of May, when it deluges all the lower country; nor do its waters retreat within their proper boundaries before the end of June. The cold is then excessive, the thermometer falls to from 60° to 70° below zero: Mercury itself freezes. It becomes almost impossible to fell timber, for the hatchets break like glass. The ice on the river, and the timber of the houses, crack with a report resembling that of a musket. On the approach of thaw, the river, in little more than a week, rises 27 feet of perpendicular height. The face of the country is like an immense lake, and only the tops of some of the trees are visible above the water: The river now becomes navigable.

Near the source of the Kolyma there are three huts, and a storehouse for preserving provisions belonging to government; and barracks are constructed there for conveying them down the stream. Several Russian stations also stand along its banks. Virchini, or the upper Ostrog, about the middle of this river, is situated on the Yaasshnoi, a mile from its discharge into the Kolyma. The most northern station is called Nischemy Kolymsk, situated on an island in Lat. 68° 17' N. and Long. 168° 17' E. It consists of a church, 70 houses, and a fort, enclosed in a square of palisades 8 feet high. Another station, called Serechinsky Kolymsk, of 15 houses of Russians, and a church, stands in Lat. 67° 10' N., and Long 157° 10' E. About 40 miles below the former, the river divides into two channels, and falls into the ocean in Lat. 66° 10' W., and Long. 166° 10' E., its course being N. E. in general from the source. Between Serechinsky Kolymsk, and Nischemy Kolymsk, a distance of 300 miles, the eastern banks are uniformly mountainous, affording porphyry, agates, Jasper, and crystals. The western banks are low. The most remarkable fossils found here are the tusks of the mammoth, which lie at a considerable depth in the high sandy shores of the river, and on the margin of the Frozen Ocean. They are exposed by the washing of the spring floods; and it does not appear singular that they are buried so deep, as the flood every spring leaves immense quantities of earth and sand, which perhaps accumulates to the depth of two or three inches among the bushes. The tusks are equal in whiteness and beauty to those of the elephant, but of a different figure.

This river contains a considerable variety of fish, few of which ascend higher than about half way to the source. Great shoals of salmon ascend in September, and depart shortly after the river closes. Some of the others are common in the European rivers. Numbers are caught with the seine in summer, and by means of other expediens in winter.

KONGSBERG, or KONIGSBERG, is a town of Norway, which is traversed by the river Lowe. It is chiefly celebrated for its silver mines, which are about two miles distant from the town. No fewer than 36 mines were working when Mr. Coxe visited them. The deepest, called Segen-Gottes in der Nord, is 628 feet perpendicular. In 1760, these mines produced £79,000; but when Mr. Coxe visited them, they produced from £50,000 to £54,000. About 2500 men were then employed. Kongsberg contains 1000 houses, and 6000 inhabitants. See Coxe's Travels in Norway, &c. vol. v. p. 33, 34. See also Norwa.

KONIGSBERG, or KROLEVIECZ in the Polish language, is a city and seaport town of Prussia, situated on the river Pregel, which flows into the Frische-Haf, and is crossed with seven bridges. It was founded in the year 1255, and was rebuilt on another site in 1264. Konigsberg is composed of 4 towns, and 16 suburbs, and is surrounded by a rampart about seven Englishmiles in circumference. Aldstadt, or the Old Town, contains 16 streets, and 550 houses, of which about 100 are breweries and malthouses. It has six gates, four bridges, and two well built towers. Neustadt, or Lobenicht, was built in the year 1800, and Kneiphof was founded in 1324. This last part of Konigsberg is situated on an island formed by the Pregel, and the houses stand on piles made of the alder tree, which has become as hard as iron from remaining long in the earth. It contains 13 streets, and 5 large gates. The principal public buildings and curiosities at Konigsberg are the chateau; the arsenal, (containing the Muskovite saloon, and the octagonal table, valued at 40,000 rix-dollars); the gardens, stables, and mint, belonging to the arsenal; the parish church of St. Nicholas; the hotel de ville, where the magistrates of the three towns, who were incorporated in 1724, hold their meetings; the Junkerhof, the church of Rossgarte; the widows' and orphans' hospital; the cathedral, containing the tombs of the margraves and the grand-masters, and also an organ, which has more than 5000 pipes, and which was completed in 1721; the Albertine college; the church of Habeberg, which is the finest in Konigsberg; the exchange; the hotel de ville of Kneiphof; the citadel; the palace of Kayserling; and the anatomical theatre. The university of this place was founded by the Margrave Albert, in 1544. It has 38 professors, exclusive of tutors, and in 1802 it contained 300 students. There is also the lyceuem of Frederic William, and the German Society. The citadel, which is called Fredericksburg, was erected in 1657, at the conflux of the two branches of the Pregel. It is a regular square, surrounded with broad ditches and the river Pregel. The principal collection of cabinets in the town are, the royal library; the collection of antiques and yellow amber at the chateau; the library of Wallenroth; the university library; and the town library.

The chief manufactures of Konigsberg are woollen stuffs, flannels, stockings, ribbons. Danish gloves, silk-cloth, wax, soap, English pottery, and works of yellow amber, which amounted, in 1776, to 977,632 crowns. There are here no fewer than 224 breweries of beer, 132 distillers of brandy, and 80 turners of yellow amber.

Konigsberg, which was formerly one of the Hanse towns, has always carried on a thriving commerce. Vessels, which draw more than eight feet of water, cannot ascend the Pregel, and remain at Pillau, which is the port of Konigsberg. On the other side, this town communicates with Poland by the Niemen, by means of a canal. Large Polish barracks, called wittinnes, carry to Konigsberg grain. hides, skins, oak, and fir timber. About 600 or 700 ships arrive here annually from the Baltic, and almost as many set out.

The following was the state of the imports in 1800:
Konigsberg contains about 4308 houses, and 54,000 inhabitants. East Long. 20° 29’ 15”, North Lat. 54° 42’ 12’.

Koom is a city of Persia, in the province of Irak. It is supposed by D’Anville to be the ancient Choana; and was built in the year of the Hegira 203, out of the ruins of seven towns, which formed a small sovereignty. The Arabian prince, to whom it belonged, having been overthrown, the inhabitants of the seven towns founded the city of Koom, which was divided into seven parts, each of which received the name of one of the towns. Koom is situated on an extensive plain, and on the banks of a small river, which is absorbed in the Great Salt Desert, and was long celebrated for its manufactures of silk. In 1722, this city was destroyed by the Afghans. A part of it has since been rebuilt, but it still resembles a vast ruin. The principal public building is a beautiful college, with a celebrated mosque and sanctuary, erected in memory of Sidi Fatima, the daughter of Iman Reza, and grand-daughter of Mahomet. The tombs of Sehi the First, and Shah Abbas the Second, are still in the mosque, and are frequented by pilgrims from all parts of Asia. The public squares of Koom are small. The walls are lofty, with seven gates. The bazaar crosses the town, from one gate to the other. In the time of Chardin, the chief manufactures were white earthen-ware, soap, sword-blades, sabres, and poniards; and the number of houses was 15,000. Its lofty dome has been gilt at the expense of the king. East Long. 50° 29’, North Lat. 34° 45’; See Chardin’s Travels; and Macdonald Kinneir’s Geographical Memoir of the Persian Empire, p. 116.

Kraiken is the name of a fabulous animal, which has been described by Bishop Pontoppidan in his Natural History of Norway. Under the head of Sea Serpents, we shall have occasion to discuss this curious subject.

Kumiss is the name of a beverage made of fermented mare’s milk, and originally used by the Tartars. A full account of the process of making it may be found in the Edinburgh Philosophical Transactions, vol. i. p. 181. It is prepared nearly in a similar way in Orkney and Shetland. See also Pallas’ Travels; and Clarke’s Travels, vol. i. An account of this beverage, and the method of manufacturing it among the Cakmucks, will be found in our article Calmucks, vol. ii. p. 268.

Kur, or Cyrus, is a celebrated river of Asia, which rises a little to the west of the town of Kars, in Armenia, and falls into the Caspian Sea. It has been written Cymus, Cyrtus, Cyrus, Kyros, Koros, and Koro, of old. At present it is called Mtkwari by the Georgians, and Kor, Kur, Kourr, or Kourra; but all these varieties generally subside into Kur, or Cyrus. According to Reineggs, the source of the river is a number of springs situated twelve miles south-west of the Turkish city, Aghalazigh, or Aksis; and, after enlargement by several streams, its course is due north, until passing this city and Borgami, in Upper Kartel, it turns eastward through the plain interposed between the southern Caucasian mountains and the most northern range of Ararat; where, meeting the mountains which divide Georgia from Shirvan, the river takes a southern direction, and twenty miles from the Caspian Sea divides itself into numerous branches, by the mouths of which it is disembogued below Satian.

The Kur, in general, is yellowish and turbid, owing to the quantity of calcareous matter which it holds in solution. Its course, for the most part, is tranquil, but rapid, and flowing between banks so steep in some places, that, it is remarked, a traveller may journey for hours without the possibility of quenching his thirst in summer, though the river be constantly before his eyes, if not provided with a leather drinking flask, and a long cord, to draw up the water.” It receives numerous tributary streams, as the Aragwi, 25 miles above Teflis, whose mixture imparts a greenish hue for a certain space, the Ktsai, Alasan, and chiefly the Araxes. After the union of this celebrated stream, about 66 miles from its mouth, the Kur enlarges to the breadth of 140 yards, and is navigable to the Caspian. Higher up it is also navigable for part of its course to Teflis, by means of rafts, whereby various commodities are carried from the fertile domain of Mughran. But this mode of conveyance is dangerous, and productive of frequent accidents. At the mouth a very profitable fishery is carried on by the Russians, but there are comparatively few fish here, and in most of the other rivers in the country, owing to their rapidity. From their scarcity in the Kur at Teflis, where it is rapid, the Georgians are said to call it Myunari, or the Blind.

The banks of the Kur are partly covered with forests, wherein the vine is uncommonly plentiful, together with various other fruits; but towards its mouth there is a great barren plain, whole districts of which are overspread with dwarf marine plants, from which soda is extracted. Here the tortoise is seen, and is supposed to live on snakes. It has been asserted, that these reptiles are in such abundance on the right bank, both of the Kur and Araxes, as to preclude a passage across the plain of Mogan. But this prejudice, which even enlightened persons entertain, is as ancient as the days of Plutarch, who relates, that Pompey was prevented from marching down by the Kur to the Caspian sea, on account of the number of serpents. The panther repairs to the banks of the river from Ghilan, taking refuge where they are covered with reeds and underwood. The wild boar inhabits the marshes at its mouth; while the lynx and hyaena are sometimes seen in the neighbourhoud. Jackals are numerous, and the forests are full of deer. The Caucasian pheasant is frequent among the bushes; and the francolin in low and reedy places.

The Kur, in its course, passes several celebrated towns and fortresses, as Aghalazigh, on which the Russians some time ago made an unsuccessful attempt, and a little below which it traverses a narrow ridge called Bedreh, defended by a castle on each side.—Togetta stands at the union of the Aragwi, where the Kur is crossed by a bridge; and it intersects Teflis, the capital of Georgia.—Satian, near the mouth of the river, is denominated a city, though composed only of several villages. Thus it appears, that the whole course...
of the Kur, from its source to the efflux, is through the kingdom of Georgia, and the province of Shirvan. But the source not being many miles from the eastern shores of the Black Sea, a plan is said to have been entertained by Seleucus Nicator, of uniting the latter with the Caspian. As canal navigation, of late years, has been carried to a great and beneficial extent, this project was revived some time ago. It was proposed to unite the river Tscharulik, which flows into the Black Sea, with the Kur, as their respective sources are not far asunder, by means of a navigable canal. However, all projectors seem to have overlooked, that the two rivers are separated by a chain of mountains—that the Tscharulik is scarcely navigable in any part—and that the Kur is not nearly so throughout.

Plutarch relates, that Pompey, who forded the Kur in one place, conveyed his army across it at another on 10,000 skins. This plan of crossing rivers is not abandoned in the East. The Arabs, dwelling on the banks of the Tigris and Euphrates, support themselves on inflated skins, in which manner whole families may be seen floating. The celebrated Persian usurper, Nadir Shah, provided a number of inflated skins, on which were laid planks, or other materials, whereby his armies crossed in their march to India. Tamerlane was enabled to pass the Kur along with his army, on a bridge formed of branches and reeds.

KURILE ISLANDS, is a chain of islands extending between Cape Lopatka, the most southern point of Kamtschatka, and Jessó, which several geographers have considered as belonging to them. The total number is unknown. Names are given by the Russians to 25: A Japanese author, who lived about a century ago, says there are 37, and of these he specifies 32. Instead of proper names, however, they are usually distinguished by numbers, as first, second, third, proceeding from the north. These islands are of unequal dimensions, but their exact extent is no where laid down. Sumseku, the first, is said to be about 33 miles in length and 20 in breadth: Xormusheir the next, double that size, and some still larger; but several are only barren rocks, almost level with the surface of the water. Navigation is exceedingly dangerous, both from prevalent fogs, and the force of currents running among the islands. The channel between Cape Lopatka, is specially prohibited to vessels, on account of the hazards attending this passage, and the frequent shipwrecks. Krusemstern affirms, that the widest channel, which he calls the Straits of Nadeshda, between the islands Iau-koke and Matusa, is 16 miles across, and free of all danger.

Nothing is known of the mineralogy of this chain, which is supposed to present the summits of so many submarine mountains. Some are volcanic, and violent earthquakes have been witnessed. The islands are, in general, hilly, with steep and precipitous shores; and ranges of naked mountains appear in the interior. Several of them contain small lakes, and rivers stored with fresh water fish.

Wood is in general scarce, or low and stunted; and many of the islands are entirely desolate of it. There seems to be scarcely any cultivation, most probably because the climate is unfavourable. Wild roots, such as the inhabitants of the north are accustomed to subsist upon, are common; and certain islands are visited, chiefly for the purpose of obtaining them, and of catching foxes or bears.

According to information communicated to La Perouse, none were inhabited in 1787, excepting the first, second, thirteenth, and fourteenth; and the natives of the thirteenth always wintered on the last. The total number of inhabitants on the whole did not exceed 1400. They were tributary to the Russians, who had exempted them from tribute since 1777, owing to the scarcity of sea otters. The Russians claim dominion over the northern, and the Japanese over the southern islands.

The natives of the Kurile islands are of low stature, and swarthy complexion; those towards the north are said to resemble the Kamtschatkas; but towards the southern limits of the chain, they are distinguished by remarkably thick beards; and all the body is covered by an unusual profusion of hair. Saytychkew remarks, that they are named hairy Kurilians, and that it is difficult to ascertain their origin, "as scarcely any people in this quarter, either Chinese or Japanese, or in fact any other northern nation of the Asiatic shores, except the Ghaks, near the mouth of the Amur, have any beard." The men shave part of the head, but the women only cut part of the hair in front. The lips of the former are stained in the middle; those of the latter are entirely blackened, and their arms are stained or tattooed as high as the elbows. They dress in the skins of birds and quadrupeds, which are patched together, regardless of uniformity; and the costume of both sexes is nearly alike. Cloth, serge, or silk, especially if scarlet, is extremely acceptable; and pieces of foreign manufacture are internixed with what composes their attire. Their language is soft and harmonious. They speak in a mild and agreeable accent, slowly and distinctly.

The Kurilians derive their subsistence chiefly from the capture of wild animals and fish, though less than some neighbouring nations, from the latter; and they dig roots from the earth, but are little acquainted with agriculture. Their habitations are excavated in the ground, and the floor and sides are covered with mattrings of grass. Owing to the scarcity of wood in the islands, what is drifted ashore from more distant countries, is employed; and the wealthier inhabitants build houses, which are supported on four posts, and furnished with articles from Japan. A man marries two or three wives, with each of whom he has had a previous intrigue, and with whom, apparently, he does not reside during the day; but during the night, he is said to be uncommonly difficult among the women: and should there be twins, one is destroyed. In case of adultery, the offended husband challenges the paramour to a combat with a club, which is interchanged between them, and three blows alternately dealt out until the one or other falls. If the husband declines to offer this perilous encounter, the price of his honour may be satisfied in clothes, furs, provisions, or other commodities.

The Kurilians are principally Pagans. They worship ship idols; to which they sometimes sacrifice the skin of the first animal they kill, while they themselves eat its flesh. On changing their nets, the skin and the idol are both left there. But when undertaking dangerous voyages, the idol is carried with them, and, in the event of imminent hazard, is thrown into the sea. They are also accustomed to throw ships among the waves as an offering, when they attempt a passage of the channel which separates the first island from Cape Lopatka.

These people enjoy a favourable character; They Manners.
are hospitable, honest, and inoffensive, and entertain a high respect for old age. Strangers from other islands are received with great demonstrations of ceremony and affability combined. Their arrival is awaited on the shore, and they are conducted to the huts, where they are entertained after the best manner of the host, who stands listening to the adventures of his guests. The narrative sometimes continues two hours; and, when completed, the eldest among the islanders—as this task, or rather privilege, always belongs to seniority—begins a corresponding relation of what has occurred to himself and his friends. Previous to the fulfilment of the ceremonial, no conversation takes place among the others. Notwithstanding the mildness of their disposition, suicide is not rare. Trade, or manufactures, can hardly be said to be practised here. Nettles are made into stuffs, which are sold to the Japanese, who, together with the Russians, are the only nations visiting the Kuriles. According to the eastern author, above referred to, a traffic was carried on from Jesso, with one of them which he calls Kitat-Soeb, and entirely by barter, as the inhabitants came down from the mountains to the coast, to exchange skins, stuffs, and cloths, for rice, salt, tobacco, and other commodities. Of later years, however, the Japanese seem to have made permanent establishments on some of the islands. The Russian embassy to Japan having experienced a contumelious reception at that island, resented it by an attack on the Kuriles. After returning to Kamtschatka, two armed vessels were dispatched from thence in 1807, which soon reached the settlements. The Japanese made a shew of resistance with their bows and arrows, but speedily fled, leaving their habitations and magazines at the mercy of the invaders. Here were found cannon, and arms of different kinds; also beautiful lacquered utensils, books, and maps, together with a large provision of rice, salt, and tobacco. The Russians returned with considerable booty, among which were many interesting objects that they had fruitlessly endeavoured to gain a knowledge of during their residence in Japan. Although the Russian merchants have resorted to the Kurile islands for a considerable time, little advantage, either commercial or scientific, has resulted from their visits. (c)

KUZISTAN, or the ancient Susiana, is a province of Persia, bounded on the south by the Persian Gulf; on the south-west, by the Tigris and the Shat-ul-Arab; on the north-west, by the dominions of the pacha of Bagdad; and on the east, by the river Tab, which separates it from Fars. This province is divided into the territories of Chab Sheikb, and those which form the government of Shuster. The Chab territories extend from the banks of the Tab to the conflux of the Karoon and the Abzal, and from the shore of the Persian Gulf to a range of hills which skirt the valley of Ram Hormuz to the south. The rivers which water this part, are the Karoon, the Tab, and the Jerahi. The greater part of it consists of extensive morasses and sandy plains. The most fertile spots are in the neighbourhood of Dorak, the capital, and on the banks of the Hafar and the Shat-ul-Arab, where alone rice and dates are produced. Wheat and barley are grown in small quantities. The north-western and western parts of the country afford pretty good pasturage.

The Karoon, supposed by D'Anville to be the ancient Choospes, is a noble river, in many parts more than three hundred yards in breadth, and navigable for boats of 25 tons burthen as far as Kishibund, four miles from Shuster. The chief towns of this part of the province, are Dorak, or Felahi, Ahwaz, Endian, Mashoor, Goban, and Jerahi. Felahi stands on low marshy ground, on two of the branches of the Jerahi. Its mud walls, which are about 16 feet thick, are nearly two miles in circumference, and are flanked at regular Dorak, intervals with round towers. The population, which Felahi. amounts to about 8000, live in the suburbs, under the shade of the date trees. Its principal trade consists in the manufacture of the abba, or Arabian cloak, which is exported in great quantities all over Persia and Arabia. Ahwaz, once a flourishing city, is now a wretched town of 600 or 700 inhabitants. It stands on the banks of the Karoon. An old bridge, and a palace, are the principal remains of the ancient city. There are some extraordinary excavations in the rocks. Endian, situated in North Lat. 30° 18', is divided Endian, into two parts by the Tab, and is nearly two miles in circumference. It trades with Bassorah and Bebahan, and has a population of between 4000 and 5000 souls. Mashoor, situated half way between Endian and Do- rak, is about two miles from the sea. It has a population of about 700, who trade with Bassorah and the Arabian coast.

The revenues of the chab are about £50,000 Sterling per annum. He can bring into the field an army of 5000 horse, and 20,000 foot.

The other part of Kuzistan, which is attached to the government of Shuster, is the best part of the province. It is fertilized by four noble rivers, namely the Karoon, the Abzal, the Kerah, or Haweesa, and the ancient Gynedes. The principal towns are, Shuster, the capital, (see the article Shuster,) Dezphoul, Shus, and Haweesa. Shuster contains nearly 15,000 inhabitants. Dezphoul contains nearly, the same number. It stands in a spacious plain, on the east bank of the Abzal. The principal building is a handsome bridge of 22 arches, 450 paces long, 40 high, and 20 broad. The ruins of Shus extend over a surface of about twelve miles. They consist of hillocks of earth and rubbish, covered with broken pieces of brick and coloured tile. The largest of these mounds is about 100 feet high, and a mile in circuit. They resemble the pyramids of Babylon. Major Rennel regards these ruins as the remains of the celebrated city of Susa, while Dr. Vincent considers Shuster as occupying the site of Susa.

Kuzistan possesses a healthy climate; and Shuster is the resort of invalids from the surrounding territories. In summer, its inhabitants avoid the excessive heats, by taking refuge in subterraneous chambers during the day, and spending the night on the flat roofs of their houses. Periodical rains prevail from December to the end of March. Two crops of grain are obtained in the year. Indigo is cultivated near Dezphoul; and excellent opium is extracted from poppies, which grow near Shuster. See Macdonald Kinloch's Geographical Mémorial of the Persian Empire, p. 85.
Laaland

Laaland is an island of Denmark, remarkable for its fertility. It produces all sorts of grain; and considerable quantities of wheat are exported from it to Copenhagen, and other parts of Denmark. It is, however, low, marshy, and insalubrious. The principal towns, are Naskow, the capital, which is walled, and has a considerable trade, with a rich hospital, and a good harbour; Mariebow, situated on a lake near the middle of the island; Nysted, on the south-east coast; and Saxkoping, on the north-east part of the island. See Denmark, Vol. VII. p. 644, 650, &c.

Laboratory is a place furnished with all the various kinds of chemical apparatus. An account of the different instruments and apparatus used in experimental chemistry, will be found in our articles Chemistry, Vol. VI. p. 151.

Labdanum, or Labdanum, is a resinous substance, which oozes from the leaves of the Cistus creticus, or labanifer. An account of this gum has already been given in our articles CANDIA, Vol. V. p. 366, and Chemistry, Vol. VI. p. 123. See also Milburn’s Oriental Commerce, vol. i. p. 138.

Labour. See Midwifery.

Labrador. A large peninsula about 850 miles square, lying between 50° and 60° of North Lat. and 53° and 71° of West Long. from Greenwich. It is bounded on the south by Canada and the Gulf of St. Lawrence; on the east by the Atlantic Ocean; on the north by Hudson’s Straits; and on the west by Hudson’s Bay. It was discovered, in 1496, by the Portuguese, and named Terra de Labrador, or “ploughman’s land,” a designation to which it seems to have very little title. It is frequently called also New Britain; and its western coast is generally denominated the East Main, by the Hudson’s Bay settlers. The whole of this vast tract of country, as far as it has hitherto been explored, is extremely barren and dreary, the surface everywhere uneven, and covered with large stones; the mountains devoid of herbage, and producing at best a little moss, or a few blighted shrubs; the valleys, in some places, full of low crooked trees of the pine and birch species. The southern parts present some appearance of soil capable of cultivation; and in some of the deep bays a little timber may be found. The native plants are wild celery, scurvy-grass, redlocks, and Indian sallad. The prevailing aspect of the whole region is a heap of bare and frightful rocks. The highest mountains extend along the eastern coast, from latitude 54° to latitude 59° or 60°; but their elevation does not appear any where to exceed 3000 feet. There are vast chains of lakes and ponds throughout the country, produced by the rains and melting of the snow; but springs are extremely rare. There are several streams, which empty themselves into the sea; but they are not deserving of the name of rivers, and are nothing more than drains from the lakes and ponds of the interior, running on a bed of solid rock, sometimes broad, but rarely of any depth. The climate is remarkably rigorous; and the winter lasts about nine months, from the middle of September to the middle of July. But, on this point, the following extract from a meteorological journal of the weather at Nain, in 57° of north latitude, will afford the most accurate information, as far as regards the state of the thermometer.

The mean of all 52 6

Of the mineralogy of Labrador, very little is known; minerals and the only subterranean productions hitherto discovered, are a little iron ore, granite, hornblende, limestone, lapis olaris, hematite, and the beautiful shining spar, called the Labrador stone. This last mentioned substance was discovered by the Moravian missionaries in sailing over the lakes, where its bright hues were reflected from the water; and is supposed to be the same article, which some of the early navigators brought from the coast as a specimen of gold ore. Its native rocks have not been discovered, but it is collected by the Esquimaux on the shores of the sea and lakes.

The animals of this country are neither very numerous nor various. Reindeer, whose venison is excellent, are tolerably abundant. Black and white bears are frequently seen in considerable numbers, especially where the fish, being retarded in their progress by the cataracts, are found collected in one place. Wolves, foxes, caribou, mountain cats, martins, beavers, otters, hares, a few ermines, and plenty of porcupines, are the principal quadrupeds met with in this dreary region. The more permanent feathered inhabitants, are eagles, hawks, horned owls, the red game, and a smaller species, called the spruce partridge. Many migratory birds frequent the woods and lakes in summer and autumn, and some of the smaller sort are remarkable for their beautiful plumage; but, after the breeding season is past, they seek a happier climate be-
before the approach of winter. The curlews are extremely abundant, and well grown, and excellent for eating. The sea fowl are remarkably numerous, especially in the little islands which lie along the eastern coast. The most prevailing kinds of fish on the coast, are whales, cod, and salmon, with a very few shell fish. There are no venomous insects or reptiles in the country; but the myriads of small flies in the warmer months are exceedingly tormenting.

Labrador. There is a thorny inhabited, and the natives are a miserable and diminutive race. They consist of various tribes, who are perpetually at war with each other; and may be divided into two general classes; the mountaineers, who inhabit the inland districts; and the Esquimaux, who occupy the sea coasts. The former resemble greatly the Hudson's Bay Indians; and those of the latter are frequent the southern parts of Labrador, carry on a regular intercourse with the Canadian traders. They are of a low stature, and have very small limbs; but are of a robust constitution, and capable of enduring the greatest fatigues in travelling. They travel chiefly by means of canoes, covered with the rind of birch, which are sufficiently large to contain a whole family, with their articles of traffic, and yet so light as to be easily carried on their shoulders. In consequence of the multitude of large ponds in the country, they contrive to go the greater part of the way by water, and, when these lakes fall out of their course, they place the canoe on their heads, and proceed over land till they meet with another opportunity of embarking. Their chief occupations consist in hunting rein-deer, catching seals, and collecting furs. These last articles they bring to the Canadian traders, and have the character of being just dealers, and good-natured people. They barter their commodities for blanketings, fire-arms, ammunition, and spirits, of which last article they are immoderately fond. Some of them have been visited by the Roman Catholic missionaries; and still retain an attachment to the priests of the Canadian church.

Esquimaux. The Esquimaux were formerly settled at different places on the coast, almost as far down as the river of St. John's; but, in consequence of their quarrels with the mountaineers, who are their inveterate enemies, or of the encroachments of the Europeans, they have removed their habitations far to the north. They are of small stature, and of a lighter colour than the other natives. They bear a near resemblance to the Greenlanders, in their persons, language, and customs; and are considered as having emigrated from the opposite coast of Davis' Straits. They have flat countenances, short noses, black coarse hair, and remarkably small hands and feet. They differ from the more inland natives, in having beards, whereas these other tribes have no hair on any part of their bodies except the head. Their food consists chiefly in the flesh of seal, rein-deer, and fish, which, till very lately, they used to eat altogether raw, and sometimes in a putrid state. Their dress is made entirely of skins (except a little blanketting which they may have procured in traffic;) and consists of a hooded close shirt, breeches, stockings, and boots, generally worn at least in cold weather, with the hairy side inwards. The women are clothed exactly like the men, except that they wear larger boots, and have their upper garment ornamented with a tail, while their heads are loaded with strings of beads, or surrounded with a hoop of glittering brass like a coronet. Their houses in winter resemble caverns sunk in the earth, and consist only of one apartment, which, though not very large, generally contains several brothers, or other relatives, with their wives and children. In summer, they dwell in tents of a circular form, constructed of poles, and covered with skins sewed together; and which they are continually moving from place to place. They have always a great number of dogs about their camp, which serve to guard the habitations, and to draw the sledges; or are occasionally used as food, and their skins made into clothing. These animals are larger than the dogs of the mountaineers, and have a head very like that of the fox. They are incapable of barking, but utter a hideous kind of howl. The weapons of these Esquimaux, are the javelin, bow, and arrow; in the use of which they are said to be by no means expert, though they have no other means of defending themselves, and of preserving their subsistence. They all practice polygamy, but their families are not generally numerous. The wives live together very harmoniously, and have all the labour to perform, except procuring food. They are continually at work, and sew very neatly with the sinews of rein-deer. The husbands are strangers to jealousy, and very readily lend one of their wives to a friend, like any other article of property. They have no government or laws; and no other punishment for the most detestable crimes than general censure. No man is held superior to another, except in as far as he excels in strength or courage, or in the number of his family. They are a harmless people, not apt to steal from one another, or to give way to violent anger; but are sufficiently harsh to the poor women, when they happen to give any offence. They are dexterous in the management of their canoes, which they steer along the coast with wonderful exactness in the thickest fogs, without any aid from a compass. They must be ranked at the same time in the lowest scale of intellect, and are said to have no name for a number beyond two. The Moravian missionaries, since the year 1764, have been endeavouring, with wonderful perseverance, to bring those rude tribes to the habits of a civilized life, and the duties of the Christian religion. They have at length succeeded in forming three settlements on the coast of Labrador, namely Nain, Okkak, and Hopedale, which employ 25 missionaries, and contain altogether about 600 inhabitants, of whom above one-half belong to the congregations. The christianized Esquimaux are said to have been taught to sing with great softness and melody in their public devotions; and to read in their own language, those parts of the scriptures which have been translated for their use. See Particulars of the Country of Labrador, from the Papers of Lieutenant Roger Curtis, in the Philosophical Transactions, London, vol. lxi.; Cartwright's Journal. (g)

LABYRINTH is the name of an ancient edifice built in such a manner that any person who had once entered it, could not again find his way to the entrance. The few celebrated labyrinths were those of Crete, Egypt, Lemnos, and Italy. See the Travels of Anacharsis, vol. iv. p. 441; and Pococke's History of the East, vol. i. p. 6.

LAC, or LACCA, is a substance prepared by the female of a small insect called the Coccus Lacca, which is found on several trees in the East Indies. It is found chiefly in the uncultivated mountains on both sides of the Ganges, and it is also produced in Pegu, and in other countries to the east. This substance is divided into four kinds, stick-lac, seed-lac, lump-lac, and shell-lac, which have already been described in our articles CHEMISTRY and DYEING. The best stick-
LAC

lac is of a red purplish colour; that which is yellow or brown is bad. In the years 1805—1808, the following quantities of seed-lac were sold at the East India-house.

Seed-lac is seldom imported. In 1808, 19 cwt sold for £222.

Lump-lac is principally used in India. The best shell-lac is transparent or amber coloured. The thick, dark, and speckled kind is bad. The following are the quantities of shell-lac imported and sold in the years, from 1803 to 1808 inclusive:

LACADIVE ISLANDS, are a group of about 32 low shelly islands in the Indian Sea, belonging to the Biby. The nearest of them is 75 miles from the coast of Malabar; and they stretch from the 10th to the 12th degree of North Latitude, being separated by a very wide and deep channel. The largest of these islands does not contain more than six square miles.

The only produce of the Laccadive Islands is cocoa nuts, betel nuts, and plantains.

They export coir, which is made from the husk of the cocoa nut, jagery, cocoa nuts, and betel nuts. Coral from the surrounding reefs is also carried to India. The best coir cables on the Malabar coast, are made from the fibres of the Laccadive cocoa nut. Their boats are made of the stem, and their houses are constructed wholly from the materials yielded by this valuable palm.

Minicoy, the southernmost island, is 7½ miles long, and ¾ mile broad. It extends in the form of a crescent to the north-west, having a coral reef across it. The town is situated within the reef; and the channel through this reef is very intricate and narrow.

Kalpeni is about 37 miles north east from Minicoy, and is about 4 miles long, and 1 broad. It is surrounded with reefs, and the town is in the midst of cocoa nut trees.

Undonat, the nearest to the Malabar coast, is about 3 miles long from east to west. It is well planted with cocoa nut trees, and the town is on the north side of the island.

Ambergris is somewhere to be met with among these islands. Vasco da Gama visited the Laccadives islands in 1498, on his return from Calicut, but they have never been carefully examined. See Dr. Francis Buchanan's Journey from Madras through the Mysore, &c., vol. ii. p. 554; and Mulberry's Commercial Journal, vol. i. p. 320.

LACIC ACID is a new acid, lately obtained by Dr. John from stick-lac. This substance having been reduced to powder, was digested in water, till it ceased to communicate any colour. The aqueous solution was evaporated to dryness, and the residue digested in alcohol. The alcoholic solution was similarly evaporated, and the dry residue digested in ether. The evaporation of the ether solution, left a syrup mass of a light yellow colour, which being again dissolved in alcohol, and the solution mixed with water, lets fall a little resin. This liquid contains the Lacic Acid, united with a little potash and lime, from which it may be separated by precipitating it with lead, and decomposing the lacate with sulphuric acid; just sufficient to saturate the oxide of lead. The following are the properties of this acid:

1. The taste is acid. Its colour is wine yellow. It is soluble in water, alcohol, and ether; and it is capable of crystallising.
2. It throws down lead and mercury from their solutions in acids white; but it neither precipitates lime water, nor the nitrates of silver and barytes.
3. It throws down the salts of iron white.
4. Its combinations with lime, soda, and potash, are deliquescent and soluble in alcohol. See Thomsons Chemistry, 5th ed. vol ii. p. 177; and Schweiger's Journal, xxv. 110, quoted by Dr. Thomson.

LACE is a delicate kind of net work, which is much used for ornament in female dress. The meshes of this net are of a kind and formed by twisting or plaiting together very fine threads of silk, flax, or cotton. Thick threads are also woven into the net to form the figures or pattern, according to some design; and these thick threads, which are called gimp, form the ornament of the lace.

There are several different kinds of lace, which are more or less esteemed, according to the fashion of the day; and, like jewels, and precious stones, they are valued in proportion to the difficulty of procuring them, rather than from any real difference in their appearance or qualities.

The lace manufactured in England is generally called Buckinghamshire, or Bedfordshire lace, after those districts wherein it is made; it is also called pillow lace or bobbin lace, because it is woven upon a pillow or cushion by means of bobbins. The latter terms are chiefly used to distinguish it from an imitation which is made by machinery at Nottingham; but by a recent invention, this lace is made in the greatest perfection by machinery, and is called bobbin-net. The bobbin lace consists of hexagonal meshes; four of the sides of each hexagon are formed by twisting two threads round each other, and the other two sides are formed by the simple crossing of two threads over each other. This is the same kind of lace which is known in France by the name of Lisle lace, being manufactured in that town.

Another kind of lace is made at Honiton in Devonshire, and is called Honiton lace. It is of the same kind as that made at Brussels, and it is also called Brussels lace; two sides of each mesh of this lace are plaited of four threads, and the other four sides by threads twisted together. The plaiting renders it much more durable than the twist lace, and it therefore bears a much greater price.

The lace made at Valencia is very highly esteemed, but is not manufactured in England. All the six sides of the hexagon are plaited; but two of the sides of each mesh are so small, that they appear like lozenges.

The Nottingham imitations of lace are of two kinds, point-net and warp-net. From the names of the machines in which they are made, they are both a species of chain-work, and the machines are varieties of the stocking frame. The warp frame makes a very close imitation of the Brussels lace, but has very little durability.

The Buckinghamshire lace is woven on a pillow, or cushion, which the woman or child who makes the lace. Manner of weaving lace.
LACE.

places on her knees. The threads are wound upon bobbins, which are small round pieces of wood, each about the size of a pencil; round the upper end of each, a depression is formed so as to reduce the bobbins to a thin neck, and on this part the thread is wound: a separate bobbin is used for each thread. To give form to the meshes, pins are stuck into the cushion, and the threads are wound and twisted together around the pins; a piece of parchment is first fixed down upon the cushion, which has been previously pierced with small pin-holes, to shew the proper places for the pins, and on this parchment the design for the gimp, or thick thread, is also traced, to guide the woman in placing the gimp, so that it will be woven in between the fine threads which form the net-work. The work is begun at the upper part of the cushion, by tying the threads together in pairs, and each pair is attached to a pin, which is stuck through the parchment into the cushion. The round form of the cushion allows the bobbins to hang down by their threads, on different sides of the cushion; and on whatever side the bobbins are placed they will continue. At the commencement of the work, the bobbins are put on one side of the cushion; but as they are brought to the front side, four bobbins, or two pairs at a time, to be twisted together. The woman takes one pair in each hand, and, with the finger and thumb, twists the bobbins over each other three times; the effect of this is to twist the threads of each pair together, or round each other, and this is done by both hands at the same time. When the twisting, which forms the sides of the mesh, is thus completed, the adjacent bobbins of each pair are interchanged, in order to cross the threads of those bobbins over each other, and make the bottom of the mesh. To render this clear, suppose the four bobbins numbered: No. 1 is twisted round, 2 and 3 is twisted round 4. Then, in order to cross, 2 and 3 are interchanged, so that 1 and 3 come together, and 2 and 4; and the next time that the twisting operation is performed, these pairs of threads will be combined together.

When a mesh, or half mesh, is made, it must be secured by putting a pin into the cushion; and, in order to catch the twist work close, the pin is introduced between the threads in this plie, which is a piece of mechanism employed in front of the row of needles of the frame. It is to be understood that the needles, and sinkers, and presser of the warp-frame, operate nearly in the same manner as the stocking-frame, except that there are no jack sinkers, because the thread is supplied to the needles in a different manner from the common stocking-frame; and the operation of the sinkers is not to form the thread into loops between the needles, but only to move the stitches of the work backwards or forwards upon the needles; and hence the nibs of the sinkers have no catches upon them; that is the name given to the small projecting pieces which bear upon the thread, when the sinkers drop down, and carries the thread down into loops between the needles.

In the warp-frame, the piece of lace is not formed of one continued thread, as in the point-net-frame; but there are as many different threads as there are needles in the frame. These threads are warped, or wound upon a roller or beam, the same as stockings are, and it is from this circumstance that the machine is called warp-frame. The roller is placed horizontally beneath the rows of needles, and the threads are carried up from it, and conducted through the guides, and to the needles. These guides are rows of small wires, with eyes through the ends like sewing needles, and the
threads pass through the eyes. Two rows of guides are used; each row containing one half as many as the number of needles in the frame; and as each guide has a thread, the two rows of guides together contain as many threads as there are needles. The machine, which is the frame containing the two bars on which the rows of guides are fixed, is so poised upon centres, that the guides are capable of advancing to the needles when they are required, to lap the threads upon the needles; and when the thread is supplied, the guides can be drawn away from the needles, to leave them free for the operations of the sinkers and presser. When the guides are first applied to the needles, they lie beneath the row of needles; but the guides can be raised up, so as to ascend in the spaces between the needles; and when the guides are thus raised clear above the row of needles, they are moved so much sideways, that when they are depressed again, they will not return between the same needles, but between the adjacent needles. It is plain that this action will loop the thread, which each guide contains, round the needle, and that this is done in the whole row of needles at the same time. The treatment of the loops thus formed is the same as in the former machine; the guides are so arranged, that those of the upper row fall immediately over those of the lower, and therefore two guides will pass between the same needles. By this means the working of the frame combines two adjacent threads together, in a series of looping, or chain-work; but at the next course, the guides are interchanged by moving them sidewise, so that those guides which were over each other in the former instance, and therefore passed between the same needles, will be separated from each other, and those which were separated in the former instance will be brought together. The warp-lace is more permanent than the point-net, because the sides of the meshes are made of two or three loops of chain-work drawn through each other, which is not so liable to unravel as the point-net when a thread breaks. These loops resemble the plaited sides of the Brussels lace; but the warp-machine is capable of making several different patterns. In both the point and warp frames, the net is woven in very considerable breadths, even as great as a yard and a half; but it is afterwards divided into pieces of the breadth required, and a row of wide meshes being formed at the intended line of division; but before the piece is divided, it is extended in a frame like that used for tambour work, and the gimp, or thick thread, which represents flowers and ornaments, is worked in by the needle; for, it must be observed, that the machine only weaves the plain net work. The ornamenting of the lace in this manner, takes more time than the weaving: it is performed by women and children. They have an enlarged drawing of the flower, or figure, they are to work; and this they are enabled to copy with great exactness, by observing the course the thread is to take amongst the meshes of the net-work.

The Nottingham lace trade was very considerable some years ago, but is at present in a state of stagnation. The lace, when well made, is exceedingly beautiful and regular; and hence it was much esteemed at first, particularly the large pieces for making veils and dresses; but, when the want of durability was detected, it lost its value: Still, as the manufacturers were able to make it at a very cheap rate, they sold immense quantities for some years.

It has long been an object of research with mechanics, to produce a machine capable of weaving the real twisted lace, like that which is made on the pillow: and no less than sixteen patents were obtained for this object before it was effected. The nearest approach to it was by John Morris, who invented the point frame in 1781.

The difficulties attending this species of machinery, are principally owing to the fineness of the meshes of lace; and it is essential to any machine for making lace, in which the threads are twisted together, that the ends of the threads, or the bobbins on which they are wound, should be capable of passing one over the other, as before described in making lace on the pillow: Hence the bobbins must be detached; and it is very difficult to make and also to operate upon so many small bobbins as a moderate breadth of lace requires.

Mr. Morris attempted to avoid this difficulty, by stretching all the threads in a parallel direction in a horizontal frame, and operating by machinery upon the middle part of the threads, to pass each one over its neighbour; which, being repeated several times, produced a twisting of the threads round each other, at each end of the frame, so as to make two pieces of lace at the same time. The crossing, which completes the meshes, was effected by interchanging the pairs of threads which were to be twisted together. But this process could not produce the real lace; because, though the threads actually twisted round each other, yet all the threads employed in the fabric proceeded in the direction of the length of the piece, and the meshes had a tendency to flatten themselves, or close up laterally.

A piece of bobbin lace is composed of two systems of threads, like the warp and weft used in weaving cloth. The warp threads proceed, in a zig-zag direction, longitudinally through the piece; and the others, which are called diagonal threads, traverse across the breadth, not at right angles to the warp threads, as the weft in cloth, but they proceed in an oblique, or diagonal direction, from one edge or selvage of the piece to the other, and then return in an opposite direction. It is the intersections, or crossings of these diagonal threads over each other, which form the upper and lower sides of the hexagonal meshes, as before mentioned; whilst the twisted sides are formed by the union of the longitudinal and diagonal threads.

Mr. John Heathcoat, in 1808, invented a machine Heathcoat's first machine for making this kind of lace, which answered the purpose very effectually. The ground-work of the invention, is to extend those threads which form the warp of the lace in parallel lines, and dispose the diagonal threads upon small bobbins, which are detached, and are capable of passing round the extended warp threads, so as to twist with them. By this means, the number of bobbins is reduced to one-half. In this machine there are two horizontal beams, or rollers; one to contain the thread, and another to receive the lace; also a number of small bobbins to contain the thread.

One roller is placed in the under part of the machine, and the other in the upper part, but both in the same perpendicular plane. The threads intended to form the warp, or longitudinal threads, in the piece of lace, are wound upon the lower roller, and ascend to the upper rollers, to which they are separately attached.

Those threads which are intended to traverse the piece of lace, (and are, therefore, designated diagonal threads,) are wound each upon a small separate bobbin. The bobbins resemble the pins used in a weaver's shuttle, but they are made very small. Each bobbin is a wire pin, round which the thread is lapped, in
the form of a small cone; and a slender spring is provided, to cause such a friction as will make the threads draw tight, when pulled off from the bobbin.

These bobbins are so arranged, between the two rollers above mentioned, that the threads proceeding from them, accompany the longitudinal threads to the upper roller, and are attached thereto. Each of the longitudinal threads, in its way to the upper roller, passes through a conical tube, or spindle, at the lower end of which, is a small pinion; and the spindle is so supported as to be capable of turning round. On the upper end of the spindle is a taper tube, composed of two parts, which, when put together, form a tube; but the two parts will separate in the direction of the length of the tube. One of the parts of the tube, so divided, remains attached to the spindle, and is thereby sustained, so that it will partake of the revolving motion of the spindle.

The longitudinal thread which passes through the spindle, is conducted through the hollow part of this half tube, and through a small eye at the extreme point of it.

The other section, or portion of the tube, can be separated from the spindle, and contains within its hollow part the small bobbin on which the diagonal thread is wound.

When the latter section, with the bobbin, is applied upon the other portion which is attached to the spindle, the two form a long taper tube, or spindle, containing a pair of threads, viz., a longitudinal thread, which comes up from the lower roller, and passes through the hollow spindle, and the half tube attached to it; also a diagonal thread, which comes from the bobbin contained in the hollow between the two sections.

These spindles are mounted in collars, so as to be capable of turning round by means of the pinion at the lower extremities, and when so turned will twist the bobbin and longitudinal threads together.

The number of these tubes or spindles is just equal to the number of pairs of each kind of threads; and their arrangement is such, that all the pinions lie in the circumference of a circle, and the spindles and tubes converge to the centre of the same circle in the manner of radii. All the pinions can be moved round at the same time by rack-work, the teeth of which correspond with the pinions. This motion is to cause the pairs of threads contained in each tube to twist together; and this twisting takes place in all the tubes at the same time.

The crossing of the diagonal threads over each other is performed in the whole breadth at once as follows:

That moveable part of each divided tube, which contains the bobbin of diagonal thread, can be removed from the other portion, and the bobbin will come away with it; also any of the separated portions, with the bobbins, will fit and attach to any of the parts attached to the spindles. By a very ingenious piece of mechanism, the whole number of these moveable parts can be detached from the spindles, and brought forward altogether until they are clear of the spindles.

During the time they are so detached from the spindles, one half of them are caused to move one space to the right, and the other half one space to the left.

The lifted parts are then put back again, and attached to the spindle; but, by this operation, each spindle will have changed its diagonal thread, without having changed its longitudinal thread. This effects the crossing of the threads throughout the whole breadth of the machine at the same time.

The pins by which the uniformity of the meshes is preserved, are all placed upon a moveable bar, and are all inserted at once into the meshes formed by the two operations of twisting and crossing. The working of the machine is a regular succession of the three operations of twisting, crossing, and taking up the meshes.

Thus the twisting is performed by the revolution of the spindles and tubes containing the two threads to be twisted.

The crossings are then made by one motion, which interchanges the bobbins containing the diagonal threads.

The pins are then all introduced at once to regulate the new meshes formed by the crossing and twisting.

This machine can be worked with great rapidity, by means of handles and treadles disposed in nearly the same manner as in a stocking-frame. It is calculated to make lace of such breadth as are usually made by the cushion, which seldom exceeds three inches; but it is not capable of any great width from the circumstance of the convergence of the spindles and tubes to a centre.

The object of this convergence is to obtain a sufficient space between the spindles for the pinions and bobbins; whilst the extreme points of the tubes, where the pairs of threads issue, are necessarily very close together; and at these points the lace is formed.

Mr. Heathcoat, in 1809, invented another machine, Heathcoats second machine, which is adapted to make lace of any required breadth; and as the mechanism is much less complicated, it has superseded the use of the former machine.

In this, like the first machine, the warp threads are wound upon a roller at the bottom of the machine, and are carried up to a work beam or roller situated at the bottom of the machine; also the diagonal threads are wound upon small detached bobbins, and regularly interspersed between the warp threads; but there is no farther similarity between the two machines. The bobbins are small flat wheels about the size and thickness of a shilling, with a deep groove in the edge to wound the thread upon. These bobbins are fitted into a small carriage or frame, in which it is at liberty to turn round when the thread is drawn off; but there is a slight spring which makes as much resistance as is necessary to draw the thread tight. The bobbins and their carriages are so thin, that, when placed side by side in rows, they will not occupy more room than the breadth of lace they are intended to make.

The longitudinal threads are stretched in a perpendicular direction from the thread roller to the lace roller, so as to form a row of parallel threads arranged at equal distances from each other; and, to guide them, each thread is conducted through a small eye in a wire resembling a needle. Two rows of such guides are fixed on two bars, which are placed horizontally, and each bar is capable of moving a small space endways, and will then carry the threads sideways with them, which indeed is the object of these rows of guides.

On each side of the row of perpendicular threads is fixed an horizontal bar, called a comb-bar, the upper surface of which is cut into notches or grooves for the reception of the small carriages which contain the bobbins. The grooves are in the upper sides of the bars, and crossways or perpendicular the length of the bar. The comb-bar at the back of the row of threads is exactly correspondent with that in the front, and the intervals of the grooves in both are the same as the space...
LACE.

Lace.

ces between the rows of guides and threads. The carri-
giages of the bobbins are placed in the grooves of the
comb-bars, and slide freely therein, so as to be capable
of passing out of the groove of one bar between the
threads, and into the grooves of the opposite bar; but
the distance between the two comb-bars is such, that
the bobbins will enter into the grooves of one bar be-
fore they quit the grooves of the other.

In working the machine, all the bobbins of the whole
row are connected together by means of a thin bar or
ruled, the edge of which is inserted in a notch made in
the carriage of each bobbin, so that all the bobbins can
be moved in the grooves of the comb-bar at the same
time, and can be passed from one bar between the per-
nicular threads, and be received into the other bar.
At the opposite end of each carriage is a similar notch,
for the reception of another such ruler; but only one
is used at a time. By means of these two rulers, the
bobbins can be transferred from one comb-bar to the
other, and will be passed between the row of threads.

Suppose, for instance, that all the bobbins are situated
in the front comb-bar, the ruler which is in its notches,
being pushed backwards, will move all the bobbins at
the same time through between the threads, and enters
them into the grooves of the back comb-bar; the other
ruiler is then applied, and when its edge is put into
the notches at the back of the bobbins, the ruler in front
is lifted up to take its edge out of the notches; in front,
this being done, the bobbins are drawn completely
through between the threads in the grooves into the back
comb-bar.

The result, therefore, of this train of manipulations,
is to transfer the bobbins from the front comb-bar to
the back, and in so doing they are made to pass be-
tween the threads. This being done, the bar sustain-
ing the guides is moved sideways through a distance
equal to the interval between two adjacent grooves of
the comb, and then the row of bobbins is returned from
the back comb-bar between the perpendicular threads,
and brought into the front comb-bar by the same move-
ments which have already been described. Now it is evi-
dent that in the bobbins passing between the perpendi-
cular threads the first time, those perpendicular threads
which were on the right side of each bobbin would be on
the left side of the same bobbins when they return, by
which means each of the threads of the bobbins makes
a turn round its corresponding perpendicular thread.

The action being repeated, each bobbin makes a com-
plete twist round its corresponding bobbin thread, and
the sides of the meshes are thus formed; but it is to be
understood that every time after the bobbins have been
passed between the perpendicular threads, before they
are passed again in an opposite direction, the row of
guides is to be moved a space, as before mentioned.

But before we can clearly explain the manner of
crossing the bobbin threads, we must point out a cir-
cumstance which we omitted before, in order to render
the description less complicated, viz. that in order to
obtain more room for the bobbins, they are arranged in
two rows, one before the other, in the same grooves of
the comb-bar; and that one row is first passed between
the perpendicular threads, and then the other. Also
the rows of guides before mentioned, are two in num-
er, and one half of the number of perpendicular
threads, that is, every alternate thread, is conducted
through the guides of one row, whilst the intermediate
threads are conducted through the guides of the other
row. In order to make room for the passage of the
bobbins, the two rows of guides are so placed during
the time that the bobbins pass, that they collect the
perpendicular threads one before the other, each alter-
nate thread falling behind its neighbour, by which
means only one half of the number of threads appear in
front, and of course the spaces between them are ren-
dered double to what they would be if the whole num-
ber of perpendicular threads were placed at regular

This separation of the bobbins into two rows, is also
required for making the crosses, which is done by mo-
vailing one of the rows of bobbins one space to the right
or left without moving the other, and, when this is done,
the threads proceeding from one row of bobbins, will be
found crossed over the other row of bobbins instead
of being parallel to them. That comb-bar, which is next
down the number of the perpendicular threads, is moved
at small distance to the right or left; and, when only one of the rows of
bobbins is in this comb-bar, it is moved a space. The
other row of bobbins being at the same time in the
back comb-bar, will receive no motion. Consequently
when one of the rows is passed between the threads, so
as to bring the two rows together into the same
comb-bar, one row of bobbins will be found to be moved
sideways with respect to the other, and this produces the
crosses.

The last operation to be noticed, is that of drawing
the twist close, and giving form to the meshes. This
is done, by a row of sharp pins, called points, which are
suspended in a frame, so that they can be brought down
low enough, to be introduced between the threads be-
neath the crosses just made, and being then moved up-
wards, these points will carry both the twists and
crosses upwards before them, and draw them close,
and also give form to the meshes. There is another
row; one which is used as above, to give form to the
recently formed meshes; and another row, which re-
lieve the former, and hold fast the last made meshes,
whilst the first mentioned points repeat their action.

The whole of Mr. Heathcoat's machine is very inge-
niously contrived, and it works with great rapidity.
The workman is seated before the machine, and em-

eys both his hands and feet, to give the different mo-
tions. The machines are made of different widths, from
1 to 2½ yards, and the bobbins are from 10 to 12
per inch in each row, that is, equal to 20 to 24 per inch.

If the machine is 2 yards wide, the number of bobbins
will be from 1440 to 1728; but all these are passed be-
tween the perpendicular threads in an instant, and it is
rarely that any derangement happens.

The manufacturers of Nottingham have exercised
much ingenuity in making lace-machines, since Mr.
Heathcoat produced his; but though their machines
differ in the mechanism which produces the movements,
they are all on the principle of Mr. Heathcoat's second
machine, and work by license under his patent.

This invention has been carried into France by some
of Mr. Heathcoat's workmen, who have established a
manufactory at Douay.
Mr. Heathcoat has recently invented machinery, by which his second machine is made to interweave the gimp in figures or flowers at the same time that the lace is made. Hitherto the machines have only made the plain net, and the figures have been worked by hand after the net was finished. (r.f.)

Lacedaemon. Lacedaemon, or Sparta, now Mistra, the capital of Laconia, was situated at the foot of Mount Taygetus, and watered by the river Eurotas. It is said by Polybius to have, at one time, occupied so great an extent of ground, as to include a circuit of forty-eight Greek stadia, or about six British miles. There are no certain records of its origin; but it is generally said to have been founded about 1516, B. C. by Lelex, from whom it was first called Legela; and it appears, from Homer's description, to have been among the most considerable of the Grecian states in those early times. Its history is not distinguished by any remarkable personages or events, till the reign of Tyndareus, whose wife (the poetical Leda), was mother of the celebrated brothers, Castor and Pollux, and of two sisters not less celebrated, Clytemnestra and Helen. The two sons having died in early manhood, the daughters were married to Agamemnon and Menelaus, princes of Argos and Mycenae. About 80 years after the fall of Troy, Lacedaemon was wrested from Tissa- my, grandson of Agamemnon, by the descendants of Hercules. Aristodemus, to whose lot Laconia fell, in the division of the subjugged countries of Peloponnesus, left two sons, Eurysthenes and Procles. The mother refusing to declare which of the princes (who were twins) was the first born, it was determined that they should succeed to the throne of their father with equal authority, and that the posterity of each should inherit the rights of their respective ancestors. The jealousy naturally consequent upon such a divided sovereignty, led the succeeding kings of Lacedaemon to court the support of the people; and thus produced so many concessions of authority, as at last to render the government of Sparta little better than a state of anarchy. In this situation of affairs, the celebrated Lycurgus, generally reckoned the fifth in descent from Procles, succeeded his brother Polydeuces; but contented himself with acting as guardian of his nephew Charilaus, who was born after the death of his father, and whom he immediately presented to the Spartans as their king. Either from a thirst of knowledge, or from the customs by which, notwithstanding his disinterested conduct, his character was assailed among the lawless Lacedaemonians, he resigned the reins of government, and resolved to spend the period of his nephew's minority in foreign travel. The insubordination of Sparta, and the miseries which it produced, became in a short time so intolerable, that both the kings and the people united in requesting him to return, and take upon himself, in quality of legislator, the reformation of the state. Aware of the influence of religious sanctions on the human mind, he took care on his way, to procure from the oracle at Delphos a high testimony to his claims as a legislator. Having farther secured a strong party of friends to favour his extraordinary scheme of polity, he proceeded to renovate the Spartan citizens. He committed the executive power of the state to a senate of twenty-eight, selected from the nobles, with the two kings as presidents; and to this assembly was assigned the entire privilege of originating laws. The assembly of the people, on the other hand, was intrusted with the election of the future senators, and with the prerogative of annulling or confirming (by simple votes, without the liberty of debate,) the laws which the senate proposed. The kings were nothing more than hereditary senators, commanders-in-chief of the armies, and high priests of the nation. He next effected the most daring innovation ever attempted by a legislator, namely, an equal division of the lands, and levelling of conditions. The whole territory was divided into 39,000 shares, 9000 of which were allotted to the city of Sparta, and the rest to the other towns; His next step was to prohibit all use of gold and silver, even as a circulating medium, and to substitute a cumbersome coinage of iron money, which rendered the accumulation of wealth inconvenient and almost useless, as well as abolished all foreign commerce and trades of luxury. Resolved to destroy every temptation to avarice, as well as to preclude every display of its gains, he ordained that all the citizens, even the kings, should eat only at public tables, where the strictest temperance should be observed. He went so far as almost to annihilate private property, by enacting, that every individual must lend what he was not immediately using; and even that any one might take, without asking, whatever he wanted of his neighbour's goods, with the obligation of replacing it undamaged. By all these regulations it was his aim to exalt every individual; and hence his laws farther required, that every citizen should, in the strictest sense of the modern term, be a gentleman. Every free Lacedaemonian was prohibited from exercising any of the mechanical or even agricultural arts. He was permitted to have no business, except that of the state; and for this, whether in peace or war, it was the purpose of education to qualify every man. Having attempted to provide against internal evils, by rendering his countrymen a nation of philosophers, he next secured protection against external violence, by making them also a nation of soldiers, superior to the rest of mankind. In this view he began with measures to provide a strong and active race of subjects for the state. He directed that the young women should be trained, like the young men, to athletic exercises; and that both sexes should appear naked in the public places. He enacted that it should be disgraceful to be unmarried, and unproductive of children to the commonwealth; but, at the same time, disregarding the sanctity of wedlock, he held it a matter of no consequence whether the marriage was for love or for gain, provided only it was healthy and well formed. To prevent, however, the natural evils of promiscuous concubinage, (which would have defeated the end in view,) he decreed, that it should be a reproach, and a species of crime, for young men to be seen in company with young women, and that even their own wives should be visited only by stealth. The Spartan legislator sacrificed to his political system, not only the moral feelings, but also the natural instincts of his fellow-creatures. He appointed that all children, as soon as born, should be examined by persons set apart for the office, and that only the vigorous and well-formed infants should be preserved, while all that were defective in shape or constitution, should be instantly exposed in the wilds of Mount Taygetus. Those, who were found fit for being reared, were delivered to the care of public nurses, to be brought up according to the mode prescribed by law; and were, after the age of seven years, introduced into the public schools, where all were educated on the same plan. Therefore, both in body and mind, they were moulded to such a temperament, as was thought most suitable for rendering them
serviceable to the state. Letters were taught only for use, not for ornament; and the Spartans, while famed for wisdom, were never eminent for learning. Great attention was paid to conversation; and, while loquacity was reproached, the boys were exercised to quickness of reply, conciseness of expression, and satirical strokes of humour. They were principally taught to cherish an ardent and paramount love of their country; and formed to a high principle of honour, especially of sensibility to applause and blame. They were allowed only one garment, which was to serve equally for winter and summer; were accustomed to sleep on rushes, which they were obliged to gather for themselves; and were supplied with very plain and scanty food; but encouraged to steal whatever they could, provided they accomplished the theft without detection. As they approached the years of puberty, their discipline became more strict, and their labour more severe. No kind of remission or indulgence was permitted, except during military service; and, while the city was the scene of toil, study, spare diet, and rigid discipline, the camp was a place of rest, relaxation, and luxury. Till the age of thirty, no one was permitted to intermeddle with political or judicial affairs; nor was either private study, or domestic business, considered as reputable; but it was every man's duty to attend the places of instruction, and to bestow a portion of his time on military and athletic exercise. Poetry and music were allowed, under the direction of the magistrate, but rather on public festivals, than for private recreation; and the amusements most encouraged, were hunting, and conversational meetings. In these conversations, naught of a peculiar species, the mirth of wit and wisdom united, was prescribed; and, while all were trained from their youth to a ready and determined style of reply, great care was taken to preserve, at the same time, a graceful, respectful, and even modest demeanour. The young were constantly under the inspection of the old, to whom the greatest reverence was recommended, and under whose eye a talent of circumspection and attention to rules was acquired.

To prevent the corruption of Spartan manners, all travelling into foreign countries was prohibited, and strangers admitted under great limitations. To preserve the state from the insurrections, or Helots, to whom all agricultural operations and mechanical arts were allotted, the most oppressive and inhuman treatment of these miserable bondmen was enjoined by law. Every thing that could humiliate their minds, and remove them to a distance from the condition of their haughty masters, was imposed upon them. Even vice was prescribed to them; and they were compelled to drunkenness, in order to render it contemptible in the eyes of the Lacedaemonian youth. Nay, to prevent the increase of their numbers beyond what the safety of the commonwealth allowed, the young Spartans were occasionally dispersed through the country, with a commission to murder the stoutest and most enterprising Helots, whom they might meet, or be able to surprise.

The military as well as the civil code of Sparta is considered as the invention of Lycurgus. Its fundamental principle was this, that the Lacedaemonians should place their security in the discipline and courage of their troops, not in the strength of their fortifications; and, hence, the city was never provided with walls. The peculiar composition of the Lacedaemonian army, so highly extolled by the military characters of ancient Greece, is not easily explained, in consequence of the contradictory descriptions given of the system by Xenophon and Thucydides. It appears, however, to have a near analogy to the arrangement of the modern European armies; and to have performed all its evolutions on the company, as the principle of motion. According to Thucydides, the enemy, or lowest subdivision, consisted of 32 men, 4 of which formed a pentecosty composed of 128; four of these again making a lechus or battalion of 512; and four of these last completing a mora or division of the army. These divisions were commanded by general officers, named polemarchs, subordinate only to the kings, who were commanders-in-chief of the forces, invested with fuller authority in the field than in the city, but amenable to the civil power for the exercise of their supremacy. Every Lacedaemonian was a soldier; and the infantry is calculated to have seldom been much fewer than 40,000; but those only who had attained the age of 30 years, were admitted to the honour of serving beyond the boundaries of Laconia. The soldiers wore a scarlet uniform; and the troops were abundantly provided with all kinds of useful baggage, camp necessaries, waggons, and beasts of burden, with numerous artisans, labourers, and servants from the Helots, that every warrior might have no other business but that of fighting, and be as much as possible at his ease when not engaged on duty. An advance guard of horse always preceded the march of the army; and the form of encampment was directed to be as nearly as possible of a circular figure. The cavalry do not appear to have ever excelled, and the infantry were always heavily armed, even when circumstances seemed to require some other mode. In order to restrain the love of war and thirst of conquest, which could not fail to actuate a nation of soldiers, Lycurgus expressly prohibited his countrymen from engaging in frequent wars with the same people, and from pursuing a flying enemy when once decisively beaten. Thus also he provided against the chance of foreigners acquiring the Spartan discipline; and, by lessening to the enemy the danger of flight, secured to his countrymen the probability of a cheaper victory.

Lycurgus, having completed his plans, and seen them fully reduced to practice, next proceeded to secure the continuance of the system. He would not consent that his laws should be committed to writing; but wished them, like oracles, which were only uttered by the voice, to remain engraved on the hearts of his people with all the authority of divine institutions. With the view of farther providing for their perpetuity, he assembled the kings, senate, and people; and bound them by a solemn oath, that they would make no alteration in the laws which he had instituted till he should return from Delphos, to which he was going for the purpose of consulting the oracle on some matter of public importance. Having obtained from the god a farther sanction of his institutions, which he transmitted in writing to Sparta, he put an end to his life by abstaining from food; that, by never returning, his countrymen might never be released from their oath. His institutions continued in force for the space of 500 years, and their influence soon became manifest in the martial spirit of the Lacedaemonians. They became impatient for war, and eagerly sought an opportunity of exerting their newly acquired strength.

* Other accounts relate that he retired to Crete, where he died at a great age, and commanded his ashes to be scattered on the sea, that the Lacedaemonians might not be able to bring back his remains, and thus to seek a release from their obligation.
One of the most important of their early struggles was carried on against the Messenians, which originated in a tumult at Liniæ, where the Messenian and Lacedæmonians, (being both of the Dorian tribe,) were engaged in celebrating the worship of Diana; and where Teleclus king of Sparta, son of Archelaus, the contemporary of Lycourgus, was slain. The Lacedæmonians complained, that the Messenians, having attempted to carry off some Spartan virgins, Teleclus received his death in their defence; while the Messenians averred that the pretended virgins were armed youths in disguise, for the purpose of assassinating the Messenian chiefs who attended the solemnity. New causes of dispute arose; and the Lacedæmonians, resolved against all measure of reconciliation, solemnly bound themselves to persevere in the contest, and, according to some writers, to remain absent from their homes till Messenia should be subdued. But the Messenians maintained the conflict with equal advantage for many years, under their kings Euphaes and Aristodemus; and it was not till after the death of the latter, that Spartan discipline and perseverance at length prevailed. The Messenians were completely subdued, and half the produce of their lands was exacted as tribute to the conquerors. Among the events of this war, an instance occurred of the singular spirit which prevailed in Sparta, and which is so generally accredited by ancient writers, as to authorize the belief that their accounts, though not altogether so consistent with each other, must have rested on some foundation. The absence of the Lacedæmonians from their homes was at length felt in the city, as not only a domestic grievance, but also a public evil; and in order to remove the check thus imposed upon the population of the state, all the young men, who had joined the army without having taken the oath of absence, were sent home to supply the place of temporary husbands to the women. After the termination of the war, the innocent offspring of this irregular connection, being slighted by the other citizens, and not submitting patiently to the disgrace attached to their class, were persuaded to emigrate to Italy, where they founded the city of Tarantum. After a period of nearly forty years, the new generation of Messenians made a resolute attempt to regain their independence; and, under the auspices of Aristomenes, a descendant of Hercules, through a long race of Messenian princes, sustained a desperate struggle with the power of Lacedæmon; but were again compelled to receive the yoke of the victorious Spartans, who repopulated the desolated tract, which they had thus acquired, by colonies of Asinians and Nauplians, who had been expelled from their natural seats by the Argians. With these last mentioned people the Lacedæmonians had previously been engaged in a severe struggle for the district of Thyrea, which was situated within their mutual limits; and which was finally annexed to the Laconian territory, a circumstance which gave rise to a long and deadly animosity between the two contending parties. A similar contention took place between the Arcadians, who enabled the city of Tegea to resist, with more than usual valour and success, the Spartan encroachments; till at length the political citizens of Lycourgus succeeded in forming a close alliance with these brave mountaineers whom they were unable to subdue, who afterwards proved the most serviceable auxiliaries in the ambitious schemes of Lacedæmon. 

As the Lacedæmonian institutions were so unfavourable to literature, adverse to all foreign intercourse, and productive of strict secrecy in their own polities, there is little accurate information to be found in ancient writers with regard to the more early internal transactions of their state. There appears, however, to have been a constant and violent struggle among the nicely balanced powers of the government; and, in order to restrain the overbearing spirit of the senate, kings Theopompus, who completed the first conquest of Messenia, seems to have either originally instituted the order, or at least to have greatly enlarged the authority, of the popular magistrates, named Ephori. These were five in number, elected annually by the people from their own body; and bearing a near resemblance to the tribunes of Rome. The primitive design of their office was merely to serve as vindicators of the constitutional rights of the people against any encroachments of the kings or the senate; but, by degrees, they acquired a more extensive authority, deciding on measures of peace or war, determining the number of forces to be raised, and providing funds for their maintenance; holding courts of inquiry into the conduct of all magistrates, supreme and subordinate; engrossing, in short, the whole administration of civil affairs; and reducing the kings always to the situation of mere hereditary generals of the army.

The Lacedæmonians were by this time far the most powerful people of Greece. Masters of Messenia, and ancient allies of Corinth, they in a great measure commanded in Peloponnesus. Their ambition was unbounded; and they watched every opportunity of extending their power. Whenever the Grecian states were involved in mutual wars, or agitated by internal seditions, they were ready to interfere as mediators; and while, in this capacity, they usually conducted matters with much apparent moderation, they seldom failed to strengthen the influence of their own state. They uniformly favoured the aristocratical or oligarchical parties in the different Grecian cities; and having always, by this plan, a few chiefs in every place indebted to their support, they easily rendered these dependent leaders effectual instruments of securing to them the aid, and almost the submission of their respective countries. This policy they began about this time to pursue among the Athenians, whom they had assisted to liberate from the yoke of the tyrant Hippias. But, for an account of their proceedings in this affair, and also of their transactions in the Persian, Peloponnesian, and Theban wars, we must refer our readers to the articles Atheni, Ephorion, and Greece.

A few of the more important of the intermediate and insulated events, however, which belong to the history of Lacedæmon, and which affected its internal interests more directly and permanently, require to be noticed, as far as our limits will permit. A short time after the conclusion of the Persian war, the Spartan commonwealth was thrown into the utmost confusion, and reduced to the brink of ruin, by a destructive earthquake in its capital, and a formidable insurrection of the Helots. By the former of these calamities, 20,000 lives were lost, and only five houses left standing in the city. The wretched slaves throughout the country, profiting by the disorder and distress which ensued, rose in a body to avenge their sufferings, and secure their freedom; but, by the exertion of king Archidamus, a sufficient number of Spartans was assembled, to protect the metropolis; and the insurgents, many of whom were descendants of the Messenians, betook themselves in a body to the strong hold of Ithome. The Lacedæmonians, though singularly expert in the use of arms, were utterly helpless in almost every other occupation; and by the simple desertion of their slaves,
exclusive of their formidable opposition as an enemy, were reduced to the greatest straits. The operations of navigation, and the exercise of the mechanic arts, were suspended; and application was made for succour to all the neighbouring states. By the reinforcements thus procured, the rebellion was so far reduced, that the remaining insurgents were blocked up in Ithomi; but the extraordinary strength of the place, and the desperate resistance of its possessors, rendered every assault unavailing; and it was found necessary to solicit the aid of the Athenians, who were esteemed the most skilful of the Greeks in the conduct of sieges. Their united attacks still proving unsuccessful, recourse was again had to the old method of blockade; and it was during the leisure of this tedious plan of proceeding, that the assuming vicitvity of the Athenians on the one hand, and the unwielding pride of the Lacedaemonians on the other, occasioned those mutual animosities, which led directly, though not immediately, to the fatal Peloponnesian war. So far did the suspicions of the Lacedaemonians arise, that they declined a continuance of the Athenian assistance; and turning on their part, were to exasperated by their dismissal, that they forthwith renounced the confidence with the Lacedaemonians, and formed an alliance with Argos, the inverteate enemy of Sparta. The reduction of the Helots was at length effected; but nothing that they had ever suffered from their relentless oppressors, can be compared with a measure which was subsequently adopted, while the Lacedaemonians were hard pressed during the first period of the Peloponnesian war, and which is perhaps the most disgraceful that has been recorded in the annals of any nation. Desirous to carry the war to a distance, but dreading the renewal of insurrection among the slaves, should the troops be removed from home, they invited, by proclamation, such of the Helots as were willing to merit the gift of freedom, and the dignity of citizens, by deeds in arms, to present themselves to the magistrates for the honourable trial. Having thus discovered the more enterprising individuals, who might have been most ready for insurrection, about 2000 were selected, marched in solemn procession around the temple, under pretence of being admitted as freemen to the participation of religious rites, and then privately massacred by their unfeeling tyrants.

Towards the conclusion of the Peloponnesian war, considerable changes took place in the spirit and administration of the Spartan government. Its kings, always more exalted in war than in peace, became interested in holding commands on distant stations, but found a constant check upon their schemes in the poverty of the state. Agis, while commanding at Derbeleis, a port which the Lacedaemonians had occupied in Attica, availed himself of a concurrence of favourable circumstances, to accomplish the establishment of a public revenue in Sparta; and, for the better support of this powerful arm of war, the Lacedaemonians, departing still farther from the system of Lycurgus were persuaded, first by Alcibiades, and finally by Lycurgus, to solicit pecuniary aid from Persia, and to allow the introduction of gold and silver coin into the republic. This stream of foreign wealth, speedily sapped the rigid integrity which had hitherto distinguished the Spartan character, and smoothed the way for those alliances with the Persian court, which were too often constructed on principles hostile to the general liberties of Greece.

After the conclusion of the Peloponnesian war, the powers of Sparta reigned paramount in Greece; and its leaders acted a distinguished part in the assistance rendered to Cyrus in the expedition against his brother Artaxerxes. By the exploits of the ten thousand on that occasion, they had both learned to despise the Persian armies, and had exposed themselves to the vengeance of the Persian monarch. The Asiatic Greeks, who were more immediately obnoxious to the apprehended retaliation, and who had formerly paid allegiance to the Athenian state, now solicited the more powerful protection of Lacedaemon; and a war with Persia, famed for wealth more than for warlike spirit, found a ready support among the needy states of Peloponnesus. The allied forces were conducted by the Spartan general Deryllidas, who, without the splendour of any memorable victory, and therefore with less renown than his talents appear to have merits, accomplished the emancipation of the Ionian Greeks from the Persian dominion.

That modesty in command, united with dignity of Spartan character, that contemn for wealth, and superiority in military and political knowledge, to which the institutions of Lycurgus had formed his countrymen, had, in former times, raised so high the character of Sparta, that the Grecian republics readily acknowledged them as their head, yielded a willing obedience to their generals in united warfare; regarded an individual of their nation at the public games with more curiosity and admiration than even the victors in the contests; and manifested a respect for their character, as was never perhaps paid to that of any other people. But in the long course of the Peloponnesian wars, and the extensive communication with strangers to which it led, and the necessity of raising a larger public revenue which it imposed, the Spartan man was become altered and corrupted, and their high fortune gave rise to a haughty tyranny in their conduct, which gradually alienated the most ancient and attached of their Peloponnesian allies. Their implacable punishment of Elpis (to whom a kind of religious supremacy was admitted among the Grecian states, but whose decrees against Sparta were avenged by the terror of the sword) produced a strong sensation against them among the Grecian people. A very considerable alteration had taken place also in their own civil arrangements; though little information exists of the particular steps, and regular progress by which these encroachments were produced. But, contrary to the system of Lycurgus, (which allowed no distinction of rank or privileges except what arose from age and merit,) the families in the capital, peculiarly named Spartans, had engrossed the whole power of the commonwealth; and the rest of the people, under the general designation of Lacedaemonians or Lacedaemons, was excluded from the higher offices. Those Spartan families who appropriated to themselves the superior dignities of the state, were distinguished by the name of Peers, though now greatly reduced in number, began to widen the distinction between themselves and other classes, and to exercise their authority with less reserve and discretion. This overbearing conduct produced a dangerous plot, a short time after the accession of Agesilaus to the throne, for effecting a complete change of government, by assassinating kings, ephors, and senate; but its leader Cinadon and his accomplices being discovered and executed, the spirit of sedition was checked, and the exclusive privileges of the peers preserved. The unanimity and stability of the state were at the same time more confirmed, than had been the case for a long period, by the talents and manners of king Agesilaus, who possessed much of the genuine
Spartan character, and paid equal respect to the ephori, senate, and people; but an event, which at first extended the power and fame of the Lacedaemonian king and commonwealth, prepared the way for the final downfall of Spartan pre-eminence.

Agis, commissioned with a powerful army to protect the Greeks of Asia against the design of the Persian monarch, entered upon a brilliant career of victory equally productive of honour and spoil. He scattered, with little difficulty, the Persian forces that were brought against him; passed from province to province as if on an uninterrupted march; excited the remoter parts of the empire to throw off the yoke, and made the great monarch tremble for his personal safety in the midst of his dominions. (See Agis.)

This extraordinary success, however, urged the Persian court to employ a different weapon of defence. By the distribution of gold, the promise of subsidies, and the disposal of the Persian fleet, a powerful confederacy of the Athenians, Corinthians, Argives, and Thebans, was arrayed against the domineering commonwealth of Sparta. The defeat and destruction of their naval force by that of the Persians and Athenians under the command of Cimon, was the first fatal blow to their power; from the effects of which they never recovered, and which was followed by a general revolt of their colonies and tributary allies. The subsequent victory gained by Agis at Coronea over the confederate Greeks, (the most sanguinary, according to Xenophon, that he had ever witnessed,) and the advantages obtained by Praxitas at Corinth, still upheld the renown of the Spartan name; and peace procured by the Persian mediation, through the able policy of Antaleidas, secured the supremacy, and served the interests of the Lacedaemonians nearly as effectually as the successful termination of the Peloponnesian war had been. But the fatal issue of the Theban war which followed, and which their own overbearing interference had excited, together with the loss of half their territory by the restoration of the Messenian state, (which was a consequence of that war,) completed their long established influence as leaders in Greece, and left the nation in a state of indiscipline and disorder from which it never recovered. (See Greece and Epaminondas.)

Before the power of Philip of Macedon had made much progress in Greece, the Lacedaemonians had so far recovered their strength as to renew their oppressions on the adjoining states, particularly of Argos and Messenia; but, though aware of the danger to be apprehended from the measures of the politic Macedonian, they were either too degenerate, or still too feeble, to make any decisive effort in behalf of the falling liberties of Greece. At the assembly of the different states summoned by Alexander the Great to concert the expedition against Persia, they were the only people who ventured to protest against the measure, (apparently, however, from a spirit of pride rather than from any settled principle of policy on the subject,) and openly asserted, in the strain of their ancient independence, that "they had been accustomed to point out the way to such glorious deeds, and not to be directed by others." But they were obliged to submit to the prevailing sentence of the assembly, and to concur in the appointment of the Macedonian prince to the office of generalissimo in the war. Unawed, nevertheless, by the power of Alexander, or by the terrible example of his vengeance inflicted on the city of Thebes, the Lacedemonians, under their intrepid king Agis, the grandson of Agis, embraced every opportunity to thwart the measures of the great conqueror, and to vindicate the independence of their country.

When the news of the victory at Arbela had alarmed the other states, by a dread of the growing Macedonian power, more than it gratified them by the humiliation of their old but despised enemy, Agis, more daring than prudent, and more ambitious of restoring Spartan supremacy than Grecian liberty, took the field with a powerful army, and marched against Megalopolis, the only Peloponnesian city which had acknowledged Alexander for its sovereign. But Antipater, who commanded in Macedonia, arriving speedily with a superior force, the Spartans and their allies were defeated, and their enterprising leader slain in the battle. Eumenes, the son of Agis, a wise and virtuous prince, and a decided advocate of peace, restrained the ardent but ill-judged zeal of his countrymen, to prosecute the unequal contest; and, when one of his subjects was magnifying the victories which his ancestors had gained over the Persians, as an argument in favour of hostilities against Macedon, "Do you think," said the king, "that it is the same thing to make war against a thousand sheep, as against fifty wolves?" Of the subsequent reigns, little more is known than the names of the kings, and of a few leading men; but amidst all the revolutions of Greece, the shadow of independence still retained at Lacedaemon. It was still governed by its own princes and senate, and had never submitted to the humiliation of receiving within its walls a Macedonian garrison. A striking instance of its ancient spirit was displayed against Pyrrhus, when in his attempt to annex the Peloponnesus to his kingdom, and who had reached the capital of Lacedaemon a time when the army was absent on an expedition to Crete. The women vied with the men in fortifying the city, and repelling the enemy; and, after repeated attempts to carry the place by assault, the king of Epirus was compelled to retreat. This was nearly the last expiring blaze of Spartan valour; opulence and voluptuousness had long prevailed in place of the poverty and discipline in-duced during the administration of Lyscurus. The most remarkable corruption of those laws had been intro-duced during the administration of Lyscurus and Agis, whose conquests had filled their country with wealth, and opened the sources of luxury and avarice. The most flagrant abuses succeeded in every department of the state, and threatened its total subversion. The ephori, instead of answering the end of their institution as a check upon the despotism of the kings and the turbulence of the people, had become an arbitrary and corrupted body, tyrannizing over all parties. The public meals, the last pledge of Spartan temperance, had been discommodified; and the lands had accumulated in the possession of a few families, who lived in the greatest splendour, while the rest of the population was doomed to extreme penury. In this state of affairs, Agis, the son of Euell, ascended the throne; and, though his family was the most opulent in the state, and himself brought up in all the ease of luxury, he nobly planned the restoration of the ancient discipline, and the re-establishment of the neglected laws of Lycurus. (See Agis.) His failure and death left the whole constitution of Sparta in the utmost confusion, and the country itself in a state of rapid depopulation. His successor Cleomenes, animated with the same spirit of reformation, but less averse from sanguinary measures, determined to pursue a
more vigorous course. Considering the ciphers as the source of the evil, he caused them to be put to death in a secret and summary manner; and having called an assembly of the people, restored the ancient constitution in all its simplicity and rigour. But the habits of his countrymen were too depraved to be so instantaneously renewed; and, as soon as he had quitted the capital to take the command of the army against the Achaeans, with whom a quarrel had arisen, the new discipline was again relaxed. His efforts to break the domination of the Achæan league over the other states of Peloponnesus were at first successful; but, by the aid of Antigonus of Macedonia, his army was almost annihilated in a general engagement at Sellasia; and, afraid to encounter his disaffected subjects, he sought an asylum in the Egyptian court. The Spartans, no longer worthy of the name, after suffering the most unparalleled cruelties from the sanguinary tyrant Nabis, were reduced by Philopomen to a state of complete subjection to Achaia; and, finally, surrendered their own liberties, as well as the general independence of Greece, by committing themselves to the protection of the Romans. See the references under the article Greece. (g)

LACQUER is a varnish applied to brass and other metals, in order to improve their colour, and preserve them from tarnishing. The different lacquers are formed by shell lac dissolved in alcohol. See GILDING and VARNISH.

LACTANTIUS, Firmianus, sometimes called also Lucius Cerlius, or Cecilius, one of the Christian fathers, is supposed to have been born at Firmum, in Italy, and to have thence derived his surname of Firmianus. But he is more generally considered as a native of Africa, where it is, at least, ascertained, that he received a part of his education under Amnobius at Sicca, and where he was probably born about the end of the third century. There is nothing known with certainty of his origin; but he soon became distinguished as a rhetorician, and was selected by Dioclesian as a teacher of the art in Nicomedia. It is not known how he escaped the cruel persecution which that emperor soon after directed against the Christians; but he appears to have remained in Nicomedia for some time after its commencement. He is said to have found little employment as a teacher of rhetoric, and is understood to have betaken himself on that account to writing. During the greater part of his life he lived in a state of poverty; but historians are not agreed, whether this was in consequence of his labours failing of their just reward, or of a voluntary renunciation of wealth on his own part. He was at one time, however, honourably, and not unprofitably, employed, when, in his old age, he was appointed by Constantine to instruct his son Crispus Cæsar in the Latin language. On this service he removed to Gaul, and resided at court; but it is not known what became of him after the death of his pupil, except that he attained to a great age, and died, as he had lived, in poor circumstances. He wrote a number of treatises, of which the most valuable are his work De operibus Dei, in which he discusses the subjects of creation and providence; his Institutiones Divinae, a general and able defence of Christianity against all the objections of the heathens, of which he afterwards drew up an abridgment, (long supposed to have been lost, till it was discovered by Piaf. in the library of the king of Sardinia at Turin, and first published at Paris, in 1712;) and, lastly, his book De ira Divina, a learned and elegant, as well as Lactometer, a complete treatise on the subject. There are numerous editions of the works of Lactantius, the first of which was published at Rome in 1408, folio; and one of the most ample at Paris in 1748, in 2 vols. 4to.

Lactantius, as a writer, is one of the most elegant and pleasing of the fathers. He was possessed of eminent talents, which he employed in the service of religion with the most disinterested views. His works discover a considerable portion of learning, and are peculiarly distinguished by the purity and elegance of his style. He studiously imitated, in this respect, the great Roman orator; and is generally denominated "the Christian Cicero." He was an ardent investigator of truth in general, and earnestly zealous for the vindication of the Christian faith. He is said to have had a natural impetuosity of temper, which is supposed to have biased his conclusions on some occasions. But he was distinguished altogether by uncommon uprightness and simplicity of character; and though more successful in refuting heathen errors than unfolding sacred truth, he may be ranked among the ornaments of the Christian name in the age in which he lived. See Histoire Litteraire de la France, tom. i.; Tillemont, Mem. Eccl. t. vi.; Lardner's Credibility of the Gospel History, part ii.; and A Concise View of the Succession of Sacred Literature, by Dr. Adam Clarke. (g)

LACTOMETER, is the name of an instrument, invented by Mr. Dices, mathematical instrument maker toometeteterer. It is constructed with ten divisions upon the stem, similar to the patent brewing hydrometer, and with eight weights, which are to be applied only one at a time upon the top, to obtain the weight of milk; an ivory sliding-rule accompanies the instrument, upon the middle or sliding part of which is laid down the lactometer weight of the milk, going from 0 to 80; and opposite thereto are placed the various strengths of the milk, from water to 100; 100 having previously been fixed upon, from a number of experiments, as the standard of good new-milk, and each of the other numbers bearing a proportionate reference thereto. At one end of the sliding-rule, the degrees of heat, from 40 to 100, are placed with a star opposite, as an index to fix the slide to the temperature of the milk; the whole being graduated to show the exact strength of the milk, as it would appear in the temperature of 55° of heat, although tried in any inferior or superior temperature between 40° and 100°; thus the great inconvenience which would attend bringing the milk at all times to one temperature is avoided, and a simple mechanical method of allowing for the contraction and expansion substituted. And as skimmed milk, being divested of the particles of butter which existed before skimming, appears to have a less degree of affinity with that than the new milk has, one side of the ivory sliding-rule is adapted to skimmed, and the other to new milk.

General Rule.—First, find the temperature of the milk with the thermometer, and fix the sliding rule so that the star shall be facing the degree of heat the mercury rises or falls to; then put in the lactometer, and try which of the weights, applied to the top, will sink it to some one division upon the stem; add the number
Again, evidently the great 72°, the lactometer with the weight 40 sinks to nine upon the stem. Fix the slide so that the star shall be facing 72°; then opposite 40 will be found 100, the strength of the milk. Again, if in 60° the lactometer with 50 on the top sinks to 6 upon the stem, the slide being fixed for new-milk, so that the star shall be at 60° degrees of heat, then facing 50 will be found 110, the strength of this milk in proportion towards the other. Provided it is equally replete with cream. To discover which, it becomes requisite these test samples should stand a certain time, that the cream may rise; which, being taken off, they are to be tried with the lactometer again; and as the cream is evidently the lighter part, the milk will appear by the lactometer denser or better in quality than before. Suppose the milk in the first example to be 57 by the lactometer in 60° of heat, then the strength by the skimmed-milk side of the rule will be 112. And admit the second example of new-milk to be 58 in 64° when skimmed, the strength would be 116.

As a comparison, say—

<table>

</tbody>
</table>

From which it appears, that No. 1 has produced a larger quantity of cream than No. 2, and consequently may be deemed the better milk. Some instances have occurred where the strength of new-milk has only been about 80, and when skimmed near 100. Thus it may, without the least impropriety, be called a milk much better adapted for making butter than cheese; the serum or whey in general being near the same density.

The instances in which the lactometer may be useful, are, according to the same writer, in discovering what breeds of cattle are most advantageous; what food in the winter season, whether carrots, turnips, potatoes, &c. are best; what the effects of different pastures may be; how far particular farms are best adapted to making butter and cheese; how far the inconvenience of large cheeses in some dairies being too rich to stand may be prevented, by discovering when this redundancy of richness exists in the milk; and in fixing a standard for the sale of this useful article of life.

A standard for skimmed milk may readily be fixed, by saying what strength the common saleable skimmed milk shall be by the lactometer, or what its specific gravity shall be in relation to that of water in the temperature of heat, and that an easy comparison may be made between the specific gravity of any milk, and its lactometer strength; this instrument is so constructed, that one of specific gravity shall exactly correspond with three of strength; that is, the strength of 90 by the lactometer is a milk whose specific gravity is 1030, to common pump water 1000. From a number of experiments and observations, it is observed, that the common saleable skimmed milk in Liverpool is from 52 to 64 of strength, that of new milk from 70 to 80; but it would be difficult to fix any standard for the latter, unless some mode could be devised to discover whether it was mixed with old milk or not. The only method would be, after fixing the strength of it, to try, by letting it stand, to discover if it produced that quantity of cream, which as new milk it might reasonably be expected to do.

Another lactometer, upon a different principle, has been recently constructed at the desire of Sir Joseph Banks, by Mr. Thomas Jones, mathematical instrument maker, Charing Cross. Sir Joseph has described it in the Farmer's Journal, and it promises to answer the intended purpose.

It consists of any number of glass tubes, of the same internal diameter, which is generally about one-third of an inch, and about 11 inches long. They are closed at one end, and open and a little flanged at the other, like the test tubes used by chemists, and are mounted on stands in the same manner. At the distance of 10 inches from the bottom of each tube is a mark, with 0, or zero, placed opposite it; and from this point the tube is graduated into tenths of an inch, and numbered downwards for three inches, so that each division is 1/10 of the tube. If several of the tubes are filled with new milk at the same time, and placed at the same temperature, the cake of cream will form at the top, and its thickness or quantity will be indicated by the divisions. In this way experiments may be made on the relative quantities of cream produced by different systems of feeding, or by different animals fed and placed under different circumstances. The per centage of cream is thus obtained by simple inspection. See Brande's Journal, vol. iii. p. 393, 394.

LADANUM. See LADDA NUM.

LADOGA, or LADOZHK, is a large lake of Russia, in the government of Viborg, lying between the Gulf of Finland and the Lake of Onega. It is about 175 versts long, and 105 broad, and is deemed one of the largest lakes in Europe. The shores of the lake have a flat coast, and a sandy beach. It produces a great number of seals. On account of the numerous shifting sand banks, and the dreadful storms which prevailed, Peter the Great, in 1718, projected the famous Ladoga canal, cut along the southern shore, from the Volkhof to the Neva. It was finished during the reign of the Empress Anne, and was at first carried only as far as the Kabona, a rivulet which enters the lake to the east of Schlusselburgh; but it now stretches without interruption from the Volkhof to the Neva. It is 64 1/2 miles long, 70 feet broad, and the mean depth of water is 7 feet in summer, and 10 in spring. It is supplied by the Volkhof and 8 rivulets, and has 25 sluices. The barks enter through the sluices of the Volkhof, and go out through those of Schlusselburgh. In 1778, 4927 vessels passed through this canal. The lake of Ladoga is connected with the Baltic by the Neva, with Lake Onega by the river Svir, and with Lake Ilmen by the Volkhof. See Navigation in Russia; Tacke's Travels in Russia, vol. i.; and Cox's Travels in Russia, vol. iii. p. 374, where the reader will find a plan of the Ladoga canal.

LADRONES, or MARIAN ISLANDS, a large archipelago on the verge of the Pacific ocean, stretching from north to south about 200 miles, are situated between the 11° and 21° of North Lat. and nearly under the 145th parallel of East Long. They were originally discovered by Magellan in 1521, who first gave them the name of Las islas de las Velas, from the peculiar sails of their prows; but afterwards denominated them Las islas de los Ladrones, from the thievish disposition and dexterity of
the inhabitants. Nearly a century and a half elapsed before the Spaniards proceeded to take formal possession of these islands, or to make any kind of settlement upon them; but, about the year 1698, Mary-Anne of Austria, widow of Philip IV, sent out a body of missionaries for the instruction of the natives; and it was owing to this circumstance that they received the name of the Marian, or more properly Mary-Anne islands. About ten years afterwards, a small military force was dispatched to support the missionary establishment; but disputes between the soldiery and the inhabitants were the consequence of this measure; and it was not till the year 1693, that the whole of the islands were completely subjected to the Spanish dominion. These indolent conquerors, however, have done nothing either to improve the condition of the natives, or to render the islands beneficial to their empire; but have merely held them as a post of communication between their possessions in the East and West Indies: Their measures have rather tended to desolate the most fertile of these distant possessions. About the end of the 17th century, an epidemical disorder having thinned the population, the remaining inhabitants of Tinian were cruelly torn from their native shores, to recruit the settlements at Guam, where the unhappy exiles drooped, and died in despair.

**Names and extent.**

The Ladrones are fourteen in number; but only three or four of them are inhabited. The principal are, Guam, or St. John, the largest and most southerly, which is about 56 leagues in circumference, and is situated in 13° 25' North Lat. (see Guam); Zarpape, or Rita, about seven leagues farther north, and 15 in circumference; Aguijan, or St. Ann, a high island, of difficult access, three leagues round, and 13 north of Zarpape; Tinian, about 12 miles long and six broad, separated from the last mentioned by a narrow strait; Saypan, or St. Joseph, three leagues north of Tinian, and 25 in circuit; Anatachan, or St. Josephine, 10 leagues round, and 36 north of Saypan; Sarigan, or St. Charles, four leagues in circumference, and separated from the last mentioned by a channel eight or nine miles in breadth; Guan, or St. Philip, still smaller, and six miles farther north; Amalagan, or Conception isle, 12 leagues northward, and five in circumference; Pagon, or St. Ignatius, 10 leagues from the last mentioned, and 14 in circuit; Agrigan, or St. Xavier, 10 leagues distance from the last mentioned, and nearly of the same size; Assonson, or Assumption island, nearly 12 leagues northwards, a black, rugged, uninhabited cone, about 40 toises above the level of the sea, with the crater of a volcano on its summit; Urae, a desert isle, three leagues in circumference, and the most northerly of the chain, is situated in 20° 45' North Lat.

Among these islands are numerous rocks, shoals, and currents which render navigation extremely dangerous; and there are few safe harbours or roads in the whole group, except on that of Guam, particularly in the town of Agana, the residence of the Spanish governor. The climate of the Ladrones, in general, though they lie under the torrid zone, is serene and temperate, except in the months of July and August, when the weather is intolerably hot; and during the season of the western monsoons, between June and October, when tremendous hurricanes are experienced at the full and change of the moon. Their general aspect is beautiful and picturesque; their mountains and forests covered with perpetual verdure, and their soil naturally fertile and productive. The decreasing numbers and depressed state of the inhabitants, however, have occasioned a deplorable change in those respects; and the most delightful among them have been subjected to desolate, from a state of cultivated beauty, into the rudest forms of an impetuous wilderness. In the year 1742, the island of Tinian, according to the description given in Lord Anson's voyage, was one of the most interesting and healthy spots in the world. The land rose in gentle slopes from the beach to the middle of the island, occasionally interrupted by valleys of easy descent; and woods of lofty spreading trees, many of them loaded with salutary fruits, covered the rising grounds. The lawns, which skirted the forests in various directions, and of considerable extent, were clothed with a clean and uniform turf, composed of the finest trefoil, intermixed with flowers. This beautiful herbage frequently extended a considerable space under the shade of the adjoining forests, which in many places were entirely free from all bushes and under-wood. In these woods were found inconceivable quantities of cocoa-nuts and cabbages on the same tree, guanas, limes, sweet and sour oranges, and the celebrated bread-fruit, besides a variety of wholesome vegetables, such as water melons, creeping purslain, mint, sour-grass, and sorrel. Cattle of a milk-white colour, with black or brown ears, and whose flesh was extremely well tasted, were seen in herds of some thousands, grazing in the meadows; and wild fowl of various kinds, particularly duck, teal, curlew, and the whistling plover, abounded on the fresh water lakes in the centre of the island. Even domestic poultry ranged the woods in great numbers, and could be run down with little trouble. Every circumstance, in short, in the aspect of the country, and the habits of the animals, conveyed the idea of a place recently inhabited, and carefully cultivated. The climate also was peculiarly salubrious and agreeable, cooled by constant breezes, and short refreshing showers; and produced the most astonishing effects upon the diseased and debilitated frames of the seamen. But, in little more than 20 years afterwards, the same spot, when visited by Byron and Wallis, presented a picture almost in every feature, completely opposite to that which Anson beheld. The woods were overgrown with underwood, and parasitical plants, which obstructed every path. The lawns were covered with rank grass and reeds, furnishing a secure asylum to swarms of centipedes, scorpions, and other venomous insects. The cattle were few in number, and so extremely shy, as to render the pursuit of them a most laborious service. The air was so hot and oppressive, that the seamen could scarcely make the necessary exertion to procure the requisite supplies of provisions; and had so powerful an effect upon the animals which they were able to kill, as to render their flesh almost instaneously putrid. The water was brackish, and full of worms. The rains were incessant, while a suffocating heat continued to prevail; and the climate proved so unpropitious, that many of the crew were seized with fevers. The fruits were much the same as at the period of Anson's visit; but none of the vegetables, so salutary in the cure of scurvy, were to be found. If the picture drawn by the first voyagers may be supposed to have been overcharged in the delightful sensations which a sickly crew would experience on reaching a verdant shore, the same reasons should equally have influenced the subsequent navigators, whose description presents so striking a contrast; and, after making every allowance for different seasons and different feelings in the writers, the change must obviously have been great in
the state of the island, and furnishes a remarkable instance of the effects produced by human culture on the soil and climate of a country, and of the rapid relapse into all their original wildness, when that influence is withdrawn.

With regard to the productions of these islands, in general, it may be farther stated, that sulphur, and some signs of metals, have been discovered on Guam, and a pearl fishery near the coast of Saypan; that the cotton and indigo trees are very abundant on many of them, and that the most valuable productions of both the Indies might be easily introduced; that, besides the animals already mentioned, there are numbers of wild hogs of a large size; some of which weighed 200 pounds) guanacoes, particularly on Saypan, which are supposed to have been introduced by the Spaniards; immense swarms of musquitoes, large black ants, a variety of venomous insects, and a species of tick, commonly attached to the cattle, but which was apt to settle on the hands and limbs of the European visitors, and burying its head under the skin, caused a painful inflammation; and that the fish on the coast have been uniformly found to be unwholesome.

The inhabitants of these islands regarded themselves, before the arrival of the Spaniards, as the only human beings in the world, and had a tradition that the first man was formed of earth from the island of Guam. In colour, speech, manners, and government, they bore a great resemblance to the Tagals, the original inhabitants of the Philippines. They appeared even to Magellan to have made some advances in civilization; and several monuments were observed by Anson and other navigators, particularly on the islands of Timean and Saypan, which indicated the arts and antiquity of the population. Square pyramidal pillars, measuring about five feet at the base, and thirteen feet in height, each surmounted by a semiglobe with the flat surface uppermost, so as to have the appearance of a large bowl, were observed in various parts of the islands, arranged in double rows. These pillars were formed of a composition of stone and sand, with a coating of plaster; and seem to have fallen rapidly into decay, after the depopulation of the island took place. The natives are tall, robust, and well proportioned; of an olive complexion, darkened by the use of cocoa-nut oil; with well grown beards, and long black hair; sometimes tied up on the top of the head. The men wear very little covering, commonly nothing more than a cap of palm leaves; but the women have a kind of petticoat made of mat. Both sexes stain their teeth black, and many paint their bodies with a red colour. They are naturally acute, lively, and ingenious; and the females are described as peculiarly cheerful in their dispositions, and graceful in their deportment. They are said also to be treated with greater respect than is usual among uncivilized tribes; and in the married state, to hold rather a superiority in point of privileges over the men. Their houses, or rather huts, were formed by the palm tree, and divided by mats into different apartments, appropriated to distinct uses, as places for sleeping, eating, working, and holding provisions. Their utensils, though few, were neatly made; and their weapons, consisting only of lances or javelins, were formed of a tough strong wood, and pointed with human bones. But the most striking ingenuity is to be seen in their canoes, called by the Europeans flying prows, or prow which are considered as peculiarly adapted to the nature of the seas and winds around these islands, and as altogether unequalled for simplicity of structure, swiftness of sailing, and ease of management. They are usually about 40 feet in length, 4 in depth, and little more than two in breadth, formed sometimes of a single stern, but commonly of two pieces sewed together with bark, and caulked with bitumen. The mast is above 20 feet high, the sail of a square or rather triangular shape, and capable of being accommodated in such a manner, as to enable the vessel to steer indifferently with either end foremost. The lee-side is perfectly flat, but the windward side is curved like other boats, and is also provided with an outrigger or frame of bamboo, about 12 feet in length, resting on a log 13 feet long, hollowed out like a little boat. The whole being kept steady by braces from the head and stern of the main vessel, and serving to prevent its being overset. These provs will sail, with a brisk wind, at the rate of 20 miles an hour; and nothing can exceed the dexterity of the natives in steering, trimming, and righting them when overset. When such an accident happens, they discover great expertise and presence of mind in the water, to which they are inured from their infancy, and are surpassed by few savage nations in the arts of swimming and diving. They were without any regular government before their subjection to the Spaniards; but have a class of nobles among them, who preserve a high degree of dignity and distance in their intercourse with the other ranks, and are treated with great respect; but possess no further authority than what their persuasion can secure. These islanders, in short, carry the practice of liberty to the utmost possible extent, and pursue their own pleasure without any control. Every man avenges his own quarrel; and hostilities frequently occur between the inhabitants of different districts; but their wars, which are conducted with more acrimony than courage, are never sanguinary; and the loss of one or two combatants decides the battle, and usually terminates the dispute. In order to qualify themselves for these martial exploits, they apply with much ardour to active and athletic exercises, such as running, leaping, wrestling, pitching stones, and throwing lances. Their religion consisted chiefly in a superstitious dread of an evil being, and of departed spirits, whom their magicians (who also practise surgery) teach them to appease by stated fasts, and various ceremonies. They have also poets among them, who are greatly admired; and whose songs (which consist in eulogies on their ancestors and nation) the women are accustomcd to sing in bands with a considerable degree of harmony of voice, and gracefulness of gesture. See Modern Universal History, vol. iv.; Anson's Voyages, book iii. ch. i.; Byron and Wallis's Voyage in Hawkesworth's Collection; Marchand's Voyage round the World, vol. ii.; and Mortimer's Observations during a Voyage to Teneriffe, &c. and the article Guam. (g).

LAGOON ISLAND, is an island in the Pacific Ocean discovered in 1765, by Captain Cook, and so named from its having a Lagoon in the middle which occupies the greater part of it. It is of an oval form, and is covered with trees, principally cocoa nut trees, and palm trees. West Long. 159° 28', South Lat. 18° 47'. See Hawkesworth's Voyages, vol. ii.

LAGUNA. See Teneriffe.

LAHORE, a large and fertile province in Hindostan, lying between the 30° and 54° of North Lat. and extending about 320 miles in length, and 220 in breadth. It is bounded on the north by the province of Cashmere; on the south by Delhi, Ajmeer, and Mooltan; on the east by the river Satuleje, separating it from Northern Hindostan; and on the west by the
Indus, which divides it from Afghanistan. It was reduced by the Mahommedan invaders under Sultan Baber, in the year 1526, and continued for some time to be the principal seat of the Mogul government, before they had established their power in the central parts of Hindostan. In 1582, as described by Abel Fazel, it contained five circars, which were subdivided into 234 pargunnahs; and was capable of furnishing 54,480 cavalry, and 426,066 infantry. It has, of late years, fallen under the dominion of the Seiks, and greatly decayed in its prosperity. It consists of two portions of nearly equal extent; the mountainous districts, which occupy the whole space from 32° north; and the flat country, to the south of this latitude, which is generally known by the name of the Punjab. This appellation is sometimes erroneously applied to the whole province, but properly describes the lower part, referring to the five noble rivers by which it is intersected, viz. the Satuleje, the Beyah (or Hypphasis), the Chinaub (or Acesines), the Jtavey (or Hydravates), the Behat (or Hydaspes). The climate is generally temperate; and in the northern regions the degree of cold, during winter, is little inferior to that of the central countries of Europe. The Punjab is by far the most fertile part of the province; and, when properly cultivated, produces abundantly wheat, barley, rice, pulse of all sorts, sugar-cane, tobacco, and various fruits. In the eastern parts, the sides of the inhabited mountains, where the earth washed down by the rain is supported by butresses of loose stones, so as to form ranges of separate flats, produce wheat, barley, and a variety of small grains; while rice, though not the usual food of the inhabitants, is cultivated in the narrow valleys. In the mountainous tract towards Cashmere, they plant rice on the sides of the hills; but the climate of the northern districts being too hot for the Persian productions, yet not sufficiently warm to mature those of India, is unfavourable for fruits and vegetables. In many parts of the province large beds of fossil salt are found; and it is conjectured, that the mountainous tracts are rich in all sorts of minerals. As the country is subject to so many petty chiefs, in a great degree independent of one another, and scarcely subject to any authoritative head, the commerce of the country is greatly obstructed by heavy duties in passing through their different territories; and the regular trade, which the Punjab used to carry on with the other parts of Hindostan, has in a great measure ceased. The Seik chiefs, however, have begun to perceive their error, and are endeavouring to afford facilities, and restore confidence to the merchant. A trifling commerce is, in the mean time, carried on by petty traders, who procure passports from the respective rajahs through whose domains they have to pass. In this way the province is open to the countries to the west of the Indus, sugar, rice, indigo, wheat, and white cotton cloths; and imports from these countries, swords, horses, fruits, lead, and spices.

To Cashmere, its exports are nearly the same; and its imports shawls and other cloths, saffron, and fruits. To the Deccan are exported horses, camels, sugar, rice, white cloth, matchlocks, swords, bows, and arrows; and from that country are imported sulphur, indigo, salt, lead, iron, spices, and European broad cloth. With the inhabitants of the mountainous parts of the province, the people of the Punjab exchange cloth, matchlocks, and horses, for iron, and other smaller commodities. The general rate of the revenue exacted by the Seik chiefs is one half of the produce; but the whole of this assessment is never levied, and the ryots or cultivators are treated with considerable indulgence. Owning, however, to the number of petty hostile states into which the country is divided, and the frequent devastations to which it is exposed, many of its best portions, especially that which lies between the Jumna and the Indus, are very imperfectly cultivated, and much of the land entirely waste. The inhabitants are composed of Jauts, Mahommedans, Rajpoots, and other Hindoos of lower castes, Seiks, and Singhos. The Jauts, originally a tribe of Hindoos, who erected a state in the province of Agra, but no longer exist as a nation, and are chiefly found among the cultivators of the soil in Lahore. The Mahommedans, who are numerous, are, in the Seik territories, a poor, oppressed, and despised race, employed chiefly in tilling the ground, carrying burdens, and performing other kinds of hard labour. They are not allowed to eat beef, or say their prayers aloud, and seldom permitted to assemble in their mosques, of which few in the province have escaped destruction. The natives of the mountains are composed of different classes of Hindoos, and differ very little from the Southern Hindoos. The goitre or swollen throat is very common among them. The inhabitants of the north-west borders are chiefly Afghans, living in small forts, or walled villages, mutually distrusting one another, and often subjected to the depredations of the Seiks. The Seiks, whose religion is a kind of deism, blended with many of the Hindoo and Mahommedan tenets, form one-fourth of the inhabitants of the Punjab; and are daily increasing in number by converts from other classes. They are chiefly descended from the Hindoos, and resemble in their cast of countenance; but, from their fuller diet, are more robust and active than the Mahruzaas. The original Seiks are full of intrigue, and remarkable from their insinuating manners, possessing all the artifice of the lower classes of Hindoos employed in business, and resembling them in dress, &c., so as to be with difficulty distinguished. The Singhos, a name signifying lions, are those Seiks, by far the majority, who follow the tenets of Gooroo Govind, their last acknowledged religious ruler; and have become a band of ferocious soldiers, distinguished by the free growth of the hair on their heads and beards. They are all horsemen, though many of them serve as infantry in other armies; and their courage is equal to that of any of the natives of India, frequently roused, by their enthusiasm, to a degree of absolute desperation. They are extremely rough and intrepid in their address, speaking invariably in a loud tone of voice. They indulge freely in spirituous liquors, as well as in opium and bang; and are rarely quite sober after sunset. The whole lower orders of the Seiks, or Singhos, are tolerably well protected from the oppression of their chiefs, by the precepts of their religion, which teaches universal equality among all who hold their faith, and by the condition of their country, which enables them easily to transfer themselves to the territories and service of a new leader. Owing, however, to the unsettled nature of the government, the whole province is in a most wretched state of cultivation, and is one of the most thinly inhabited in India. The population, dispersed over a surface of 70,000 square miles, is not supposed to exceed four millions. It might otherwise, with its great natural advantages, the remarkable fertility of its southern plains, and the temperate climate of its northern districts, form the basis of a powerful empire; and,
from its topographical situation, has been considered as the country from which Hindostan might best be ruled or conquered. See Malcolm's *Political History of India, and History of the Seiks; Foster's Journey from Bengal; and Asiatic Annual Register*, vol. xi. (q)

LAHORE, the capital of the last mentioned province, is situated on the south side of the Ravey river, in North Latitude 31° 50', and East Longitude 73° 48'. It is a place of great antiquity, and has undergone many revolutions. After its capture by Sultan Baber in 1520, it was for some time the residence of the Mogul sovereigns; and was greatly improved by Acber and his immediate successors. It was afterwards for a long time possessed by the Abdali Afghans of Cabul, by whom it is named Sikrei; and is now occupied by Rajah Runjeet Singh, the most powerful of the Seik chiefs. But as Amristar, about 40 miles to the southeast, is the capital of the Seik nation, Lahore has been greatly neglected, and may be said to be in a progressive state of desolation. In 1665, it is said to have been about a league in extent, and is still a town of considerable size with a good bazar. The walls are lofty and decorated on the outside, but hastening to ruin. The fort is a place of little strength, having no ditch, or defences for cannon. The river on its northern flank, though about 300 yards in breadth, is neither deep nor rapid except at the height of the rains. There are several manufactories of matchlock barrels, which are esteemed the best in India, and also of cotton cloths, and curious carpets. But the wealthier inhabitants have migrated to Amristar, as a place of greater safety, and many of the best private houses are falling into decay. An avenue, celebrated by early Indian travellers, formerly extended from Lahore to Agra, at a distance of near 500 miles, having an obelisk at the end of every coss, and at every third coss a well for the refreshment of travellers. The principal remaining curiosity in its neighbourhood is the magnificent mausoleum of Jehangeer, within a wall nearly 600 yards square, about two miles north of the city. Lahore is 380 miles from Delhi; 617 from Agra; 689 from Lucknow; 1356 from Calcutta. See Remel's *Memoir of a Map of Hindostan; Asiatic Annual Register*, vol. xi.; and *Asiatic Journal*, vol. iii. (q)

LAKE. See Physical Geography.

LALANDE, Joseph Jerome le Français, a celebrated French astronomer, was born at Bourg in Bresse, in the department of the Ain, on the 11th July 1732. At the early age of six, he was anxious to know how the stars were attached to the firmament; two years afterwards, his whole time was spent in writing sermons, which he preached in the habit of a Jesuit; and in 1744, his time was occupied in observing the comet which then appeared. Having been sent to the Jesuits at Lyons, he conceived a great taste for poetry and eloquence; but an eclipse of the sun, which happened about that time, turned his views towards astronomy. His friends, however, had destined him for the bar, and in obedience to their wishes, he went to Paris to study law. A visit to the observatory, however, excited in young Lalande an ardent passion for astronomy, and from that moment he abandoned for ever his professional studies. Having placed himself under the tuition of Delisle, at that time one of the most celebrated of the French astronomers, and professor of astronomy in the College of France, he made rapid progress in his new studies, and endeavoured himself to his master by the goodness of his disposition, and by his ardent love of knowledge. Lalande also attended the lectures on natural philosophy delivered in the College by Lemonnier, another celebrated astronomer, who was much pleased with the progress of his pupil. The law studies of Lalande being now finished, he received the title of advocate at the age of 18; and, but for an accidental event, he would have been for ever fixed in the profession which had been chosen for him. When Lacaille was about to set off for the Cape of Good Hope, for the purpose of determining the moon's parallax, and her distance from the earth, it was found necessary that corresponding observations should be made in the same meridian, and at the greatest distance from the Cape that could be conveniently obtained. Berlin was chosen as the fittest place for this purpose, being 857° distant from the Cape, and Lemonnier had indicated an intention of making the observations himself; but when the time of his departure arrived, he contrived to get his pupil Lalande appointed in his stead, although he was then only 18 years of age. When the young astronomer was presented to Frederick, he showed some astonishment at his youth, and remarked "the academy of sciences has, however, appointed you; and you will justify their choice." From that moment he was admitted at Court, welcomed by the academy, and became acquainted with the most eminent persons of Berlin. The observations of Lalande were made at the observatory of Berlin in 1751 and 1754, and he has published an account of them, and of the results deduced from a comparison of them with the observations of Lacaille, in three memoirs, which appeared in the memoirs of the academy for 1751, 1752, and 1753.

Lalande was elected adjunct astronomer in the academy of sciences, on the 7th February, 1753. He was admitted associate on the 20th December, 1758, and pensioner on the 4th March, 1772.

The first separate work which he published, was entitled *Étretes historiques à l'usage de la province de Bresse*, and appeared at Paris in 1755.

In 1757, he published his discourse, entitled *L'esprit de justice assure la gloire, et la durée des Empires*, which gained the prize offered by the academy of Marseilles in 1757.

* The more recent accounts from India communicate the following intelligence respecting the personal qualifications and political conduct of this enterprising chief. To a fine and prepossessing figure he unites a countenance remarkably animated. His eyes are large, and of jet black, his forehead high, nose aquiline, mouth small, and smile expressive. He possesses a richly endowed mind, is well versed in the Eastern dialects, and speaks with fluency one or more European languages. He selects his ministers with great discrimination, and with a constant regard to their abilities. During the whole of his reign, war has been his delight; but, in a late attempt to conquer Kashmir, he sustained a severe discomfiture through the treachery of his Sirdars, and gave a cruel vent to his impatience upon his unhappy attendants. He has little confidence in his own subjects as soldiers, but places his chief reliance on the hardi mountainers of Afghanislan. At Lahore he is said to appear to great advantage as the father of his people, administering mild and equal laws, patronising genius, relieving poverty, and, without the tyranny of Indian princes, at once awing and attracting his subjects. He is amiable in private life, and courteous in his demeanour, though rather reserved in conversation; but is de
terrible to his enemies. Under his administration the Punjab is daily regaining its prosperity by rebuilding of villages, clearing of canals, and sinking of wells.
His next work, which appeared in 1759, was a translation of the astronomical tables of Halley, enriched with several new tables, and the history of the comet of 1759.

In 1760, he published the *Oraison funèbre de Maurice Comte de Saxe*. In 1768, a discourse sur la douceur; and in 1769, appeared the first edition of his *Traité Astronomique*. The only French works on astronomy which then existed, were those of Cassini the younger, Lemonnier, and Lacaille, and there was great room for a fuller and more correct system of astronomy. A second edition of this valuable work appeared in 1771, in three vols. 4to. and was followed in 1781 with a fourth volume, which contained a treatise on the tides, and a large memoir by Dupuis on the astronomical origin of Fables. A third edition was published in 1792, in three vols. 4to. and was regarded as the best work on the subject, till it was superseded by the masterly work of M. Le Chevalier Delambre.

In the year 1760, Lalande was charged with the compilation of the Connaissances des Temps; and between the years 1775 and 1807, he published no fewer than thirty-two volumes of that work. In 1770, he published his *Dissertation sur la cause de l'élévation des líquèurs dans les tubes capillaires*; and in 1789, appeared in 8 vols. 12mo, *his Voyage d'un Français en Italie dans les années 1765 à 1766*, containing the fullest and best description of Italy that has been published.

Lalande composed all the astronomical articles for the Encyclopædia of Yverdon, which was published in 38 vols. quarto, and also those for the Supplement to the Encyclopædia; and those for the Encyclopædique Methodique. He wrote also the mathematical articles in the *Journal de Savans*, from 1760 downwards.

In the year 1761, Lalande succeeded M. De Lisle in the chair of astronomy in the College of France, and he discharged the duties of his new office with such ability, that his school became a seminary of disciples who filled most of the observatories in the world.

In 1768, M. De Lalande made a journey into England, with the view of witnessing the progress of the arts and sciences in our country, and of bringing to perfection the third edition of his astronomy, with which he was then occupied. He spent much of his time with Dr. Herschel, Dr. Maskelyne, and Mr. Ramsden, and he considered himself as peculiarly fortunate in having had the honour to walk through the 40 feet telescope of Dr. Herschel.

He published about this time his *Traité des Canaux*, and in 1793 appeared his *Bibliographie Astronomique*, in one volume 4to.; a work which contains the most complete catalogue of astronomical works that has ever been published, with occasional biographical notices of the different authors. In 1793, he published his *Abrégé de Navigation Historique, Théorique, et Pratique*; and in 1802 he published a new edition of Montucla's *Histoire des Mathématiques*, in 4 vols. 4to. The two last volumes were prepared from the papers of Montucla, with the assistance of Laplace, Lacroix, and other eminent mathematicians. In the same year, he published his pocket volume, containing tables of logarithms, sines, tangents, &c. During the last years of Lalande's life, he published an annual history of astronomy, containing a short view of the principal events in the science which had been enriched during the preceding year.

When the old observatory of the Military School was demolished in 1788, a new one was constructed at the solicitation of Lalande, and furnished with the best instruments which could then be obtained. The direction of it was given to Lalande; and in 1789, he and his nephew began their observations. Between 1789 and 1791, they had observed about 10,000 of the northern stars, with very excellent instruments.

Lalande was a member of almost all the distinguished academies and societies in Europe, and corresponded with all the principal astronomers of the age. He published no fewer than 150 memoirs in the *Memoirs of the French Academy*. He died at Paris, on the 4th April, 1807, in the 75th year of his age.

Although the name of Lalande is not associated, in the history of astronomy, with any important discovery, yet there is perhaps no individual to whom this science is under deeper obligations. By the most unremitting activity, during more than half a century, he excited a love for astronomy, and contributed essentially to its progress in every part of the world. He had the honour also of founding an annual medal, which the Academy of Sciences awards to the author of the best astronomical memoir, or of the most curious observation made during the year. A full account of the character and writings of Lalande will be found in M. Delambre's *Eloge in the Mémoires de l'Institut*, tom. x.

LAM. See THIERRY.

LAMBERT, John Henry, an eminent German philosopher, was born at Mühlhausen, in the Sundgau, on the 29th of August, 1728. He was descended from a family which had emigrated from France, during the religious persecutions after the revocation of the edict of Nantes. Notwithstanding his early disposition for study, and the testimony which his first teachers bore to the superiority of his talents, the limited circumstances of his parents precluded the possibility of their conferring upon him the advantages of a liberal education; and he was destined to follow his father's trade, which was that of a tailor. But the genius of Lambert soon enabled him to surmount all the difficulties of his situation. In order that he might not lose the knowledge of Latin, which he had acquired at school, he read all the Roman classics that came within his reach; and he procured much of his education by selling to his companions small drawings, which he found the means of executing amidst his domestic occupations. A work on mathematics having accidentally fallen in his way, it laid open, at once, the richest vein of his genius; and from this book, without farther assistance or instruction, he taught himself the principles of arithmetic and geometry.

With such talents and industry, the uncommon scientific attainments of a youth of fourteen, in his unfavourable circumstances, could not fail to attract notice; and as he had learnt to write an elegant hand, he was taken from the shop-board, and placed, as a copyist, in the chancery of his native town. Soon after, he went, as book-keeper, into the service of M. de la Lampe, who possessed some iron-works in the neighbourhood of Mühlhausen. Here he learnt the French language. Two years afterwards, he was engaged by M. Iselin, at Basle, as his secretary or amanuensis; and in this situation he found opportunities of acquiring instruction in philosophy and the belles lettres; while, at the same time, he successfully prosecuted his favourite mathematical studies.

In the year 1749, M. Iselin recommended Lambert to M. de Salis, president of the Swiss confederacy, as a
proper person to superintend the education of his children; and, during his residence in the house of the president, at Coire, his thirst for scientific information was amply gratified, by the use of a large and valuable library. Here he accordingly gathered in a store of useful knowledge in various sciences, and learnt several dead and living languages. Here, too, he began to exhibit some of the fruits of his mathematical attainments, by the invention of several machines for facilitating scientific operations; such as his mercurial chronometer, his arithmetical and logarithmic scales, and his machine for drawing in perspective. About this time, he was admitted a member of a learned society, instituted at Coire; and he was also elected a member of the Helvetic Society, whose transactions he enriched with a number of mathematical and physical treatises. After a residence of several years at Coire, he accompanied his pupils on their travels through a great part of Germany, Holland, and France; and had thus an opportunity of conversing with a number of the most eminent cultivators of science in Europe. In the year 1758, he formed an intimate acquaintance with the celebrated philosophical mechanic Branden, at Augsburg; and wrote his Treatise on Photometry, in which he set forth new principles upon this interesting, but hitherto neglected subject. During his residence at Augsburg, he was chosen a member of the newly established Bavarian academy of sciences, with a pension; and, at the same time, with permission to reside abroad, provided he contributed to their transactions; an engagement which he faithfully performed. In the year 1763, he was appointed one of a commission employed to settle the boundaries between the territories of the Valtelline and the duchy of Milan; and, after the termination of this business, he repaired to Leipsic, where he published his New Organon, a comprehensive system of logic, containing many original ideas, which procured for its author no small portion of celebrity. At length, on the invitation of the great Frederic of Prussia, who fully appreciated his scientific attainments, he went to reside at Berlin, where he was appointed an ordinary member of the academy, and became a valuable contributor to its transactions. On the establishment of a college, for the purpose of superintending the general improvement of the Prussian state, Lambert was appointed chief councillor for buildings; which situation he held until his death, on the 25th of September, 1777.

Lambert was not less esteemed for the amiable qualities he displayed in the intercourse of life, than he was respected on account of his scientific acquirements. In his manners and habits, indeed, he exhibited many traces of his originally humble situation in life; but these peculiarities were amply compensated by the excellency of his heart, and his uncommon talents. His morals were correct, and he was impressed with a deep veneration for religious truths.

If we compare the difficulties with which Lambert had to contend, with the actual extent of his knowledge, and the success with which he prosecuted his scientific researches; he must undoubtedly appear to have been a man of no ordinary genius. Of him, it may be said with truth, that he derived his knowledge more from the resources of his own mind, than from books; and, hence, he always places the subject of which he treats, in a new and original point of view. The sciences of logic, metaphysics, and mathematics, were those which he chiefly cultivated. In the two former sciences, as may be seen from his New Organon, and his Architectonic, he endeavoured to investigate our simple notions, as the basis of all philosophical knowledge, with the same acuteness and precision as the notion of quantity is treated in mathematics. The various branches of mathematical and physical science, are eminently indebted to the researches of this philosopher, and his treatises on Practical Geometry, Spherical Trigonometry, Optics, Astronomy, &c. may be studied with advantage, even in the present more advanced state of the sciences, which he proposed to illustrate or extend.

The following list, we believe, will be found to comprehend all his most important publications.

The "Berliner Ephimeriden," an astronomical journal, on the plan of the Parisian Connoissance des Temps, was originally undertaken at the suggestion of Lambert.

LAMBERT. See Surrey.

LAMP. A well known apparatus, for producing artificial light.

A lamp, in the most simple form, has a wick, composed of several cotton threads, partially immersed in oil, contained in a flat dish, furnished with some small support, to hold the upper end of the wick in a perpendicular direction, a small height above the surface of the oil; this oil-holder, or dish, when suspended in a globular glass-case, is the common street lamp. When the wick is lighted, by the application of a burning torch, the heat of its flame causes the oil, which is contained in the wick, to boil, or rise in vapour; and the combustion of this vapour, is the flame which produces the light. As fast as the oil in the wick is carried off, by this vaporization, a fresh supply is drawn up, by the capillary attraction of the wick, from the oil contained in the oil-holder.

Hence it appears, that lamps and candles, are both of the same nature as gas-lights. The difference consists in the materials from which the gass is to be extracted, and the manner in which the extracting of it is performed; but in all cases, flame is nothing more than the combustion of gas. In gas lights, an apparatus is previously employed, to make and preserve the gas, and to conduct it to the place where artificial light is to be obtained from its combustion; but in lamps and candles, the heat of the same flame, which produces the light, is employed to vaporize the combustible matter, and form gas for its own maintenance. The difference between lamps and candles is, that lamps are supplied with the combustible matter in a fluid state, but candles are supplied with a solid material; and the heat of the flame must first be employed, to reduce the tallow or wax to a fluid state; and this fluid, which forms itself round the base of this wick, sustains the flame just in the same manner as the oil in lamps. The process of burning in candles, has been explained in our article Candle, vol. v. p. 375; but, as the combustion is more perfect in well constructed
LAMP.

Lamps.

General observations on lamps.

Lamp.

Use of the wick.

General observations on lamps.

The flame which we employ for artificial light, is produced by the combustion of some gas, which contains carbonaceous matter; and it is most probable, that the matter, while it burns in these gases, is chiefly composed of particles of carbon, in a very minute state of division. Combustion takes place when the carbon combines with the oxygen of the atmospheric air, in the requisite proportion to produce the carbonic acid gas: and if the oxygen is supplied in a less proportion, the oxide of carbon will be produced in the form of smoke or soot.

The chief circumstance influencing the combustion of the different carbonaceous matters which are used for producing light, is the degree of temperature which they require, in order to make them combine with the oxygen of the atmosphere, in sufficient proportion to produce flame.

The relative affinities of oxygen and carbon increase or diminish according to the degree of heat which they possess at the time of union; and, for this reason, the same carbonaceous matter, which, when properly heated, will combine with oxygen in such a proportion as to produce flame, will only produce smoke, when heated to a less degree; and that degree of heat, which is sufficient to volatilize the carbonaceous matter, is not sufficient to create that affinity for oxygen, which will inflame it; but a higher degree of heat must be applied, or we shall have smoke instead of flame. This we see, whenever a lamp burns with the wick drawn up too high, or when a candle burns with too long a snuff. The wick then exposes a greater quantity of oil to volatilization than the flame can perfectly consume; for the heat of the flame is carried off so rapidly by this volatilization, that it is not sufficient to heat all the gas to that temperature which is necessary for its inflammation. In this state of things, such a portion of the gas as is sufficiently heated, combines fully with the oxygen, and produces flame; another portion is heated sufficiently to combine with the oxygen in that proportion which produces soot: and some small portion will be so little heated, as to escape in the state of vapour of oil, or tallow, part of which will condense by cold, into an empyreumatic grease.

The nature of this oily vapour is most clearly exhibited when a candle is blown out by a sudden current of air; this removes the flame sideways from the wick, and carries off so much heat from it, that the gas which it still continues to afford, in the form of a thick white smoke, will not combine with the oxygen of the atmosphere, in sufficient degree to produce either soot or flame. This white smoke, when it cools, forms a rancid tallow, as is evident from its unpleasant odour. This is less obvious in a lamp, because oil seems to require a greater heat to volatilize it than tallow.

These particulars being understood, we may deduce from them the requisite properties for a perfect lamp.

1st. It must be supplied with carbonaceous matter, and with oxygen; 2d. It must convert the former into a gaseous state; and, 3d. It must bring the gas, so produced, in contact with oxygen, at such a temperature, that the carbon will combine with the oxygen, in the fullest degree, to produce the greatest quantity of flame, without any smoke.

With respect to the supply of oxygen, we have no means sufficiently simple for common use, in any greater degree of concentration, than as it exists in atmos-
LAMP.

On this account, another form of the lamp is used in houses. The oil vessel is a small globe, and the wick rises out of a nozzle formed on the upper side of it. The only objection to this is, that the surface of the oil sinks down as it is consumed, and at length the wick has to draw the oil up from such a depth, that it can only yield a diminished supply to the flame.

The fountain reservoir is a very good method of supplying the wick of a lamp with oil: See Plate CCCXLII. In this, the reservoir AA, which contains the store of oil, has only one opening in it, and that is in a neck B proceeding from the lowest part. The reservoir must be inverted in order to fill it with oil; but when it is in use, the opening into the neck is immersed beneath the surface of the oil contained in the small cup or dish D. Where the wick C is placed, the oil in the cup D precludes the admission of air, and consequently the oil cannot descend out of the reservoir. But when the oil in the cup D is so far diminished, as to allow a bubble of air to enter into the opening of the neck B, it will rise up into the reservoir, and allow an equal quantity of oil to descend into the cup for the supply of the wick. In this way this will raise the oil in the cup D so as to cover the opening into the neck, no more oil can come out until that which is in the cup is consumed. By this means, as long as the reservoir contains oil, the oil in the cup must always preserve the same level, but will never run over. E represents the small nozzle, which holds up the wick in a perpendicular direction. It is a short piece of tube, with three projecting feet at the lower part, which stand in the bottom of the cup.

This fountain reservoir, was known by the name of the lamp of Cardan in the time of Mr. Boyle. That gentleman made one in an improved form, which is described in the early Philosophical Transactions. It consists only in making the cup D, into which the oil descends, of a considerable area, and forming a communication between this and another small cup, which receives the wick. By this means, the oil is less liable to descend in gluts.

Fig. 10. is a simple lamp, which has the property of supplying the wick very regularly with oil. This is called the automaton lamp; and a Mr. Porter had a patent for it in 1804. The wick is situated at f, at one end of a rectangular vessel AA, which contains the oil. The whole lamp is suspended by a wire loop B on centre-pins at k, in the manner of a scale beam, so that the lamp is at liberty to librate freely. The position of the centre k is such, that the lamp will incline as the oil contained in it diminishes, as is shown by the dotted lines; and the inclination will in all cases be such, that the surface of the oil will just reach to the proper height on the wick. The makers of these lamps have attained this end from experiment with great precision, and the drawing, Fig. 10, is taken from one of them.

The best kind of lamp is that of Argand, which was invented in France about 1784. The wick is a hollow cylinder or tube; and the upper part of it when lighted, forms a ring or short tube of flame. A rapid current of air is made to pass through the inside of the tube as well as the outside. To produce this current, a cylindrical glass chimney is placed over the flame, and the rarified air which ascends through the chimney, causes a current to pass on each side of the flame that is on the outside and inside of the ring of flame.

This lamp is exhibited in Plate CCCXLII. Figs. 1 and 2, the former representing the external form, and Fig. 2, a section of the part called the burner, which contains the wick. A, Fig. 1, is the oil reservoir, from which the oil descends into the oil cistern B, one drop at a time, and is then conveyed by a pipe C to the burner E. The external appearance of the burner is a perpendicular tube, E; within this is a smaller tube F, (Fig. 2,) which is closely united to the former at the lower end, but both are open at top. The space between the two tubes, therefore, forms a narrow circular cistern, which is freely supplied with oil through the pipe C, but the oil cannot rise above the dotted line e, because the oil reservoir A is constructed in the manner of the fountain. The wick G is a circular tube of cotton placed in the space between the two tubes E and F, and the top or upper end of the cotton rises a little above the tubes at J. At that part the flame is produced. H is the glass chimney, which rises up to a considerable height, as shown in Fig. 1; the lower part is enlarged, and stands on a small circular gallery I. The interior tube F, Fig. 2, is open at the lower end, and the air can freely enter therein as shown by the arrows; and this air rising up through the tube F, must pass in contact with the interior of the circular ring of flames. The outside air for the same, enters the external part of the flame enters beneath the gallery I, and rises up within the glass chimney, which is contracted at the place most favourable for projecting the air upon the flame. This chimney is one of the great improvements introduced by M. Argand. The heated air in the glass chimney, being lighter than the external air, is forced upwards by the cold air which rushes in beneath the edge of the glass chimney, and also up the interior tube as shown by the arrows. This cold air passing in immediate contact with the flame affords oxygen to it; and that portion of air which is not consumed becomes heated, and, by ascending the chimney, gives place to a fresh supply of air, so that a constant current is kept up.

Another valuable improvement, first introduced by Argand, is the mechanism to elevate or depress the wick at pleasure above the tops of the tubes E, and thereby regulate the height of the flame. In Argand's original lamps, the wick was raised up by a rack and pinion, but the more modern construction is shown in Fig. 2. The exterior surface of the tube F, Fig. 2, has a spiral groove or notch formed round it, and the cylindrical cotton wick G is stretched tight over a short piece of tube or ring r, which slides up and down upon the tube F, a small tooth projects on the inside of the ring r, and enters into the spiral groove. Now it is plain, that if the ring r is turned round, its tooth acting in the spiral groove will cause the tube to ascend and descend, and also the wick which is attached to it. To give motion to the ring r from the outside, a moveable tube is placed within the tube E and F, and incloses the ring r within it. On one side of this tube a notch is cut from top to bottom, and a second tooth, which projects from the outside of the ring, enters into this notch. The tube rises a little above the top of the external tube E of the burner, and has three small wires p fastened to it, which descend to the gallery I, and are fixed thereto so as support it; the same wires also fit the interior of the glass chimney, and prevent it from being overthrown. By turning the gallery I round, the tube attached to it is made to turn round, and the projecting tooth of the ring r communicates motion to the ring also. As before mentioned, the interior tooth of the ring, acting in the spiral groove, moves the ring r and the wick up or down; the
Lamp.

notch in the side of the tube, which turns the ring, allows it to rise or fall without communicating a similar motion to that tube or gallery. It is a shade which surrounds the light and prevents its action on the eyes. This is particularly useful for reading or writing, as it also reflects the light upon the paper.

The conception of the fountain reservoir for the Argand lamp, is also explained in Fig. 2. The oil reservoir $A$ terminates at the lower end with a neck which screws into the oil cistern $B$. A hole $n$ made in the neck at one side for the oil to come out; but this cannot happen until the surface of the oil in the cistern $B$ is drawn down below the dotted line, so as to admit air to enter the opening, and then a drop of oil comes down. The air has free admission into the cistern $B$ through a hole $x$. When the lamp is extinguished, the small knob or handle $t$ is drawn up, which closes the hole $n$ by the short tube $o$ sliding over it, and prevents the oil from being split if the lamp is inclined.

The fountain reservoir casts a very extensive shadow, and is therefore best adapted to be placed against a wall. It is a great advantage in lamps to have the oil reservoir situated beneath the burner, so that the light will not be intercepted in any direction; and there are several ingenious methods of raising the oil to a constant level for the supply of the wick.

Dr. Hook's semicylindrical counterpoise, described in our article HYDRODYNAMICS, Vol. xi. p. 484, was intended to retain the oil of a lamp always at a constant height.

The hydropneumatic lamp is a small Hungarian machine or Chenznitz fountain; see our article HYDRODYNAMICS, Vol. xi. p. 567. The pedestal of the lamp contains three oil cisterns, one above the other. The upper cistern is at the top of the pedestal, immediately beneath the burner or wick holder, and is made air tight; it has a pipe ascending from the bottom of it to feed the burner with oil; this is therefore the oil reservoir. The second cistern is placed beneath the former, and is open to the external air; a pipe descends from it to the bottom of the third or lower cistern. The latter is made impervious to air, and has a pipe ascending from the top of it to the top of the upper vessel or reservoir.

Suppose the two upper cisterns to be full of oil, and the lower one empty; the oil in the second cistern being pressed upon by the air, the oil in it descends through the pipe to the bottom cistern, and enters therein; but as the contained air cannot escape from this vessel except through the air pipe to the upper vessel or reservoir; it ascends therein, and presses upon the surface of the oil so as to force it up the pipe, to the burner which is constructed, on Argand's plan, as in Fig. 2. The height to which the oil will rise in the space between the two tubes $EF$ of the burner, is regulated by the height of the middle cistern above the lowest, because the pressure of that column of fluid is transferred by the medium of the air to elevate the oil out of the top cistern into the burner.

When all the oil in the second cistern has descended to the lower cistern, the power of action will be exhausted, and the action of the fountain is renewed by inverting the whole lamp, and then the oil from the bottom cistern runs back, and the oil reservoir being again filled, the lamp is again ready to proceed. In lamps for common use the reservoir is made sufficiently capacious for the consumption of one night; but they have been made for halls and staircases of a sufficient size to hold oil for a month's consumption.

This lamp is called the French lamp, because the were first brought from France. But we have seen a letter from Mr. Watt to M. Argand, dated 1787, suggesting this plan in a form very little different from what is at present used; and in consequence of this, M. Argand first made them in France.

We have lately found a figure of such a lamp in an Italian work, entitled Le Machine, by Branca of Rome, published in 1629.

The hydrostatic lamp, first described by Dr. St. Claire in the Philosophical Transactions, and afterwards improved by Mr. Keir, is shewn in section in Fig. 3. FF is the burner where the wick $G$ is placed. This may be constructed upon Argand's plan, as we have already described, but the figure represents a flat wick $G$, with a rack and pinion for elevating and regulating its height above the nozzle. The oil reservoir is situated in the bottom of the pedestal at A, and is closed on all sides except where a pipe $a b$ ascends to the burner $E$; and also another pipe, which communicates with a small cistern $R$. The latter is open to the atmosphere, and is filled with a solution of salt and water, which fluid being of greater specific gravity than the oil, a column of it, which is equal in altitude to $AB$, will sustain a higher column of oil, viz. from $A$ to the dotted line $E$, which is the level at which the oil will stand in the cistern.

The proportion of the column of water to that of the oil is generally as three to four. As the oil is diminished by burning, the height of the column of oil will be diminished, and will no longer balance the column of water, which will therefore descend; but on entering into the vessel $A$ it will displace the oil from it, and before the two come again to an equilibrium, the water will have restored to the oil column three-fourths of that height which it had lost by waste. As this loss of weight is to be reckoned on the surface of the large reservoir $A$, it is very slow; and from the above contrivance, the height of oil only partakes of one-fourth of it. Therefore the height of the oil in the burner is kept sufficiently constant to supply the flame very regularly.

A statical lamp for the same purpose is shown in Fig. 4. It was invented by M. Edelcranz. This is on the same principle as Mr. Keir's, except that the maintaining power to raise up the oil in the weight of the lamp itself, or rather the weight of the upper part of it. The oil reservoir is at $A A$, and is capable of enlarging and diminishing its dimensions. The bottom of the pedestal is a cylindrical vessel $L L$, which is open at top, and within it is a hollow cylinder $m n$ closed at top; the two cylinders are closely joined together at bottom, and form a narrow circular space $L n$ between the two; this space is filled with mercury. The real oil vessel $A A$ is open at the bottom, and the lower edge of it is immersed in the mercury $L n$, so that the oil cannot escape. A tube $a b$ rises from the oil vessel up to the burner $E$, which is made the same as in Fig 2. Now the oil vessel $A A$, and the burner $E$ being filled with oil as high as the dotted line $D D$, it will not be able to escape, because the lower edge of the vessel is immersed in the mercury contained in the circular space $m n$, but the oil will press on the upper surface of the oil vessel $A A$ with a force proportional to the altitude of the column; and to resist this the vessel must be loaded with weights $x y$, in addition to the weight of the burner and superstructure. As the oil diminishes, the oil vessel and the upper part of the lamp will descend and diminish the capacity of the oil vessel $A A$ as much as the oil has lost by burning; because the weight being constantly the same, it will always require a column of the same
The streets of London, are upon a very imperfect construction, being only a flat-soil dish for a burner, suspended in a glass vase. No provision is made for the entrance of the fresh air, except through the chimney at which the smoke and heated air issue. From the defective supply of air, the flame is very weak, and the glass is soon obscured by the smoke. To increase the light, some parishes in London have adopted lamps with lenses, to concentrate the light, and throw it upon particular parts of the foot-path; but as this must abstract the light from other parts of the space which should be illuminated, no advantage whatever is gained by this addition.

Fig. 8 and 9. represent Lord Cochran's patent lamp, which possesses all the advantages without any of the defects of the common lamp. The glass vase N, is made of a hemispherical figure, and the light is placed in the centre, so that the rays pass through the glass perpendicular to its surface. The top of the vase is covered up by a close cover K, from the centre of which a chimney L rises up nearly to the top of the roof or head M, and terminates with the openings at the top of the same, where the smoke issues. To supply the lamp with fresh air, a curved tube $f$ is carried beneath the oil reservoir $e$, and supplies a constant current of fresh air to the flame, which is situated just between the orifices, or mouths, at the extremity of the air pipe $f$, one being on each side of the wick, so that they project the air immediately upon the flame. The heated air, which is contained in the chimney L, cannot balance the cool atmospheric air which enters freely through the air-pipe $f$, and rushing by the flame, displaces the hot air; but, becoming heated, it will be forced up the chimney by the fresh air which follows through the air-pipe. By this means a most brilliant flame is kept up. That as little light as possible may be lost, the oil-vessel $e$ is made very narrow, and the light which is thrown upwards to the cover $K$, is reflected downwards again on the pavement. The head, or roof $M.$ of the lamp, is made with holes all round the lower edge to admit fresh air, and has also an opening in the top to allow the hot air to pass out; but both the air pipe $c$, and the chimney $L$, are open to the chamber or space which contains the head $M$, and the consequence is, that the flame is never disturbed by winds, because, by the blowing of the wind, the air in the chamber KL is rendered more dense, it will increase the pressure equally upon the orifice of the chimney L, and upon that of the air pipe $c$, so that the two actions will be balanced.

For the convenience of trimming and lighting this lamp, the roof $M$ is made to take off, but not the cover $K$. The chimney $L$ is not fastened to the cover, but to a piece which lays upon it; this piece being lifted up, as shown in Fig. 9, will raise upon a joint, or hinge, at $a$, and the oil vessel $e$ being suspended on the same joint, will be turned up likewise, so that the part containing the wick will rise up through a hole in the centre of the cover into a convenient situation for lighting the wick or replacing the cotton, as seen in Fig. 9. The oil vessel $e$ is of the fountain kind; and when it is raised up in this way, the hole, or orifice for the admission of air, will be higher than the vessel, so that the oil can be poured in; but when the vessel is restored to its proper situation, as in Fig. 8, this hole will be immersed beneath the surface of the oil in the little cup which contains the burner, so that it can only afford the oil as fast as it is consumed. Lord Cochran has two patents for these lamps, taken out in 1813, and they are used to great advantage in some districts in London. (J. R.)
A very neat improvement upon the lamp has lately been introduced into this country from France. The oil is contained in a circular rim, in the centre of which is placed the wick, which is supported upon a vertical stand. This circular rim is supported by two slender arms, proceeding to the stand; and as the rim answers the purpose of a support for a hemispherical shade of paper on ground glass, the lamp has the appearance of being supplied with its oil, either hydrostatically or mechanically, from the lower part of the stand.

It would be foreign to the present article to enter into any account of the recent and beautiful discoveries of Sir Humphrey Davy, respecting flame and combustion, or to describe the ingenious safety lamps which he has invented. There is one invention, however, which has arisen from these discoveries, namely, a lamp without flame, which we shall here describe, as it may be of great use even for domestic purposes. If a cylindrical coil of thin platina wire, about the hundredth of an inch in diameter, is placed so that part of it surrounds the cotton wick of a spiral lamp, and part of it is above the wick, and if the lamp is lighted so as to heat the wire to redness; then if the flame is blown out, the vapour which ascends from the alcohol will keep the upper part of the wire red hot, as long as there is any alcohol remaining in the lamp. This red hot coil of wire is capable of kindling German gunpowder, or paper prepared with nitre, so that a sulphur match, &c. may be at any time lighted. It is of great importance that the wire should be as nearly as possible the 100th of an inch in diameter, as a wire of a larger size yields only a dull red light, and a smaller one is very difficult to use. About 12 turns of the wire coiled round a cylindrical body, a little larger than the diameter of the wick, will be sufficient. Four or five coils should be placed on the wick, and the remaining seven or eight coils above it. Mr. Thomas Gill, who has been the first to give a description of this lamp, found, by experiment, that a wick, composed of 12 thread, of the ordinary sized lamp cotton yarn, with the platina wire coiled round it, will require half an ounce of alcohol to keep it red hot for eight hours. During the ignition of the lamp, a slightly acid smell is given out, arising from the decomposition of the alcohol. This lamp has in one case been kept burning for upwards of sixty hours. Mr. Gill used it for several nights in his bed-room with great convenience, and we have no doubt that it will not only come into general use as a night lamp for domestic purposes, but will be of some utility in the arts. See the Annals of Philosophy for March 1818, vol. xi. p. 217.

LA N A R K, the county town of Lanarkshire, is situated on the northern bank of the Clyde, on an elevated situation, 32 miles south-west of Edinburgh, and 25 miles south-east from the city of Glasgow, in 55° 34' of North Latitude, and 3° 5' of West Longitude from Greenwich.

Lanark was erected into a royal burgh by Alexander the First, whose charter, together with those granted by Robert I. and James V. several authenticated by Charles I. in 1632. These charters, from the ample privileges they confer upon the burgesses, prove that it was at least, in the time of Alexander, the principal place in this district of the country, and even then, the county town, and as such, its inhabitants had the sole right of carrying on commercial business within the shire, all others being prohibited from buying "wool or leather within our said sheriffdom of Lanark, or exercising any other merchandize,"—"or making and dyeing cloths!"—"except burgesses of our said burgh."—Charter of Alexander I.

In 1244, Lanark, according to Fordun, was almost entirely destroyed by fire, but from what cause it proceeded is now unknown.

This town, in 1297, Wallace made his first effort to redeem his country from a foreign sway, by taking the place, with a few of his friends, and killing Hesilig, the governor or sheriff, and upwards of 200 of his countrymen, in consequence of his wife having been unjustly put to death by Hesilig's orders. The castle of Lanark, which was erected upon the site of the Roman station, or castellum, has undergone several sieges. It was built by David I. and, at times, was the residence of that monarch. From this castle, in the year 1197, is dated the charter granted by William the Lion to the town of Ayr, erecting it into a royal burgh. In the negotiation which took place between Philip of France and John Balliol, relative to the marriage of Philip's niece to Balliol's son, Balliol, in security of the lady's jointure, mortgaged this castle along with his estates in France and some other lands.

Lanark has, from a very remote period, had the privilege of keeping the standard for all weights that are used in Scotland, as appears from several authentic documents; particularly an act of parliament in 1617, narrating, that of old, the keeping and outgoing of the weights to the burghs and others, was committed to this town, and again of new committing to it "the care of the weights," for the public use of the realm. In consequence of enjoying this privilege, new standard weights were sent from London to Lanark at the Union, by which the other weights in Scotland should be regulated.

This town is built nearly in the form of the letter K, its streets diverging from the centre in a similar manner: These are, the High Street, which runs east and west in a line with the Bloomgate, and terminates at the cross—a little below which the Bloomgate begins, and extends west to the extremity of the town—the Wellgate, which branches from the cross in a south-east direction—and the Castlegate and Broomgate, which likewise diverge from the same point towards the south-west.

Lanark is governed by a provost, two bailies, a dean of guild, and 13 councillors; and has seven incorporations. It is classed with Linlithgow, Selkirk, and Peebles, in sending a member to the British senate. The number of inhabitants has increased greatly since the introduction of the cotton manufacture, and amount at present to about 3000. The general aspect of the Public town is now much superior to what it was formerly, such new houses as are built being erected in the modern style, and in every respect more agreeable and commodious. In Lanark are several public buildings, such as a town-house, near the centre of the town, with a county-hall, a council-room, court-hall, and weigh-house. Immediately adjoining is the prison,
containing the office of the town-clerk, &c. The parochial church is situated in the centre of the town. It was erected in 1779, and is a large modern building, with a square spire, and two bells. The grammar school in Broomgate Street has, besides a commodious teaching room, a large room, containing a library for the use of the inhabitants, bequeathed by the late Dr. William Smellie, a gentleman well known for his skill in the obstetric art. In addition to these, may be mentioned the public markets and the county inn, the last of which is situated in Broomgate Street, and was built by the subscription of a number of gentlemen interested in the county, the magistrates of the town, and several others. At Lanark are also two churches, or meeting-houses, belonging to each of the inhabitants as assessed by the Burgess or Relief persuasion.

The principal manufacture carried on here is the cotton manufacture, the staple of the county. A great number of the people are employed in the weaving of muslins, and many at the spinning establishments of New Lanark. Formerly a great quantity of shoes was manufactured, and exported to our army in America, during the war with that country; but this manufacture has been long on the decline. The manufacture of stockings, cabinet-work, the making of candles, and tanning of leather, are also carried on. Here are seven fairs annually for the transacting of business, and the buying and selling the produce of the county. They are, in general, well frequented, and often by people from a considerable distance.

The country around Lanark is celebrated for its beautiful and picturesque scenery. The chief objects of attention, and which have long and deservedly been admired, are the Falls of the Clyde—the scenes upon the Mouse, called Cartlaine Craigs—some of the great cotton manufactories. There are three remarkable waterfalls in this vicinity, viz. those of Stonebyres, Corra, and Bonnington. Stonebyres Fall, or Lin, is situated about two miles below Lanark, and consists of three successive falls, over which the whole body of the river rushes into a deep chasm below. Its height is 64 feet. The ear-stunning noise, the lofty rocks which arise on every side, the variegated copse-wood which covers their summits, and the effect produced from the union of the whole, renders this cataract a scene of great beauty and interest.

The Corra Linn is situated about a mile and a half from Lanark, in a southerly direction, and is reckoned the most picturesque of the falls of the Clyde. Here the river, forming two separate falls of upwards of 80 feet, rushes with impetuous force into a deep abyss, and with an incessant and overpowering noise. On every side, the course of the river is environed with rocks of a great height, of the most romantic forms, and covered with trees of every diversity of foliage. Upon the summit of one of the highest, and directly above the upper fall, stands the ruinous castle of Corra, formerly the residence of a family of the name of Somerville; and in its near neighbourhood, the modern house of the same name, the seat of Miss Edmonstone. Between these, and situated in a very singular and romantic situation, and immediately upon the verge of the fall, is a picturesque mill, whose feeble wheel, and rugged walls, totter, as it were, with the concussion of the waters. To describe, however, in adequate language, the beauties of the scene, or the effect it has upon every spectator of taste, would be a difficult task. The rushing of the stream—the rapidity of its motion—the dashing of its waters from rock to rock—the thundering noise occasioned by these concussions—the height of the rocks—the ivy-clad and mouldering castle of Corra—and the clouds of mist rising majestically from the abyss below—form altogether a scene univalled in the island, and surpassed by few in any other situation.

From the Corra Linn, a walk conducts to the Fall of Bonnington, at the distance of about half a mile. This walk is beautifully picturesque: Here, it passes through groves of trees, intermixed with the honeysuckle, the wild rose, and other flowering shrubs; there, it approaches the brink of some precipice, from which the Clyde is seen deep engulfed amongst rocks, thundering and boiling through a broken and contracted channel. Proceeding thus, a view is at length obtained of the Fall of Bonnington.

This fall, or linn, consists of one unbroken sheet of water, precipitating itself over the rock into the channel below. Its height is about 30 feet; and though inferior in this and some other respects to the other two falls of Corra and Stonebyres, yet, with its companions of wood and rock, it presents a scene of much interest and grandeur, and well merits the attention of the stranger.

Returning along the banks, a walk leads to a pavilion, near the house of Bonnington, a seat belonging to Sir Charles Lockhart Ross, Bart. from which, by the position of a mirror, another and reflected prospect is obtained of the Corra fall pouring downwards, as it were, upon the head of the spectator, and which, from the singularity of the view, produces a pleasing and striking effect. From the windows of this summer-house a variegated and romantic prospect is obtained of the scenery down the river and the adjacent country, comprehending the town of Lanark, the village of New Lanark, its extensive cotton-works, and many other objects at a greater distance.

To the north-west of Lanark, and on the Mouse, there are also many fine scenes deservedly esteemed. The most remarkable in this direction is Cartlaine Craigs, at the distance of somewhat less than a mile from that town. This place, which extends nearly half a mile on both sides of the river, is a most romantic dell, bounded on either side by lofty rocks, diversified with natural wood and plantations. The approach from the north, which is the most common point of entry, is particularly striking. A level piece of ground, around which the Mouse makes a sweep, conducts to the mouth of this great chasm, which consists through its whole extent of a succession of grand and picturesque scenes, enlivened by the water of the river, flowing over an irregular and broken channel. In the most sequestered part of this ravine, at some height above the Mouse, and embowered in copses, is a natural chasm in the rock, called Wallace's cave, which tradition and history concur in assuring us was often resorted to by that hero.

Nor is this place valuable merely to the admirer of the scenery of nature—the naturalist will also find ample scope for entertainment, whether by examining its geological formation, or its rich botanical treasures, many rare and curious plants presenting themselves on every hand in traversing its devious windings. An account of the mineralogy of the Cartlaine Craigs has been given by Dr. Macknight, in the Wernian Transactions, vol. ii. (n. s.)

LANARK, New, is a well built and populous village of Lanarkshire, about a mile to the south of Lanark. It
LANARK.

is situated in a romantic picturesque situation on the banks of the Clyde, which rise around it to a considerable height in the form of an amphitheatre, and are finely variegated with woods and rocks, the river passing through the middle of the valley, and forming a small isle immediately opposite to the village.

New Lanark owes its erection to an extensive establishment for the manufacture of cotton yarn, which was begun here by the late David Dale, Esq. in 1784, previous to which time, the site of the village was a mere morass, remarkable only for a mineral spring impregnated with iron, called the Well of Spa, the surrounding high grounds on the north side of the river being covered with broom, furze, and fern. At this period, the ingenious inventions of Sir Richard Arkwright were exciting considerable attention, amongst such as were interested in the manufactures of the country; and as a command of water appeared then to be absolutely necessary, for carrying on such manufactures, Mr. Dale was no sooner acquainted with this situation, and its advantages, than he fixed upon it as a place well adapted for the purpose. Accordingly having seized the property from the late Robert M'Queen, Esq. of Braxfield, Lord Justice Clerk, and obtained some land adjoining, he began his operations, by founding the first mill in April 1785, and cutting a subterraneous aqueduct through a rocky bank of a considerable length, for the purpose of procuring a fall of water from the river.

In the year 1788, a second mill was built; but before it was finished it was destroyed by fire, and being again rebuilt, was finished in 1789. Shortly afterwards two others were erected; all of which are nearly adjoining, and are each from 150 to 160 feet in length, by from 50 to 40 wide, and seven stories high.

As the town of Lanark, and the surrounding country, could not supply the number of people wanted to carry on these works, families were invited from a distance; and many children were procured, some of the charitable institutions in Edinburgh, for this purpose.

In March 1786, the spinning commenced, and the manufacture has been in a progressive state of advancement, particularly since it came into the possession of Messrs. Owen and Co.; and besides, being amongst the first which was established in Scotland, it is remarkable for being still the largest in the island, in respect to the number of people to whom it gives employment and support.

Behind the mills, which are situated on the right bank of the river, and to which they are parallel, is situated a range of buildings, for the stowage and cleaning of the cotton, &c.; and at a little distance from the mills, is a large mechanical establishment, with an iron and brass foundry. The whole of the extensive mechanism which these buildings contain, is impelled by the water of the Clyde. The number of spindles now at work, for the manufacture of what is called water twist, being about 13,000, besides the mule spindles, which form a large proportion of the spinning here.

The houses in the village are built after a regular plan, and of a construction not inelegant. They stand on the face of a declivity above the works, and are formed into regular and well paved streets, containing a population of 2400, all supported by the manufactury; and of whom, excluding those who are too young to work, (children not being admitted into these mills till the age of ten,) and those engaged in domestic occupations, or such as are infirm through age or otherwise, 1600 or 1700 are actually employed. Their time of working is ten hours and a half in the day.

As the principal proprietor, and sole manager of this establishment, Mr. Owen, has been engaged, during a period of many years, in endeavouring to meliorate the condition of the working classes, it is hoped that a short account of the excellent moral and economical arrangements which have taken effect, or are in progress here, will not be unworthy of insertion. The institution for education may be first described. The building, which is centrally placed, and forms an ornamental part of the village, is 145 feet long by 45 broad, and of three stories in height, having a considerable inclosed area or play ground in front. The ground floor being unconnected with the purposes of the institution, is entered from behind. The first storey in front is divided into three apartments, the other into two, the largest of which is fitted up, as to serve also as a general lecture room, or chapel, and being provided with a gallery, accommodates 1000 or 1200 persons. The day school is composed of children between the ages of two and ten, to the number of about 360, who are divided into five classes, corresponding with the number of apartments in the institution. The youngest, or infant class, under the age of five, are of course occupied only in those amusements which are suitable to their age, playing about in the area before the school, when the weather admits it, under the charge of a male and female superintendent, and whose principal office it is, to encourage amongst them habits and feelings of good will and affection towards each other.

The remaining four classes are taught, besides the usual branches of elementary learning, music, vocal and instrumental, dancing and the military exercise. The girls are taught sewing and knitting; and when the further contemplated arrangements are completed, the boys will be instructed in gardening and agriculture, and the girls will attend in rotation at the public kitchen, in order to acquire some knowledge of domestic economy. The masters of the different classes, are particularly instructed to make a well directed kindness, (instead of force and severity) the instrument of exciting from the scholars due obedience to the regulations of the school; and experience has, in this instance proved, that a system, combining amusement with instruction, and conducted under such influence, exonerates the master from all the difficulties which usually attach to his office.

In the evenings, the institution is opened to the young people, who are employed in the manufactury during the day, when they are occupied for two hours, to the number of three or four hundred, in improving themselves in the different branches of learning, and in amusements, of which dancing and music form a principal part. There is a concert once a week at the establishment, assisted by the village instrumental band; and on these evenings, as well as on every other occasion, the place is open, of course, to the visits of the older inhabitants, and of all respectable persons in the neighbourhood.

The next object of our notice, is the building lately erected for a public kitchen. It is of considerable dimensions, being about 150 feet in length, by 45 broad, and three stories in height. The ground floor comprises two spacious kitchens, a bakehouse, store-rooms, and superintendents apartments. The upper stories are divided, each into two equal apartments; those on the first being designed for eating rooms, and the two above for lecture and reading rooms, &c. to be open to
the older class of villagers. The obvious effect of such an establishment, besides many accompanying advantages, is to diminish the expense, while it multiplies the comforts of living to the inhabitants in general, by the economy of fuel and attendance, and by the cheaper and more nutritious preparation of food which may be thus attained.

There has long been granted to each householder, at New Lanark, a portion of garden-ground to cultivate; but in order to increase the supply of vegetable food, a new public garden has been laid out by the company, which is to extend to seven or eight acres. It is surrounded by a belt of planting, and a spacious walk for the recreation of the work people. This promenade, and others formed for that purpose, to which they have access, commanding in every direction diversified views of a beautiful country, may comprise an extent of probably not less than two miles; and in consequence of the limited hours of labour which prevail at this manufacture, they are thus enabled to partake of that exercise in the open air, which the nature of their employment renders absolutely necessary for a moderate degree of health and happiness.

The inhabitants here, in addition to these conveniences, are supplied with provisions, clothing, and every necessary of a good quality, and at a reasonable rate at the store, which has been long established by the company, and conducted under regulations to induce, as far as possible, a provident expenditure of their earnings. Pothouses, and all their injurious consequences, have long been banished from the place. A fund for the maintenance of the sick and superannuated, is supported by a contribution of one-sixtieth part of their wages; and a surgeon, paid by the company, resides at the village. Many other regulations and arrangements besides these, exist at this establishment, which our limits will not allow us to specify. Suffice it to say, that these have produced, as far as they hitherto have had time to operate, (according to the information of the writer of this article) all the effects which the proprietors could wish or expect, both with respect to the mercantile interests of the concern, and the moral condition of the people. But although the latter enjoy a large share of the comforts of life, when their situation is brought into comparison with that of many others, yet it is the decided opinion of the principal proprietor, Mr. Owen, that manufactures, when they constitute the exclusive employment of a population, are not compatible, by any possible arrangement, be made, with the possession of that degree of health and happiness to which human beings are entitled; and that this object can only be attained under a system, combining manufacturing with agricultural labour, and of which the latter is the basis. See Denholm's MS. History of Lanarkshire; Tour to the Lakes, by the same author; Statistical Account, &c. (p. 4.)

LANARKSHIRE, the name of one of the counties in the southern division of Scotland.

The county of Lanark is situated between 55° 14' 42" and 55° 56' 10" of North Lat.; and 3° 22' 51" and 4° 22' 51" of West Long. from Greenwich. On the north it is bounded by the counties of Dumfriesshire, Stirling, and Linlithgow; on the south by Lanarkshire; on the east by Peebles and Edinburghshire; and on the west by Renfrewshire and Ayrshire. The length of Lanarkshire is 52 miles; and its greatest breadth, nearly in a line at right angles to its length, from the confines of Peeblesshire on the east at Garvaldfoot, to the source of the Avon, on the frontiers of Ayrshire on the west, is 33 miles. It contains an area of 926 square miles, or 471,278 Scots statute acres.

Towards the south, particularly in the parishes of the county, Crawford, Crawfordjohn, Lamington, Coulter, and the upper part of Douglas, the county is hilly and mountainous. A ridge of lofty mountains, called the Lanthers, stretches through the country from near the Clyde to the south-western boundary, where part of the chain extends Lanarkshire from the county of Dumfries. From the southern extremity of Lanarkshire another ridge runs northward for many miles between and Peeblesshire. A third chain, farther to the north, crosses the county towards the west, about 20 miles from the southern limit. The eastern part of this chain is called the hills of Tinto, and the western part, separated from the eastern of the vale of Douglas, the Haughshaw hills. The general surface of this hilly district is about 1000 feet above the level of the sea. Many of the mountains are of a great height; Lowther Hill is 2450 feet high above the same level; Tinto 2326 feet; Coulter-fell about the same height; and Cairaible, on the borders of Ayrshire, measures 1062 feet.

To the northward of the hills of Tinto, Lanarkshire is, in general, a fine champaign and variegated country, declining to the north-west, and in many situations remarkable for its picturesque beauty, and the grandeur of its scenes.

Many beautiful vales stretch along the numerous Valleys or rivers. The chief of these is the vale of Clyde, extending from about two miles above Lanark, to within three or four miles of Glasgow, every where remarkable for its natural beauties, its numerous country seats, its waterfalls, romantic dells, orchards, hanging woods, and cultivated fields.

The principal river of the county, and in point of commercial importance the first in Scotland, is the Clyde; which, traversing the whole length of Lanarkshire, gives it the name of Clydesdale. It collects its supplies from no less than 1200 square miles of surface, including the areas described by its tributary streams. Its farthest source is situated near Queensberry-hill, at the southern extremity of the county, at the head of a rivulet called the Crook-burn, flowing into the river Daer, and which, after a course of several miles, is joined by a stream called Little Clyde; this last has its rise near the mountain of Clydesaw, in the vicinity of which the rivers Tweed and Annan have also their sources.

The general direction of the river is towards the north-west. In its course, by a noble sweep, it winds around the base of the mountain of Tinto; then leaving the hilly district of the county, and entering the more cultivated division, at no great distance from the southern extremity of the vale of Clyde, it forms the celebrated waterfalls of Bonnington, Corra, Dundaff, and Stonebyres, in the vicinity of the town of Lanark. Continuing to flow through this fine vale, it passes Hamilton, Rutherglen, and the city of Glasgow, a few miles above which it first receives the influence of the tide; and then gliding onwards, with a smooth and gentle current, and passing Renfrew, Dumbarton, and Port Glasgow, it forms the Frith of Clyde, nearly opposite to Greenock, after a length of course from its most distant source to this point, including its various windings and sinuosities of 1053 miles, and during which it falls no less than 1100 feet.

The Clyde is navigable for upwards of two miles.
above Glasgow for small vessels and steam-boats, and to that city for such as do not exceed 170 or 180 tons. The improvement of this navigation has been always considered by the inhabitants of Glasgow as an object of great importance; and from an early period, much attention has been paid to it, particularly of late years, by which the trade of the river has greatly increased; and vessels drawing 9 feet 6 inches, can now navigate the Clyde up to the city. This increase will appear from the following short statement, for which the writer of this article is indebted to the politeness of James Spreul, Esq. city-chamberlain and superintendent of the operations upon the river.

On the 8th January 1813, the number of vessels at the Broomeknow was

Of this last number there were

- 30 of 40 tons
- 29 from 60 to 100 tons, and
- 48 of from 48 to 60 tons
- 8 of 100 tons and upwards
- 64 of from 60 to 80 do.

The revenue of the river, from 8th July, 1816, to 31st July 1817, amounted to £7,026 0s. 7d Sterling.

The tide flows up the river about three miles above Glasgow, and in spring tides even farther; the flow continues at an average about 4 hours and 20 minutes; and at that city the mean tides rise 5 feet 6 inches, and the spring tides 2 feet higher.

The Clyde is very subject to inundations. The most remarkable record took place in the years 1712 and 1782. In the former of these years, the water rose 18 feet 6 inches higher than the level of the tide, and in the latter year, on the 12th of March, from 12 to 24 feet, according to the expansion or contraction of the banks in different places. The principal tributary streams of the Clyde are the Darc, the Coulter, the Methven, the Douglas, the Mousie, the Nethan, the Avon, Calder, North and South, Rotten Calder, Kelvin, Cart, and Leven.

The principal mineral springs are Walston Well, in the parish of that name; Monkland Well, near Airdrie; a spring in the parish of Blantyre; and another on the banks of the Clyde, near Rutherglen Bridge. These springs were formerly much more famous than they are at present, for their medicinal qualities; particularly those of Monkland Well and Blantyre, which, about 60 years ago, were visited by the gay and fashionable from all quarters.

The most considerable lake is the Bishop's Loch, between the parishes of Calder and Old Monkland; it is one mile in length, and about a quarter of that extent in breadth. The Black Loch, in New Monkland parish, is three quarters of a mile in length, and half a mile in breadth. To these succeed a number of others, as God's Loch, Johnston Loch, both in the parish of Calder; and Huggenfield and Frankfield Lochs, in the barony parish of Glasgow. The most extensive sheet of water, however, and artificially formed, is the Hill-end reservoir for supplying the Forth and Clyde canal; it is in the parish of New Monkland, and covers an extent of 317 acres, containing a supply to that navigation of 11,850 lockfulls of water.

The climate of this county, like that of the island, is in general variable; but from the situation of its several districts, and other local circumstances, there is a difference as to certain degree, even in this respect. In the north-western, or low district of the county, near the mouth of the Clyde, the rains are reckoned to be more frequent and lasting than in the country between Hamilton and Lanark, or even somewhat farther south; but this regards only the level districts; for in the hilly part of the county bordering on Dumfries-shire, they are more frequent than in the central parts of the county. Owing to the attraction of the numerous mountains in that quarter, the heats of summer and cold of winter, are also greater in these divisions than nearer the mouth of the Clyde. The wind blows in this county from the south-west, at an average, for more than two-thirds of the year, and from this cause the trees almost universally incline in the opposite direction. The north-east and east wind, often continue for a considerable time during the spring months, and even sometimes in May and June.

The following Table shows the quantity of rain which has fallen in two different situations of the county, from 1807 to 1817, as indicated by two excellent rain gauges:

The greatest degree of heat observed in the upper part of the county for many years, was, on the 28th June 1785, when the mercury in the thermometer stood at 85°; and at the same time, in the middle division at 84°. Last summer, 1817, the heat for some days was also very considerable, the mercury at Glasgow, in the shade, standing at 85°. In the level district of the county in 1740, during the winter, the cold was so severe, that the mercury stood 23° below the freezing point, and in January 1768, it was 34° below it. On the 19th January 1780, it stood 40° below the freezing point, and on the 22d January 1814, at 8° below zero.

The mountainous district in the southern parts of the county bordering on Dumfries-shire, appears to be of primary formation. It consists chiefly of argillaceous rock, or schistus, in a position nearly vertical, ranging east and west, and contains frequent veins of heavy and calcareous spar, indicating the presence of metallic ores. This rock is covered occasionally by amygdaloidal, or tuffstone, called there Copper Craig, and by basalt, or whinstone, which, in many situations, obscures itself into clay.

Towards the north-west, a considerable difference takes place in the geological structure of some of the mountains. Tinto, and its adjoining hills, which separate the mountainous district from the low country, is of secondary formation, and may be described as a floetz, or superimposition on grey wacke, and of this rock the great mass of the hills in the neighbourhood of Tinto seem to be composed. The substance which lies immediately over it in the body of the mountain, is a conglomerate, with a basis of clay, over which claystone, greenstone, and greenstone passing into clinkstone, and porphyry, successively appear till we arrive at the summit of the mountain, which consists of compact felspar, and felspar porphyry, with crystals of quartz, mica, felspar, and hornblende. Some miles to the westward of Tinto, limestone occurs, and beds of sandstone. Indeed the last rock, called by the Wuricrians the old red sandstone, appears to compose the whole inferior districts of Lanarkshire, though, in many places, it is broken in upon by rocks of a very dif-
LANARKSHIRE.

The field of coal which has been most attended to, lies adjacent to Glasgow, and is hence called the Glasgow field, which dips upon either side of the Clyde towards the river. This field, like the others in the county, consists of 8 seams. The most remarkable of these are the first six, which have the following names, situations, &c.

1st. The upper seam 4 feet thick, below which are strata of different substances 15 fathoms thick.
2d. Seam or rough coal 40 inches thick, below which are 6 fathoms of strata of different kinds.
3d. Rough Main, or main coal, 4 feet thick, the intervening strata between and No. 4, 10 fathoms thick.
4th. Hump coal about 30 inches, below 10 fathoms of different substances.
5th. Split Ell coal 40 inches in thickness; below lie strata of several substances from 1 to 10 feet.
6th. Lower Main, or Split Main, 7 feet thick; this seam contains sometimes balls of ironstone.

Below these seams are the 7th and the 8th. The 7th seam, called Sour milk coal, is about 12 fathoms below No. 6, and measures about 3 feet thick, but is not at present wrought; and the 8th seam is lower still 10 fathoms, being about 30 inches in thickness, and is likewise not as yet attended to.

In some parts of the county, as at Calder iron-works, the 2d and 3d seams unite, and form a seam of 10 feet in thickness; and at Woodhall, 16 fathoms above the upper coal, is a strata of candle coal about 8 inches thick, which burns with a brilliant light, and yields a much greater quantity of hydrogen gas for illuminating than the common coal. At Pounshie, in the upper part of the county, where the coal field appears to be a continuation of that of Muirkirk, the seam is between 7 and 8 feet thick. And in the parish of Lesmahagow, at Auchencrook, Nethanfoot, &c. there are very fine seams of candle coal, of a compact and close texture, which is much valued, and carried to a great distance, from the superior light which it yields, to that produced from the ordinary coal.

At these different collieries, immense quantities are raised. In 1816, at Calder colliery, about 9 miles eastwards from Glasgow, 75,000 carts were put out; and at that of Govan, in the immediate vicinity of that city, the number raised that year was 60,000, each of 12 cwt. There are in the county about 35 coal companies, who employ about 2900 workmen, and raise annually from the mine, for home sale and exportation, 700,000 carts of coal.

In the deep vales, sequestered dells, and woods of Botany this county, are to be found several rare plants. The few following may be mentioned. Circina alpina, mountain enchanter's nightshade, in Hamilton wood; Veronica montana, mountain speedwell, in Cartlane Craig, near Lanark; Mercurialis perennis, dog's mercury, a poisonous plant, banks of Clyde; Circina lutetiana, enchanter's nightshade, Gilburnsike, parish of Kilbride; Impatien noli me tangere, yellow balsam touch me not, in moist groves. Atropa belladonna divale, or deadly nightshade, in waste ground; tulipa sylvestris, wild tulip, near Hamilton; Convallaria majalis, lily of the valley, falls of the Clyde; Berberis vulgaris, barberry, in the woods about Lanark; Antirrhinum cymbalaria, ivy leaved snap dragon, on the old walls of Bothwell castle; Cheiranthus fruticosus, wild wallflower, Mains Castle, Kilbride, Bothwell Castle, &c.; Geranium lucidum, shining cranesbill, Cartlane Craig, Blantyre Priory; Scropola latifolia, broad leaved heliborne, in the woods of Bothwell, Hamilton, &c. and Humulus lupulus, hop, Craighnethan Castle.

The Bison Scoticus, or orus, described by Caesar, lib.
vi. appears to have been once a native of this county, the skeleton and horns of this animal having been dug up at New Lanark, in 1805, and the horns of another at Torrance, near Kilbride. Among the wild animals are, the otter, mustella, which is rarely to be met with, and the weasel. Mustella vulgaris, which abounds every where. On the dry heathy spots, in the uper part of the county, you often meet with the retreat of the Ursus stellus, or badger; and amongst the rocks of Cartlane Craigs, and similar situations, the wild cat, Vrotus ferox. The fox, the hare, &c. are nearly alike plentiful in the cultivated and barren districts.

Amongst the feathered tribe, may be reckoned the eagle, Falco chrysaetos; the heron, Ardeus major; the wild goose; and a great variety of the duck kind.

The woods and copses are enlivened by the black-bird, the thrush, the bullfinch, and many other little songsters; and amongst the woods of Hamilton and Bothwell, the pheasant is now no longer a stranger. The birds of passage are, principally, the swallow, the martin, and the land-rail, or corn-crake; and the moors and waste grounds on either side of the county, abound with game, particularly red and black grouse.

The rivers and lakes contain the salmon, the flounder, the baze, the trout, the eel, &c.; and the lower part of the Clyde is visited by several of the inhabitants of the deep, as the porpoise, Delphinus phocaen, which sometimes visits the Broomielaw, and has ascended even some miles farther up the Clyde. Below the Stonebyre fall, is also to be found the pearl-bearing musele, Unio margaritifera, from which pearls have been sometimes though seldom procured.

Lanarkshire, lying in the south division of Scotland, was situated in the Roman province of Valentinia; and, according to Ptolemy, was inhabited by the Damini, a nation or tribe of considerable note in the early period of British history. This county was formerly much more extensive than at present, including the whole of Renfrewshire, which, in the reign of Robert III, was disjoined from Lanark, and formed into a separate jurisdiction, in favour of his eldest son James, prince and steward of Scotland, by a charter of erection, dated at Perth, the 10th of December 1104.

To facilitate the administration of justice, Lanarkshire, which is under the jurisdiction of a sheriff-depute, and three substitues, magistrates of burghs, has been long divided into three districts called wards, viz. the upper ward, to the south-east; the middle ward, so termed from its situation; and the lower ward, to the north-west. These wards contain 81 parishes, exclusive of certain parts of the parochial districts of Moffat, Kilbarchan, and Cathcart, which also belong to Clydesdale; and form, with the adjoining parishes of Skirling, Broughton, Glenholm and Kilbarchan, in Peebles-shire, Cumbernauld, in Dumbartonshire, and Cathcart, the greatest part of which belongs to Renfrew, the presbyteries of Biggar, Lanark, Hamilton, and Glasgow; the first is included in the synod of Lothian and Tweeddale, and the three others in that of Glasgow and Ayr.

The upper ward, which is the most extensive, contains 544 square miles, or 277,846 Scots acres; the middle ward 302 miles, or 153,954 acres; and the lower ward 78 miles, or 40,078 acres.

According to the census of 1811, the population of the county was as follows:

Number of inhabitants in the upper ward 28,868
in the middle ward 41,857
in the lower ward 122,501
Total in the county in 1811, 194,226

Since that year, however, the population of some districts has greatly increased, particularly that containing the city of Glasgow, its suburbs, and of the adjacent barony parish, which contain at present about 120,000; and allowing only 3000 of increase for the other parts of the county, the population of Lanarkshire may now be stated at 215,000.

The greatest part of this county in former times belonged, in right of territory, to a few noble and ancient families, particularly those of Douglases, Hamilton, Blantyre, Carnwath, and Hyndford, and the Bishops of Glasgow. These great landholders held their property immediately of the crown in feoff; in course of time this was partly again disposed of to another class of occupant, in consideration of military service or wardholding. Upon its abolition, such persons as held their lands by that tenure had it converted into feu holding, they becoming bound to pay the superior a yearly rent in money or grain, nomine feuird firma.

The valued rent of the county in Scots money, by which the land-tax and other assessments are proportioned, is as follows:

The number of freeholders on the roll (January 1818) amounted to 99. Some of the qualifications for this privilege have been lately sold as high as £1130 Sterling.

There are three royal burghs, Lanark, the county town, where the chief courts of the freeholders are held, and the members of Parliament for the shire elected; the city of Glasgow, and the town of Rutherglen. The other towns are Hamilton, a burgh of barony, Strathaven, Douglas, Biggar, Airdrie; and many thriving and populous villages, as Leadhills, Carnwath, Carluke, Stonehouse, Wishawtown, &c.

Many extensive coppices and natural woods adorn this county, particularly near the banks of the Clyde, and, from the Falls, downwards. These are supposed to amount to about 3000 acres, and are cut periodically in certain portions or allotments called bals. Till within these 70 years there was very little attention paid to the planting of wood. The late John Earl of Hyndford was the first nobleman who began to plant on a great scale; and being much abroad as ambassador to different courts, his designs were carried into execution by James Denholm, Esq. commissary of Lanark, his Lordship's factor, who, in the course of a few years, reckoning from 1738, planted upwards of 30 acres; and since then great additions have been made. The present Lord Douglas has also planted very large tracts, extending at least to about 2000 acres; and the other landholders have in like manner paid much attention to this object. It is not easy to state what may be the extent of the plantations in the county; they likely, however, exceed at this time (1818) 8,500 acres.

The orchards in Clydesdale are deservedly celebrated. They lie chiefly on the banks of the Clyde between Lanark and Hamilton, and may extend to about 300 acres. The principal orchards are those of Cambusnethan and Dalziel. The fruit of Cambusnethan in some sea-
The arable ground lies principally in the districts extending from the eastern base of Tinto downwards, along the Clyde, and its tributary streams to the extremity of the shire. The soil in the upper ward, particularly in the neighbourhood of Lanark, is light and friable; this shades into the clay soil, the characteristic of that in the middle and lower divisions. The arable land along the Clyde, above the falls, is superior to any in the lower part of the county, exceeding in real intrinsic fertility the fine low grounds, which are 400 or 500 feet less elevated; and the harvests are in these more elevated districts often earlier. The rotation of crops differs in different parts. In the lighter soils of the upper ward, the most prevalent method is, to divide the arable ground into eight parts, and each, in its turn, undergoes the following rotation: First year, fallow, or turnips in drills, and manured, and a portion of potatoes; second, barley, sown with grass seeds; third, hay; fourth, fifth, and sixth, pasture; seventh and eighth, oats. In the middle ward, the following is prevalent: First year, the land is summer-fallowed, dunged, and limed, and wheat sown; second, beans and peas; third, oats, with grass seeds; fourth, hay, which is cut for one or two years, and afterwards pastured, as long as it is thought fit to let it rest. In the lower ward the following rotation is the most approved:—The farm is divided into five lots, and each managed thus: First year, The land is spring-fallowed, manured, and potatoes planted; second, wheat is sown as soon as the potatoes are taken up, and grass seeds sown among the wheat in the spring; third year, hay, twice cut; fourth year, hay, once cut, and the afterfodgerage pastured; fifth year, the field having been manured, in the latter part of harvest, with a compost of lime, and some kind of earth, is cropped with oats. Sometimes barley is sown instead of wheat, and sometimes the land is spring-fallowed. After the wheat and barley, it is sown with grass-seeds; and thus the rotation takes in another year.

Live stock.

The draught horses of this county are deservedly celebrated. They are bred principally in the upper districts of the county, and purchased by dealers from all quarters, at the fairs of Lanark, Carnwath, Glasgow, and Rutherglen. The superior qualities of the horse has greatly diminished the number of oxen; the number of these now kept is inconsiderable, perhaps not exceeding 200. The oxen, however, are a mixture of many different kinds. Of late years, a considerable attention has been paid to the improving of the breed; and, in consequence, they are gradually increasing in size and value, and may amount to about 30,000. Sheep are chiefly reared in the higher parts of the county. The numbers are continually varying, but may be stated at 120,000. The rearing of swine has never yet been a great object here, though now more attended to than formerly. We have no rabit warrens, and very few deer. Domestic fowls are, however, in abundance, and vast numbers are annually brought to market.

Manufactures and commerce.

From the co-operation of a number of causes, which our limits will not allow us to investigate, the manufactures and commerce of Lanarkshire have arisen to a pitch of greatness and extent hitherto unknown in the northern part of the island, and rivaling the first commercial districts, either in Britain, or on the Continent. At an early period, the inhabitants appear to have been much engaged in the buying and selling of wool; the manufacture of coarse woollen cloths for home consumption; the making of malt; and brewing of ales. In process of time, these branches of business were extended, and some of the produce of the manufactures were exported from Glasgow, in the lower part of the county, which was favourably situated for a trade of this kind; and, owing to this and some other circumstances, the manufactures and commerce of that city gradually increased, and attained, in a short time, a pre-eminence over the other districts. In 1718, the first vessel belonging to Clyde crossed the Atlantic; and in 1735, so much had the trade extended, that Glasgow counted no less than 67 vessels trading to foreign countries, with a tonnage of 5000 tons.

About the beginning, and towards the middle of last century, a great deal of fine linen and checks was made, and immense quantities of yarn spun every where in the county. This encouraged the establishment of the manufactures of lins and cambrics; which continued for many years to give employment to an extensive population. In the mean time, commerce still continued to prosper, and an immense quantity of American produce, particularly tobacco, was imported into Clyde: no less than 57,143 hogsheads of that article, the year previous to the breaking out of the American war, having been imported by the merchants of Glasgow. Beside the linen, check, lawn, and cambric manufactures, which were carried on, there were several others, as glass, the incle manufacture, and calico printing.

The American war gave a severe shock to the commerce of this district. By degrees, however, new channels of trade were found out; and its effects began to be less felt, when the cotton manufacture was introduced, which soon became an object of great attention. Cotton mills were erected in different situations in the county—the muslin manufacture commenced, and prospered; and thus manufactures and commerce went hand in hand, with increasing success, to the present time.

The most remarkable spinning establishment is that of New Lanark, belonging to Messrs. Owen and Co. (see LANARK, NEW.) These mills contain, at present, 23,000 spindles for the manufacture of water twist, besides the mule spindles, which form a large proportion of the spinning there. The Blantyre mills, the property of Messrs. Montieich and Co. produce also a great quantity of yarn: There are 8000 water spindles, and 22,000 mules. In the vicinity of Glasgow there are also very extensive works, particularly at Anderston, Woodside, the Gorbals, Cathkin, Bridgend, Cowcaddens, Ruther-...
The iron manufacture is also carried on to a great extent. The number of works for smelting the ore, and converting it into pig-iron, is five—Clyde, Calder, Cleland, or Omos, Shotts, and Wilsontown. The first of these, has two blast furnaces; Calder one, Cleland two, Shotts two, and Wilsontown two. Besides these, there are about twelve foundries in Glasgow and its neighbourhood, where great quantities of pig-iron are converted into articles of general demand. The manufacture of glass bottles was early introduced, and is still continued with success; that of Flint glass, or crystal, is of more recent date, but is carried on with taste and spirit. In addition to these, may be mentioned the making of ropes—the brewing of porter and ales, which is now an extensive and well-conducted business—the pottery manufacture—the distilling of spirituous liquors—and various others in different parts of the county, which our limits will not allow us to particularize.

The flourishing state of the cotton manufacture has contributed essentially to the present prosperity of commerce; the annual value of the imports and exports to and from the Clyde, amounting to an immense sum, the value of the exports from that river, for 1815, being no less than £4,016,181, 12s. 2d. Sterling; and these are likely still to increase, more especially since the great attention which has been paid to the deepening of the Clyde to Glasgow, a very great part of the foreign produce, and coasting trade, is now brought up to the city, employing a considerable and annually increasing number of vessels. The following Table shews the quantities of the imports of the three principal articles of colonial produce into Clyde for 1817:

There are three canals connected with this county, viz. the Forth and Clyde Canal, the Monkland Canal, and that of Ardrossan.

The first connects the firths of Forth and Clyde, and runs across the isthmus between the middle and southern divisions of Scotland. It was first proposed in the reign of Charles II.; and the idea was afterwards several times revived, and attempts made to carry it into execution. Many unforeseen obstacles, however, prevented anything from being done till the year 1764, when a survey having been made by Mr. Sinton, by desire of the Board of Trustees, a company was formed, and an act of parliament obtained for this purpose in 1768, for making a canal seven feet deep. By this act, the company were empowered to raise £150,000, in 1500 shares, of £100 each, and to borrow £50,000. The dividends to the proprietors not to exceed 10 per cent.; and when it exceeded that sum, the act ordained that the tolls were to be lowered.

The operations upon this canal began on the 10th of July 1768; and in July 1775, it was completed as far as Stocking Field, where a side-cut goes off to Port Dundas, in the immediate vicinity of Glasgow. The expense having at this time exceeded the estimate, and the funds being exhausted, an act was obtained from government of £50,000 from the forfeited estates, government drawing dividends along with the other proprietors. In consequence of this assistance, the work again recommenced; and the canal was finished in July 1790, when the opening of the navigation took place. This canal is raised from the Carron near the Forth by 20 locks, to the summit level 156 feet, and descends to the Clyde, after passing a remarkable aqueduct over river Kelvin, by 19 locks, in the whole 39. The extreme length of the navigation is 35 miles; the medium width of the surface of the canal is 56 feet, and of the bottom 27; the depth throughout the whole being 8 feet. Vessels of 19 feet beam, 60 feet keel, and drawing 8 feet water, can pass along the navigation, the banks having been raised a foot since 1787. The canal is supplied with water by 8 reservoirs, which yield annually 24,902 lockfulls. In addition to these, are several streams and feeders, by which an increased annual supply of 29,593 lockfulls can be obtained when required.

That this canal has been productive of great advantage to the country, in a commercial point of view, will appear from the following state of its revenue at different periods.

Monkland canal.

This canal connects the city of Glasgow with the extensive coal fields in the parishes of Old and New Monkland. It was projected and cut, principally for the purpose of supplying that city with coal. It is 32 feet in breadth on the level of the water, and 24 at the bottom; its depth is 4 feet 6 inches; and the upper and lower levels (at a place called Blackhill, where the ground ascends to the east) are connected by 4 locks of 2 chambers, of 71 feet in length. The principal article carried on the canal is coal; but, besides this, there are also transported iron, manure, &c., paying a certain tonnage per mile; and as it is now connected with the Forth and Clyde Canal, its utility is every year becoming more apparent, and more especially since boats have been established upon it for the conveyance of passengers.

Ardrossan canal.

About the year 1805, this canal was projected by the Earl of Eglinton. It was intended to form a communication betwixt the city of Glasgow and the Firth of Clyde at Ardrossan. A stock having been raised by subscription, a survey made, and legislative authority obtained, the operations were begun in 1807, and in October 1811, that part of the canal, betwixt Port Eglinton, near Glasgow, and the village of Johnston, was opened, being a distance of 11 miles. Upon this part of the canal, which is all that has been yet finished, the sum of £110,000 Sterling has been expended. The cutting of the remaining part of it to the harbour of Ardrossan, is estimated at £143,000; but, owing to the want of funds, the work is at present at a stand. When completed, its length will be 323 miles; its breadth is 30 feet, and 4 ½ in depth. Before it is completed, it will require 21 locks, viz. 8 betwixt Johnston and the summit level, and 13 betwixt that point and the sea at Ardrossan. Besides the vessels employed on this canal for commercial purposes, there are 3 boats for the conveyance of passengers to and from the city of Glasgow.

Roads and bridges.

Previous to the year 1755, the roads were made and repaired by the statute labour. As the work was done with much reluctance, and in a very indifferent manner, turnpikes were introduced about that time, and since then a great alteration for the better has taken place. The principal roads are those leading from Glasgow to Edinburgh; from Glasgow to Carlisle; from thence to Greenock, Ayr, Paisley, Lanark, Muirkirk, Dumfries, and Stirling; and from Edinburgh, by Hamilton, into Ayrshire; from the same city, by Biggar, to Leadhills, &c.; and from Lanark to Edinburgh. From the great resort to the city of Glasgow, the tolls upon such of the roads in this county as lead thither, let annually at a great rent. These in the immediate neighbourhood, in 1815, yielded £20,000 Sterling; and one in particular, the Gallowgate toll, let at no less a sum than £5630 Sterling, being nearly £100 more than the rent of the preceding year.

The chief bridges in the county are upon the Clyde. In the upper part of the river, are the bridges over Little Clyde; and at Elvanfoot, amongst which the great road leads from Glasgow to Carlisle. Farther down, are Wolf Clyde bridge and Thankerton bridge. Hyndford bridge, two miles from Lanark, crosses the river where it is 140 feet in breadth, and is a very beautiful structure, built about 40 years ago. The old bridge of Lanark was erected about the end of the 18th century. It has three very fine semicircular arches, and had lately a gateway, but which is now removed. Garion bridge is situated nearly half-way betwixt Lanark and Hamilton. It is the latest structure on the Clyde, and was opened 12th January 1818, for the accommodation of the public. Hamilton bridge was built in 1780. From a sudden inundation of the Clyde, part of it gave way, and fell into the river about five years ago, and it has never yet been repaired. Bothwell bridge is an ancient structure, famous for a skirmish in the reign of Charles II. between the covenanters and the king's army, in which the former were defeated with great slaughter. Rutherford bridge, near that town, was built in the year 1776. The old bridge of Glasgow. This is the most ancient structure, it is believed, on the river, having been erected by Bishop Rae in 1745. It consisted of eight arches. Two of these on the north side, have for many years been built up. One of its arches fell in 1671, and was again rebuilt: it was also since widened and repaired. Eastward from this bridge, is a very handsome wooden bridge erected in 1803, and placed in the situation of a stone bridge, founded in 1794; but which, before it was completed, was swept away by an inundation. The New of Jamaica-street bridge, is the lowest on the Clyde. It was founded in 1767, and widened for carriages in 1773. The aqueduct bridge across the Kelvin, and amongst which the great canal is carried, is a very strong and beautiful structure, about three miles north-west from Glasgow. It is the largest in Britain, being 275 feet in length, and 68 feet in height above the river Kelvin. It cost the Canal Company £9058, and was founded in the year 1787. Excepting an old Roman bridge over the South Calder, the most ancient bridge upon the other rivers of the county is perhaps Avon bridge, near Hamilton. It was built previous to the middle of the 16th century. The old bridge of Partick, over the Kelvin below Glasgow, is likewise of some antiquity, having been founded about the year 1577; and great part of it erected at the expense of Crawford of Jordan Hill, whose arms are still to be seen on the west side.

A reference having been made to Lanarkshire in the article Glasgow, in this work, for an account of the Gorbals, in that county, the following short historical sketch and description of that barony is in consequence inserted here.

The barony of Gorbals, including the populous villages of Hutcheson Town, Lawrie-ston, and Tradeston, is situated on the south bank of the Clyde, immediately opposite to the city of Glasgow. The lands of Gorbals appear anciently to have belonged to the see of Glasgow, with the exception of a certain space towards the western boundary, which, in the 16th century, was the property (together with the grounds upon which the bridgegate of Glasgow is built) of Lady Campbell of Lochow. That lady having erected an hospital for lepers upon her lands near Gorbals, named St. Ninian's Croft, she assigned the revenues thereof, together with the feu duties of Bridgegate, for its support, and which were collected as late as the year 1614.

Upon the erection of the barony and regality of Glasgow by James II in 1450, the lands of Gorbals were included in that jurisdiction; and, immediately after the Reformation, they were feued out by Archbishop Boyd to George Elphinston, merchant in Glasgow, whose son Sir George Elphinston, Lord Justice-Clerk, obtained a charter of confirmation from James VI. in 1011 of the
LAN

grant of the archbishop; and by which charter these lands were disjoined from the barony of Glasgow, and erected into a separate barony and regality with the usual powers and privileges. Sir George Elphinston having become insolvent, the property was attached by his creditors, and sold by them to Robert Douglas, Lord Viscount Belhaven; who, dying without issue, was succeeded in his estates by Sir Robert Douglas of Blackerston, by whom the barony of Gorbals was sold in 1647 to the magistrates and town-council of Glasgow, the "Trades' House," and Hutchison's Hospital; the latter having purchased one half of the property for the price of £40,066, 13s. 4d. Scots, and the other half being equally divided between the magistrates and the Trades' House. In virtue of this disposition, the magistrates of Glasgow became vested in the superiority and right of regality, which they still retain.

The lands and barony of Gorbals, till the year 1771, formed part of the parish of Govan. In that year the village and burying ground, containing about 12 or 14 acres, were erected into a new parish; and afterwards the lands of Little Govan and Polmadie, containing about 500 or 600 acres, together with the whole barony of Gorbals, including upwards of 400 acres, were annexed to the parish of Gorbals. The village of Gorbals had most likely its origin soon after the building of the old bridge of Glasgow, and at an early period, from its situation, was called Bridgend. It had for many years, however, made little progress; as we are informed, that so late as the beginning of the last century it consisted only of a few thatched houses on each side of the great road from the south end of the old bridge. These were mostly possessed by maltmen, who carried on the principal business of the village. In the year 1790, it had increased considerably; the intermediate spaces between the old houses being filled up with others, so as to form a regular and connected line of street. In 1748, the greatest part of the village was burnt, after which the houses were built after a more modern plan, some consisting of two, and others of three stories in height. It is only, however, within these 28 years that any remarkable improvements or additions have been made with respect to the laying out of new streets or erecting buildings on this barony. Previous to that time, the only street, properly so called, was that running southward from the old bridge, and from which branched two or three lanes, as Rutherford lane and Paisley lane, leading to these places. Since then, and in 1794, the directors of Hutchison's Hospital have feued their property to the east of the old village of Gorbals, which now forms Hutchison Town, having several broad and spacious streets, and regular and well built houses. The Trades' House of Glasgow and other proprietors have, in like manner, feued the grounds to the west; and in this situation are Lawreston and Tradestown; the last feued in 1790, which also contain many excellent streets. The finest of these is Carleton Place, a beautiful range of buildings scarcely to be surpassed in Scotland, upon the banks of the Clyde, between the old and new bridges of Glasgow, and immediately opposite to Clyde street, Charlotte and Claremont places in that city.

It has been already mentioned, that an hospital called Leper's Hospital, was erected here about the middle of the 13th century; it was situated, with its burying ground, to the east of the Old Bridge, but no vestiges of it have been observed for more than a century. An old chapel, dedicated to St. Ninian, still remains on the east side of the principal street of Gorbals, adjoining to which is a square tower, with turrets, now used as a prison, &c. which was built by Lord Viscount Belhaven, about the beginning of the 16th century. The chapel is now used as a court-house, police office, &c. The old church of Gorbals, situated to the west of the main street, was built as a chapel of ease to Govan in 1729, and used as the parish church, till within these few years. It is now a Gothic chapel, where worship in that language is regularly celebrated. The new church is a handsome modern building, facing the Clyde, to the east of Carleton Place, with a fine spire, 174 ft.; it was erected in 1810. In Hutchison Town is a meeting-house for a Reformed congregation, built several years ago, and in Tradestown, another for the Methodists, on an elegant plan, erected in 1812.

The barony of Gorbals is governed by a magistrate appointed by the magistrates and town-council of Glasgow, who is one of that body, and under whom are two deputies or magistrates resident within the barony, who hold regular courts for the discussion of cases, either civil or criminal. An excellent system of police has also been established of late years, which has been found of the greatest service to the public, by the protection it affords to the persons and properties of the inhabitants.

The population of the parish of Gorbals, including Hutchison Town, Lawreston, and Tradestown, has of late rapidly increased. An enumeration was made two years ago, when it was found that the inhabitants amounted to 17,000; but, as the buildings have been still increasing, and the amount of the population may be stated at present, January 1818, at no less than 20,000. See Denholm's "MS. History of Lanarkshire; Nasmyth's Agriculture of Clydesdale; Denholm's History of Glasgow; Hopkirk's Account of the Forth and Clyde Canal; Statistical Account. (n. s.)"

LANCASHIRE is a maritime county on the north west coast of England. It is bounded on the north by Westmoreland, and a part of Cumberland; on the east by Yorkshire; on the west by the Irish sea; and on the south by Cheshire. In shape, it is very irregular; at the northern extremity, there is a considerable portion of it, entirely detached from the rest, across an arm of the sea. Indeed it may, in some measure, be regarded as composed of three peninsulas, of which this just mentioned is one. This is comprehended between the river Duddon, which separates it from Cumberland, and the Ken which divides it from Westmoreland; the second peninsula lies between the Ken and the Ribble; and the third between the Ribble and the Mersey, which is the boundary betwixt this county and Cheshire. The first of these, which Camden and other ancient geographers call Furness-falls, and which is still known by the name of Furness, is in some places 14 miles from north to south; but in most, not above seven, and 4 miles from east to west. The line of coast, however, stretches upwards of 30 miles. The second peninsula, or natural division of Lancashire, which is comprehended between Westmoreland, that divides Furness from the rest of the county, and the river Ribble, was called by the Saxons, Aemundi-ness; by the Normans, Aigmardernesse; and now commonly Anderness, extends about 25 miles from north to south, and about 12 miles from east to west. The last natural division of the county lies between the rivers Ribble and Mersey; it is the largest and finest part of Lancashire, extending about 26 miles from north to south, and in some places 26 from west to east.

The greatest length of the whole county is about 74 Extrem miles; its greatest breadth, which is at the southern
LANCASHIRE.

end, 45; its circumference 34 miles; its area covers about 1800 square miles; and the number of acres is about 1,200,000. It is divided into six hundreds; Salford, West Derby, Leyland, Blackburn, Amounderness, and Anderness, and Lonsdale. The number of parishes in Lancashire is extremely small, considering the size of the county, proving its thin population at the period when they were divided; they amount only to 61. There are 27 market towns, of which the principal are Lancaster, the county town; Liverpool and Manchester, nearly of a size, and next in population to London; Bolton, Rochdale, Preston, Garstang, Wigan, Berry, Warrington, &c. It returns 14 members to Parliament; two for the county; two for Lancaster; two for Preston; two for Clitheroe; two for Wigan; two for Liverpool; and two for Newton. It is in the province of York, and diocese of Chester and Carlisle, and in the northern circuit.

Duchy.

Lancashire is a county palatine. The duchy was forfeited to the crown in the first year of Edward IV.; and at the same time an act was passed to incorporate it with the county palatine. The landed property which his majesty possesses, as Duke of Lancaster, is of great extent, and lies in the most northern parts of the county. The court belonging to the duchy of Lancaster, has the power of deciding all causes belonging to it; and amongst its officers, has a chancellor, attorney-general, &c.; the offices of the duchy court are at Somerset-place, London.

Surface and soil.

The surface of Lancashire varies very much; the disjoined portion of it, or the hundred of Furness, is wild and rugged, and very similar to those parts of Westmoreland and Cumberland, on which it borders. That part of the county which lies between the road from Garstang to Preston, and the sea, called the field-country, is flat; the southern portion of the tract between the Ribble and the Mersey, is also flat from the sea to the hills, which lies on the borders of Yorkshire. The eastern portion of Lancashire is hilly, and in some parts mountainous, being connected with that ridge, called the Backbone of England. The soil varies nearly as much as the surface; a sandy loam of considerable fertility prevails in the greatest portion of that district, which lies between the Ribble and the Mersey; this soil is also found in some other places; but the most prevalent soil is of a stronger nature, and not nearly so warm and fertile. The substratum of the sandy loam is either red rock or clay marl. The substratum of the poorer soil is in general a cold clay. There is no gravelly soil in Lancashire, at least to any extent, and no chalk or flints. Hence it will appear, that in respect of soil this county is not highly favoured; nor is it better adapted to the purposes of agriculture, with regard to its climate. Under the article England, we have given many facts relative to the quantity of rain which falls in it. In this place, therefore, we shall merely state, that the quantity of rain which falls in every part of it is large; that the atmosphere, even when no rain is falling, is often cold and damp; that the temperature of the summer months is low; that the winter, though not often very severe, continues long cold and unpropitious; that the springs are backward; and that the prevalent winds are the south-west and north-east. From the latter, however, Lancashire is in a great measure defended by the ridge of mountains which lies between it and Yorkshire. On the other hand, this ridge of mountains, intercepting and breaking the clouds, which the west winds bring from the Irish sea, contributes, in this way, to render the climate of Lancashire Lancashire, very wet.

The principal rivers of this county are, the Irwell, the Mersey, the Douglas, the Ribble, the Calder, the Wyre, and the Lune; they all direct their course to the west, and fall into the Irish sea. The Irwell rises on the hills that form the boundaries between Lancashire and Yorkshire. Its first course is to Bury; it then bends to the west, and afterwards to the south-east, to Manchester, where its waters are enlarged by two streams: its course is again changed to the west, till it falls into the Mersey below Flitton. The Mersey rises on the borders of Cheshire and Derbyshire; it divides the latter, forsees the common of Lancaster and Cheshire and Lancashire, for a course of nearly 60 miles, about 35 of which are navigable from Liverpool, where it falls into the sea, to the mouth of the Irwell. The Ribble rises in the Craven Moors, Yorkshire; its course is first south to Clitheroe; it afterwards declines to the west to Chester, and the valley of Ribblesdale, to Preston; and soon afterwards falls into the Irish sea, by a very broad estuary. The Lune rises in the falls of Westmoreland; and being formed by several streams, it flows through the valley of Lonsdale to Lancaster; here it becomes navigable; and two miles below the town, bears ships of considerable burden; it also joins the sea by a very broad estuary. The Duddlen, which divides the west side of Furness from Cumberland, at its junction with the sea, forms a considerable bay, at high water. The Crake, which runs nearly parallel to the Duddlen, connects Thurston water with the sea, at Leven sands.

In describing the sea coast of Lancashire, we shall begin at its southern extremity. The Mersey empties itself into a great estuary filled with banks, and crossed by a bar, over which, at low tide, there is but a foot or two depth of water; but the tides rise very high, from 21 to 25 feet. The coast here is very flat, and in some places the sea is encroaching on it, particularly between the Ribble and Morecambe Bay. In the estuary of the Ribble there are many sand banks, dry at low water, but on which the tide rises six fathoms. Morecambe Bay is a large gulf, between the mainland of Lancashire and the peninsula of Furness. Off the extremity of this peninsula are several islands, the principal of which is called Walney; which is ten miles long and one broad. It is so low that it is frequently nearly inundated. It would appear that these islands were formerly in one, and probably connected with the main land.

In our description of the rivers and coast of this county, it will be seen that the former generally empty themselves into the sea, with very broad and shallow mouths, filled with sand banks. This is caused by their taking their rise in the mountainous districts in the east county—the constant rapidity of their streams—and the shortness of their course. The sands of Lancashire most noted, are those of Lancaster and Leven. By an inspection of the map of the county, it will appear that the shortest route to the Furness district is across these sands; hence, though this route is extremely dangerous, it is frequently pursued. At three miles from Lancaster the Lancaster sands commence. They are fordable at low water for a distance of about nine miles. The Leven sands lie between Cartmel and Ulverston. At spring tides the water sometimes rises 15 feet over them.

In the north of Lancashire are several lakes. Conis- lon, or Thurston water, is about seven miles long,
from north to south; but its greatest breadth is not more than three quarters of a mile from east to west. Its greatest depth of water is forty fathoms. There are several small bays on its shores, which are lined with coppice woods, small farms, and rocks. The scenery of this lake is much praised by Mrs. Radcliffe. It abounds in fish; and the char found in it is much esteemed for its flavour. Esthwaite water is about two miles in length, and half a mile broad. It is nearly divided by two peninsulas, one of which projects from each shore. The scenery of this lake is rather mild and pleasing, than bold, romantic, or picturesque. Formerly there was in it a floating island; but latterly it has become stationary. There are several varieties of fish in it; but it is remarkable, that though it is connected with Windermere, no char is found in it. The lake of Windermere may be regarded as belonging partly to Lancashire and partly to Westmoreland, as it divides the district of Furness from the latter county. It is fifteen miles long, with an average breadth of one mile; but, in some parts, its breadth does not exceed 500 yards. Its greatest depth is about 201 feet. It is famous for its char.

No county in England abounds more in canals than Lancashire. The first complete artificial navigation was formed in it. This is called the Sankey Canal, and forms a navigable communication between the Mersey and the coal and copper works near St. Helen’s. Its length, from the place where it separates into three branches, is 9½ miles. The whole distance from the Mersey is 11½ miles. There are eight single and two double locks upon it, with 60 feet fall. The chief article carried upon it is coal. Besides this canal, Lancashire is intersected by parts of nine others, four of which communicate with Manchester. The Ashton-under-Lyne runs from that town to Manchester. Its length is 11 miles, with a rise of 152 feet. Near Duck- enfeld-lodge it unites with the Peak-forest canal, and at Fairbank, a branch goes off towards Oldham. One part of the Duke of Bridgewater’s canal runs from Manchester to Worsley, a distance of nine miles. At Worsley it is carried under ground to the collieries. Near this place, a cut branches off to Chat Moss. Another portion of the Duke of Bridgewater’s canal runs from Manchester to Runcorn, in Cheshire. The Manchester, Bury, and Bolton canal commences at the Mersey and Irwell navigation, near Manchester, and terminates at the town of Bolton. At Bury is a branch four miles long, which joins the Haslingden canal. The Rochdale canal connects the Bridgewater canal, at Manchester, with the Calder navigation, near Halifax. The Douglas river navigation commences at the estuary of the Ribble, and terminates in the Leeds and Liverpool canal, at Brier’s Mill. The whole rise from the Ribble is 40 feet, in the Leeds and Liverpool canal begins in the Mersey, at the lower part of Liverpool. It passes by Ormskirk, crosses the river Douglas, and continues the Lancaster canal, near Houghton Tower. The Lancaster canal runs upwards of 7½ miles, through nearly the whole county of Lancashire, and part of Westmoreland. It begins at West Houghton, and thence proceeds to Wigan, Preston, Garstang, and Lancaster. Here it is carried over the river Seine by an aqueduct of five arches. It passes out of Lancashire near Burton. The great object of this canal, one of the most important in the kingdom, is to open a communication between the coal and limestone counties; the county north of Preston being destitute of coal, but abounding in lime.

Besides these canals, several rivers in Lancashire have been rendered more fit for navigation than they naturally were. In order to render the Mersey, above Warrington, navigable as far as Manchester, through its communicating branch the Irwell, an act of parliament was obtained near a century ago; and the object has been effected by means of weirs, locks, &c.; but the Duke of Bridgewater’s canal has rendered this navigation of little use or profit. ‘About the same time, the navigation of the river Douglas was also improved by artificial means; but this has been since purchased by the proprietors of the Leeds and Liverpool canal, who have, in part, substituted an artificial cut for the natural channel of the river.

The most abundant and valuable of the minerals of Lancashire are its coals. Immense beds of them are found in the southern parts, and towards the centre; but none, as has been already remarked, beyond Preston. The hundreds of West Derby, Salford, and Blackburn, are most abounding in this valuable article. There is one species of it almost peculiar to Lancashire. This is called Cannel coal. It is found at Haigh, near Wigan. It burns with uncommon brilliancy, without smoke. It is very apt to fly into pieces, if not placed on the fire in a particular position. It is very hard, and susceptible of a high polish. If broken transversely, it presents a smooth conchoidal surface. Limestone abounds in the north and north-east parts of the county; but none is found in the south or western parts, except near Liverpool, where it is met with in small quantity, and at a great depth; and near Leigh and Manchester, where lime peculiarly adapted for tarras occurs. Marble is abundant in the south and western parts of the county. Stone of various sorts abounds in Lancashire. Quarries of an excellent sort are wrought near Lancaster. It bears an excellent polish. Lancashire is entirely built of it. At Holland, near Wigan, there are quarries of flag and grey slates; and large quantities of blue slates are procured from the hills near Hawkshead. They form a lucrative branch of the export trade of the county. Scythe the stones are obtained near Rainford. With respect to the metals, iron ore abounds in Furness; and at Anglesey, near Chorley, is a lead mine, consisting of several veins, intersecting the strata of the county almost perpendicularly, and running in various directions. These mines are noted for containing carbonate of barytes. In the north of the county some copper mines have been wrought, but not to much advantage.

As an agricultural district, Lancashire is not celibated. Its climate and soil are not favourable to agriculture; and since the manufactures of the county have spread so widely, and given employment to such a large portion of its inhabitants, agriculture has been suffered to decline. In the south of the county there are few very large estates, properly having become more moderately divided since the introduction of manufactures. The yeomanry, formerly numerous and respectable, have greatly diminished; and most of the farmers who have gained fortunes by agriculture, place their children with manufacturers. There are, however, still some large estates, as well as farms of considerable extent, and well managed. One of the largest estates in the county, if not the largest, belongs to the Earl of Derby. The tenures are chiefly freehold; leases for lives are more common in Lancashire than in most other counties. The general size of farms is about 50 acres; very few exceed 200. Although agriculture has not advanced very rapidly in Lancashire, yet, in
The rotation of crops followed, is by no means judicious or profitable. In many parts, oats are sown for years together; and even in the Fylde district, where agriculture is more extensively the object of attention, the land is cropped in a very severe and unhusbanded manner. The points of agriculture for which Lancashire is most noted, are the application of marl; the cultivation of oats and potatoes; and its cattle: of the first, we shall speak afterwards. The climate, and in general the soil of the county, are favourable to the growth of oats; and this grain constitutes the principal food of the labouring classes, even in the manufacturing districts: hence oats are cultivated to a very great extent, and in general with considerable attention and skill. Various kinds are grown; especially the tartarian and the potato oats. Wheat does not succeed well in this county: more from the coldness and moistness of the climate than from the nature of the soil; for in part of Furness, the low lands near the shore beyond Lancaster, the Fylde, and the south-west part of the county, there are excellent wheat land. There is still less barley grown, and scarcely any peas or beans. For potatoes, Lancashire has long been famous; and indeed the cultivation of this root is here extremely well understood, and their cookery not less so. Lancashire is said to have been the first county in which they were grown. The best mode of cultivating them is on the sward; they are always drilled, and well hoed while growing. Great attention is paid to changing the seed, in order to prevent the curl. The produce, on a medium, is from 200 to 300 bushels, of 90 lbs. each, to the statute acre. Early potatoes are much cultivated, and with very great care and skill, near the large towns.

Lancashire produces so little corn, that it is estimated the corn raised in it would not support its inhabitants more than three months in the year; hence it will be concluded that the larger portion of its lands are under grass, which is the fact. In this department of agriculture, Lancashire presents little that is interesting; its meadows produce hay not of very good quality, owing partly to the soil and climate, and partly to the mode in which it is made. The common average of the best feeding lands will support one cow on the statute acre during the summer.

There is one branch of horticulture for which Lancashire is celebrated; the best gooseberries have their origin in this county; and uncommon attention and zeal are still shewn for the purpose of raising large and new varieties. Meetings are annually appointed at different places, at which there are public exhibitions of gooseberries, and other fruits, and flowers; at these meetings gooseberries have been produced which weighed upwards of 17 dwt.; and one year a gooseberry tree yielded 21 quarts of fruit, which weighed 28 lbs. averndupois. The manufacturers, who generally possess a small quantity of ground adjoining their cottage, spend much of their leisure time in cultivating fruits and flowers. Vegetables of different sorts are cultivated with great care and skill near Liverpool and Manchester. About five miles from the latter place there are upwards of 60 statute acres planted with apple trees.

There are no natural woods of any consequence in this county, and, in general, it is bare of timber. A mode of raising trees near the sea, which is generally regarded as impracticable, has been followed with success in some parts of Lancashire, which deserves notice. In order to protect the young trees from the sea air, they are placed in little iron cages fixed round them. It is remarked, that the sycamore, ash, alder, fir, and plan- tanus, thrive best in this situation.

This county abounds in bogs or morasses, called here mosses. The principal are, Chat moss and Trafford moss. Attempts have been made to drain and improve these with considerable success.

Of the manures employed in the greatest abundance, and with most effect, marl may be reckoned the chief. There are several kinds in this county. The principal are the blue, or reddish slate marl, which contains a large proportion of calcareous earth; and the strong clay marl, which contains less calcareous matter. The poorest lands have been improved by marling; and though the expense is heavy, it is found to pay well.

The Lancashire long-horned breed of cattle have been deservedly celebrated: on them Mr. Bake- well made his improvements: they are found in almost every part of the county, but the prime stock is bred in the Fylde. Among the cow-keepers, all kinds are met with, but especially the Holderness and Der- buryshire. The county produces a considerable quantity of cheese is made in this county, but none of it is of very superior quality, except what is made near Leigh; this is little inferior to the Dunlop cheese of Ayrshire, in mildness and richness; yet it is surprising that the land here is chiefly barren, the soil being shallow, with clay under it. The quantity made from a cow, is about 300 lb., fit for the market. There are very few sheep kept in the southern parts of the county: in the northern parts they are bred and kept upon the hills; but Lancashire is not a sheep district. It is said, there is not a single shepherd, properly so called, in the whole county. Almost the only sheep kept, are the black faced Scotch and Welsh. The Lancashire breed of horses were used by Mr. Bakewell, as the basis of his improvements; but in the county itself, little attention is paid to improving or keeping up this breed: they are universally preferred to oxen for the purposes of husbandry.

"The Fylde is the principal district in this county Poultry, which keeps a surplus stock of poultry. Poul- terers also collect the chief part of what is brought to the Ormskirk market, from the cottagers and farmers, and retail them out again at the Liverpool market. On Martin Mere, are turned a number of flocks of geese, on a certain day, brought from different parts of the country. Those flocks are so marked as again to be known. Upon this mere, they continue till about Michaelmas, when they find sufficient food from the grasses, insects, &c. The proprietor of the water claims half of the stock that remains alive for their summer's keep."

It has been observed, that there is a greater length of roads in this county, in proportion to its extent, than in any other county in the kingdom: in the north, and north-eastern parts, they are made of limestone; in the middle and southern parts, the roads are paved with stones, principally brought from the Welsh and Scotch coasts. On the road between Manchester and Liverpool, slag or copper scoria has been advantageously used.

Lancashire is the most manufacturing county, with exception, in the kingdom. Its staple manu- facture is that of cotton in all its branches; but as we have entered very fully into a view of this manufacture, in our account of the Statistics of England, our
notice of it here must be brief and general. Manchester may be considered as the centre of the cotton spinning and manufacturing district. From this town this branch of trade has spread southwards into Cheshire, and northwards as far as Preston; various branches of it are also carried on at Bolton, Cheshunt, Bury, Wigan, Blackburn, &c. Besides those employed in spinning and weaving cotton, there are bleachers, dyers, printers, tool and machine makers, &c. There are also in Lancashire, manufactories of woollen goods, hats, especially at Oldham, stockings, pins, needles, nails, watch-movements, tobacco, and tobacco-pipes, snuff, earthen ware, English porcelain, paper, &c. There are also large works for smelting iron and copper, and for casting plate glass, and the making of common glass, white lead, lamp black, vitriolic acid, &c.

The commerce of Lancashire is also very great; almost entirely from Liverpool to America, the West and East Indies, Africa, the Mediterranean, Spain, Portugal, Ireland, &c. Lancaster also enjoys some commerce, but the quantity is proportionally small; and it seems to be declining. The principal articles of export are the various manufactures of the county; and the principal articles imported, are cotton, wool, sugar, tobacco, rice, timber, corn from Ireland, &c.

It is generally supposed that the Brigantes inhabited Lancashire at the period of the Roman conquest. According to the authority of Ptolemy, however, they were preceded by a tribe, whom he calls the Seguntii. The Romans entered their territory, under Julius Agricola, about the year A.D. 79; and Mr. Whitaker says, that the principal Roman stations were formed at this period, of which Manchestaria, or Manchester, was one. The Romans also formed several excellent roads through the county. The whole of Lancashire, along with Yorkshire, &c. was called by the Romans Maxima Cæsariensia, or Britannia Superior; by the Saxons it was included within the kingdom of Northumbria: Soon after it was conquered by Egfrid. About the year 860, it was formed into a separate county. Soon afterwards it was divided into hundreds, tithings, &c. South Lancashire was at first divided into three hundreds, and, just before the conquest, subdivided into six. Previous to and under the early Norman sovereigns, this county was distinguished as an honour. Landed honours generally belonged to the king, but were sometimes granted in fee to noblemen. Soon after the conquest, three noblemen held the honour of Lancaster; but King Stephen confirmed it on his son, and thenceforward it seems to have been attached to those of royal blood. In the time of Henry III., it was constituted an earldom; and in the time of Edward IV. the dukedom of Lancaster was created. John of Gaunt procured it to be raised to the dignity of a county palatine. The antiquities of this county are by no means numerous or interesting.

In the year 1803, the poor's rate of this county amounted to £30,765: for the year ending 25th of March 1815, the sum paid by 449 places (for, in consequence of the great extent of its parishes, they are subdivided into townships), is £38,671: 2: 10; returns had not been obtained from three places. From comparing the returns in 1803 and 1815 it will appear, that the poor-rates of this county have not increased in a very great degree. In the year 1776, the sum of £56,182 was raised; and the average of the years 1783, 1784, and 1785, was £50,301. In 1803, the number of persons relieved was 46,200, or 7 in the 100 of the population; the money raised was 6s. 10½d. per head on the population; the rate at which each pauper was relieved, was £3. 9: 3. Nine hundred and fifty-seven friendly societies were enrolled at that time; and the number of members was 104,776, or 16 in the 100 of the population; the number of children in schools of industry was 1704.

The population of Lancashire was very thin before Population, it became a manufacturing county. In the year 1700, it amounted only to 166,200; in the year 1750, it had increased to 297,400; in the year 1801, it had augmented extremely, being 695,100; by the returns it appears to have increased still further in 1811. At that time,

In 1801: 695,100

Increase: 133,909

The population in 1811, is nearly at the rate of 380 per square mile. The baptisms were 1, to 29, the burials 1 to 48, and the marriages 1 to 108. See Aikin's Manchester; Beauties of England and Wales; and Dickson's Agricultural Survey. (w. s.)

Lancaster, a town of England, in the hundred of Lonsdale, in the county of Lancashire, lies in 54° 4' North Lat. and 2° 56' West Long. It is 293 miles N.N.W. from London. It is a borough, the civil government of which is vested in a mayor, 12 aldermen, a recorder, 2 bailiffs, 12 common councilmen, or capital burgesses, &c. It returns two members to parliament. The right of election is vested in the freemen, who amount to about 1000. The returning officers are the mayor and two bailiffs. This town is situated on a gentle ascent, on the top of which stand the church and castle. The river Lune makes nearly an acute angle on the north side of the town. The direction of several of the principal streets are from it to the south, the church and castle being in some measure detached. Hence it will appear, that the situation of Lancaster is, upon the whole, striking. The houses are in general good, being built of an excellent freestone found in the neighbourhood, and covered with slate. Many of the streets, however, are narrow. The most important, as well as the most interesting public building in Lancaster, is the castle. It is supposed, that the Romans first built a castle on the site of the present one, and that part of the old foundations are still visible; and it is pretty well ascertained, that the large square keep was the work of the Saxons. But the main building was the work of Edward III. and his son John of Gaunt, whom he created Duke of Lancaster. Its walls cover an area of 360 feet from east to west, by 350 feet from north to south. At present, the whole is appropriated to the county goal. The summit commands very extensive views, embracing the windings of the Lune, Morecambe bay, the mountains of Cumberland, Westmoreland, and Yorkshire. The shire hall, a beautiful modern structure, and the county courts, are attached to the castle. The other public buildings are, the town hall, theatre, custom-house, assembly-room; and over the Lune there is a very grand bridge, which was built by the county at the expense of £12,000.

Lancaster

About a mile to the north-east of the town, is the aqueduct-bridge of the Lancaster canal, which consists of five arches, and cost £45,000. Barges of 60 tons can pass over it. This town has communication, by internal navigation, with the rivers Mersey, Ribble, Ouse, Trent, Severn, Humber, Thames, Avon, &c. This navigation, including its windings, extends about 500 miles into the counties of Lincoln, Nottingham, York, Westmoreland, Cheshire, Stafford, Warwick, Leicester, Oxford, Worcestershire, &c. There is scarcely any manufacture of consequence in Lancaster. It is chiefly celebrated for its cabinet ware. The spinning of twine, printing of cotton, and weaving of sail cloth, is also carried on to some extent. Ship-building has been carried on to a considerable extent, and vessels of 450 tons have been launched here. The river being obstructed by shoals, only vessels of 250 tons can reach the quay. Its trade is principally to America and the West Indies. In 1799, 52 vessels cleared out for the latter, with cargoes estimated at upwards of two millions; but at present the trade is not so considerable. On the 30th of September 1800, the registered shipping consisted of 140 ships, 19,094 tons, navigated by 1926 men. In the immediate neighbourhood of the town, is an excellent salt marsh, of about 501 statute acres, which belongs to 80 of the oldest burgesses, or their widows. In the year 1801, Lancaster contained 1601 houses, and 9030 inhabitants. In the year 1811, the returns were as follow:

| Houses Inhabited       | 1694 |
| Families occupying them | 1906 |
| Houses uninhabited      | 37   |
| Families employed in agriculture | 182 |
| Dwellings, do. in trade | 1260 |
| All other families      | 404  |
| Males                   | 4237 |
| Females                 | 5010 |
| Total                   | 9247 |

LANDEN, John, a celebrated mathematician, was born at Peakirk, near Peterborough, in Northamptonshire, in January 1719. So early as 1744, he was a contributor to the Ladies Diary; but it was not till the year 1754, that he published in the Philosophical Transactions, his first paper, entitled, An investigation of some Theorems, which suggest several very remarkable properties of the Circle, and are at the same time of considerable use in resolving Fractions, the denominators of which are certain multinomials into more simple ones, and by that means facilitate the computation of Fluents. In 1755, he published a small volume, entitled Mathematical Lociuations, containing a variety of tracts relative to the rectification of curve lines, the summation of series, the method of finding fluents, and other branches of the higher mathematics.

About the end of 1757, he published proposals for printing by subscription, the Residual Analysis; and in 1758, he published his Discourse on the Residual Analysis, in which he resolved a great variety of problems by an entirely new mode of reasoning, and pointed out the superior elegance of his method to that which had been derived from the fluxional calculus.

In the Transactions of the Royal Society for 1760, he published A new method of computing the sums of certain Series, a subject which he afterwards pursued in his Mathematical Memoirs, which appeared in 1780.

Hitherto Mr. Landen had lived as a farmer at the village of Walton, near Peterborough; but in 1762, he removed to Milton, the seat of Earl Fitzwilliam, where he discharged the duty of land steward to that nobleman till within a few years of his death.

In the year 1764, he published the first book of the Residual Analysis, in which he applies it to the drawing of tangents to the finding the properties of curve lines; to describing their involutes and evolutes; finding the radius of curvature, their greatest and least ordinates, and points of contrary flexure; and to the determination of their cusps, and the drawing of asymptotes. He proposed in a second book, to shew its application to a great variety of mechanical and physical problems; but he never found leisure to complete this part of his plan.

On the 16th of January 1766, Mr. Landen was elected a member of the Royal Society; and in 1768, he published his Specimen of a new method of comparing Curvilinear Areas, by which many such areas may be compared, as have not yet appeared to be comparable by any other method. In the same work for 1770, he gave Some new Theorems for completing the Areas of certain Curve Lines.

In the Phil. Trans. for 1770, he published A disquisition concerning certain Fluents, which are assignable by the Area of the Conic Sections; where are investigated, some new and useful Theorems for computing such Fluents. This subject had been previously treated by Macaurin in his Fluxions, and by D'Alembert in the Memoirs of the Berlin Academy; but Landen had the merit of removing a very great defect in their methods: In the same year, he published his Animadversions on Dr. Matthew Stewart's computation of the Sun's distance from the Earth, a work written in a style of anonymity disgraceful to a man of genius.

In the same work for 1775, he published an Investigation of a general Theorem, for finding the length of any Arc of any Conic Hyperbola by means of two Elliptic Ares; with some other new and useful Theorems deduced from it. In this paper, he has shown that both the elastic curve, and the curve of equable recess from a given point, with many others, may be constructed by the rectification of the ellipsis only, without failure in any point; whereas the elegant method by Maclaurin, of constructing them by the rectification of the hyperbola and the ellipse, fails when some principal point of the curve is to be determined, as the hyperbolic arc and its tangent, then become infinite, though their difference be at the same time finite.

In 1777, he published in the Philosophical Transactions, A new Theory of the Motion of Bodies revolving about an Axis in free Space, when that Motion is disturbed by some extraneous force either persuasive or accelerative. In this paper, he considers only the motion of a sphere, sphereoid, and cylinder; but in consequence of his having afterwards found, that D'Alembert had treated of the same subject, he purchased the Opuscule of that eminent author, where he found it stated, that some mathematician doubted, whether there is any solid whatever besides the sphere, in which any line passing through the centre of gravity will be a permanent axis of rotation. He was thus led to resume the subject, and he succeeded in pointing out several bodies, which, under certain dimensions, have that remarkable property. This paper was published in a volume of memoirs, which appeared in 1780, and which contains also a large appendix, with a complete collection of Theorems for the calculation of Fluents, principally investigated by himself.

Mr. Landen published three small tracts on the summation of converging sines, in which he explained and extended the theorems of De Moivre, Stirling, and Thomas Simpson.
About the commencement of the year 1782, Mr. Landen had made such additions to his theory of rotatory motion, that he thought himself capable of resolving the general problem, namely, to determine "the rotatory motion of a body of any form whatever, revolving without restraint about any axis passing through its centre of gravity." Having found, however, that the result was materially different from that given by d'Alembert; he declined publishing his solution. The solution of the same problem given by Euler, in the Memoirs of the Berlin Academy for 1757, happened to fall into his hands, and he saw that the result was the same as that of d'Alembert; but the great perspicuity of Euler's investigations, enabled him to discover the point in which the solution differed from his own. After repeated examinations of his own solution, he was firmly convinced of its correctness, and at last published it in the Philosophical Transactions for 1783. The Rev. Charles Wildbore, a respectable mathematician, attacked Landen's solution in the Phil. Trans. for 1790, in a paper on Spherical Motion, and obtained the same solution as that of Euler and d'Alembert. Mr. Landen was thus led to revise and extend his solution, and having found a result similar to that of Euler, in Frisi's Cosmographia; and having also learned, that Euler had revised his own solution, and obtained the same result, in his Theoria Motus corporum Solidorum seu rigidorum, which appeared in 1765, he set about a full explanation of his own views.

He was now severely afflicted with the stone; but during the painful intervals of that agonizing disorder, he continued to write the second volume of his Memoirs, which appeared after his death. This volume contains, among other important papers, a solution of the general problem concerning rotatory motion, the resolution of the problem relative to the motion of a top, and an investigation of the precession of the equinoctial points, in which he had the honour of detecting, for the first time, Sir Isaac Newton's mistake in his celebrated solution of the same problem. Mr. Landen had the satisfaction of receiving a copy of this work on the day before his death, which took place at Milton, near Peterborough, on the 15th of January, 1790, in the 71st year of his age. A flat stone in the north aisle of the church of Castor in Northamptonshire, is the only monument to the memory of this distinguished mathematician.

As a mathematician, Mr. Landen is entitled to a very high reputation; but he possessed, in no small degree, a coarseness of mind, and a disposition to contemn the pursuits of others, which, we regret to say, is too often exhibited by those who exclusively cultivate the mathematics. His treatment of Euler is by no means handsome; and the controversy with Dr. Henry Clarke respecting that gentleman's translation of Loria's treatise on series, was carried on with an asperity of language unworthy of a man of genius. From the singular contrast between the manners of Mr. Landen and those of his noble friend the Earl of Fitzwilliam, the villagers often exclaimed, when they were seen to pass together, "There goes Lord Landen and Mr. Fitzwilliam." Mr. Landen left one daughter, who, we believe, is still alive. His manuscripts were sold to the shopkeepers of Peterborough for waste paper.

LANDES, LES, is the name of a department in the south-west region of France. It is bounded on the north by the department of the Gironde; on the east by that of Lot, and Garonne, and Gers; on the south by the Lower Pyrenees; and on the west by the sea. It contains 480 square leagues, or 9475 square kilometres, and is watered by the river Adour, and by the Medan, which passes by Mont Marsan. Its principal productions are barley, wines, cork, charcoal, and resin; but the soil is in general sandy and unfruitful, the north and west parts consisting of heath and marshes. The sea is said to have once covered this department, and to have flowed as far as Dax. The villages and hamlets stand on spots of fertile ground, like islands, among the sand. The shepherds are remarkable for being mounted on stilts, which raise them from three to five feet above the ground, for the double purpose of keeping them out of the water, which lies deep on the sands, and of enabling them to see their sheep at a greater distance on the level ground. The principal towns are:

The forests of pines and oaks cover about 2018 acres, and belong in general to individuals. The contributions in 1803, were 1,207,397 francs; and the population of the department, 228,889. Mont Marsan is the capital.

LANDSCAPE GARDENING.

In the infancy of human arts, all gardening would be comprehended in the culture of a few fruits and esculent plants in a very limited space; but at present, the word garden has at least three distinct significations: to designate a spot, destined for the culture of fruits and culinary vegetables; to mark a space, devoted to flowers and botanical pursuits; and to denote a more extended scene, characterized by forest trees, and walks for shade and recreation, and combining such other objects belonging to external scenery, as taste, art, or locality may confer. For kitchen gardening and botanic gardening, we refer to our view of HORTICULTURE. The art of forming the third class of gardens, and to which we propose in this article to confine our attention, has been, till of late, indifferently known under the terms pleasure, ornamental, and rural gardening; but is now more generally designated landscape gardening, a very happy term, particularly as applied to the modern style of laying out grounds. But as we intend directing our attention to both styles, we shall employ the term gardening as a generic distinction, comprehending both the geometric or ancient, and the modern or landscape gardening. We shall arrange our observations in the following order:

1. An historical view of ornamental gardening, ancient and modern.
2. The object of this art, and the principles of composition adapted to it.
3. The application of these principles to the different materials employed in forming a country residence.
4. The application of these principles, in uniting these materials in compositions or constituent parts of a country residence.
5. The union of these constituent parts, in the formation of the different varieties of country residences.
6. The practice of landscape gardening.
History.

CHAP. I.

HISTORY OF ORNAMENTAL GARDENING.

What is known of the history of this branch of gardening, may be arranged in four distinct epochs. 1st. From the earliest accounts, that is, from about the tenth century antecedent to the vulgar era, to the second century before the same era; referring chiefly to the Jewish, and some of the Greek authors, as Moses, Solomon, Homer, Hesiod, Panassias, &c. 2d. From the above period to the decline of the Roman empire, including the Roman poets and philosophers; as Catu, Varro, Virgil, Pliny, Columella, &c. 3d. From the revival of the arts to the introduction of the modern style, or what is properly called landscape gardening, about the middle of the 18th century; including Zanoni, Clarici, &c. among the Italians; Gesner, Trinkhaus, &c. among the Germans; Lobel, Liebault, &c. among the Dutch, and the United Provinces; Bertrand, D'Argenville, &c. among the French; and Didymus Mountain, Temple, James, Switzer, &c. among the English. 4th. From the introduction of the modern style to the present time; among the principal writers during which period may be reckoned Laugier, Girardin, Wattélet, &c. among the French; Hirschfeld, Grohmann, &c. among the Germans; and Shenstone, G. Mason, Chambers, Wheatley, Mason the poet, Price, Knight, Repton, &c. among the English. We shall take a cursory view of each of these periods, and in our progress, refer the more inquisitive reader to such works as will afford him ample information.

SECT. I. ASIATIC AND GRECIAN GARDENING.

First epoch, 1600 to 260 B. C.

Paradise.

The first garden on record is known to every reader. Moses, in describing it, no doubt intended to combine every sort of excellence of which he deemed a garden susceptible; and it is remarkable, that in so remote an age, his outline should contain so much of general nature. What was sketched by Moses, was ably completed by Milton, whose finished performance, as Mr. Walpole observes, exhibits all the higher beauties of the rural scenery of a modern country residence. Thus the origin of gardening, as of most other arts, is traced to the Eastern nations, through the writings of the Jews.

It is to be regretted, that Solomon has left so imperfect an idea of the manner in which his garden was laid out, though he has made some degree of compensation for this omission, by the hints of what it contained. Besides fruits and odoriferous flowers, there were baths, summer-houses, and water in various forms.

It was powerfully enclosed, as is generally the case with eastern gardens to this day, for the sake of privacy and seclusion. That it was contiguous to some of his palaces, appears more than probable, from the circumstance of Ahasuerus, one of his successors, being mentioned as going forth from the banquet of wine into his garden, and returning; and king Ahab wishing to extend his garden, desired the vineyard of Naboth for that purpose, "because it was near his palace."

The next garden in the order of time, was situated on an island in the Archipelego, on the confines of Europe, and is that of the Phoenician king Alcinous. It is very minutely described in the Odyssey, and seems to have been little more than an orchard of four acres, containing three or four sorts of fruit trees, some beds of flowers or vegetables, two fountains to water it, and a hedge as the boundary enclosure. That of Laertes, also described in the Odyssey, was very similar to the above. Both appear to have been placed adjacent to the house, and evidently intended for use more than ornament. Odys. lib. v. 112.

The parishes of Semiramis, or, according to Mr. Bryant, (Ann. of Ancient Mythology, vol. ii. p. 100, &c.) of a people called Semarini, ancient Babylonians, are the next in order. They were distinguished by their elevated and romantic situations, and also by their extent. "When Semiramis came to Chacon," observes Diodorus Siculus, (book ii. chap. 13,) a city of Media, she observed on an elevated plain, a rock of stupendous height, and of considerable extent. Here she formed another paradise, exceeding large, enclosing the rock in the midst of it; on which she erected sumptuous buildings for pleasure, commanding a view both of the plantations and of the encampment."

Where nature did not furnish an adequate site, art supplied the deficiency; and hence those well-known stupendous mechanical constructions, entitled the hanging gardens of Babylon, and ranked among the ancient wonders of the world. "This surprising and laborious experiment," observes Mr. G. Mason, (Essay on Design in Gardening, p. 9,) "was a strain of complaisance in king Nebuchadnezzar to his Medean queen, who could never be reconciled to the flat and naked appearance of the province of Babylon, but frequently regretted each rising hill and scattered forest she had formerly delighted in, with all the charms they had presented to her youthful imagination. The king, who thought nothing impossible for his power to execute, nothing to be unattempted for the gratification of his beloved consort, determined to raise woods and terraces, even within the precincts of the city, equal to those by which her native country was diversified."

The word paradise, among the eastern nations, seems to have had different shades of meaning, as well as the word garden of modern times. The paradise of Alcino- nus was an orchard; while those of queen Semiramis, seem to have included all the external scenery appropriated to a country residence.

Those of the Persians combined use with beauty. Xenophon in his Economics, makes Socrates say of the Persian king, "Wherever he resides, or whatever place he visits in his dominions, he takes care that the gardens called paradises, shall be filled with every thing both beautiful and useful the soil can produce." Memorab. Socratis, lib. v. p. 829. Lysander finds the younger Cyrus in his paradise at Sardis. As he avows to the Spartan general, that he "planted the whole himself," it seems to have been of a more simple description. But another paradise at Celaeno was very extensive, and abounded with wild beasts; and we are informed, that the same prince there mustered the Gre- cian forces, to the number of thirteen thousand." De Cyri Expeditione, lib. i. Aulus Gallus informs us, that the vivarium, or park of the Gallias, which contained game and wild beasts, was the same as the paradise of the Greeks. The Greeks, there can be little doubt, would in this, as in other particulars, copy from the Persians.

The trees in the Persian gardens, were arranged in straight lines and angular figures, and the ground was covered with tufts of roses and odoriferous flowers. The kings themselves often assisted, as we have seen, in their culture with their own hands. A considerable variety of trees were introduced, among which the plane and the re- sinous tribe seem to have held conspicuous places. The Persian gardens, described by modern travellers, differ little from the accounts derived from ancient writers. Ficugeros, who was ambassador from the court of Spain
LANDSCAPE GARDENING.

History to that of Persia, in 1617, informs us, that at Schiraz, the royal garden was so large that it appeared like a forest; the trees consisting of cypress, planes, and elms, which were planted in squares and avenues, intermingled with thickets of roses. The fruits were grapes, pears, pistachio nuts, and almonds. In the middle was a large and beautiful lake."—Daines Barrington in Archeologia, vol. vii. p. 114. Chardin, Le Bruyn, Sir John Malcolm, and other modern travellers, add nothing material to the above features of an ancient and modern Persian garden.

Turning from Asia to Africa, we find only the fabulous gardens of the Hesperides. They are ranked by Pliny with those of Alcinous and Semiramis, (Nat. Hist. lib. xix. c. 4.) and described by Scylax as situated to the east of Berenice, in Cyrenaica, and "lying in a place eighteen fathoms deep, steep on all sides, and two stadia in diameter, covered with trees of various kinds, planted very close together, and interwoven with one another." Historical View of the Gardens of Antiquity, &c. p. 29. Among the fruit trees, were apples, pomegranates, mulberries, vines, olives, almonds, and walnuts; and the ornamental trees included the arbutus, myrtle, bay, ivy, and wild olive.

Little is known of the private gardens of the Greeks, though it is more than probable, that, from their connection with Asia, they would imitate, as far as the difference of climate and other circumstances would permit, the parades or gardens of the Assyrians and Persians. This supposition appears justified, from the admiration which Xenophon, a Greek philosopher of the fourth century before Christ, expresses for the gardens of Cyrus at Sardis. We are informed by Diogenes Laertius, that Epicurus delighted in the pleasures of a garden, and made choice of it for his school of philosophy. Plato lays the scene of his dialogue on beauty, in an unbraggiasipe art on the banks of the Illissus: from which proof of his taste for the beauties of natural scenery, it may not be too much to infer, that something of wildness and irregularity might have been sometimes admitted in Grecian paradies, as well as art and uniformity.

The Academus, or public garden of Athens, Plutarch informs us, was originally a rough uncultivated spot till planted by the General Cimon, who conveyed streams of water to it, and laid it out in shady groves, with gymnasium, or places of exercise, and philosophic walks. Among the trees, were the olive, plane, and elm, which had attained to such extraordinary size, that at the siege of Athens by Sylla, in the war with Mithridates, they were selected to be cut down, to supply warlike engines. In the account of these gardens by Pausanias, we learn, that they were highly elegant, and decorated with temples, altars, tombs, statues, monuments, and tombs; that among the tombs, were those of Phthisus, Theseus, Oedipus, and Adrastes; and at the entrance was the first altar dedicated to love. In the first seclusion of Theocritus, the scene is laid under the shade of a pine tree; and the beauty of Helen is compared to a cypress in a garden. It would appear from this and other circumstances, that the love of Te rebithinate trees, so general in Asia, was also prevalent in Greece; and the same flowers were probably cultivated in both countries. The narcissus was common to both, as also the ivy and the rose. It may be remarked generally, respecting the Asiatic and Grecian gardens of these early ages, that forest trees were chiefly cultivated for their shade, fruit trees for their produce, and flowers for their odour. At any rate, it does not appear that mere beauty of form or foliage entered into their idea of excellence.

Such are the scanty particulars which can be collected respecting the gardens of ancient Greece. If we may be allowed to hazard a conjecture on the subject, we should say that the country of Greece, being by nature more picturesque, its climate more temperate than the Asiatic regions, and its inhabitants comparatively active and frugal, paradies of the most luxurious description would not find a place. Kitchen gardens, and ornamental orchards, would no doubt be general; but had any very extensive gardens or parks been possessed even by the princes, it is highly probable we should have had some traditionary hints respecting them, through their own, or the early Roman authors. That their poets and philosophers had a just taste for the beauties of natural scenery, is sufficiently evident, from Homer's description of the grotto of Calypso, (Racemazioni zur Gartenkunst der Allen, bei Her von Battinger, &c. 1800.) and from various descriptive passages in Hesiod, Aléïan, Theocritus, Athenæus, and other writers. It may just be remarked, however, that their descriptions enlarge chiefly on the shade, coolness, freshness, breezes, fragrance, and repose of such scenes. The picturesque is a species of beauty, which it is not clear that either the Greeks or Romans recognised so distinctly as the modern Europeans.

Sect. II. Roman Gardening.

The first mention of a garden in the Roman history, is that of Tarquinii Superbus, by Livy and Diony sius Halicarnassus. From what they state, it can only be gathered, that it was adjoining to the palace, and abounded in flowers, chiefly poppies. The next in the order of time are those of Lucullus, situated near Baiae, in the Bay of Naples. They were of a magnificence and for scenes rivalled only by those of the Emperor Tiberius, and procured to this general the epithet of the Roman Xerxes. They consisted of vast edifices projecting into the sea; of immense artificial elevations; of plains formed where mountains formerly stood; and of vast pieces of water, dignified with the pompous titles of Nilus and Euripides. (Plutarch in vita Luculli; Sallust, &c.) Lucullus had made several expeditions to the eastern parts of Asia, and it is probable he had there contracted a taste for this sort of magnificence, which Varro afterwards ridiculed for its sumptuousness. Lucullus had the merit, however, of introducing the cherry, the peach, and the apricot, from the east; a benefit which still remains to mankind.

We know little of the gardens of the Augustan age of Virgil and Horace, generally thought to be that in which taste and elegance were eminently conspicuous. Virgil and Propertius mention the culture of the pine tree, as beloved by Pan, the tutelar deity of gardens; that the shade of the plane, from the thickness of its foliage, was particularly agreeable, and well adapted for convivial meetings. The myrtle and the bay, they describe as in high esteem for their odour; and to such a degree of nicety had they arrived in this particular, that these odours were discovered to mingle well together, and the trees were planted adjoining each other for this purpose. Flowers, and especially roses and the narcissus, were in great repute.

From Cicer and the elder Pliny we learn, that trees were generally planted in rows, or in quincunx; and from these authors and Martial, that the fashion of clipping trees was first introduced by Cneius Matius, a friend of Augustus. Propertius relates, that statues and fountains now became in vogue. A mode of forcing flowers and fruits, and of growing cucumbers in the winter season, was also in use by means of talie cases,
LANDSCAPE GARDENING.

History.

(Spectuncaria) or plates of the lapis specularia; which Seneca and Pliny inform us could be split like slate in lengths not exceeding five feet.

Sir Joseph Banks conjectures, that, by the same means, it is highly probable they had peach-houses and vineyards. (On the forcing houses of the Romans, in Hort. Trans. vol. i.) Daines Barrington seems to be of the same opinion, which he considers more probable from the circumstance, that the luxury of cooling liquors with ice was in use about the same time; these two arts being coeval in invention in England.

The form and extent of Pliny’s winter garden at Laurentium, nothing very accurate can be obtained from his letters. It was evidently small, being surrounded by hedges of box, and where that had perish’d, made good by rosemary. Vines, figs, and mulberries, were the fruit trees. He seems to have valued this retreat chiefly from its situation relatively to the surrounding country, which he describes with delight; “pointing out all the beauties of the woods, the rich meadows covered with cattle, the bay of Ostia, the scattered villas upon its shore, and the blue mountains in the distance.” (Preface to Girardin’s Essay on Landscape, translated by D. Malthouse, Esq.) Eustace mentions that the same general appearance of woods and meadows exists to this day. (Classical Tour, vol. i. p. 1.)

The situation of Pliny’s Tuscan villa was a natural amphitheatre, formed by the richest part of the Apennines, whose lofty summits, crowned with groves of oak, are broken into a variety of shapes, their sides watered by numerous springs, and diversified by fields, vineyards, and copses. Of the artificial part of the grounds, we have a particular and well known description in Pliny’s Epistles, book v. letter 6, in which is of importance to our purpose, as shewing what was esteemed good taste in the pleasure grounds of a highly accomplished Roman nobleman and philosopher.

“It is almost superfluous to remark,” observes Dr. Faulkener, speaking of Pliny’s gardens, “the striking resemblance which they bear to one in the French or Dutch taste. The terraces adjoining to the house; the lawn declining from thence; the little flower garden, with the fountain in the centre; the walks bordered with box; and the trees sheared into whimsical artificial forms, together with the fountains, alcoves, and summer houses, form a resemblance too striking to bear dispute.” “In an age,” observes Lord Walpole, “when architecture displayed all its grandeur, all its purity, and all its taste; when arose Vespasian’s amphitheatre, the temple of peace, Trajan’s forum, Domitian’s bath, and Adrian’s villa, the ruins and vestiges of which still excite our astonishment and curiosity; a Roman consul, a polished emperor’s friend, and a man of elegant literature and taste, delighted in what the mob now scarce admire in a college garden. All the ingredients of Pliny’s garden corresponded exactly with those laid out by London and Wees on Dutch principles; so that nothing is wanting, but a partner to make a garden in the reign of King William.” We consider these remarks of this eloquent author, as dictated by too limited a view of the subject. Because the Roman gardens were considered as scenes of art, and treated as such, it does not follow that the possessors were without a just feeling for natural scenery. Where all around is nature, artificial scenes even of the most formal description will please, and may be approved by the justest taste, from their novelty and contrast, and other associations. If all England were a scattered forest like ancient Italy, and cultivation were to take place only in the open glades or plains, where would be the beauty of her parks and pleasure grounds? The relative or temporary beauties of art should therefore not be hastily or entirely rejected in our admiration of the more permanent and absolute beauties of nature.

That the ancient Romans admired natural scenery with as great enthusiasm as the moderns, is evident from the writings of their eminent poets and philosophers; scarcely one of whom has not, in some part of his works, left us the most beautiful descriptions of rural scenery, and the most enthusiastic strains of admiration of all that is grand, pleasing, or romantic, in landscape; and some of them, as Cicero and Juvenal, have deprecated the efforts of art in attempting to improve nature. “Whoever,” says Mr. G. Mason, “would properly estimate the attachment to rural picturesque among heathen nations of old, should not confine their researches to the domains of men, but extend them to the temples and altars, the caves and fountains, dedicated to their deities. These, with their concomitant groves, were generally favourite objects of visual pleasure as well as of veneration.”

Sect. III. French Gardening.

As the French made the most conspicuous figure in gardening during this period, we shall commence with such notices as we have been able to collect of its progress in France, and pass successively to the other countries in Europe.

The earliest notice which we have been able to find of a garden in France, is in the Capit. de villis et currits imperatoris Caroli Magni, prepared about the end of the eighth century, and referred to by Montesquieu as a “chef-d’oeuvre of prudence, good administration, and economy.” It contains 70 articles, recommending or proposing every possible attention and precaution; and the 70th contains a list of the plants and trees to be cultivated. Among these, medicinal plants hold a considerable place; there are but few shrubs, and only the common fruit trees. This monarch had domains in most parts of France, and gave every encouragement, as the Abbé Schmidt (Encyc. Method., tomes 4 and 5.) informs us, to clearing away forests, and planting vineyards and orchards. From his intimacy with the Saracenic Prince Haroun al Raschild, he introduced many charming varieties of the rose, the best sorts of pulse, melons, and the finer sorts of fruits. He had a noble palace at Ingleheim on the Rhine, supported by a hundred columns of Italian marble, and containing an immense number of apartments. The whole is consecrated by Nigellus in a Latin poem of considerable length.

The next notice of a garden in France, unaccompanied by any details, is that of the Hotel de St. Paul, at Paris, formed by Charles the V. in 1564. The scene of the Romanum de Rose is in a garden; but, excepting that there were edgings of violets and primroses, there is not a hint as to its form or productions. Little appears to have been done in France before the beginning of the 16th century, when, in consequence of the marriage of Francis the I. with the daughter of Leo the X. something of what that illustrious pontiff revived in Italy would be transplanted to France. Stephens and Liebault published their Maison Rustique towards the end of this century; from which it appears, that gardening, and every other rural art, had made considerable progress in France. What relates to ornament in La Maison Rustique, may be included in the directions given for forming arbours of jessamine, rows of box, juniper, and cypress, and the
plates for parterres and labyrinths. Botany began also to be cultivated about this time, the taste having been imported from Italy, where it originally had its rise, this country being now looked up to by all Europe as the fountain of learning and elegance.

The Royal Botanic Garden of Paris was first opened in 1634; and Boyceau published his *Treatise du Jardinage selon la raison de la nature et de l'art*, with figures, in 1638. From this book it appears, that considerable progress had been made in the more common and easy descriptions of planting and orcharding, but very little, as Benard, a modern writer also informs us, in the culture of exotics.

Le Notre, during the reign of Lewis the XIV, improved and settled the French taste in laying out grounds. This taste,昼夜ean says, they acquired originally, as they did everything else, from Italy; to which country Le Notre was sent to study the art. He returned, and seems to have determined on exceeding, at least in magnitude, every thing he had seen. His chief work is that of Versailles; though there is scarcely a country in Europe for which he has not given designs. His taste and manner continued in full reputation for above a century; and appears to have been in general vogue so late as 1771, 50 years after the introduction of the modern style in England. For the edition of the *Jours de Plaisance* of 1634, by F. de Warton, the first year, in a critique on the French translation of Weathley's *Observations Modern Gardens*, after the most liberal encomiums on the work, expresses his doubts as to how it would be received in France, where he adds, "Le Notre's school is still followed, and every rich proprietor is anxious that his garden, if it does not resemble, shall, at least, recall to his mind those of the court at Versailles, Trianon, Meudon, Sceaux, or Clagny."

Dufresnoy.

The editor, Millin, mentions Dufresnoy, a cotemporary of Le Notre, as an artist of greater genius, and more attached to natural beauties, though less known by his talent for designing gardens than by his comedies. The French nobles, as Hirschfeld has remarked, were not attached to a country life. As they did not engage in agriculture, and took little or no interest in the welfare of their tenants; all that they had to detain them at their chateaux was the enjoyment of field sports, (to which, as a nation, they are not greatly attached,) and the inability of supporting the expense of a residence in the town. The country was, by the court, and the gaiety and bustle of a city life, better suited their natural character; which this humane author thinks may account for their best gardens being in or near to their large towns, as well as for a too profuse introduction of little and trifling ornaments. Among these he reckons vases and flower-pots, with which, in Lord Walpole's time, every walk in Marshal Biron's garden, of 1½ acres, was "carefully buttoned."

It is very probable that gardening was never entirely neglected in Italy from the time of the Romains; though in what consideration it was held during the earlier periods of the Western Empire does not appear. With the other arts, it was revived and patronized by the Medici family, in the beginning of the 16th century; and the most celebrated gardens, we are informed by Mr. Roscoe, were those of Lorenzo de Medici, and of the wealthy Bernado Rucellai. The latter served as a model for the famous Boboli garden at Florence, and those of the Vatican, and of the Medici, Bregheze, Aldobrandini, and other palaces in Rome."

(Quarterly Review, Jan. 1817; Roscoe's Life of Leo the X. vol. ii. octavo edit.) Public botanic gardens, established in Italy about the middle of the preceding century, (istoria Botanico di Giacomo, Bologna, 1675,) led to an extension of the culture of flowers in private gardens, and rendered them less exclusively architectural than formerly. Warton, in his Essay on Pope, 5th edit. mentions, that in L'Adam, less, the statues, terraces, and gardens published at Milan in 1617, by G. B. Andreini, a Florentine, "the prints that are to represent Paradise are full of cliped hedges, square parterres, straight walks, trees uniformly long, regular knots and carpets of flowers, groves nodding at groves, marble fountains and water-works;" a fact which gives rise to many curious reflections.

In a very complete and learned work, *istoria e coltura delle piante con un Trattato dell'Architettura d'un Giardino*, &c. published at Venice in 1726, by B. Clarici, the same style is treated of and displayed in an elegant engraved bird's-eye view of the palace and gardens of S. Gerardo Sagredo, at Morocco, near Venice. In Percier's *Choix des plus celebres maisons de plaisance de Rome*, Kraft's *Vieues*, and Laborde's *Designs*, may be seen the general arrangement of an Italian villa, both of the last century, and the present day. It differs nothing in the general features from the description of the French style which we have just given; but, in detail, is much more architectural; and the area of the garden, of the parterre, the basin, marble fountains, seats, &c. which characterize it, are placed more closely together. Their effect, however, is well harmonized by the exuberant vegetation, rich display of oranges, and other fruits and flowers, and by the clear sky, and mild climate.

From Italy the taste for gardening, and especially of systematic botany, was first carried to Holland and the Belgic provinces during the flourishing periods of Dutch commerce in the beginning of the 16th century. This attachment to the study of plants led to a great degree of horticultural perfection among the Dutch, and ultimately characterized their style. We are informed by Deluze that, in 1500, exotic plants were more cultivated in the Low Countries than any where else. This taste, which had existed among them from the time of the crusades, and increased by the commercial intercourse of the Flemings with the West Indies, was particularly prevalent under the Dukes of Burgundy. During the civil wars which lately had desolated the provinces, many of the estates of the wealthy were ravaged and destroyed. Lobel, in his "Historie des Plants," published in 1576, deprecates the misfortunes of his time, and gives a list of the most considerable country seats and gardens which had been desolated by the enemy.

The parterre and botanic gardens appear to have arrived at perfection in these countries, probably from the great number of species, then introduced and cultivated, requiring to be arranged in some regular form. This characteristic of the Dutch style is a very natural invention of a plodding industrious people, with few overgrown nobles, and occupying a dull flat country. The Dutch have still the reputation of excelling every other people in the culture of bulbous roots; and it is only in Holland that a citizen's garden can be found wholly occupied by beds and knots of flowers, without either trees, shrubs, or culinary productions.

To the flatness of the country may also be traced, in some degree at least, their attempts to find resources in grassy terraces and slopes, perspectives of hedges, and other topiaric works, which they carried to a greater
extreme than the Italians, of whose architectural decorations these verdant ornaments supplied the place. The climate of the Low Countries is particularly favourable to pasturage; and turf work and parterres may, therefore, term the characteristics of the ancient Dutch style of laying out grounds. Of country seats on a grand scale, they necessarily had few; but in these, there can be little doubt the Italian and French arrangement would be imitated. There are two royal palaces at the Hague, joined to which are level gardens, bounded by a moat, and passed by draw-bridges. The one is entirely in the ancient style, the other partakes of a more free manner. In neither are many ornaments, buildings, or statues; but the utmost attention is paid to neatness and culture.

According to Professor Hirschfield, little was done in the art of laying out grounds in Germany till about the time of Le Notre, when a sort of gallomania seized the German nobles, and various avenues and parks were planted in the French style in the different states. Nothing of great consequence, however, was done previously to the middle of the last century, when the gardens of Schoenbrunn were greatly enlarged, and magnificently laid out, under the Emperor Francis I. by Stockhoven, a Dutch artist.

The Augarten at Vienna deserves to be mentioned. It was formed from a design of the celebrated German architect Fischer, during the reign of the Emperor Joseph. Its form is square; the boundary enclosure an elevated terrace; and the space within filled with wood, intersected by right-lined avenues and alleys, some covered and shorn, and others natural and open. Attached is a public banqueting or coffee-room, free to every citizen.

The ancient, royal, and principal private gardens at Dresden, exhibit nothing remarkable in the way of art. They were formed chiefly during the reign of Frederick Augustus, king of Poland, and are remarkably confined, and by no means interesting in detail. The situation and environs of Dresden every one feels to be delightful; but there is perhaps no city of the same rank on the continent, equally deficient both in ancient and modern gardens.

Almost all the gardens of Prussia were formed during the propitious reign of Frederick the Great. The Tiergarten is a sort of ancient park, on a flat sandy soil adjoining the gates of Berlin. It is intersected by public roads leading to the city; and contains private alleys and walks, a large place for military exercises, statues, and obelisks, and several public coffee-rooms and sheds for music and rural fêtes.

The royal gardens at Potsdam, laid out during Frederick the Great's reign, are in a mixed style, very much in Switzer's manner; uniting straight with serpentine and naturally winding walks, with every appendage and ornament of the French, Italian, and Dutch taste. Various artists, but chiefly Manger, a German architect, and Salzmann, a gardener, (each of whom has published a voluminous description of his works therewith,) were employed in their design and execution; and an ample history and description of the whole, accompanied by plans, elevations, and views, has been published by the late celebrated literary bookseller, Nicolai of Berlin. The hill of terraces in front of Sans Souci, in which every terrace wall has a glass roof placed against it for ripening fruit; the superb picture gallery; the magnificent architecture of the new and marble palaces; the avenues, open promenades, alleys, statues, fountains, and other artificial decorations in the foreground; the architectural riches of Potsdam, the lakes, the river, and extensive fir woods in the middle distance; and a horizon of bleak and barren sands, varied but little with spots of verdure, compose altogether a scene unrivalled in its kind, though less grand or elegant than it is artificial and picturesque.

Very little was done in Poland previously to the gardens of time of the unfortunate Stanislaus Augustus. That monarch built the beautiful palace or villa of Lazienki, or the Bath, in a situation originally a marsh, from the designs of Camisizer, a German architect. This beautiful piece of Roman architecture consists of a centre and two wings. The centre is placed in the middle of a narrow part of the lake, and the wings are on opposite shores, joined to the centre by arches, with orangey over. The entrance is through a carriage portico in one of the wings, to which you arrive without seeing the water. On entering the orangery, the effect is surprising and delightful. In the lake, at one side near the palace, is an island, which served as the protection to an open Roman amphitheatre of stone on the shore. The orchestra was placed close to the brink; and in addition to the common business of a theatre, ships and naval engagements were occasionally exhibited. The theatre was open to every person without exception; and the effects of the music and the performances, are still mentioned in raptures by the more elderly inhabitants of Warsaw. The grounds were not extensive, and, excepting near the palace, not highly ornamented. They contained various coffee-rooms, ice cellars, circles of turf, or dancing places, situations for tents and rural fêtes, and three pavilions for the king's mistresses, connected by covered alleys with the palace.

The principal private gardens in the ancient style, was that of Villeneuve, late the property of Count Stanislaus Potocky, a few miles from the capital, and now modernised. Judging from the excellent views of these gardens, painted by Canaletti, and now in the royal zamok, or castle, in Warsaw, they were more in the verdant and simple style of the Dutch, than in the enriched Italian or French taste.

It is questionable whether the ancient style was at Gardens of all introduced into Russia before the time of Peter the Great. Peterhoff, near Petersburg, is the creation of that monarch, through the French artist and author Le Blond, and is worthy of the patron and the designer. Its chief merits consist in its water works, which are equal if not superior to those at Versailles.

The principal private ancient garden in Russia, is Gardens at Kowrastovmowsky, near Moscow. The near Mos- hedges and alleys are chiefly formed of spruce fir, which are sharpen, and seem to flourish under the sheers. It contains also a labyrinth, and a turf amphitheatre, on which the Court at one time had operas performed by his domestic slaves.

Sophiowski, in Padolia, is a magnificent residence of the Countess Potocki, laid out by a Polish architect, M. Metzel, in the manner of Switzer. It has a magnifi- cent terrace or promenade, and extensive avenues, conservatories, and gardens.

Little or nothing appears to have been done in the Swedish ancient style in Sweden. Hermand, who published gardens, his Regnum Sueciae, in 1671, mentions gardens only once. These belonged to the court, and were used, he says, for delight and recreation. The most beautiful were those between the Palatium and Vivarium. The latter contained some wooden buildings, in which were
LANDSCAPE GARDENING.

The features of a pleasure garden in Chaucer’s days, may be guessed at from three lines of his Troilus and Cressida:

“Thy yarde was large, and ruled all the ayres, And shadowed wele with blossome bowes greene, And benches newe, and sondid all the wayes.” v. 521.

During the century of disputes between the houses of York and Lancaster, little or no attention could be paid to the peaceful arts; and accordingly we find no other notice of a garden till the time of Henry VIII. when the royal gardens of Nonsuch were laid out and planted. These gardens were of limited extent, and contained only two or three species of shrubs, (see our article Horticulture, where this garden is more particularly described,) and fruit trees, with a bowling-green and dial. Not a vestige of any part of these improvements remain at that seat, which is now private property, and arranged in the modern style.

During the reign of Elizabeth, an Italian published some Latin poems, in which he represents her majesty as curious in flowers. In the same reign, Hentzer informs us, that there was in the privy garden a jet-d’eau, which, by turning a cock, wetted all the spectators who might be standing near. Hampton Court was laid out at the end of this reign by Cardinal Wolsey. The labyrinth, one of the best which remains in England, occupies only a quarter of an acre, and contains nearly half a mile of winding walks. There is an adjacent stand, on which the gardener places himself, to extricate the adventurous stranger by his directions. Switzer condemns this labyrinth for having only four stops, and gives a plan for one with twenty. Daines Barrington says, that he got out by keeping close to the hedge. It is not perfectly clear, that the whole of the ancient gardens at this palace, were laid out during the Cardinal’s life. We know, that some additions were made in King William’s time, and others during the reign of George I. Here, in fact, the Dutch style was first displayed under the first of these monarchs.

James I. formed or improved the gardens at Theobalds, of which a description from Mandelslo has already been given under the article Horticulture. The same author mentions a royal garden at Greenwich, improved by this monarch. Lord Bacon attempted to reform the national taste during this reign, but with what success is not known. He wished still to retain shrub trees and hedges; but proposed winter, or evergreen gardens, and rude or neglected spots, as specimens of wild nature. “As for the making of knots or figures,” says he, “with divers coloured earths—they be but toys. I do not like images cut out in juniper, or other garden stuff—they are for children.” (Essay on Gardens.)

The Gardner’s Labyrinth by Didymus Mountain, was published in the reign of Elizabeth; and Lawson’s New Orchard in 1626. Both contain plates, exhibiting “knots and mazes, cunningly handled for the beautifying of gardens.”

In a Janus Divinilus, published at Oxford during Cromwell, the commonwealth, we are informed that “gardening is practised for food’s sake in a kitchen garden and orchard; or for pleasure’s sake, in a green grass plat and an arbours.” As to the formation of the latter, he adds, “The pleacher (topiarius) prepares a green plat of the more choice flowers and rarer plants, and adorns the garden with pleach work; that is, with pleasant walks, and bowers, &c. to conclude with purling fountains and water works.” Chap. 32. We learn also from this con-

kept specimens of lions, leopards, and bears. As kitchen gardeners and botanists, the Swedes, even at the period of which we now speak, were in a considerable state of advancement, of which there are proofs in the history of the gardens of Uppsali, given in the first volume of the Amaranitas Academicae.

Sir John Curr, and Her von Lehmann, have mentioned some ancient royal gardens at Denemark, which, however, are now in a state of dilapidation, and could not now hesitate.

The Spaniards appear to have had less taste for gardening than any of the other nations of Europe. The botanical garden of Madrid was not formed till 1757, but they had at one time two or three magnificent examples in the French style; those of the Escorial and Aranjuez, from designs by Le Notre; and that of Ildefonso, of which we have not been able to learn the name of the designer. Hirschfeld describes these gardens from the journal of an Italian, in 1775. A detailed account of those of the Escorial, has been published in England by J. Thomson. They appear to have contained a splendid profusion of water works, and covered alleys, rock works, statues, and other details of an ancient garden; and we regret to find, from more recent travellers, that they are now in a state of dilapidation. The oldest gardens in Spain, are undoubtedly those of the religious houses. There are still some water walks, walks, and unbragorous scenes, adjoining the Alhambra and the Alcazar. At the Retiro, near Malaga, a seat of Count Villacasa, and formerly a royal residence, are gardens in the Moorish style, with straight cypress walks, and excellent water works. Granja, the seat of Don Ramon Fortuny, near Tarragona, appears to be in good taste, combining the ancient style, and the cultivation of orange, olive, and other orchards, with vineyards; and with an accidental mixture of rocks and picturesque scenery.

Montserrat, near Cintra, a seat of the late eminent merchant Mr. Beckford, was laid out by his English gardener, but is in no respect remarkable.

Wherever Europeans have settled, and enriched themselves in other quarters of the world, it is natural to suppose they would attempt to introduce their native style of gardening. We know of no remarkable instance applicable to that of the ancient style, excepting that of the Dutch governor at the Cape of Good Hope. In Lachman’s Travels of the Jews, published in 1687, it is described as a square enclosure, occupying 10 acres, with “covered and open walks, natural thickets, and rills of water; and, ‘on the whole,’ says Father Premsa, ‘is one of the most beautiful spots in the world, in which art had taken far less pains than nature.’” Lachman’s Travels, vol. i. p. 37.

One of the earliest notices which we find of a garden in England, is in Leland’s Itinerary. He states, that “at Wrexhill castelle, in Yorkshire, the gardens within the mote, and the orchardes without, were exceeding fair. And yrn the orchardes, were mountes, opere topiares, written about with degrees like turnings of cokli shelles, to com to the top without payn.” (Itinerary, &c. p. 60.) Such a mount still exists in the garden of the castle inn at Marlborough, not ascended by steps or degrees, but by a winding path. It is covered with an ancien yew trees, no longer opere topiares. Leland also mentions the gardens at Moril, in Derbyshire, and some others of less note in the northern counties.

The first park (habitationem terrearum) of which we have any notice, is that of Henry I. at Woodstock, mentioned in Henry of Huntington’s history. Lib. 7.
prepossessing author (Comenius) the ancient use of parks. We are told "the huntsman hunts wild beasts; whilst he either allures them into pit-falls, and killeth them, or forces them into toils, and what he gets alive he puts into a park." Chap. 97.

We are informed by Daines Barrington, that Charles II. sent for Perrault and Le Notre; that the former declined coming to England, but that the latter planted Greenwich and St. James' parks. The magnificent seat of the Duke of Devonshire at Chatsworth, was laid out in this reign, and, it is conjectured, from a design by the same artist. (Beauties of England and Wales. Derbyshire.) Waller the poet formed his residence at Beaconsfield about the same time. The grounds there being very irregular, he has been at considerable labour in reducing the parts near the house and banqueting room, to regular slopes and levels, and in forming an oblong basin or canal. It is but-justice to the memory of this amateur, who was undoubtedly reckoned a man of taste in his day, that, in the more remote walks no appearances of art are discernible, or seem ever to have been intended. They are mere gravelled paths through natural woods, and exhibit a fine contrast to the artificial scenes at Prior's Park.

It is conjectured, that one of the first garden buildings was erected during this reign by Inigo Jones, at Beckett, near Farringdon. This banqueting-room is placed on a point of land, projecting into a lake, and is surrounded with a broad base, or platform, protected by a parapet wall, and shaded by the far projecting eaves of the building. It consists of one apartment with a cellar below; and the covered platform, or base, is conjectured to be for the purpose of angling. (Daines Barrington in Archæologia.)

Lord Keppel, and the Earl of Essex, are mentioned by Switzer as eminent encouragers of gardening during this reign. The latter sent his gardener, Rose, to study the much celebrated beauties of Versailles, and, on his return, he was appointed royal gardener. He produced such remarkable dwarfs at Hampton Court, Carleton House, and Marlborough gardens, that London, his apprentice and successor, and afterwards a nurseryman, in his Retired Gardener, published in 1697, challenges all the world to produce the like. Daines Barrington thinks it probable, that forcing-houses and ice-houses may have been introduced by Charles II. since the installation dinner, given at Windsor in April 1667; there were cherries, strawberries, and ice creams, orange- and green-houses had been introduced before, oranges having been first planted at Beddington, in Surry, by Sir Francis Carew, previously to 1595. (Camden.) And from one of Leland's poems, entitled Horli Cul. Guntheri hyeme vernantes, we may conjecture that green-houses of some sort were known before his time.

Evelyn's gardens at Sayes Court, near Deptford, and at Walton in Surrey, flourished about this time. Those at Deptford, are described as most boscareseque. They contained a fine holly hedge, of which the owner was proud; and complains in his letters to Ray and Sir Hans Sloane, that it was destroyed by the Czar and his servants, who had taken the house at Sayes Court, to be near the docks. This edifice is now a miserable work-house; and of the garden, only the remains.

Little seems to have been done to the royal gardens during the short reign of James the II. His successor, Mr. Barrington informs us, gave vogue to clipt yews, with magnificent gates and rails of iron, not unfrequent in Holland, and about this time introduced into France; and in reference to the opaque stone walls which they supplanted, called claires-voieé. (Huetiana.) The more extensive iron screens of this sort in England, next to those of Hampton Courts, were formed by Switzer, at Lecswold, in Flintshire, laid out by that artist in a mixed style, or what is called Bridge- man's first manner; but they are far surpassed by those of the summer gardens at Petersburgh. Hampton Court being at this time the actual residence of the royal family, the gardens underwent considerable improvements. An elegant above and arched trellis were added at the end of one of the alleys; and four urns, placed before the principal part of the house, supposed (Daines Barrington in Archæologia) to be the first that were thus placed in England. Botany received the patronage of this king, who most probably had acquired some knowledge and taste in that science before he left Holland. Towards the end of this century, vegetable sculpture, and embroidered parterres, were probably in their highest vogue; a conjecture confirmed by the works of Le Blond, James, Switzer, etc. published during this and the following reign. Sir William Temple's Essay on the garden of Epicurus had been previously published. His picture of a perfect garden, is that of a flat or a gentle descent, of an oblong shape, lying in front of the house, and descended to by steps from a terrace, extending the whole length of the house. The enclosure is supposed to be cultivated as a kitchen garden and orchard. Such a garden he found at Moor Park, Hertfordshire, laid out by the Countess of Bedford, celebrated by Dr. Donne. Sir William describes it as "the sweetest place, I think, that I have seen in my life, before or since, at home or abroad." Lord Walpole observes on this description, that any man might form as sweet a garden, who had never been out of Holborn. It has long since been destroyed, and a beautiful lawn occupies its place, and forms an appropriate fore ground to the now highly cultivated Vale, probably at the time unenclosed, but varied with scattered groups of trees and cottages, as a distance to the garden described by Sir William Temple, would form in its turn a landscape equally interesting.

The principal alteration of the royal gardens, mentioned by D. Barrington, as having taken place in Queen Anne's time, was that of covering the parterre before the great terrace at Windsor with turf. Switzer mentions, that her majesty finished the old gardens at Kensington, begun by King William. Wise, who had been apprentice to Rose, and succeeded him as royal gardener, turned the gravel-pits into a shrubbery, with winding walks; with which Addison was so much struck, that he compares him to an epic poet, and considers these improved pits as episodes to the general effect of the garden. Wise and London afterwards turned nurserymen and designers of gardens, in which capacity they were nearly in as great demand as was afterwards the celebrated Brown. They made regular journeys every summer for this purpose; and from their nursery at Brompton, which was the first of any consequence established in this country, they are said to have gained £2000 a-year. To London and Wise, succeeded Bridgeman, who appears to have been a more chaste artist than any of his predecessors. He banished vegetable sculpture, and introduced wild scenes and cultivated fields in Richmond Park; but he still clipped his alleys, though he left to their natural growth, the central parts of the masses which they enclosed.

Blenheim, Castle Howard, and indeed almost all
the principal noblemen’s seats in the ancient style, were laid out during this, the preceding, and part of the latter reigns, or between the years 1650 and 1720.

Nothing of consequence appears to have been done to the royal gardens in the reign of George I. though, near the end of it, Vanburgh was appointed surveyor of the gardens and waters of the crown. In the succeeding reign, Queen Caroline enlarged and planted Kensington gardens, and formed what is now called the Serpentine River, by uniting a string of detached ponds. This was a bold step, and led the way to subsequent changes of taste. Lord Bathurst informed Daines Barrington, that he was the first who deviated from the straight line, in pieces of made water, by following the natural lines of a valley, in widening a brook at Ryskins, near Cobebrook; and that Lord Stratford, thinking it was done from poverty or economy, asked him to own fairly how little more it would have cost to have made it straight.

Cannons, the magnificent seat of the Duke of Chandos, is one of the principal places laid out in the ancient style in this reign. We are not acquainted with the French artist who gave the design, but the execution was superintended by Dr. Blackwell, a physician and agriculturist of some note. As far as we have been able to learn, the last extensive residence laid out in the ancient style, in the south of England, was Exton Park, in Rutlandshire, finished about the year 1730. Kent had already returned from Italy, and been employed as a painter and architect, and began to display his genius a few years afterwards, as a landscape gardener.

In this brief outline of the progress of the ancient style in England, we have not had room to detail the numerous improvements made by private individuals; preferring rather to notice what has been done in the gardens of the court, which, as they generally lead the fashion in every country, may be considered as a tolerably exact index of the state of a nation’s taste. The reader who is desirous of tracing more minutely the history of gardening and laying out grounds, among the landed proprietors of England, will find himself amply gratified by consulting “The Beauties of England and Wales,” a work in which is exhausted every source of antiquarian and topographical research, up nearly to the present time.

Useful and decorative gardening, in the early ages, are necessarily so much connected, that in our history of the former art in Scotland, we have necessarily embraced the greater part of what was known of the latter. We have, therefore, to refer to the article Horticulture, for some part of what might have here occupied our attention. From the early and long continued connection of this nation with the French, much of the manner, style of living and of art, bears the marks of importation from that people. This is obvious to the most indifferent observer, in the common architecture and arrangements of the towns built previously to the union, and not less to the curious enquirer in that of the country seats and gardens of the same period.

The earliest distinct notice of a royal attention to gardens is well known; James III. being blamed for “delighting more in music and police, (probably from the French polir, to remove, level, or improve; or from a corruption of so polir, to improve one’s self, levelling and smoothing the grounds about a house, being naturally the first step after it is built,) and build-
more to be attributed to the inhabitants than to the ayre." In an inedited account of a Tour in 1634, also quoted by Mr. Walker, (Trans. R. I. A.) Bishop Us-her's palace is said to have a "pretty neat garden."

Some of the largest sculptured evergreens in Ireland are at Bangor, in the county of Down; and at Thomas-town, in the county of Tipperary, are the remains of a hanging garden, formed on the side of a hill, in one corner of which is a verdant amphitheatre, once the scene of occasional dramatic exhibitions.

Blsington gardens, if tradition may be relied on, were laid out during the reign of James the II. by an English gentleman, who had left his estate at Byfleet in Sussex, to escape the persecution of Cromwell. The first forcing house is supposed to have been erected in these gardens; and the first plant-stove at Moyra, in the succeeding reign, by Sir Archibald Rawdon, an an-

cestor of the Marquis of Hastings.

In King William's time, knots of flowers, curious edges of boxes, topiary works, grassy slopes, and other characteristics of the Dutch style, came into notice. Rowe and Bullein, Englishmen, who had successively nursed gardens at Dublin, were, in those days, the principal rural artists of Ireland; though Switzer and Laurence, as well as Batty Langley, occasionally visited these countries.

Of the state of country seats in Ireland during the 16th and 17th centuries, we are not sufficiently ac-

quainted to be able to give any general outline. If tradition is to be credited, they were more in the Eng-

lish than in the Scotch manner; and, as might be ex-

pected, inferior to both in respect to domestic con-

veniences.

Having now completed an historical outline of the ancient style, or what may be, with equal propriety, called French or Roman gardening, in Europe, we shall proceed to our next epoch, which embraces the modern style.

**Sect. IV. Chinese Gardening.**

We have chosen this period to introduce what is known of the art of gardening among the Chinese; not only because we have now brought down our history to the time it first received the attention of Europeans, but also because a previous account of it will serve greatly to facilitate our investigations into the origin of the English style.

The first authentic notice of Chinese gardening re-

ceived in Europe, is contained in the well known "Lettres Edifiantes et Curieuses," &c. in a letter dated Pekin, 1743, giving an account of the emperor's gardens there. It was translated by Mr. Spence, under the fictitious title of Sir Harry Beaumont, whom Lord Wal-

pole describes as having "a great taste and zeal for 

the present style;" and was published in Dodsley's collection in 1761. The chief features in the Emperor's gardens were buildings, mock towns, villages, artificial hills, valleys, lakes, and canals; serpentine bridges, covered by colon-

nades and resting places, with a farm and fields, where his imperial majesty is accustomed to patronize rural in-

dustry, by putting his hand to the plough; or, as it has been otherwise expressed, "to play at agriculture once a-year."

But some idea of the Chinese style must have been known from the verbal accounts of Chinese merchants or travellers, nearly a century before. A proof of this is to be found in Sir William Temple's Essay, written about the middle of the 17th century. He in-
LANDSCAPE GARDENING.

sents no image but that of unsubstantial tawdriness." At the same time, they do not seem to be altogether devoid of picturesque and even wild scenes; for Lord Macartney mentions that the view from one of the imperial gardens might be compared to that from the terrace at Lowther Castle, which is altogether wild and romantic, and bounded by high uncultivated mountains, with no other buildings than one or two native cottages. In what degree of estimation such a view is there held, does not, however, appear; it would be too much to conclude, that, because it existed in that situation, it was therefore considered as eminently beautiful or desirable.

His Lordship's other observations, as well as those of Sir George Staunton and Mr. Barrow, do justice to the material facts and general character of Sir William Chambers' account. "It is our excellence," observes his Lordship, "to improve nature; that of a Chinese gardener to conquer her; his aim is to change everything from what he found it. A waste he adorns with trees; a desert he waters with a river or a lake; and on a smooth flat is raised hills, formed valleys, and placed all sorts of buildings."

The Chinese style most probably originated in that country, as being an arrangement of verdant scenery, the most contrasted to common cultivation. So far this is in just taste, as the only means left them of distinguishing ornamental from useful scenes. The farther desire of obtaining distinction among the distinguished, could only be effected by lavishing expense in multiplying objects, or exaggerating expression. Art among them seems to have attained that last culpable extreme, the object of which is to excite admiration of the skill of the artist, and the limited extent of individual territory, and the cramped state of the human mind in that country, seem to account for their approbation of this expression.

An attentive examination of the great majority of those seats in which appeared the first indications of a change of taste in this country, and throughout Europe, will prove that our object was to copy, or, at least, to imitate, the Chinese manner. Sir William Chambers (see a passage quoted in the beginning of this article), Hirschfeld, (Théorie des jardins, 12mo, Lipsig, 1775), Wattelet, ("Cette nation (the English) imprunte, dit on, elle même l'idée de ses jardins des Chinois," Essai sur les jardins, Paris, 1774,) say so in express terms; and the numerous books of gardens, root-houses, covered seats, Chinese buildings of various sorts, rockworks, and other objects, published during the first 50 years of the 18th century, put this matter, in our opinion, beyond a doubt. The good sense of the country, however, soon disapproved of such expensive and yet heterogeneous scenery; and by introducing greater simplicity, the English style gradually arose from the ruins of that of the Chinese.

Sect. V. English Gardening.

In the concluding part of the last section, we have expressed our opinion of the origin of the English, or modern art of laying out grounds; which, after the utmost attention which we have been able to give the subject, we have been, in some degree, reluctantly compelled to adopt; not only as being at variance with that of some names of great authority, but as depriving us, in some degree, of the merit of entire originality. As in a work of this nature it is proper that our readers should judge for themselves, we shall first state the various sentiments of other writers, and next enumerate the first eminent practitioners and artists.

Warton, in his Essay on Pope, and Lord Walpole, in his History of Modern Gardening, agree in referring the first ideas to Milton; and the former adds, that the Seasons of Thomson may have had a very considerable influence. Eustace is of opinion, that we may, with nearly equal propriety, refer to Tasso's celebrated description of the garden of Armida; and Battininger, in his Racenaxionen zur Garten Kunst der Allen, &c. carries us back to the descriptions of the grotto of Calypso, by Homer; the vale of Tempe, by Alcin, and of Vaucluse, by Petrarch. To these opinions may be very properly added a remark of Mr. G. Mason, that "we were only classical authorities consulted, it would hardly be supposed that even from the earliest ages any considerable variation in taste had ever prevailed." (Essay on Design in Gardening, p. 27.) Mr. Alison seems to consider the modern style as derived from our taste for the classic descriptions of the poets of antiquity. "In this view," (alluding to the progress of art from the expression of design to the expression of variety and natural beauty,) he observes, "I cannot help thinking that the modern taste in gardening, (or what Mr. Walpole very justly, and very emphatically, calls the art of creating landscape,) owes its origin to two circumstances, which may, at first, appear paradoxical, viz. to the accidental circumstance of our taste in natural beauty being founded upon foreign models; and to the difference or inferiority of the scenery of our own country to which we were accustomed peculiarly to admire."

The poet Gray (Life and Letters, &c. Letter to Mr. Hor, dated 1763.) is of opinion, that "our skill in gardening, or rather laying out grounds, is the only taste we can call our own; the only proof of original talent in matters of pleasure. This is no small honour to us; since neither France nor Italy have ever had the least notion of it."

Mason, the poet, states, in a note to the English Gardening, that "Bacon was the prophet, Milton the herald of modern gardening; and Addison, Pope, and Kent, the champions of true taste." The efficacy of Bacon's ideas, Mr. G. Mason considers to have been "the introduction of classical landscapes," though this does not very clearly appear from his essay, the object of which seems to be, to banish certain littlenesses and puerilities, and to create more variety, by introducing enclosures of wild scenery, as well as of cultivation. The title of champion applied to Addison, alludes to his excellent paper in the Spectator, No. 414. "On the causes of the pleasures of the imagination arising from the works of nature, and their superiority over those of art, published in 1712; and when applied to Pope, it refers to his celebrated Guardian, No. 173. published the following year. Battininger, however, affirms that the bishop of Avranches had thrown out similar ideas, previously to the appearance of the Spectator. (See "Huetiana," Pensee 51. "Beautés naturelles préférables aux beaux de l'art," and P. 72. "Des jardins à la mode.""

Mr. G. Mason, the third writer on the modern style, (Pope and Shenstone being the two first,) in reference to Sir William Temple's observations on the Chinese manner, observes, "little did Sir William Temple imagine, that in not much more than half a century, the Chinese would become the nominal taste of his country; or that so many adventurers in it would do.
great justice to his observation, and prove by their works, how difficult it is to succeed in the undertaking. Yet to this whimsical exercise of caprice, the modern improvements in gardening may chiefly be attributed."

( *Essay on Design*, &c. p. 50.) No man could be a more enthusiastic admirer of the classics, a warmer patriot, or a more rigid critic, than this author; and it appears from another part of his work, ( *Discussion on Kent*, p. 105.) that he was well aware, when he wrote the above passage, that the origin of the modern style was generally traced to Kent. That he should derive it from our attempt at the Chinese manner, we consider as a proof of candour and impartiality. Having now given the different views respecting the origin, we shall next advert to the improvement of the modern style, in which happily there is a greater unanimity of opinion.

It is allowed on all sides, that Addison (who had many years afterwards a small retirement at Bilston, near Rugby, laid it out in what may be called a rural style, and which still exists with very little alteration besides that of time,) and Pope "prepared for the new art of gardening the firm basis of philosophical principles." Pope attacked the verdant sculpture, and formal groves of the ancient style, with the keenest shafts of ridicule; and in his epistle to Lord Burlington, laid down the justest principles of art—the study of nature, of the genius of the place, and never to lose sight of good sense. In so far as was practicable on a spot of little more than two acres, Pope practised what he wrote; and his well known garden at Twickenham contained, so early as 1716, some highly picturesque and natural-like scenery, accurately described by various contemporary writers. (See * Beauties of England and Wales.*)

But it was reserved for Kent, the friend of Lord Burlington, to carry Pope's ideas more extensively into execution. It was reserved for him, says Daines Barrington, "to realize the beautiful descriptions of the poets, for which he was peculiarly adapted, by being a painter; as the true test of perfection in modern gardening is, that a landscape painter would choose it for a composition." Bridgeman, the fashionable designer of gardens previously to Kent, Lord Walpole conjectures to have been "struck and reformed" by the *Guardian*, No. 173. He banished verdant sculpture, and introduced morsels of a forest appearance in the gardens at Richmond; "but not till other innovators had broke loose from rigid symmetry." The capital stroke was the destruction of walls for boundaries, and the introduction of ha-has—the harmony of the lawn with the park followed. Kent appeared at this moment, and saw that all nature was a garden; "painter enough to taste the charms of landscape, bold and opinionative, enough to dare, and to dictate, and born with a genius to strike out a great system; from the twilight of imperfect essays, he realised the compositions of the greatest masters in painting." "Kent," continues his lordship, "was neither without assistance nor without faults. Pope contributed to form his taste; and the gardens at Carleton House were probably borrowed from the poet's at Twickenham."

The various deviations from rigid uniformity, or more correctly, the various attempts to succeed in the Chinese manner, appear thus to have taken a new and decisive character under the guidance of Kent, a circumstance, in our opinion, entirely owing to his having the ideas of a painter; for no mere gardener, occupied in imitating the Chinese, or even Italian manner, would ever have thought of studying to produce picturesque effect. Picturesque beauty, indeed, we consider to have been but little recognised in this country, excepting by painters, previously to the time of Pope, who was both a painter and a poet. The continued approbation of the modern style, as purified from the Chinese absurdities, originally more or less introduced with it, and continued in many places long after Kent's time, we consider to be chiefly owing to the circumstance of the study of drawing and landscape painting having become a part of the general system of education: and thus, as Mr. Alison observes, our taste for natural beauty was awakened; "the power of simple nature was felt and acknowledged, and the removal of the articles of acquired expression, led men only more strongly to attend to the natural expression of scenery, and to study the means by which it might be maintained or improved."

Kent was born in Yorkshire, and apprenticed to a coach painter in 1719. He soon afterwards came to London, discovered a genius for painting, was sent to Italy, patronised there by Lord Burlington, returned with his lordship, and lived with him at Burlington House till 1748, when he died at the age of 65 years. On his first return, he was chiefly employed to paint historical subjects and ceilings, and the Hall at Stowe is from his pencil. Soon afterwards he was employed as an architect, and lastly as a landscape gardener. It is not known where he first exercised his genius as a layer out of grounds; probably at Claremont and Esher, two of his designs, both minutely described by Wheatley, and, judging from the age of the trees, laid out sometime between 1725 and 1735. Kent was also employed at Kensington gardens, where he is said to have introduced parts of dead trees to heighten the allusion to natural woods. Mason, the poet, mentions Kent's Elysian scenes in the highest style of panegyric, and observes in a note, that he prided himself in shading with evergreens in his more finished pieces, in the manner described in the 14th and 15th sections of Wheatley's *Observations.*

Claymont has been celebrated by Garth, and Esher by Watton, (in the *Enthusiast, or Lover of Nature*, 1740;) and Mr. Walpole, with the authority of an eye-witness, has very accurately delineated Kent's manner of realizing landscapes; and has expatiated on his merits, without concealing his few demerits in his profession. "According to my own idea," adds Mr. G. Mason, "all that has since been done by the most deservedly admired designers, by Southcote, Hamilton, Lyttleton, Pitt, Shenstone, Morris, for themselves, and by Wright for others, all that has been written on the subject, even the gardening didactic poem, and the didactic essay on the picturesque, have proceeded from Kent. Had Kent never exterminated the bounds of regularity, never actually traversed the way to freedom of manner, would any of these celebrated artists have found it of themselves? Theoretical hints from the highest authorities, had evidently long existed without sufficient effect. And had not the great masters actually executed, what Kent's example first inspired them with the design of executing, would the subsequent writers on gardening have been enabled to collect materials for precepts, or stores for their imaginations?" ( *History of the Royal Institution of Cornwall*, 1740.)

Lord Cobham seems to have been occupied in re-keeping the grounds at Stowe, about the same time that Kent was laying out his gardens at Twickenham. His lordship began these improvements in 1714, employing Bridgeman, whose plans and views for altering old Stowe from the most rigid character of the ancient
the garden scenery has been long since choked by the growth of the forest trees; and at last the fence was removed, and the whole thrown into the park.

Soon after the improvements of Hamilton and Lyttleton, Pitton, "the great Pitt," Mr. G. Mason informs us, "turned his mind to the embellishment of rural nature," and exercised his talent at the South Lodge upon Enfield Chase. "The first ground surrounding the enclosure, was then wild and woody, and is diversified with hill and dale. He entertained the idea (and admirably realized it) of making the interior correspond with the exterior scenery. His temple of Pan is mentioned in Observations. But the singular effort of his genius, was a successful imitiation of the picturesque appearance of a bys-lane, on the very principles Mr. Price supposes it might be practicable."

The Leasowes were improved about the same time. Shenstone. It was literally a grazing farm, with a walk, in imitation of a common field, conducted through the several enclosures. Much taste and ingenuity was displayed, in forming so many points of view in so confined an extent, and with so few advantages in point of distance. But root houses, seats, urns, and inscriptions, were too frequent for the whole to be classed with a common, or even an improved or ornamented English farm. It was in fact intended as an emblematical scene, in which constant allusion was made to pastoral poetry; and if we consider it in this light—in that of a sentimental farm,—it was just what it ought to have been. We regret to find that Mr. Repton should attack the taste of this amiable man, from a misconception, as we presume, of his intentions, by blaming him for not "surrounding his house with such a quantity of ornamental lawn or park only, as might be consistent with the size of the mansion, or the extent of the property."

We fear that if Shenstone had adopted this mode of improvement, the Leasowes had never been distinguished from places got up by the common routine of professorship. Shenstone broke his heart, through the infames conduct of a Birmingham attorney, in whose hand he had placed the title-deeds of his estate. The farm is now much neglected, though the paths, and many of the urns, seats, and root houses still remain.

Persfield was laid out so late as 1750. It is a small Moris. park, with an interesting walk, carried along the brow of a romantic rocky bank of the river Wye, perhaps as faultless as the nature of the place admits of. "I cannot recollect," says Mr. G. Mason, writing of this place in 1768, "that any of the scenes on the Wye are the least adulterated by the introduction of any puerile appendage whatever."

As Pope and Kent introduced English gardening, Authors, so these are the principal voluntary artists, whose works exhibited and established its character. We shall now enumerate the principal authors.

Pope's Epistle to Lord Burlington has been already Pope, referred to, as well as Shenstone's Unconnected Thoughts; Shenstone, the former published in 1716; the latter in 1764. Mr. George Mason's Essay on Design in Gardening, from G. Mason, which we have so frequently quoted, was first published in 1768, and afterwards greatly enlarged in 1795. It is more a historical and critical work than a didactic performance.

The grand fundamental and standard work on English gardening, is the well known "Observations on Modern Gardening" published in 1770, by Wheatley. Wheatley. It is entirely analytical, treating, first, of the materials, then of the scenes, and lastly, of the subjects of gardening. Its style has been pronounced by Ensor, inimita-
LANDSCAPE GARDENING.

The English Garden was published in four different books, the first of which appeared in 1772. With the exception of the fourth book, it was received with very great applause. The precepts for planting are particularly instructive. On the whole, the work may be classed with the "Observations" of Wheatley: and these two books may be said to exhibit a clear view of the modern style, as first introduced and followed by liberal and cultivated minds; whilst the Dissertation on Oriental Gardening, by Sir William Chambers, published in 1772, holds up to ridicule the absurd imitations of uncultivated amateurs and professors, who had no other qualifications than those acquired in labouring with the spade under some celebrated ground worker.

We shall now proceed to notice the principal professors to whom the demand for the new style gave rise; and by whom it was, in a short time, extended over the whole country; not indeed in so chaste, varied, and original a taste as is exhibited in the places and publications we have enumerated, but according to their different degrees of talent for imitating what, with one or two exceptions, it does not appear they understood.

The first of these is Wright, who seems to have been in some repute at the time of Kent's death. His birth and education, Mr. G. Mason informs us, "were above plebeian; he understood drawing, and sketched plans of his designs; but never contracted for work, which might occasion his not being applied to by those who consider nothing so much as having trouble taken off their hands." At Becket, the seat of Lord Barrington, he produced an admired effect on a lawn; and at Stoke near Bristol, he is supposed to have decorated a copse wood with roses in the manner advised in the fourth book of the English Garden. He also designed the terrace walk and river at Oaklands, both deservedly admired; the latter being not unfrequently mistaken for the Thames itself.

The next professor, in the order of time, is the celebrated Mr. Brown. He was bred a kitchen gardener at a small place near Woodstock in Oxfordshire; and was afterwards head gardener at Stowe till 1750. He was confined (see Beauties of England and Wales, Bucks,) to the kitchen garden, by Lord Cobham, who, however, afterwards recommended him to the Duke of Grafton at Wakefield Lodge, Northamptonshire, where he directed the formation of a large lake, which laid the foundation of his fame and fortune. Lord Cobham afterwards procured for him the situation of royal gardener at Hampton Court and Windsor. He now attained the summit of his popularity. The fashion of employing him continued, says Mr. G. Mason, not only to 1768, but to the time of his death, many years afterwards. Mr. Repton has given a list of his principal works, among which Croome and Fishwick are the two largest new places which he formed, including at Croome the mansion and offices, as well as the grounds. The places he altered are beyond all reckoning. Improvement was the passion of the day; and there was scarcely a country gentleman who did not, on some occasion or other, consult the royal gardener. Mason, the poet, praises this artist, and Lord Walpole apologises for not praising him. Daines Barrington says, "Kent hath been succeeded by Brown, who hath undoubtedly great merit in laying out pleasure grounds; but I conceive that, in some of his plans, I see rather traces of the kitchen gardener of old Stowe, than of Claude Lorrain. I could wish therefore that Gainsborough gave the design, and that Brown executed." The taste and memory of Brown have been severely attacked by Mr. Knight and Mr. Price, and strenuously defended by Mr. Repton, who styles him his great self-taught predecessor. "Brown," observes Mr. G. Mason, "always appeared to myself in the light of an egregious mannerist; who, from having acquired a facility in shaping surfaces, grew fond of exhibiting that talent, without due regard to nature, and left marks of his intrusion wherever he went. His new plantations were generally void of genius, taste, and propriety; but I have seen instances of his managing old ones much better. He made a view to Chẹney's church, from Latimer, (Bucks) as natural and picturesque as can well be imagined. Yet at the same place, he had stuffed a very narrow vale, by the side of an artificial river, with those crowded circular clumps of firs alone, that Mr. Price attributes to him. The incongruity of this plan struck most of the neighbouring gentlemen, but was defended by the artist himself under shelter of the epithet playful—totally misapplied." (Essay on Design, p. 130, 2d edit. 1795.)

That Brown must have possessed considerable talents, the extent of his reputation abundantly proves; but that he was imbued with much of that taste for picturesque beauty which distinguished the works of Kent, Hamilton, and Shenstone, we think, will hardly be asserted by any one who has observed attentively such places as are known to be his creations. Whatever be the extent or character of the surface, they are all surrounded by a narrow belt, and the space within is distinguished by numbers of round or oval clumps, and a reach or two of a tame river on different levels. This description, in short, will apply to almost every place in Britain laid out from the time (about 1740) when the passion commenced for new modelling country seats, to about 1785 or 1790, when it in a great measure ceased. The leading outline of this plan of improvement was easily recollected, and easily applied; the great demand produced abundance of artists; and the general appearance of the country so rapidly changed under their operations, that in 1772, Sir William Chambers declared that if the mania were not checked, in a few years longer there would not be found three trees in a line from the Land's-end to the Tweed. Brown, it is said, never went out of England, but he sent pupils and plans to Scotland and Ireland; and Paulowksy, a seat of the late Emperor Paul, near Petersburg, is said to be from his design. Potemkin's gardener, Gould, was also one of his pupils. Brown, as we have learned, though not draughtsman, had assistants, who made out plans of what he intended. He generally contracted for the execution of the work.

The immediate successor of Brown was his nephew, Holland. Mr. Holland, who was more employed as an architect than as a landscape gardener; though he generally directed the disposition of the grounds when he was em-
played in the former capacity. Mr. Holland, we believe, retired from business some years ago.

The next artist that deserves to be mentioned, is Mr. Eames, of whom, however, we know little more than that he is mentioned in terms of respect by Mr. G. Mason.

Mr. Repton, a highly respectable artist, from being an amateur, began his career as professor of landscape gardening about thirty years ago; and, till a sort of decline, or inactivity of taste took place ten or twelve years since, he was extensively consulted. Though at first an avowed defender and follower of Brown, he has gradually veered round with the change effected in public opinion by the Essays on the Picturesque, so that now, comparing his earlier works of 1795 and 1805, with his Fragments on Landscape Gardening, published in 1817, he appears much more a disciple of Price, than a defender of his "great predecessor." Mr. Repton is a beautiful draughtsman, and gives, besides plans and views, on his white, blue, and green, a regular form, generally combining the whole in a manuscript volume, which he calls the red book of the place. He never, we believe, undertakes the execution of his plans. Mr. Repton has not, as far as we are aware, been employed out of England; but Valleyfield, in Perthsire, was visited by his two sons, and arranged from Mr. Repton's designs. The character of this artist's talent, seems to be cultivation rather than genius, and he seems more anxious to gratify the preconceived wishes of his employers, and improve on the fashion of the day, than to strike out grand and original beauties. This, indeed, is perhaps the most useful description of talent, both for the professor and his employers. Mr. Repton's taste in gothic architecture, and in terraces, and architectural appendages to mansions, is particularly elegant. His published "Observations" on this subject are valuable; though we think otherwise of his remarks on landscape gardening, which we look upon as wanting depth, and often at variance with each other. In his attempt to give a grand and comprehensive view, he has been too much influenced in asserting, that both by his splendid volumes, and extensive practice among the first classes, he has supported the credit of this country for taste in laying out grounds.

Decline of Brown's school.

Though it may be true, that "in all liberal arts, the merit of transcendant genius, not the herd of pretenders, characterises an era": yet in an art like that of laying out grounds, whose productions necessarily have such an influence on the general face of a country, it is impossible to judge otherwise of the actual state of the art, than from the effect which is produced. This effect, about forty years ago, when clumps and belts blotted every horizon, could never be mistaken for that intended by such professors as Kent, or such authors as Wheatley and Mason. The truth is, as we have already hinted, such was the rage for improvement, that the demand for artists of genuine taste exceeded the regular supply; and, as it is usual in such cases, a false article was brought to market, and imposed on the public. This false taste, which may be said to have for the time reduced a liberal to a mechanic art, gave a new character to modern improvements, which, from consisting in a display of ease, elegance, and nature, according to the situation, became a system of set forms, indiscriminately applied in every case. This system was in fact more formal, and less varied, than the ancient style to which it succeeded, because it had fewer parts. An ancient garden had avenues, alleys, stars, patés d'oeie, pelotons, or plantations, (square clumps,) circular masses, rows double and single, and strips, all from one material, wood; but the modern style, as now degraded, had only three forms, a clump, a belt, and a single tree. Place the belt in the circumference, and distribute the clumps and single trees within, and all that respects wood in one of these places is finished. The professor required no further examination of the ground, than what was necessary to take the levels for forming a piece of water, which water uniformly assumed one shape and character, and differed no more in different situations, than did the belt or the clump. So entirely mechanical had the art become, that any one might have guessed what would be the plan given by the professor before he was called in; and Mr. Price actually gives an instance in which this was done. The activity of this false taste was abated in England before our time; but we have seen in Scotland, between the years 1795 and 1805, we believe, above a hundred of such plans, in part formed by local artists, and in part by an English professor, who was in the habit of making annual journeys in the north, taking orders for plans, which he got drawn on his return home, not one of which differed from the rest in any thing but magnitude."

The good sense of the country soon revolted at such monotonous productions; and proprietors were ridiculed for expending immense sums in destroying old avenues and woods, and planting in their room young clumps, for no other reason than that it was the fashion to do so. Partly on this account, and partly because almost every place in England had been metamorphosed, and that latitude had ensued which always succeeds over exertion, the career of improvement slackened its pace in England about the year 1780. Various causes contributed to diminish its course, till it became the most decisive blow given by Mr. Knight and Mr. Price in 1794.

The first symptoms of disapprobation that were ventured to be uttered against the degradation of the new taste, appear to be contained in an epistolary novel, entitled Village Memoirs, published in 1775, in which the professors of gardening are satirized under the name of Mr. Layout. A better taste, however, than that of Mr. Layout is acknowledged to exist, which the author states "Shenstone and nature to have brought us acquainted with." Most of the large gardens are said to be laid out by some general undertaker, "who introduces the same objects at the same distances in all," P. 143. The translation of Girardin De la composition des paysages, ou des moyens d'embellir la nature autour des Habitations, en joignant l'agréable à l'utilité, &c. accompanied with an excellent historical preface by Daniel Malthus, Esq. in 1783, must have had considerable influence in purifying the taste of its readers. A poem in Dodsley's collection, entitled, Some Thoughts on Building and Planting, addressed to Sir James Lowther, Bart. published in the same year, and in which the poet recommends, that

"Fashion will not the works direct, But reason be the architect."
and the various picturesque tours of Gilpin, published at different intervals from 1768 to 1790, had the principal influence on persons of taste. The beauties of light and shade, outline, grouping, and other ingredients of picturesque beauty, were never before exhibited to the English public in popular writings. These works were eagerly read, and brought about that general study of drawing and sketching landscape among the then rising generation, which has ever since prevailed; and will do more perhaps than any other class of studies, towards forming a taste for the harmony and connection of natural scenery, the only secure antidote to the revival of the distinctness and monotony which characterize that which we have been condemning. The coup-de-mains, however, has been given to this system by the works of Mr. Knight and Mr. Price, above mentioned. Their effect has been gradual but certain; for, though at first they were violently opposed by professors and periodical critics, yet 'they have carried conviction to all men of taste; and even, as we have before stated, have converted Mr. Repton himself. The object of The Landscape, a didactic poem, is to teach the art of creating scenery, more congruous and picturesque than what is met with in that "tiresome and monotonous scene called pleasure ground." Mr. Price's Essay on the Picturesque, and on the use of studying Pictures, with a view to the improvement of real Landscape, is written with the same intention; but, as might be expected from a prose work, enters on the subject much more at length. In order to discover "whether the present system of improving is founded on any just principles of taste," Mr. Price begins by inquiring, "whether there is any standard, to which, in point of grouping and of general composition, works of this sort can be referred; any authority higher than that of the persons, who have gained the most general and popular reputation by those works, and whose method of conducting them has had the most extensive influence on the general taste?" This standard (which it will be recollected by the candid reader, is desired only for what relates to grouping and composition, not utility, and convenience: some have hardly asserted,) Mr. Price finds in the productions "of those great artists, who have most diligently studied the beauties of nature, both in their grandest and most general effects, and in their minutest detail; who have observed every variety of form and of colour; have been able to select and combine; and then, by the magic of their art, to fix upon the canvas all these various beauties." Mr. Price recommends the study of the principles of painting, "not to the exclusion of nature, but as an assistant in the study of her works." He points out and illustrates two kinds of beauty in landscape; the one the picturesque, characterized by roughness, abruptness, and sudden variation; the other beauty in the more general acceptance, characterized by smoothness, undulations, intermixed with a certain degree of roughness and variation, producing intricacy and variety. Such beauty was made choice of by Claude in his landscapes, and such, he thinks, particularly adapted to the embellishment of artificial scenery. These principles are applied by Mr. Price in a very masterly manner, to wood, water, and buildings. When the works of these gentlemen were published, they were opposed by professors, by a numerous class of mankind who hate innovation, and with whom "whatever is is right," including perhaps some men of taste, who had not a sense of the picturesque, or had mistaken the object of the book. The first answer to Mr. Price's work, was a letter by Mr. Repton, in which candour obliges us to state, that Mr. R. has misrepresented his antagonist's meaning, by confounding the study of pictures with that of the study of the principles of painting. Mr. Price published an able answer to this production, which, he informs us, was even more read than the original essay. Two anonymous poems of no merit made their appearance, as satires on The Landscape. The Review of the Landscape, and of an Essay on the Picturesque, &c. by Mr. Marshall, was published in 1795. There can scarcely be any thing more violent than this publication. One reason for his not approving of the essay on the picturesque, he has made evident by his remarks on the same subject, and on painting; the fact being, as we have already more than once stated, and wish strongly to impress on the reader's mind, that a taste for the picturesque is not so natural as a taste for what is singular, grand, comic, or affecting, but requires a certain degree of previous study or preparation,—this preparation Mr. Marshall is evidently not furnishe with. Among the second class, or those with whom "what critiques, ever is is right," I shall just mention the periodical critics, who, in reviewing these works, brought forward all sorts of reasons against the use of the study of pictures, and deny (with truth perhaps as to themselves) the distinct character of the picturesque. Mr. Price they treat as "a mere visionary amateur," and Mr. Knight as "a Grub-street poet, who has probably no other garden than the pot of mint before his windows." The vague opinion of a great mass of country gentlemen, tourists, and temporary authors, may be here included, who, taking the word picturesque in its extreme sense, and supposing it intended to regulate what was useful, as well as what was ornamental, concluded that Mr. Price's object was to destroy all comfort and neatness in country seats, and reduce them to mere portions of dingle or jungle scenery. Such opinions we have frequently heard expressed by men, in other respects of good sense. Even continental authors have imbibed and disseminated similar exaggerations. "Égarés par Gilpin, que a cherché par ses voyages en diverses parties de l'Angleterre et de l'Écosse, a donné des règles, pour y assujeter le genre pittoresque et romantique, ils ont pris l'occasion pour demander que l'art fût totalement banni des jardins. Ils adoptent le pittoresque d'un Salvator Rosa dans les paysages, comme le vrai nature dans l'art de faire des jardins, et on rejeté comme un asservissement à ce même art, toutes les règles qu'un Bridgewater (Bridgeman ?) et un Brown avaient publiées dans ce genre," (Description Pittoresque des Jardin, du goût le plus moderne. Leipsig, 1802. See also Tübingen Taschenbuch, für nature und Gartenfreunde, 1798, p. 181.) Of enlightened and liberal minds, who have in some degree opposed Mr. Price's principles, we can only instance the late Mr. Wyndham, who, in a letter to Mr. Repton, (Mr. Repton was at one period secretary to Mr. Wyndham, when that gentleman was in office,) written after the publication of his defence, com- bats, not the works of Mr. Price, but the popular objec- tions to the supposed desire of subjecting every thing to the picturesque. "The writers of this school," he observes, "shew evidently that they do not trace with any success the causes of their pleasure. Does the
pleasure that we receive from the view of parks and gardens, result from their affording in their several parts, subjects that would appear to advantage in a picture? What is most beautiful in nature, is not always capable of being represented in a painting; as prospects, moving flocks of deer. Many are of a sort which have nothing to do with the purposes of habitation; as the subjects of Salvador Rosa. Are we therefore to live in caves? Gainsborough's Country Girl is more picturesque than a child neatly dressed. Are our children to go in rags? No one will stand by this doctrine; nor do they exhibit it in any distinct shape at all, but only take credit for their attachment to general principles, to which every one is attached as well as they. Is it contended, that in laying out a place, whatever is most picturesque is most conformable to true taste? If they say so, they must be led to consequences which they can never venture to avow. If they do not say so, the whole is a question of how much or how little, which, without the instances before you, can never be decided. "Places are not to be laid out to view to their appearance in a picture, but to their use, and the enjoyment of them in real life; and their conformity to these purposes, is that which constitutes their true beauty. With this view, gravel walks, and neat mown lawns, and, in some situations, straight alleys, fountains, terraces; and, for ought I know, parterres, and cut hedges, are in perfect good taste, and infinitely more conformable to the principles which form the basis of our pleasure in those instances, than the docks and thistles, and litter and disorder, that may make a much better figure in a picture." (Letter from Mr. Wyndham, in a note to Mr. Repton's Observations on the Theory and Practice of Landscape Gardening.

From the vein of excellent sense which pervades this letter, and particularly the latter part of it which we have extracted entire, it is impossible to avoid suspecting, either that there is a culpable obscurity in the works referred to, or that Mr. Wyndham had not sufficiently, if at all, perused them. We are inclined to believe that there is some truth in both suppositions. We have no hesitation, however, both from a mature study of all the writings of these gentlemen, relating to this subject, as well as a careful inspection of their own residences, in saying, that there is not an opinion in the above extract, to which they would not at once assent. Mr. Knight's directions in regard to congruity and utility, are as distinct as can well be expected in a poem. Mr. Price never entered on that subject. His works say, "Your object is to produce beautiful landscapes; at least this is one great object of your exertions. But you produce very indifferent ones. The beauty of your scenes is not of so high a kind as that of nature. Examine her productions. To aid you in this examination, consult the opinions of those who have gone before you in the same study. Consult the works of painters, and learn the principles which guided them in their combinations of natural and artificial objects. Group your trees on the principles they do. Connect your masses as they do. In short, apply their principles of painting whenever you intend any imitation of nature, for the principles of nature and of painting are the same. Are we to apply them in every case? Are we to neglect regular beauty and utility? Certainly not, that would be inconsistent with common sense."

We next present the opinion of Mr. Stewart on the same subject, as given incidentally in his philosophical disquisition on the beautiful. (Essays, 1810, p. 283.) "As to the application of the knowledge thus acquired from the study of paintings, to the improvement of natural landscape, I have no doubt, that to a superior understanding and taste, like those of Mr. Price, it may often suggest very useful hints; but if recognised as the standard to which the ultimate appeal is to be made, it would infallibly cover the face of the country with a new and systematical species of affection, not less remote than that of Brown, from the style of gardening which he wishes to recommend," "let painting be allowed its due praise in quickening our attention to the beauties of nature; in multiplying our resources for their farther embellishment; and in holding up a standard, from age to age, to correct the caprices of fashionable innovations; but let our taste for these beauties be chiefly formed on the study of nature herself; nor let us ever forget so far what is due to her indisputable and salutary prerogative, as to attempt an encroachment upon it by laws, which derive the whole of their validity from her own sanction," 287.

We shall conclude by remarking, that however individuals have differed as to the theory of Mr. Price and Mr. Knight, yet all agree in coming to the same seats, Mr. Knight's entirely, and Mr. Price's in great part improved by himself, without professional assistance. Nature has certainly done much for each, and especially for that of Mr. Knight; but in both the genius loci has been so happily humoured, that the operations of art have greatly heightened the natural expression of each, while a strict attention to convenience and use has not been forgotten in either situation. (See a Description of these Seats in Mr. Repton on the Approaching Changes of Taste in Landscape Gardening and Architecture. 8vo. 1810.)

If we have dwelt longer on the writings of these authors, it is because we consider a knowledge of them of the greatest importance, not only to the introduction of a better taste than has hitherto been displayed, even in the comparatively chaste periods of Kent, Shenstone, and Hamilton; but, as Mr. Stewart has expressed, as leading to studies which shall "hold up a standard from age to age, to correct the caprices of fashionable innovations."

The general taste for drawing, as already remarked, in the present generation, and the late frequent practice of making tours to the more picturesque parts of the island, have co-operated with Mr. Price's work, in refining the taste of the higher classes. Mr. Knight's learned and comprehensive "Analytical Enquiry into the Principles of Taste," Mr. Alison's beautiful and profound essay on the same subject; and the Philosophical Essays on Beauty by Mr. Stewart, have undoubtedly had considerable influence. The necessity of economising income has enforced the maxim, that "from truth and use all beauties flow;" so that, as Mr. Repton observes, the characteristic of the present improved taste may be said to be "a just sense of general utility."

We confess, however, that this refined taste is by no means of a nature impelling to action; for, partly from a fear of doing mischief, and partly from the great attention, during the last twenty years, to war and agriculture, less has been done in beautifying country seats, or improving their scenery, as scenery, than appears to have been the case for at least two centuries before. Horticulture, and continental travelling, seem now to take the place of war and farming; and so very little has been done since the late political changes in Europe, that Mr. Repton,
in his *Fragmenta*, published in 1817, expresses his doubts whether landscape gardening may not become one of the *artes perdita*. He observes also, that war, and war taxes, have depressed the spirit of elegant improvement—that the sudden acquisition of riches, by individuals, has divided wealth into new channels; "men are solicits to increase property, rather than to enjoy it: they endeavour to improve the value, rather than the beauty of their newly purchased estates. The country gentleman, in the last century, took more delight in the sports of the field than in the profits of the farm; his pleasure was to enjoy in peace the venerable home of his ancestors; but the necessity of living in camps, and the habit of living in lodgings at watering places, has of late totally changed his character and pursuits; and, at the same time, perhaps tended to alienate half the ancient landed property of the country." "The taste of the country has bowed to the shrine which all worship." "It is not therefore to be wondered at, that the art of landscape gardening should have slowly and gradually declined."

In confirmation of these remarks, it is worthy of record, that one of Kent's first and best efforts, Esher, was selected and described as an example of modern gardening, by Mr. Wheatley; and one of Brown's most celebrated creations, Fisherswick, (See Marshall's "Plant- ing and Rural Ornament," and Leicestershire in the "Beauties of England and Wales") have been sold in lots, and the mansions razed to the ground. Let us hope, however, that those who are now engaged in visiting other countries, will shortly return with a renewed love of their own; and that landscape gardening, of which Lord Walpole affirms we have given a true model to the world, may yet flourish and perpetuate the credit we have obtained.

The celebrated Lord Kames appears to have been the first who introduced the modern style into Scotland, sometime between 1740 and 1750, by displaying it on his own residence at Blair Drummond. An irregular ridge, leading from the house, was laid out in walks, commanding a view, over the shrubs on the declivity, of portions of distant prospect. One part of this scene was composed entirely of evergreens, and formed an agreeable winter garden. Lord Kames did not entirely reject the ancient style, either at Blair Drummond, or in his Essay on Gardening and Architecture, published in the "Elements of Criticism." In that short but comprehensive essay, he shews an acquaintance with the Chinese style and the practice of Kent, admits both of absolute and relative beauty as the objects of gardening and architecture, and from this complex destination, accounts for that difference and wavering of taste in these arts, "greater than in any art that has but a single destination." (Vol. ii. p. 431. 4th edit. 1769.)

Lord Kames's example in Scotland, may be compared to that of Hamilton or Shenstone in England; it was not generally followed, because it was not generally understood. That the *Elements of Criticism* tended much to purify the taste of the reading class, there can be no doubt. Every person who admired Blair Drummond; but as every country gentleman could not bestow sufficient time and attention to gardening, to be able to lay out his own place, it became necessary to have recourse to artists; and, as it happened, those who were employed, had acquired only that habit of mechanical imitation, which copies the most obvious forms, without understanding the true merits of the original. In short they were itinerant pupils of Brown, or professors in his school, who resided in Scotland; and thus it is, that after commencing in the best taste, Scotland continued, till within the last twenty years, to patronise the very worst. As a contrast to the style of Blair Drummond, and a proof of what we have asserted in regard to the style introduced immediately afterwards, we next refer to the grounds at Duddingston House, near Edinburgh, laid out about the year 1750. The architect of the house was Sir William Chambers; the rural artist, whose original plans we have examined, was Mr. Robertson, sent down from London. We know no example in any country, of so perfect a specimen of Brown's manner, nor of one in which the effect of the whole, and the details of every particular part, are so consistent and co-operate so well together in producing a sort of tume, spiritless beauty, of which we cannot give a distinct idea. It does not resemble avowed art, nor yet natural scenery; it seems, indeed, as if nature had commenced the work and changed her plan, determining no longer to add to her productions those luxuriant and seemingly superfluous appendages which produce variety and grace. The trees here, all planted at the same time, and of the same age, seem to grow by rule. The clumps remind us of regularly tufted perukes. The waters of the tame river neither dare to sink within, nor to overflow its banks; the clumps keep at a respectful distance; and the serpentine turns of the roads and walks, seem to hint that every movement to be made here, must correspond.

The extent of this place, we suppose, may exceed 200 acres. The house is placed on an eminence in the centre, from which the grounds descend on three sides, and on the remaining side continue on a level till they reach the boundary belt. This belt completely encircles the whole; it is from 100 to 300 feet wide, with a turf drive in the middle. One part near the house is richly varied by shrubs and flowers, and kept as garden scenery; in the rest the turf is mown, but the ground untouched. A string of wavy canals, on different levels, joined by cascades, enter at one side of the grounds, and taking a circuitous sweep through the park, pass off at the other. This water creates occasion for Chinese bridges, islands, and cascades. The kitchen garden and offices are placed behind the house, and concealed by a mass of plantation. Over the rest of the grounds are distributed numerous oval unconnected clumps, and some single trees. In the drive are several temples and covered seats, placed in situations where are caught views of the house, sometimes seen between two clumps, and at other times between so many as to form a perspective or avenue. There is also a temple on the top of a hill, partly artificial, which forms the object from several of these seats, and from other open glades or vistas left in the inside of the belt. The outer margin of this plantation is every where kept perfectly entire, so that there is not a single view which is unhorrifying to the eye of the owner; unless in one instance, where the summit of Arthur's Seat, an adjoining hill, is caught by the eye, from one part of the belt, over the tops of the trees in its opposite periphery. That this place has, or had, in 1790, great beauties, we do not deny; but they are beauties of a peculiar...
many facilities for landscape scenery, that under the guidance of such an artist as Mr. Nasmyth, much beauty may be preserved and created.

There is now residing in Scotland, an English gentleman and amateur, who we believe is also employed professionally, Mr. G. Parkyns, author of an "Essay on the different natural situations of Gardens," prefixed to the quarto edition of Mr. W. Hamilton's Works, of some designs published in a work on Architecture, by Mr. Soane, in 1798, and of some Plans and Descriptions, published in numbers in Edinburgh, since 1800. These works are, on the whole, of unexceptionable merit; the author appears to be a correct and elegant draughtsman, and a man of general taste. We have not seen any specimen of his practical talents.

The first attempts to introduce the modern style in Ireland, are supposed to have been made by Dr. Delany at Delville, near Classenbin, about the year 1720; Swift has left a poetical description of these scenes. Like Pope, Dr. Delany impressed a vast deal of beauty on a very small spot of ground. As there existed an intimacy between these two characters, it is supposed that Pope may have assisted his Irish friend. This example appears to have had the same sort of influence in Ireland, that the gardening of Lord Kames had in Scotland. It gave rise to a demand for artists of the new school; and the market was supplied by such men in the way. Much less, however, was done in that country partly from the abundance of rocky and picturesque scenery in many districts, and partly from other obvious causes. Mount Shannon, near Limerick, the seat of the late chancellor Clare, is said to be laid out from his lordship's designs, as are chiefly the recent improvements at Charleville forest, where one of the most comfortable and magnificent castles in Ireland has been executed by Mr. Johnston of Dublin, from designs which were the joint productions of Lord and Lady Charleville.

Mr. Walker of St. Valori, a very beautiful spot near Bray, laid out by the owner, mentions Marino, Castletown, Carton, Curraghmore, the retreat of St. Woulats, and Moyras, as exhibiting the finest garden scenery in Ireland. Powerscourt, and Mucross, near the lakes, are reckoned the most romantic residences, and are little indebted to art.

We are not aware, that any English artist of eminence has been employed as a landscape gardener in Ireland, the more common practice being to engage a good kitchen gardener from England, and leave every thing to him. A Mr. Sutherland was, in 1810, the native artist of greatest repute. Mr. A. M'Leish has since settled in this country, and, from what we know of this artist, we have little doubt he will contribute, in an eminent degree, to establish and extend a better taste than has yet appeared there. Though landscape gardeners from the capital have not been called to Ireland, yet it has happily become not an unfrequent practice to employ eminent English architects,—a practice certain of being attended with the most salutary effects.

Hirschfeld mentions Laugier, as the first French author who espoused the English style of gardening in France, in his Essay sur l'Architecture, published in 1750 to 1753; and next in order is Prevôt, in his Homme du Gout, published in 1770. About the same time, the first notable example was preparing at Ermenonville, the seat of Viscount Girardin, about ten leagues from Paris. An account of this place was written by Girardin himself in 1775, and published in 1777. It was soon after...
translated into English by D. Malthus, Esq. and is well known for its eloquent descriptions of romantic and picturesque scenes. Ermenonville (still in the same family, but now rather neglected,) appears to have been laid out in a chaste and picturesque style, and, in this respect, to have been somewhat different, and superior to cotemporary English places. Useless buildings were avoided, and the picturesque effect of every object carefully considered, not in exclusion of, but in connection with their utility. There is hardly an unexceptionable principle, or even direction referring to landscape gardening, laid down in the course of the work; and in all that relates to the picturesque, it is remarkable how exactly it corresponds with the ideas of Mr. Price. M. Girardin, high in military rank, had previously visited every part of Europe, and paid particular attention to England; and, before publishing his work, he had the advantage of consulting that of Wheatley, from which he has occasionally borrowed, as well as the writings of Chambers, Shenstone, and Gilpin. He professes, however, that his object is neither to create English gardens, nor Chinese gardens; and less to divide his grounds into pleasure grounds, parks, or ridings, than to produce interesting landscapes, "patinages interessans," &c. He received the professional aid of J. M. Morel, the Kent of France, who afterwards published *Theorie des Jardins,* and probably that of his guest Rousseau, who seems to have composed the advertisement to his book. M. Magellan, in the *Gazette Litteraire de l'Europe* for 1778, in giving some account of the last days of Rousseau, who died at Ermenonville, and was buried in the island of Poplars there, informs us, that M. Girardin kept a band of musicians, who constantly permeabilized the grounds, making concerts, sometimes in the woods, and at other times on the waters, and in scenes calculated for particular seasons, so as to draw the attention of visitors to them at the proper time. At night they returned to the house, and performed in a room adjoining the hall of company. Madame Girardin and her daughters, were clothed in common brown stuff, *en Amazones,* with black hats, while the young men wore "habillements le plus simple et le plus propres a les faire confondre avec les enfants du campagnard," &c.

The next example of English gardening in France, is of a very different description, and is that of M. Watelé, the author of an *Essai sur les Jardins,* which appeared in 1774. M. Watelé's garden was situated in the suburbs of Paris, and contained about four acres, varied by buildings, grottos, temples, and inscriptions; and was, on the whole, more in the Chinese style than in that of Kent or Shenstone. The author, who professes to take utility or the basis of his art, seems to have felt something wanting in this particular to his temples and altars; and is ridiculed by Hirschfield, *Sur les Jardins,* tom. i. p. 166., for proposing occasionally "de faire paroître auprès des temples, des autels, des arcs de triomphe, &c. une troupe de pantomimes vêtues suivant le costume nécessaire——imitant des cérémonies, faisant des sacrifices, allant Porter des offrandes," &c. The object of such as attempt English gardening in France on a small scale, is still, more to imitate the garden of M. Watelé, than the "patinages interessans" of Girardin. In much better taste is the *Theorie des Jardins* of J. M. Morel, already mentioned, and published in 1776. It appears from this judicious writer, that very little had been done in France up to the period in which he wrote. One place only is mentioned besides Ermenonville as worthy of attention. Most of the attempts were made on a small scale near Paris, in Watelé's manner. Soon after this, Delille's celebrated poem, *Les Jardins,* made its appearance, and is perhaps a more unexceptionable performance than The English Garden of Mason. The French indeed, have written much better on gardening and agriculture than they have practised,—a circumstance which may be accounted for, from the general concentration of wealth and talent in the capital, where books are more frequent than examples; and of professional reputation in that country, depending more on what a man has written than on what he has done. It does not appear that English gardening was ever at all noticed by the court of France. The garden of Monsieur, before the revolution, the property of the Duke of Orleans, was laid out in a romantic and irregular style, as were some scenes in that of the Petit Trianon, especially in the lower part of the grounds, now occupied by ruins, water, and a cottage, and in their kind very picturesque. Bagatelle, in the Bois de Boulogne, formerly a retreat of Count d'Artois, was laid out in the same taste.

During the consulate, Malmaison, the residence of Consulate Buonaparte, was laid out avowedly in the English manner by a Scotch gardener; and was afterwards stocked with every variety of trees and shrubs from that country. The Grand and Petit Trianon have also been partially subjected to this style, and more especially the latter. The dry arenaceous soil of these places, joined to the great heats in summer, is particularly unfavourable to the production of what constitutes one of the finest beauties of English gardening—a velvet turf; which in no country or soil is produced in such perfection as on the strong loams and under the temperate climate of England. This, we learned on the spot, was the chief drawback to Ermenonville when in its greatest perfection, and will probably ever prevent an English garden from exhibiting in any other country that beauty which it does in England. There are a few exceptions, referring to maritime districts, which afford useful hints to any who may think of displaying a British country residence in any of the continental states.

For a more particular account of the present state of gardening, as well as of that of rural architecture, and the general arrangement of country residences in France, we refer our readers to Craft's *Plais du plus beaux Jardins de France et d'Italie,* &c. Paris fol. 1809—10; Laborde's *Description des Jardins de la France,* &c. 1812—15; the various works in French, *Sur Architecture Rurale,* and Le Grand's *Histoire generale de L'Architecture.*

It was our intention to have collected from these works, the characteristic particulars of the domestic and rural economy of France; but we have already far exceeded the limits of this chapter of our article. We shall only therefore add, that the Grecian style is employed not only in France, but everywhere on the Continent, to the exclusion of every other manner of building.

The English style appears to have been introduced in Germany about the same period as in France, and, as might be expected, by private individuals rather than royal courts. The first example was a small spot, Garden of the court of Louis XVI,

"Garten der Schwobber," laid out about the year 1750, with winding walks, seats, and a rich collection of rare shrubs, plants and shrubs, in the neighbourhood of Pyrmont, in Westphalia. The fine mountains which skirt the valley of Pyrmont, form picturesque distances to venerable exotics of different species, which form now the chief remains of this interesting parent of the new style in Germany. The next instance we shall notice, is a
LANDSCAPE GARDENING.

splendid example exhibited by Field Marshal Lacy, at Dornbach, near Vienna, and which would probably originate in the family connections of that warrior in England. It was laid out by the German architect Fischer, and an English gardener Morrison, between the years 1760 and 1770, at an expense of half a million of florins. Its picturesque views and extensive prospects are much and deservedly admired; but on the whole, as an English garden, it owes much more to nature than to art. Lacy's example was soon followed by a number of proprietors near Vienna; and an account of various English gardens is to be found in the guides to that city and its environs. The imperial chateaux and gardens of Prussia, 1771, which a留学生 Englishman, A. D. 1714, in part an artificial grove, and in part an extensive natural forest of venerable oaks and thorns, open to the public, is certainly the most natural and picturesque public park in Europe; as the grounds of Schoenbrunn are the most majestic and extensive example of the ancient style of gardening.

There are now specimens of English gardening, more or less extensive, in the capital towns of every state in Germany; but, with a very few exceptions, they are of a very inferior description, and such as, when the novelty of the style has passed away, are not at all likely to perpetuate this taste in these countries. From the arid soil and limited extent, result bad turf, and an air of constraint; and from too many buildings and walks, a distressing bustle and confusion. They are crowded with winding sand climb hatch, continually intersecting each other, little clumps, and useless seats or temples, and very frequently resemble more the attempts of amateurs, or caricaturists, than imitators of our taste. In short, the defects of the English style in every country, are more frequently copied than the beauties; which, we presume, arises from the circumstance of few of those who lay out such gardens, having had a proper idea of the end in view in forming them, viz. a painter-like effect in every case, where it does not interfere with utility, or some other preferable beauty; and, in many cases, an entire allusion to natural scenery. It is difficult for a person of limited education and travel to form a distinct idea of what English gardens really are. The foreigner can seldom divest himself of the idea of a very limited and compact space as requisite for this purpose; the reverse of which is the case with all our best scenes, both of ornamental, horticulture, and picturesque beauty.

The English gardens in the vicinity of Dresden, Brunswick, Hamburg, Prague, Toplitz, Leipzig, and other places, have given rise to those remarks, in which even those professedly English in Prussia, might be included. There are some exceptions which might be pointed out at Cassel, Stuttgart, (for views of these gardens, see L'Almanach du Jardinez, Weimar, (see Description du Parc de Weimar, et du Jardin de Tifeyards, Erfurt 1797,) the park of Fürstenstein near Breslaw, and the walk at Munich, laid out by Count Rumford, may be referred to as less obnoxious to our general remark.

The principal examples of the new style in Prussia, are the royal gardens at the summer residence of Charlottenburg near Berlin, begun by Frederick the Great, but chiefly laid out during the reign of Frederick William II. They are not extensive, and are situated on a dull sandy flat, washed by the Spree; under which unfavourable circumstances, it would be wonderful if they were very attractive. In one part of these gardens, a Doric mausoleum of great beauty, contains the ashes of the much lamented queen. A covered avenue of Scotch firs, leads to a circle of the same tree, 100 or 150 feet in diameter. Interior circles are formed of cypresses and weeping willows, and within these, a border of white roses and white lilies, (Lilium candidum). The form of the mausoleum is oblong, and its end projects from this interior circle directly opposite the covered avenue. A few steps descend from the entrance to a platform, in which, on a sarcophagus, is a reclining figure of the queen: a stair at one side, leads to the door of a vault containing her remains.

The garden of the palace of the Heiligen see, is awon Heiligen E Uhr English, and is in much better taste than that at Charlottenburg. The palace is almost entirely marble, of chaste Greek architecture; and placed close to the lake, a covered way leads to the kitchen 100 feet distant, disguised under the form of a temple rising from the water. These sumptuous works are the joint production of Mr. Langhans and Mr. Gontard; and it is said that Professor Hirschfield was consulted on the plan for the gardens.

The Germans have no original author on the subject of landscape gardening. Professor Baron Hirschfield, almost their only writer on the subject, published his Théorie der Gartenkunst, in 1775, in 12mo; which contains a succinct outline of the history and principles of gardening, and seems to have been circulated with a view to procure information for his larger work, the first volume of which appeared in Germany, in quarto, under the title of Über der Gartenkunst, and in Holland under the French title, "Sur les Jardins," in 1779, and the last, or fifth volume, in 1783. It contains a valuable assemblage of historical information up to that time, some interesting descriptions, drawn from Wheatley, Girardin, and other authors, and a just and comprehensive view of the principles of gardening. The work is illustrated with many plates, chiefly of buildings.

The following are a few of the principal German works on gardening, besides those above mentioned. Gallerie der Gartenkunst, Wien, 8vo. 1783. Hirschfield über der Vereinigung der Gartenkunst und der Malerei, (Gothaish Mag.) Gärten und Parks, &c. Leipzig, 1808. Anweisung für ordnung der Gärten in deutsches Geschmack, Leip. 1794. See a more complete list in Sulfer's Théorie des beaux Arts, &c.

The first gardens laid out in the modern style, are Modem those of the imperial residence of Zarskojezelo, begun in 1778 by Mr. Bush, an Englishman, and father of Russia, their present superintendent. The gorgeous magnificence of this residence is well known. A natural birch forest, on ground somewhat varied, forms the ground-work of the park and gardens. The gate by which they are approached, is an immense arch, of artificial rock-work, over which is a lofty Chinese watch tower. The first group of objects is a Chinese town, through which the approach leads to the palace; a building, which with its enclosed entrance, court, offices, baths, conservatories, church, theatre, and other appendages, it would seem like exaggeration to describe. The rest of the garden scenery consists of walks, numerous garden buildings, with bridges of marble and wood, a large lake, and extensive kitchen-gardens and hothouses.

The best specimen of the English style, in the neigh- Paulowskybourhood of the Russian capital, or indeed in the empire, are the grounds of Paulowsky, begun during the reign of Catherine, in 1780, from a design said to have
History.

been furnished by the celebrated Brown, from a description sent him by Gould, and finished afterwards during the reign of Paul. This place possesses considerable variety of surface, and a varied clothing of wood, the Scotch fir and aspen being natural to these grounds, as well as the birch. Near the house, there is a profusion of exotics of every description, including a numerous collection of standard roses, which, with some of the American shrubs, require to be protected with straw and mats during winter. The Chevalier Storch has given a very interesting description of these gardens, in his Briefe über Paulowsky, &c. 1802. We pass over several imperial and private English gardens to notice those of Potemkin, one of the most extravagant encouragers of this art that modern times can boast. The most extensive gardens of this prince are in the Ukraine, but the most celebrated were those belonging to the palace of Taurida, now an imperial residence in Petersburgh. The grounds are level, with several winding and straight canals, and walks, adorned with numerous buildings, a rich collection of exotics, and most extensive hothouses of every description. Their grand feature, in Potemkin’s time, was the conservatory, or winter garden, attached to the palace. The plan of this part of the building is that of a semicircle, embracing the end of a saloon, nearly 300 feet long. They are lighted by immense windows, between columns, with an opaque ceiling, and heated by common German stoves. They are too gloomy for the growth of plants, but those grown in the glass sheds of the kitchen garden, are carried there, sunk in the ground, and gravel-walks, turf, and every article added to render an illusion to some fairy scene in the open air as complete as possible. Their effect was after all, it is said, never satisfactory, but when illuminated. This palace, the original exterior of which was in a very simple style, and the interior most magnificent, is said to have been the entire design of Potemkin, but it was entirely remodelled at his death by Catherine, used as barracks by Paul, and is now very imperfectly restored. (See Storch’s Description.) The gardens at Potemkin’s other residences, as well as many imperial and private gardens in Russia, were laid out by Mr. Gould, a pupil of Mr. Brown. Sir John Carr relates an anecdote on Gould’s authority, which was confirmed to us, in 1815, by the present gardener, Mr. Call, his successor, and deserves a place here. In one of the prince’s journeys to the Ukraine, Mr. Gould attended him with several hundred assistants, destined to assist in laying out the grounds of Potemkin’s residence in the Crimea. Wherever the prince halted, if only for a day, his travelling pavilion was erected, and surrounded by a garden in the English taste, composed of trees and shrubs, divided by gravel-walks, and ornamented with seats and statues, all carried forward with the cavalcade. On another occasion, having accidentally discovered the ruins of a castle of Charles XII. of Sweden, he immediately not only caused it to be repaired, but surrounded by gardens, in the English taste.

The most extensive gardens laid out in the modern style, in the neighbourhood of Moscow, are those of Gorinka, a seat of Count Alexy Razumowsky, and Petrovsky Razumowsky. The former is remarkable for its botanical riches, and an immense extent of glass. The grounds are of great extent, but the surface flat, and the soil a dry sand. A natural forest of birch and wild cherry clothes the park, and harmonizes the artificial scenes. The mansion, built by an Englishman, is highly elegant; and the attached conservatories, and stoves, and decorated lawn, form a splendid and delightful scene, unequalled in Russia.

Petrowsky Razumowsky contains both an ancient garden, already referred to in our third section, and a large extent of ground, laid out in the modern style, and adorned with designs by Signior Camporezi. There is some variety of surface, abundance of birch and fir woods, with some oaks and aspens interspersed, and a large piece of water. Among the ornamental buildings is a cotton manufactory, in actual use as such. The practice of introducing manufactories as garden buildings, is very general in Russia, and almost peculiar to that country. The palace and gardens of Count Alexy Razumowsky, and of Paschow, in Moscow; of Zaritzina, a singular Turkish palace, built by Potemkin for Catherine; of Astankina Count Chérémétow, Peckra, Prince Galizin, and various others, would well bear description, but we are necessarily precluded from doing this by our limits, and conclude by observing, that extent, exotics, and magnificent artificial objects, is more the object of the modern style in Russia, than scenes merely of picturesque beauty. We think this may be accounted for, partly from the general want of refinement of taste in that country, and partly for its inaptitude for that style. The people there are suddenly rendered aware of being distanced in point of civilization by those of most other European countries, are resolved not merely to imitate, but even to surpass them in the display of wealth. The most obvious marks of these, in the most refined countries, are necessarily first singled out by rude and ambitious minds, and large magnificent houses and gardens are desired, rather than comfortable and elegant apartments, and beautiful or picturesque scenes; since, as every one knows, it is much more easy to display riches than to possess taste.

English gardening was introduced into Poland by the Princess Czartoryska, at Pulhawa. This lady, highly accomplished, of great taste, and much good sense, had been a considerable time in England. She carried to Poland Mr. Savage, a gardener, and with his assistance, and that of Mr. Vogel, and Mr. Frey, artists of Warsaw, she laid out Pulhawa between 1780 and 1784, and published in Polish, a folio work with plates, on English gardening, in 1801. The situation, like almost every other with which we are acquainted in Poland or Russia, is flat and sandy; but is somewhat relieved by the Vistula. On the brink of this river, on a wooded bank, stands the house, a plain Grecian building, and with the grounds described by Burnet, in his view of Poland, (Chap. xi.) Independent clumps of shrubs are more frequent in these gardens than would be admitted by a good taste in England; but all Poland is a natural forest; and as the grand object of improvement in every country, is to obtain applause by the employment of art and expence, artificial forms, from their rarity, are better calculated for this purpose than such as are more universally beautiful, but so common as to want the charm of novelty, or whose beauties are too refined to be generally understood. Thus clumps in Poland, may be as much esteemed, as groups are in England, on the same principle, that, in a wild country, game is less esteemed than butcher meat, because it is the common food.

The other eminent examples of the modern style, are those of Count Zamoski at Zamost, and Count Potocki at Villanueva, mentioned in our third section. Modern style in Poland.
The first are of limited extent, but the latter, near Warsaw, are very extensive, and were laid out chiefly from the designs of Princess Czartoryska. The gardens of General Benningsen near Wilna, were in a mixed style, and rich in botany, before they were destroyed by the retreat of the French army in 1812. Those of Colonel Lachamitzki at Poniemion, on the banks of the Niemen at Grodnos, are not extensive, but contain more romantic and picturesque scenery than any we have seen in Poland.

Our remarks, as to the present state of architecture and domestic arrangements of Russia, will nearly apply to Poland; but the *amor patriae*, from superior education and recent intercourse with every country in Europe, is of a much more active and intelligent nature in the latter country, and will, we are persuaded, within a moderate period, place Poland on a level with any of the continental kingdoms, more especially if her individuality shall be preserved.

The royal gardens at the Haga, near Stockholm, form the earliest and the chief example of the English style in Sweden. They were begun by Gustavus III. with the assistance of Masreter, a Swedish artist, and subsequently varied and extended, so that they now present a mixture of picturesque, with some formal beauty. They are surrounded and interspersed with rocks, covered with Scotch and spruce firs, and abound in winding walks, Chinese, and other buildings. There are some confined spots laid out in the English taste, chiefly by British merchants, in the neighbourhood of Gottenburg, as there are also near Christiansand in Norway; but it may be remarked, that this style is not likely to be generally adopted in either country, because they already possess much greater beauties of the same kind which it is our aim to create, and with which those created would not bear a comparison.

A distinguished example of the English style exists in Denmark, at Drongbrod, the residence of an eminent Danish merchant, DeConminck, about sixteen miles from Copenhagen. The grounds are situated on an extensive declivity, which descends to a natural lake of great extent, whose circuitous shores are verged with rich woody scenery and country houses. The soil here approaches more to a loam than is general on the continent, the turf is, therefore, happily of a deep tone of green, and close texture. The oak and beech abound in these grounds, as well as firs, and a number of exotics. Buildings are not too frequent; but there are several, and among them a hermitage, to which it is stated one of the family actually retired, on occasion of a matrimonial disappointment, and lived there for several years, till called forth by some military arrangements. There are numbers of small spots round Copenhagen of considerable beauty, in which something of the English style has been imitated; but in none of the gardens of the court has it been awedly introduced.

We are not aware that the English style has been introduced into Spain, unless on a very small scale, in the neighbourhood of Seville, or other maritime towns, by the British residents, though Mr. Repton mentions one instance in which he was called on to give a design in the modern style, for a very small spot near Lisbon. These are not countries for change of ideas, or refinement of taste.

Very little more has been done in Italy than in Spain and Portugal as to English gardening, and in a great measure from the same causes—the general stagnation of mind, and the abundance of picturesque scenery. The villa Borghese, is universally allowed to be the first of Roman villas. "The gardens," Mr. Eustace informs us, "are laid out with some regard, both for the new and for the old system; for though symmetry prevails in general, and long alleys appear intersecting each other, lined with statues and refreshed by cascades, yet here and there a winding path allures you into a wilderness formed of plants, abandoned to their native luxuriance, and watered by streams murmuring through their own artless channels." Of Italian gardens in general, the same author observes, "howsoever they may differ in extent and magnificence, their principal features are nearly the same; the same with regard to artificial ornaments, as well as natural graces. Some ancient remains are to be found in all, and several in most, and they are all adorned with the same evergreens, and present upon a greater or less scale the same Italian and ancient scenery. They are in general, it is true, much neglected, but for that reason the more rural. The plants, now abandoned to their native forms, cover the walks with a luxuriant shade, break the long straight vistas by their fantastic branches, and turn the alleys and quinquevex into devious paths and tangled thickets." (Classical Tour, vol. i. ch.18.)

Modern Italian gardens appear, from the accounts of travellers, to be exactly the same as described in the earliest accounts of gardening in the east. The gardens in Africa partake of the Turkish manner, which has nothing in it differing materially from the Asiatic. Those of the grand Sultan, remain the same as in Lady Montague's time.

Small specimens of the English style, we believe, are to be found near almost every great commercial city in the world, and undoubtedly in the chief towns of the British colonies. The governor's gardens at Calcutta are highly spoken of, as are others at Madras, at the Cape of Good Hope, and in Jamaica; and slight efforts have been made in the neighbourhood of Rio de Janeiro, and Buenos Ayres. In North America, the late General Washington's Ferme Ornee at Vermont, was perhaps the most elegant country residence in that part of the world; but there are occasional English gardens to be seen near New York, Baltimore, and other elder cities; and Montesquieu mentions several country residences in the interior, in which some attention to ornament was not deemed incompatible with agricultural improvement.

**SECT. VI. Remarks on the different Styles.**

The common practice of almost every author who has written on the modern style, is to condemn indiscriminately every other taste as unnatural and absurd. If by unnatural, an allusion is made to the verdant scenery of uncultivated nature, we allow that this is the case; but we would ask, if, for that reason, it follows, that though now absurd, these gardens were not as natural and reasonable in their day, as any of the manners and customs of these times? Gardening, as a liberal art, is destined to create scenes, in which both beauty and use are combined: admitting, therefore, that both styles are liable to criticism, to say that the modern is beautiful, is to say that there is only one sort of beauty adapted to gardening; or that there is no beauty but that of the picturesque; or that all former ages, and every other country, is in a state of barbarism with respect to this art. If we take the term natural in a more extensive sense, and apply it to the climate, situation, condition, and manners of a people; and if we allow these to be natural, why may not their gardening be na-
The gardening we now commend so unreservedly, has subsisted, as we have seen, from the earliest ages in warm climates; and still prevails there, as well as in more temperate countries, whose inhabitants are not altogether ignorant of the modern style. It may, therefore, be said to have grown up with mankind, and at all events must be perfectly suited to the wants and wishes of the inhabitants of such countries. In order to judge of the fitness or utility of a style, we must know the purposes to which it is applied; and in order to judge of its beauty relatively to the people who employ it, we ought to know what beauties are already most abundant in their country, as well as something of the degree of their advancement in civilization.

The gardens of the east, we have every reason to believe, were used more as an arbour or a conservatory in this country, than as places of exercise and active enjoyment. The object was repose, indolent recreation, sedentary or luxurious enjoyment. To breathe the fresh air, shaded from a tropical sun; to inhale the odour of flowers; to listen to the murmur of fountains or fountains, to the singing of birds; or to observe the minute beauties of the surrounding foliage, was and still continues to be the ordinary class of beauties desired in an eastern garden. A higher and more voluptuous kind, consisted in using it as a banqueting place, bath, or seraglio, as is still the case in Turkey and Persia; in feasting the eyes with the sight of dancing beauties; in ravishing the ears with concerts of vocal or instrumental music, and in firing every sense with wine. Exercise* was incompatible with that languor of body, which is attendant on a warm climate and a distant prospect; inconsistent with security from wild beasts, and that privacy which selfishness or jealousy might dictate. Add to this, that the natural surface of warm countries is generally so parched with heat,† as to be far less agreeable to look on than the verdure of a limited space, kept luxuriant by water. If to these we subjoin the use of fruit, and, what is common to every exertion of man, a desire of obtaining applause for the employment of wealth so exerted, it shall include every object sought in an eastern garden.

An eastern garden, therefore, appears to have been a collection of all those beauties found scattered about in general nature, in order to adapt them to the use and enjoyment of man. Let us now inquire how their plan, as far as we are acquainted with it, was calculated for this end. Moderate extent, and immediate connection with the house, are necessary and obvious ingredients in their design. The square form would be adapted for the enclosure as the simplest; the trees would be ranged in rows, to afford continuity of shade; and the walks would run parallel between them, to admit uninterrupted progress; that walk parallel to, and close under the house, would be a raised platform or terrace, to give elevation and dignity to the house, to give the master a commanding view of the garden, and to serve as a connecting link between art and comparative nature.

By leaving open plots or squares of turf in the areas, formed by intersecting rows of trees, a free circulation of air would be facilitated; and the same object, as

---

* The Persians do not walk in gardens so much as we do, but content themselves with a bare prospect, and breathing the fresh air. For this reason, they set themselves down in some part of the garden at their first coming in, and never move from their seats till they are going out of it." Chardin's Travels, ch. vi.

† "Nothing surprises the people of the East Indies so much, as to see Europeans take pleasure in exercise. They are astonished to see people walk who might sit still." Kingsley's Letters from the East Indies, p. 182.

‡ "Before the end of May, the whole country round Aleppo puts on so parched and barren an aspect, that one would scarcely think it capable of producing any thing but the very few plants which still have vigour enough to resist the extreme heat." Rusell's Aleppo, p. 13.
as well as the gardens within and without its walls, which she particularly desired. The air in that elevated region would be more cool than below; the noise and bustle of the city would cease to be offensive; the whole would be more exposed to breezes and winds; and we cannot help fancying, that so much enjoyment in so singular and elevated a situation, would produce in the mind an impression of sublimity. But a faint idea of these gardens will be excited, by imagining the quadrangle of Somerset House crowned with a portion of Kensington garden; or the summer garden of the palace placed over the Kremlin in Moscow. How and with what propriety the eastern style came afterwards to be adopted in Greece, Italy, France, and finally in England, is our next inquiry. The principle or instinct of imitation, would be the first cause why the more distant nations, whether colonies from the cast, or returning travellers or conquerors, adopted this parent style. This is so obvious, as to require no comment beyond what will be furnished by individual inquiry into our earliest tastes, habits, and predilections in dress, amusements, furniture, and other matters of common life. The next principle is that of use or fitness, which would vary in application, proportionally to the distance and different circumstances of the imitating country. Thus it would not exactly apply in Greece or Italy, where the climate was more temperate, active exercise more congenial, and the habits of the wealthy for a long time at least comparatively frugal. Add to this, that verdant landscapes, shade, breezes, rills, waterfalls, and lakes, with their sound and murmurs, singing birds, reflections of objects, were more liberally distributed over the face of general nature. The more active character of man in such countries, would in time also appropriate to their use from this natural abundance, a greater variety of fruits and legumes.

We know little of the private gardening of the Greeks, but a very slight attention to this difference of circumstances, will enable us to account for the character assumed by the eastern style under the ancient Romans. The necessarily different culture required for perfecting fruits and culinary vegetables would give rise to the orchard and kitchen garden. This would simplify the objects of the ornamental garden, which would thus exhibit less a collection of natural beauties, than the display of art, the convenience of taking exercise, here a pleasure rather than a fatigue, and the gratifications of shade, cool breezes, and aromatic odours. A prospect of the surrounding country was desired, because it was beautiful; and where, from various circumstances, it was interrupted by the garden or its boundary fence, mounds or hills of earth were raised, and in time prospect-towers appended to the houses. Greater extent would be required for more athletic recreations, and would be indulged in also by the wealth and pride of the owner for obvious reasons. Abridgement of labour would suggest the use of the sheers, rather than the more tardy pruning knife in thickening a row of trees. A row of low trees so thickened, would suggest the idea of a row of clipped shrubs. Hence at first hedges; and subsequently, when art and expense had exhausted every beauty, and when the taste had become tired of repetition, verdant sculpture would be invented, as affording novel, curious, and fantastic beauty, bordering, as do all extremes, upon absurdity. A more extended and absolute appropriation of territory, than what we may suppose to have taken place in the comparatively sterile country of the east, would lead to agricultural pursuits, and these again would give rise to the various arrangements of a Roman country residence which we know to have existed, and which it would be superfluous to describe. Various other circumstances might be added; but enough has been stated to shew, that the gardening of the Romans was perfectly natural to them, under the circumstances in which they were placed; it suited their wants, and produced scenes, which they found to be beautiful, and was therefore in the justest taste. To have imitated the scenery of nature, or studied picturesque beauty in a garden, would have been merely adding a drop to the ocean of beauties which surrounded them. Expenditure incurred for this purpose could never have procured applause to the owner, since the more like nature the production, the less would it excite notice. All that was left for man to do, therefore, was to create those beauties of art, convenience and magnificence, which mark out his dwelling place, and gratify his pride and taste by their contrast with surrounding nature.

The gardening of the Romans was copied in France and Britain, with little variations, beyond those dictated by necessity and the difference of climate. It was found to be perfectly beautiful and agreeable; and would have continued to prevail, had Britain continued in similar circumstances to those in which she was in at the time of its introduction. But such has been the progress of improvement in this country, that the general face of nature became as it were an ancient garden, and every estate was lined out, bounded, and subdivided, by stripes of wood, rows of trees, canals, ponds, walls, and hedges. The credit or distinction to be obtained here, by continuing to employ the ancient style, could be no greater than what the Romans would have obtained by imitating nature. In their case all the country was one scene of uncultivated, in ours it was one scene of cultivated, beauty. In this state of things the modern style was adopted, not solely from a wish to imitate the gardening of the Chinese, or a high degree of refinement in taste, but from the steady operation of the same motives which produced and continued the ancient style—a desire of distinction. The Chinese style, if introduced, would never have become purified, or ended in our simple style, had England remained an open country like France or Italy, or a thickly wooded one like Poland or America. On this principle it may be affirmed, that the English style cannot please in these countries, otherwise than from its novelty, or as giving rise to certain associations with the people, whose name it bears. What delight or distinction can be produced by the English style in Poland; for example, where the whole country is one forest, and the cultivated spots only so many open glades, with the most irregular and picturesque boundaries? But let a proprietor there dispose of the scenery around his residence in the Roman or French manner; let him display a fruit or kitchen garden, bounded by high stone walls; a farm subdivided by clipped hedges and ditches, and a pleasure ground of avenues, stars, circles, fountains, statues, temples, and prospect towers, and he will gratify every spectator. The view of so much art, industry, and magnificence, amid so much wild and rude scenery, awake so many social ideas of comfort and happiness, and so much admiration at the wealth and skill employed, that a mind of the greatest refinement, and the justest taste, would feel the highest sensation of pleasure, and approve as much of such a country residence in the wilds of Poland or America, as he would of the most natural and picturesque residence of England, amid its highly artificial scenery.
We trust we have said enough to prove, that every style of gardening must be considered relatively to the state of society, and of the country where it is employed; and that the ancient and modern styles, viewed in this light, are each perfectly natural, and equally meriting adoption, according to relative circumstances; less than from any positive beauty, or advantages of either manner. We are consequently of opinion, that the ancient style, divested of some ingredients which relate to warm climates, and purified from the extravagances of extremes in decoration, would be in much better taste in some situations in the Highlands of Scotland, and the south of Ireland, than the modern style; and that this style cannot, for a long series of years, afford any other satisfaction on the continent, than what arises from the temporary interest of novelty and accidental association. It may never be altogether lost sight of, in subsequent arrangements; but whenever the influence of fashion has subsided, the beauties of the ancient style will be desired, as fulfilling better the objects in view, till landed property, in these countries, becomes enclosed, subdivided, and cultivated, as it is in England.

Part of the prevailing antipathy to the ancient style, proceeds from a generally entertained idea, that the modern is an improvement on it; but the truth is, the two styles are as essentially and entirely different in principle, as painting and architecture, the one being an imitative, and the other an inventive art.

Landscape gardening agrees with ancient gardening in no other circumstance, than as employing the same materials. It is an imitative art like painting or poetry, and is governed by the same laws. The ancient style is an inventive and mixed art, like architecture, and governed by the same principles. The beauties which architecture and geometric gardening aimed at, were those of art and utility, in which art was every where avowed. The modern style of gardening, and the arts of poetry and painting imitate nature; and, in doing so, the art employed is studiously concealed. Those arts, therefore, can never be compared, whose means are so different; and to say that landscape gardening is an improvement on geometric gardening, is a similar misapplication of language, as to say that a lawn is an improvement of a corn-field, because it is substituted in its place. It is absurd, therefore, to despise the ancient style, because it has not the same beauties as the modern, to which it never aspired. It has beauties of a different kind, equally perfect in their kind as those of the modern style. The question therefore is not, whether we shall admit occasional specimens of obsolete gardening, for the sake of antiquity, but whether we shall admit specimens of a different style, from that in general use, but equally perfect in its kind. If we have extended this chapter to a length that may seem uncalled for in a work of this kind, we are not, as we think, without weighty arguments in our justification. The disgust excited in men of taste, first by the excess of buildings, which distinguished our imitations of the Chinese style, and subsequently by the tame insipidity of that of Brown and his followers, which nothing but their novelty, and the overcoming force of fashion could render tolerable, has given rise to a number of critical works on the subject, of great merit and taste. These, especially the writings of Mr. Price, have been very generally circulated; and while they have produced a salutary scepticism in the minds of the patrons of art, have excited, in almost every description of artists, such an indiscriminate and exclusive admiration of the picturesque, as is scarcely compatible with admitting that there is any other species of beauty, or any occasion in matters of taste, for the assistance of good sense. The retired country gentleman, puzzled with so many different opinions, is thus deterred from improving, lest he expose himself to the critical severities of a picturesque traveller, or to the ridicule of the common sense of his neighbours.

The historical view we have now given, points out the picturesque as only one beauty among a number; and though of a superior class, yet not to be adopted indiscriminately or exclusively. Another motive with us has been, to expose and root out if possible, the strong and most unphilosophical opinions which are entertained of the ancient style, by shewing, that they are founded in prejudice and a limited view of the subject. Proprietors we know to be frequently deterred from the improvement of their seats, because to do so in such a way as to obtain the approbation of the popular taste, the first step would be, to remove certain terraces, avenues, and other remains of the ancient style, which they justly venerate. A third reason is, to prevent our forming erroneous expectations of our continental neighbours on the subject of English gardening. It is almost the universal practice at present, to criticise the gardens of the continent, with a reference to general nature, or the English style, and thus to condemn the whole of them as absurd and in bad taste. We have, we think, shewn, that the contrary is true, and that the imitation of the English style in many parts of the continent, displays a worse taste than the continuation of the ancient system of improvement. A fourth reason is, to account for the share of attention which we mean to bestow on the ancient style in the succeeding chapters of this article; convinced as we are, that it merits occasional adoption in this country. If what we have submitted has the intended effect, the result will be a greater harmony of opinion among artists and professors, greater decision of judgment in matters of taste among country gentlemen, and more liberal views towards our continental neighbours.

CHAP. II.

OF THE OBJECTS OF GARDENING, AND OF THE PRINCIPLES BY WHICH THESE OBJECTS ARE ATTAINED.

From the remarks in the preceding chapter, the object of reader will be prepared to include under the objects of gardening, as a generic term, all the various purposes, useful as well as ornamental, of a country residence: as Gardens and buildings. (Lord Kames observes,) may be destined for use solely, for beauty, solely, or for both. Such variety of destination, bestows upon these arts a great command of beauties, complex not less than various. Hence the difficulty of forming an accurate taste in gardening, and architecture; and hence, that difference or wavering of taste in these arts, greater than in any art that has but a single destination." (Elements of Criticism, 4th edit. vol. ii. 431.) Not to consider the subject with a view to these different beauties, but to treat it merely as the art of creating landscapes," would thus embrace only a small part of the art of laying out grounds, and leave incomplete a subject which contributes to the immediate comfort and happiness of a great body of the enlightened and opulent in this and in every country; — an art.
The ancient authors on architecture and gardening, have rarely attempted to lay down any general principles of composition. Vitruvius hints obscurely, that the different parts of buildings, should bear some proportion among themselves, like that which subsists between the different members of the human body; that the quantities constituting the magnitudes of temples, should have certain ratios to one another, and he lays down canons for the individual proportions, and collective arrangement of the columns of the different orders. These however, are not principles, but mechanical rules formed on very limited associations. The same remarks will apply to the directions respecting the walks, walls, hedges, and borders of the ancient style, laid down by D'Argenville, Clarici, and Switzer. It is in the writings of modern authors therefore, and chiefly from the enlightened investigations of Mr. Alison, that we are to draw our information as to the principles by which the artists of the ancient style were instinctively guided in their productions.

With respect to the modern style, considered as including what belongs to the conveniences of a country residence, as well as the art of creating landscapes, Pope has included the principles under, 1. The study and display of natural beauties. 2. The concealment of defects: and, 3. Never to lose sight of common sense.

Wheatley concurs in these principles, stating the business of a gardener to be "to select and to apply whatever is great, elegant, or characteristic" in the scenery of nature or art; "to discover and to shew all the advantages of the place upon which he is employed; to supply its defects, to correct its faults, and to improve its beauties." Mr. Repton, whose works on landscape gardening bear on the title pages, "written with a view to establish fixed principles in these arts," enumerates congruity, utility, order, symmetry, scale, proportion, and appropriation, "if," as he observes in one place, "there are any principles." Mr. G. Mason places the secret of the art in the "nice distinction between contrast and incongruity." Mason, the poet, invokes "simplicity," probably intending that this beauty should distinguish the English from the Chinese style; simplicity is also the ruling principle of Lord Kames; Girardin includes every beauty under "truth and nature," and every rule under the unity of the whole, and the connection of the parts; and Shenstone states "landscape, or picturesque gardening," to "consist in pleasing the imagination by scenes of grandeur, beauty, and variety. Convenience merely has no share here; any further than as it pleases the imagination." Congruity and the principles of painting, are those of Mr. Price and of Mr. Knight. From these different theories, as well as from the general objects or end of gardening, there appear to be two principles which enter into its composition, those which regard it as a mixed art, or an art of design, and which are called the principles of relative beauty; and those which regard it as an imitative art, and are called the principles of natural or universal beauty. The ancient or geometric gardening, is guided wholly by the former principles; landscape gardening, as an imitative art, wholly by the latter; but as the art of forming a country residence, its arrangements are influenced by both principles. In conformity with these ideas, and with our plan of including both styles under the generic term gardening, we shall first consider its principles as an inventive or mixed, and secondly, as an imitative art.

SECT. I. Of the Beauties of Gardening as an inventive and mixed art, and of the principles of their Production.

Works of art, Mr. Alison observes, may be considered, either in relation to their design or intention—to the nature of their construction for the intended purpose—or to the nature of the end they are destined to serve; and their beauty accordingly will depend, either upon the excellence or wisdom of the design, the fitness or propriety of the construction, or the utility of the end. The considerations of design, of fitness, and of utility, therefore, may be considered as the three great sources of the beauties of works of inventive art. They have been called relative beauties, in opposition to those of native and imitative art, which are hence denominated natural or independent beauties. There is a third source of beauty common both to arts of invention and imitation, which is that of accidental beauty, or such as is produced by local, arbitrary, or temporary associations. The beauties of objects, whether natural, relative, or accidental, are conveyed to the senses by the different qualities of matter, sounds, colours, smells, forms, and motion; but form is the grand characteristic of matter, and constitutes in a great degree its essence to our senses. In our remarks, therefore, on the beauties of inventive art, we shall chiefly consider design, fitness, and utility, in regard to form.

The expression of design is displayed by such forms of design, and dispositions, as shall at once point out that they are works of art. Thus regularity and uniformity are recognised in the rudest works of man, and point out his employment of art and expense in their construction. Hence the lines, surfaces, and forms of geometric gardening should be different, and in some degree opposed to those of general nature. Irregular surfaces, lines, or forms, may be equally useful, alike works of art, and, considered with reference to other beauties, may be more agreeable than such as are regular; but, if too prevalent, they might be mistaken for the production of nature, in which case they would lose the beauty of design; "but forms perfectly regular, and divisions completely uniform, immediately excite the belief of design, and, with this belief, all the admiration which follows the employment of skill and expense." Ground in level or regular slopes, or in hills or hollows of symmetrical shapes, woods of right lined boundaries; trees, and especially such as are foreign to the soil, planted equidistantly in masses, in quincunx, or in straight rows; water in architectural basins, regular canals, or fountains; walks, and woods, of uniform width and perfectly straight, straight walls and hedges, are easily distinguished from nature's management of these materials, and are highly expressive of the hand of man.

Another reason why regular forms are satisfactory, Mr. Stewart (Philosophical Essays, 238.), derives from the principle of a sufficient reason, adopted by Leibnitz, "What is it, that in any thing which is merely ornamental, and which at the same time does not profess to be an imitation of nature, renders irregular forms displeasing? Is it not, at least in part, that irregularities are infinite; and that no circumstance can be imagined which should have decided the choice of the artist in favour of that particular figure which he has selected? The variety of regular figures (it must be
acknowledged) is infinite also; but supposing the choice to be once fixed about the number of sides, no apparent caprice of the artist in adjusting their relative proportions, prevents a disagreeable and explicable puzzle to the spectator.

In the progress of the arts, the expression of design, though at first difficult, becomes afterwards easy, and renders regularity and uniformity only expressive of common design. Hence, to confer a character of superiority in works of design, variety would be introduced; and as uniformity was the sign of design, so uniformity and variety would become the 'sign of improved or embellished design. "Considering, therefore, forms in this light as beautiful, merely from their expression of design, the observation of Dr. Hutcheson may perhaps be considered as an axiom with regard to their beauty, viz. That where the uniformity is equal, the beauty of forms is in proportion to their variety; and when their variety is equal, their beauty is in proportion to their uniformity." (Alison's Essays, p. 106.)

To this stage, in the progress of design, may be referred the architectural ornaments introduced in garden scenery, such as seats, obelisks, statues, urns, &c., and in the later stages of the art, serpentine walks, labyrinths, verdant sculpture, and many other improvements. The variety and embellishment thus conferred on the arts, produced in many abundant luxuries that we would not wish to see resorted to with a revival of the ancient style, unless in examples considered solely with a view to imitation.* The sculpture of trees, however, might, when first introduced, be greatly admired, even by men of sense, for its novelty, and the discovery of a certain degree of skill in the artist; but as, in our times, they would neither be new or meritorious, they could scarcely be consistently introduced with a view to embellish design.

To prevent variety from degenerating into confusion, and, as Mr. Stewart characteristically expresses it, "puzzle the spectator," unity of intention must never be lost sight of. This, indeed, is necessarily implied in every work of art, since, without it, the slightest attempt at design would only end in a chaos of materials. Fitness. Hence, or the proper adaptation of means to an end, is the second source of the relative beauty of forms. Considered in relation to the parts of a building, it is generally denominated proportion, and refers to the adequate strength of certain parts to bear certain weights, &c. In the detail of the ancient, and in scenes of relative beauty in the modern style of gardening, it relates to the magnitude and situations of buildings, and other artificial objects, relative to natural ones—to the extent of the different scenes or constituent parts of a residence, compared to the whole—to the propriety and congruity of certain objects as ornaments—and, in general, to the adequacy of means to an end, whatever these means or that end may be.

Utility. Utility is the third source of the relative beauty of forms. None of the other beauties will compensate for the entire want of utility in any scene of architecture or gardening. Objects at first thought beautiful, soon lose this expression when they are found to be of no use; and others, with first impressions the most disagreeable, are felt to become beautiful as they are known to be useful. "This species of beauty," Mr. Alison observes, "is in itself productive of a much weaker emotion than that which arises from the different sources of ornamental beauty; but it is of a more constant and permanent kind, and much more uniformly fitted to excite the admiration of mankind." (Essays on Taste, vol. ii. p. 201.) "To unite these different kinds of beauty; to dignify ornamental forms also by use; and to raise merely useful forms into beauty, is the great object of ambition among every class of artists. Wherever both these objects can be attained, the greatest possible beauty that form can receive will be produced. But as this can very seldom be the case, the following rules seem immediately to present themselves for the direction of the artist:

1. That where the utility of forms is equal, that will be the most beautiful to which the most pleasing expression of form is given.

2. That where those expressions are at variance; when the beauty of the form cannot be produced without sacrificing its utility; that form will be most universally and most permanently beautiful, in which the expression of utility is most fully preserved. Essays, vol. ii. p. 202.

Of the various modifications of utility, as applied to country residences, may be here enumerated.

For the purpose of habitation, for example, good air and water, a genial climate, fertile soil, cheerful prospect, and suitable neighbourhood, &c. are known requisites.

Convenience must be joined to use, comforts to conveniences, and luxuries to comforts. Exercise, whether in the shape of walking, riding, or driving, requires to be provided for; and recreation, whether in the common field sports, athletic games, or in botanical, agricultural, and other useful, elegant, or scientific pursuits, must be kept in view; rural seats and amusements might also be enumerated.

Accidental associations form the last class of relative beauties, and are "such associations as, instead of being common to all mankind, are peculiar to the individual." (Stewart's Essays.) Among these may be reckoned,

1. Classical and historical associations. The influence of the former in architecture is well known; the latter often adds charms to a spot, in no respect remarkable to those who are unacquainted with its history. Classical associations, Mr. Stewart observes, "have added immensely to our natural resources, but, at the same time, warped our taste in various instances," acquiring, as Mr. Alison adds, "a superiority over the more permanent principles of beauty, and determining for a time the taste of nations."

2. National associations are also frequently at variance with such as are universal, and have perhaps greater influence than any other associations whatever. (Stewart's Essays.)

3. Personal associations, or such as arise from the accidental style of natural beauties, to which we have been accustomed in our youth. Many particulars come under this head, which it would be tedious to enumerate; but one mode of vanity and selfish feeling deserves particular notice, as intimately connected with the business of the landscape gardener. It is that in-

* As at a cottage and garden in the style of Henry the VIII.'s time, formed at Woburn by his Grace the Duke of Bedford, in which clipped yews are very properly introduced to complete the illusion.
The chief object of all the imitative arts is the production of natural or universal beauty. Music, poetry, and painting, are the principal imitative arts; to these has been lately added landscape gardening, an art which has for its object the production of landscapes by combinations of the actual materials of nature, as landscape painting has for its object their imitation by combinations of colours. Landscape gardening has been said "to realise whatever the fancy of the painter has imagined," (Girardin); and "to create a scenery more pure, more harmonious, and more expressive, than any that is to be found in nature herself," (Alison.) Such are Mr. Alison's ideas of the powers of this art; and such appear in some degree, to have been those of Mr. Wheatley and M. Girardin. A more correct idea of its capacities, in our opinion, is suggested by the remark of Lord Walpole, when he represents it as "proud of no other art than that of softening nature's harshnesses, and copying her graceful touch." It has also been said, that it is "to poetry and painting, what the reality is to the representation," (Girardin.) But experience proves, that the former (the reality) is always exceeded by the latter, both in respect to natural and picturesque beauty; and this reality is supposed to exceed any representation, if it is a scene of gardening, that is, if it is any given variety of ground, rocks, and distance, as the basis to be furnished with wood, water, and buildings; the rocks shewn, or concealed, as the gardener may wish, or as the genius of the place may require, and every other purpose effected, which is in the power of gardening to perform; When all this is done, it will be a scene greatly inferior in beauty, not only to the imitative creation of a painter from the same ground work and materials, but to a similar scene produced by nature. To put this matter in a clear light, let their be a natural landscape, either of mediocrity or of any given beauty, with every circumstance so arranged, as to be alike suitable for both arts; and let a painter and a gardener, each attempt to copy it according to their art, with or without permission to imitate the beauties. Which of the two imitations would be most beautiful, considered in the abstract, and without reference to any selfish or arbitrary association? Decidedly, in our opinion, the production of the painter.

The great source of the beauty of every verdant landscape is wood; and so much of the beauty of all woods depends on accidental circumstances, in their progress from the time of planting, till they attain a considerable age, and which circumstances cannot be said practically to be under the control of the gardener, that however high our aim, however we may study the natural effects of time, and however correctly we may imitate them, at the end of all our labours any wood of art will always be far inferior to a wood of nature under the same circumstances. For further illustrations we have only to appeal to such painters as have made landscape their particular study, and who certainly must be considered in this case as the best judges.

To what kind, or degree of beauty then, can landscape gardening aspire? To this we answer, that, abstracted from all relations of utility and design, it can seldom succeed in producing any thing higher than picturesque beauty, or such a harmonious mixture of
LANDSCAPE GARDENING.

forms, colours, lights, and shades, as will be grateful to the sight of men in general; and to such, more particularly, as have made this beauty in some degree their study. This harmonious assemblage of objects may be grateful and agreeable, without being accompanied by any, or at all events by much general expression; for example, of gaiety, melancholy, grandeur, simplicity, or elegance; but it may also combine one or more of these poetic or general beauties in a high degree, and this, too, with or without being picturesque. It may recall many other pleasurable emotions, if we admit the considerations of fitness, novelty, or its contrast to surrounding scenery, and utility, or the adaptation of its objects.

Such is our opinion of the capacities of landscape gardening. If it is lower than that of some authors and artists, we can only say, that it has been formed from the observation and experience of what actually takes place. The artist may and ought to aim at the highest degree of beauty, which his own imagination, the genius of the place, and the views of the owner will admit of; but let him not proceed with, or hold out to the world, mistaken views of what his art can and cannot perform.

From this view of the powers of art, it will be sufficiently obvious, that with Price, Girardin, Knight, and other authors, we consider the principles of painting to be those of landscape gardening, in what view of this term which limits it to "the art of creating landscapes of picturesque beauty, and in viewing it as adding to picturesque beauty, some other natural expression, as of grandeur, decay, melancholy, &c. we consider it, with Pope, Warton, Gray, and Eustace, as requiring the aid of poetic mind; that is, of a mind conversant in all these different emotions, or pleasures of imagination, which are called up by certain signs of affecting or interesting qualities, furnished by sounds, motion, buildings, and other objects.

If, taking a third view of landscape gardening, as "the art of laying out the grounds of a country residence," then, with popular opinion, we comprehend under the term all the above beauties, with those of relative beauty, the principles of which have been the subject of the preceding section.

The principles of landscape gardening then, as an imitative art, we conclude to be derived from nature.

1. As developed by the principles of landscape painting; and,

2. As recognised by poetic mind, or a mind alive to those general beauties or associations universally felt.

We consider this, perhaps to many, a tedious development of the principles of landscape gardening, called for by the vague and indefinite manner in which they are spoken of by authors, no less than by artists; and, as a proof of this, we refer our readers to the volumes of Mr. Repton, of whose practical taste, in many instances, we highly approve.

We shall attempt, as a proof of our theory, a slight analysis of the principles of a composition, expressive of picturesque and natural beauty. For this purpose it is a matter of indifference, as far as respects picturesque beauty, whether we choose a real or painted landscape; but, as we mean also to investigate its poetic, or general beauty, we shall prefer a reality. We choose then a perfect flat, varied by wood, say elms, with a piece of water, and a high wall, forming the angle of a ruined building; it is animated by cows and sheep; its expression is that of melancholy grandeur; and, independently of this beauty, it is picturesque, that is, if painted it would form a tolerable picture.

1. The first obvious principle which pervades this, Unity, or any beautiful or expressive view, is a certain degree of unity in its expression. No ideas of gaiety or prettiness are excited by this scene. All the parts unite in forming a whole, which the eye can comprehend at once, and examine without distraction. "La vue," says M. Girardin, "le plus vagabond de tous les ens, un besoin d'être fixe pour jouir avec plaisir et sans lassitude." Were this principle not prevalent, the groups of trees, the lake, and the building, would only please when considered separately, and the result would be as poor a production as a machine, the wheels of which are accurately finished, and nicely polished, but which do not act in concert so as to effect the intended movement.

2. It is true to nature; that is, the objects or materials are what they appear to be. The trees (which are neither very old, nor very young,) though in the distance diminished by their remote situation, we discover by their trunks and contour, to be still trees. They are not shrubs placed near the eye, with a view to produce a false perspective; nor is the fragment of building merely a disguised wall, because it has openings which have once been windows, and is crowned in one part by battlements. The water is natural, its surface being below the level of the adjoining ground, not raised above it, as is often the case in artificial waters. This completes the truth or reality of the scene.

The necessity of adhering to truth, is still greater in painting, in which all objects must appear to be natural, not only in forms and colour, but also relatively to the forms and colours around them. Objects, especially those whose forms and dimensions are familiar to us, as men or horses, painted of different heights in the same plane, as for example in the distance, of the magnitude they appear in the foreground, would, from the acquired habit of measuring unknown, by known objects, give a falsehood to the scene, and appear as animals of a different species, or as monsters.

It seems to be from the same principles of being true to nature, that a gradation of scene, or what is called distance is required, or at least is so satisfactory in landscape. The mind, after being impressed with the effect of a whole, delights in examining its parts in succession; the more simple and obvious the arrangement of these parts, therefore, the more readily does the mind acquiesce in their effect. The eye of the artist, seizing on the nearest and most remote parts of a scene, readily marks an intermediate or middle distance; no given extent seems necessary for this purpose:

"To make the landscape grateful to the sight,
Three points of distance always should unite;
And however the view may be confined,
Three marked divisions we shall always find."  

The Landscape, by R. P. Kneott.

3. Having been pleased with the impression of this component part of nature, and having satisfied ourselves that its component parts are individually natural, let us, in the next place, observe their disposition, or how in this respect they coexist in forming a whole. As to forms, we find that their distinction is in groups or masses. The largest group, for example, is placed towards one side of the picture in the foreground, another towards the opposite side of the middle distance, including the building and adjoining lake; and the remote, or third distance, consists of a low line of wood, with projecting groups or masses. As to colours, we find only
different shades of yellow and green on the trees and ground. As to the light, we find one large and principal light near the middle of the view, diverging into shade as it approaches the sides; the clearest part is the water, and the next clearest the building, and the third light spreads over a broad space of ground, near the water. The groups in the foreground, are all in a deep shadow. One of these, near the water, partakes of the principal light, and those in the third distance are distinguished by a sort of neutralization of light, colour, and shade. Such is the disposition of the groups or parts, in order, in a complex view of the whole, to fix the eye, and prevent it from being distracted by scattered lights, confusion of forms, and inharmonious colours.

4. We shall next remark the connection which subsists between these different groups. 1. They are connected in each distance by a real nearness of situation; and, 2. In the view as a whole, from the one group coming in part before the other, as to produce connection by progression. Suppose the trees to be the case, and that the groups were unconnected either by real or apparent distance of situation, the consequence would be, that each group being surrounded by light, would become a distinct object. The eye would have no resting place, and the assemblage would compose a whole.

5. What comes next to be examined, is the relation which subsists between the parts composing each individual group. 1. In regard to the form of the parts of each group, as they are all groups of the same sort of tree, we find one elementary form prevalent, but differing in magnitude, and in combination, by their contrasted disposition, to such a degree, that each group differs in form from the others, without at the same time being of opposite forms.

2. In regard to colour, the same kind of colour prevails in each and in all of the groups, but is varied in degree by the same contrasted disposition. In some parts a yellowish green prevails, in others a greenish yellow, in others a russet or red green, and occasionally a bright green, as on that part of the turf where the light strikes with the greatest force.

3. In regard to light and shade, those parts of the groups which rise above the horizon, and are backed by the sky, are dark, and generally darker than such as are backed by the ground, or by other adjoining groups. The prominent parts of each group, are lighter than the retiring parts or recesses among the spray and leaves. These prominent and retiring parts, in the near groups, are very numerous; in the distance they are lost in the general aerial shade of the group. It may be observed as a general principle, that trees, from their rough surface, and consequent imperfect reflection of light, are always comparatively darker than water, buildings, or ground. In creating real landscape, they serve in some measure as shades, as the other materials mentioned serve as lights.

We have said nothing of the sky, the cows, and sheep. Suppose, then, in order to complete this sketch, that we represent the sky as merely grey and cloudy, and the cattle and sheep grouped in the middle distance, what will be the expression of the view? We think it would express very little to general observers; but there being nothing glaringly offensive in the arrangement, it would be expressive of some beauty to him who had bestowed some attention to the subject of landscapes; for, though it exhibits but little harmony of forms and colours, light or shade, it still possesses enough of these ingredients to render it worth looking at as a picturesque view.

It remains to account for the general or natural expression of melancholy and grandeur. For this purpose let the building be the ruins of an ancient castle, whose lofty quadrangular form may be readily imagined from the walls we mentioned, as composing the ruined building.

The character of grandeur, then, is not in this instance communicable to the picture, by the picturesque effect of the walls, which have no variety of form, light, or shade, in themselves, but by the mental associations to which they give rise in a cultivated mind.

It will not be supposed from this, that we mean to recommend the introduction of artificial ruins in improved scenes, we have merely made choice of this expression, as very obviously pointing out the distinction between picturesque and poetic or general beauty. We shall add a few other examples.

1. Imagine the cattle and sheep removed, the surface of the ground covered by smoothly mown turf, and the luxuriant branches of some of the fore ground, nearly reclining on the ground. The first expression would be that of beautiful, or elegant picturesque; the next that of stillness, and conseration to man,—stillness, as being without animals, or moving objects; and consecration to man, from the mown surface, greatly heightened by the circumstance of the branches of trees reclining on the ground, which never can happen where sheep or cattle are admitted, and which forms the leading visible distinction between a group of trees in a park, and a group on a mown lawn. It is not from the smoothness of the turf, or any particular mixture of light and shade in the reclining branches, that this expression is produced, but from reflecting on the cause of this appearance.

2. Imagine, instead of the smooth turf, uncouth rough ground, covered in some places with furze, briars, brambles, and tangled thickets; the water fringed with rushes, and partially concealed by aquatic shrubs; and wild horses and deer forming the animated part of the scene. The expression would be eminently picturesque; but there would also be an expression of wildness, not resulting from the picturesque qualities as such, but from mental reflection on the difference between this scene and one of cultivation.

3. Imagine the view deprived of the lake and the building, and consisting only of the wood and ground, with the heads of a straggling row of willow trees appearing in the middle distance, and the sound of a distant waterfall heard through the trees. Here to picturesque beauty we have an idea of water—of an immense body of it in the lake or river which supplies the waterfall—and of the rocks, which oppose their powerful obstruction to a body of water. The reader will here remark, how much of the sublime beauty of this scene depends on sound, which can never be included under picturesque beauty. The leading expression is that of sublimity, accompanied by various associations of dignity produced by the rocks, and of grandeur suggested by the stream, after the waters have renewed their tranquil course, and rolling, as we may imagine, majestically along under the shade of the line of willow trees.

Other examples of a more striking nature might be adduced; but these instances we consider sufficient to shew the difference between a composition merely picturesque, and one expressive of general or natural beauty, and to prove our position, that both poetry and
painting enter into the principles of landscape gardening.

They will also show, how very little the production of natural beauty is within the power of the landscape gardener. He may display it to more advantage. In the first example of expression, for instance, the building, or such parts of it as more obviously show its real character, might be displayed by the removal of some over obtruding branches; and in the second, a garden seat, and some garden trees, as the lime, elder, &c., might add to the idea of consecration to man. In the third, a corn field or a barn in the distance, would aid the effect by contrast; and in the last, a bridge would determine the situation and reality of the river. But to attempt effecting these expressions by building a ruin, placing a garden seat in a paddock, or erecting a bridge where there was no water, would, however common in the infancy of the art, be now justly considered ridiculous.

But much more might be done in improving the picturesque beauty of each of these scenes, provided the trees were already grown to maturity, and too numerous rather than too few; but if these trees are yet to plant, it is evident that only the ground plans of the masses and groups of trees, and of the breadth of the lawn, could be formed by the artist. But in doing this, he will still be guided by the principles laid down. To illustrate the application of which, both in forming infant and improving mature scenes, is the business of our succeeding chapters.

CHAP. III.

Of the Materials of Gardening.

Whatever style of gardening we adopt, the materials with which we work in order to obtain the desired effect, are the same. Those of nature, are ground, wood, water, and rocks; to these, art has added buildings; roads, walks, fences, and animated or moving objects, sounds, &c. may be considered as accompaniments.

Sect. I. Of Ground.

The operations of art on this ponderous material, are necessarily of a very limited description. The most extensive and costly operations, to restore or create natural surfaces, even when attended with the desired effect, afford less gratification to personal feeling than most other improvements. If a large space, naturally or artificially deformed, has been restored to natural beauty, we are delighted with the effect, whilst we recollect the difference between the present and the former surface; but when this is forgotten, though the beauty remains, the credit for having produced it is lost. In this respect, the operations on ground under the ancient style, have a great and striking advantage; for an absolute perfection is to be attained in the formation of geometrical forms, and the beauty created is so entirely artificial, as never to admit a doubt of its origin. Long, therefore, after the improvement is finished, the credit and the beauty remain to gratify and charm the owner. Improvements on surfaces, whatever be their object, ought to be made in scenes which are near the eye, or intended to be frequently seen; at a distance, they are lost if the effect be on a small scale, and often better effected by wood, if on one of considerable magnitude. All operations on ground may be included under, 1. Those which have for their object the beauty of art or design; and 2. Those where natural beauty is intended to be produced.

1. Operations with a view to relative or artificial beauty.—The forms in use for this purpose are few and simple. They originate in, and are influenced by those of the house; and are, for the greater part, bounded by right lines; and the surfaces are levels or slopes of different degrees of abruptness. The magnitude as well as form of each of the figures in the ground immediately adjoining a house, or in a detached walled enclosure, should be regulated chiefly by the magnitude of the mansion, or extent and grandeur of the whole place, though they are often obliged to conform, in some degree, to the natural surface. When the ground slopes from the house in all directions, narrow parallelograms will be the prevailing forms both of the levels and slopes, the broadest level, and greatest perpendicular depth of slope, being placed next the house, and the next broadest level, &c. in succession, till, after three or four levels, and as many slopes are obtained, the artificial surface shall finally blend with the natural, unless, as is frequently the case in the geometrical style, a kitchen garden, or some similar scene of art, is joined to it. In this case, separation by some architectural or other accompaniment, will, by forming a break in the order of forms, admit of adopting, in continuation of the artificial surface, such levels and slopes as the character of the scene may require, or a due regard to economy dictate. When the mansion, or scene of operations, is on a surface naturally flat, the levels will be of greater dimensions, the slopes smaller, and both forms fewer in number. But though parallelograms are the common figures employed, sections of polygons, trapeziums, circles, and curvilinear figures, are frequently admitted. They are used in architectural elevations, and in fortifications, which are the prototypes of this part of ancient gardening; and, therefore, when apparent in the mansion, should be reflected, as it were, by the grounds.

The forms to be used, however, is a matter easy to determine. The problem is difficult to arrange them together, so that they may concur in producing a whole or a good effect. In disposing, connecting, relating, and contrasting them for this purpose, the artist will preserve regularity and uniformity in the complex view of the whole, varying and harmonizing the detail according to the degree of beauty and variety he intends to produce. If he has duly prepared his mind by theoretical studies, and practised architectural and landscape drawing, his own feelings will suggest when he has attained the desired effect; for the models of artificial surfaces, which remain of ancient gardens, are poor productions compared to what might be created in this way, through the judicious application of the principles of relative beauty. See Terrace in the succeeding chapter.

2. Natural beauty of ground. As the right lines and geometrical forms of the architect, take the lead in grounds of artificial beauty, so the flowing and broken lines, and undefined forms of the landscape painter, take the lead in those of natural beauty. To create them in ground, is generally impracticable and unadvisable; but where they exist concealed by accidental deformities, or incomplete in expression, through fullness in their leading features, art may relieve them from the impediments to beauty, even though the situation is some distance from the eye. In reclusive scenes immediately under view, art may aspire to create beauty even from.
LANDSCAPE GARDENING.

Of the Materials of Gardening. (Ground.

... but especially from its opposite, a flat abounding with deformities. In effecting all those purposes, the same principles apply. The first thing to fix in the mind is the desired surface, or that style of natural ground which is best to be imitated. The next thing is to examine on what parts, forms, and lines, the natural beauty of this ground chiefly depends; if undulating, whether the concave or the convex prevails; if broken ground, whether horizontal and perpendicular, or curved and inclined lines prevail. These are then to be imitated in the improved, ever keeping in view the important principle of a whole as the end of connection, and the other principles we have discussed as the means of producing it.

1. The removal of accidental deformities, forms one of the commonest operations on ground. Old quarries and other pits, useless cattle ponds, open drains, and the ground to be removed, and some variety given to a surface otherwise dull and featureless. If the fence consists of a great number of turns of different lengths, by placing them in the earth to be removed, some advantage may be taken of the fence, and the surface given to a surface otherwise dull and featureless. If the fence consists of a great number of turns of different lengths, by placing them in the earth to be removed, some advantage may be taken of the fence, and the surface given to a surface otherwise dull and featureless.

2. Natural bumps or excrescences are not uncommon in many grounds which have not been subjected to agricultural improvements. With these, if not large, the process of filling them with the plough will remove them; when they are of some magnitude, they may often become sources both of polished and picturesque beauty. If they are numerous and so distributed, as that by the removal of some, and the enlargement through that means of others, they may give an impression of undulation, especially if situated on a naturally irregular surface. If on a declivity, and covering rocks or huge stones, a mixture of flowing lines with abruptnesses may be happily introduced.

9. A varied but yet dull surface, may often be improved by a skilful artist. By studying the character indicated by nature, it will generally be found, that the deficiency of expression, is owing to the hollows being in part clogged up, either naturally or by long continuation under the plough; and the swells lowered in a corresponding degree by the same process. In this case, the obvious improvement is to remove earth from the hollows, and place it on the eminences, ever keeping in view the natural expression, and avoiding to the improvement by leaving the hollows gutters, and the eminences pointed ridges. This sort of improvement is not a very obvious one, though often attended with surprising effects, for every foot of depth taken from a hollow, and laid on an adjoining hill, adds two feet to the height of the latter.

4. In reclusive scenes, immediately under the eye, art Reclusiveness sake of a scene of beauty, may create a sort of miniature of beautiful ground. Man scenes. houses or mountains, are only to be improved by wood; and these remarks, in so far as they extend, will suggest not what is to be removed, but what must be concealed. Many excellent remarks on this part of the subject, are to be found in the picturesque tours of Mr. Gilpin, referring to ranges of hilly scenery in different parts of the country, of much of which he has given views. With respect to ground, as respects garden scenery, almost the only writer who has treated of it at length, is Mr. Wheatley, whose excellent book so frequently referred to by all succeeding writers on gardening, ought to be in the hands of every man of taste. In the chapter on ground in that work, the author concludes with a salutary caution which ought ever to be taken in connection with the wisest rules, 'a caution which has more than once been alluded to, must always be had in remembrance; never to suffer general considerations to interfere with extraordinary great effects, which rise superior to all regulations, and perhaps owe part of their force to their deviation from them. This caution therefore may not be useless within these narrow bounds; but nature proceeds still farther, beyond the utmost verge to which art can follow, and, in scenes licentiously wild, not content with contrast, forces even contradictions to unite. The grotesque discordant

The removal of accidental deformities, forms one of the commonest operations on ground. Old quarries and other pits, useless cattle ponds, open drains, and the ground to be removed, and some variety given to a surface otherwise dull and featureless. If the fence consists of a great number of turns of different lengths, by placing them in the earth to be removed, some advantage may be taken of the fence, and the surface given to a surface otherwise dull and featureless. If the fence consists of a great number of turns of different lengths, by placing them in the earth to be removed, some advantage may be taken of the fence, and the surface given to a surface otherwise dull and featureless.

Natural bumps or excrescences are not uncommon in many grounds which have not been subjected to agricultural improvements. With these, if not large, the process of filling them with the plough will remove them; when they are of some magnitude, they may often become sources both of polished and picturesque beauty. If they are numerous and so distributed, as that by the removal of some, and the enlargement through that means of others, they may give an impression of undulation, especially if situated on a naturally irregular surface. If on a declivity, and covering rocks or huge stones, a mixture of flowing lines with abruptnesses may be happily introduced.

A varied but yet dull surface, may often be improved by a skilful artist. By studying the character indicated by nature, it will generally be found, that the deficiency of expression, is owing to the hollows being in part clogged up, either naturally or by long continuation under the plough; and the swells lowered in a corresponding degree by the same process. In this case, the obvious improvement is to remove earth from the hollows, and place it on the eminences, ever keeping in view the natural expression, and avoiding to the improvement by leaving the hollows gutters, and the eminences pointed ridges. This sort of improvement is not a very obvious one, though often attended with surprising effects, for every foot of depth taken from a hollow, and laid on an adjoining hill, adds two feet to the height of the latter.

In reclusive scenes, immediately under the eye, art Reclusiveness sake of a scene of beauty, may create a sort of miniature of beautiful ground. Man scenes. houses or mountains, are only to be improved by wood; and these remarks, in so far as they extend, will suggest not what is to be removed, but what must be concealed. Many excellent remarks on this part of the subject, are to be found in the picturesque tours of Mr. Gilpin, referring to ranges of hilly scenery in different parts of the country, of much of which he has given views. With respect to ground, as respects garden scenery, almost the only writer who has treated of it at length, is Mr. Wheatley, whose excellent book so frequently referred to by all succeeding writers on gardening, ought to be in the hands of every man of taste. In the chapter on ground in that work, the author concludes with a salutary caution which ought ever to be taken in connection with the wisest rules, 'a caution which has more than once been alluded to, must always be had in remembrance; never to suffer general considerations to interfere with extraordinary great effects, which rise superior to all regulations, and perhaps owe part of their force to their deviation from them. This caution therefore may not be useless within these narrow bounds; but nature proceeds still farther, beyond the utmost verge to which art can follow, and, in scenes licentiously wild, not content with contrast, forces even contradictions to unite. The grotesque discordant
Sect. II. Of Wood.

Almost all the grand effects in both styles of improvement are produced by wood, which, whether in scattered forests, thickets, or groves, or in compact geometric squares, avenues, or rows, constitutes the greatest charm of every country. A tree in itself is indeed the noblest object of inanimate nature; it combines every species of beauty, from its sublime effect as a whole, to the most minute and refined expression of mind in the individual beauty of its leaves; exhibits that majestic uniformity and infinite variety which constitutes the essence of relative beauty, and the natural expressions of individual species, are as various as are their forms and magnitude, their utility to man, and the situations, soils, climates, and other general and accidental circumstances of which they are indications. Previously, therefore, to entering on the subject of wood, we shall endeavour to form some arrangement of this great storehouse of beauty.

The hardy trees of Europe may be classed according to magnitude, form, color, mode of growth, duration, and expression.

1. Magnitude. Trees of great height are, the English elm, asph, larch, Polish and Carolina poplar, &c.; but the laburnum, mountain ash, and evergreen oak, are very low trees. A medium in height may be found in the maple, pine, and birch. Some trees exceed in breadth, as the oak, Spanish cheesnut, and Scotch elm; others of different heights are very slender, as the Lombardy poplar, cypress, and bird cherry.

2. Form. The oak and Spanish cheesnut afford the most irregular and picturesque shapes with round heads; the English elm, and ash, have long narrow forms and round heads; the beech and horse cheesnut, compact oval forms, with obtuse heads; the larch, spruce, and fir tribe in general, have conical shapes, and pointed spiry tops, &c.

3. Colour. The Scotch fir, yew, and horse cheesnut, are dark greens; the larch and elm, a yellow green; the ashe, huntingdon willow, a slivery green, &c.

4. Mode and time of growth. The nature of some trees is to lose their lower branches as they increase in height, as the fir tribe; and others have a tendency to retain them, as the wych elm. In some the branches descend, and often recline on the ground, as the lime tree and platanus. Some are very compact in their foliage, as the horse cheesnut; others very open, as the ash and the acacia. Some have drooping spray, as the weeping willow; that of others tends upwards, as in the Lombardy poplar; horizontally, as in the oak; and obliquely, as in the Scotch fir. Some grow with rapidity, as the Carolina and Athenian poplars; others very slowly, as the oak and the stone pine.

5. Duration. The most durable of trees is the oak; the least so, some of the poplar and fir tribe. A medium is to be found in the elm and lime.

6. Expression. Some trees convey ideas of utility in the arts, and mark the attention and industry of man, as having planted them for this purpose, as the oak, ash, elm, &c. Others are known, or supposed to be of little use, and convey ideas of neglect or of wildness, as the hornbeam, sori, trembling poplar, &c. Some indicate general improvement and artificial plantations, as the larch and spruce fir; others garden scenery or plantations near a house, as the cedar, stone pine, and platanus. Some indicate rich deep soil, as the oak; and rich thin soil, as the elm; others chalk or gravel, as the beech; rocky ground, as the ash; marshy ground, as the alder; the proximity of water, as the willow.

There are also natural expressions belonging to trees, partly from general, and partly from accidental association; as strength and stability to the oak, ease and elegance to the birch, sweetness to the lime, gloom to the cypress and yew, melancholy to the weeping willow, &c.

Shrubs may be similarly arranged, but we prefer arranging them into magnitude, mode of growth, evergreen, deciduous, native, naturalized, and exotic.

1. Magnitude. Some shrubs are high, approaching to the character of trees, as the mespilus and common holly; others very low, as the butcher's broom and dwarf birch.

2. Mode of growth, including creepers, as the ivy; climbers, as the virgin's bower; trailers, as the bramble; compact forms, as of the arbor vitae; open airy branches, as in the tamarisk; and singular branches, as those of the staghorn sumach. Some as shrubs soon acquire picturesque shapes, as the thorn, holly, and elder.

3. Evergreens, as the holly, laurel yew, laurustinus arbatus, &c.

4. Deciduous, as the guelder-rose, lilac, syringa, &c.

5. Native, as the holly, privet, hazel, thorn, briar, &c.

6. Naturalized, as the rose, syringa, lilac, laburnum, &c.

7. Exotic, or foreign, as the aucuba, rhododendron, azalea, &c.

The above arrangement refers to the plants as growing detached from other trees, and as nearly full grown. It is less intended to comprehend every characteristic distinction, than to suggest to the artist the principal light in which he ought to view trees and shrubs. Nor could he with confidence attempt planting, with even such a knowledge as could be obtained from the above arrangement, completed by inserting all the names under their proper heads; for unless he has seen the majority of the full grown trees himself, both singly and connected in groups and masses, and is acquainted with the comparative rapidity of their growth in different climates and soils, he cannot well foresee the result of his labours, or look forward "with the prophetic eye of taste" to certain beauty. Of this there are numerous proofs, arising from the unjust preference given to exotics of unknown shapes and duration, in situations where the general form and situation of the tree, or even of one or two trees, is of the utmost consequence to the effect of a whole. How frequently on a lawn, or in a plantation near a house, do we see acacias, cutleaved elders, variegated sycamores, &c. where the oak, birch, lime, or Spanish cheesnut, would have produced a much more impressive general effect!

For the history, character, and culture of trees and shrubs in general use, see Planting and Rural Ornament, by Mr. Marshall; Hunter's Evelyn's Sylva; and Hanbury's Complete Body of Planting and Gardening.

We shall now proceed to consider planting, with a view to relative and natural beauty, or, in other words, the ancient and modern style.
PART I.  Planting in the Geometric or Ancient Style.

The first consideration is the nature of the whole or general design; and here, as in the ground, geometric forms will still prevail, and while the masses reflect forms from the house, or represent squares, triangles, or trapeziums, the more minute parts, characterised by lines rather than forms, such as avenues, rows, clumps and stars, &c. are contained in parallelograms, squares, or circles. In regard to the parts, masses and avenues should extend from the house in all directions, so far as to diffuse around the character of design; and as much farther in particular directions, as the nature of the surface admits of, the distant beauties suggest, and the character of the mansion requires. In disposing these masses, whether on a flat or irregular surface, regard will be had to leave uncovered such a quantity of lawn or turf, as shall at all events admit a free circulation of air, give breadth of light, and display the form of the large masses of wood. Uniformity and variety as a whole, and use as well as beauty in the parts, must be kept constantly in view. Avenues, alleys, and vistas, should serve as much as possible as roads, while lines of fencing, screens of shelter or shade; but where this is not the case, they should point to some distant beauties, or near artificial objects, to be seen at or beyond their termination. The outer extremities of artificial plantations may either join natural woods, other artificial scenes, cultivated lands, or barren heaths or commons.

Connection.

When artificial plantations join natural woods, the avenues, alleys, and circular glades of the former may be continued a certain length in the latter, so that the point where the natural wood begins, and the artificial plantation ends, may not be discoverable. In aid of this effect, the sort of tree which prevails in the natural scenes, should also prevail in the adjoining parts of the artificial wood. When artificial scenes join other artificial scenes, nothing can be easier than by the reciprocal continuation of avenues, strips, or masses, so far to unite the two seats, as to conceal the boundaries of each, while the two mansions will thus each borrow a splendour from the other.

There are still existing proofs of the attention paid to this subject in former times, an instance of which occurs in the apparent connection by avenues between Blenheim, Ditchley, and Heythrop, though the last mansion is nearly ten miles distant from the first.

When artificial scenes join cultivated lands, if those lands are enclosed, broad strips, hedge-rows, square or round clumps in the angles of the fields, with such reciprocal disposition of lines or forms as the case may suggest, will continue the character of artificial plantations; and where roads are necessary, if utility does not forbid, they should be formed in part as avenues, in continuation of those within the artificial scene.

When artificial plantations are bounded by barren heaths or commons, all that can be done is to advance beyond the boundary of the place, portions of avenues, and rows of trees of different lengths. Sometimes an inequality, crowned by a clump or thicket, may promote the idea. On other occasions, where the heath or waste may be so black as to convey no sensible expression, and therefore is, of course, struck out entirely from the improved scene, a sort of connection may be given, by advancing strips or rows from the boundary plantation into the heath. Even single or scattered trees, if they can be protected in that situation, will have a tendency to produce that sort of connection required; and, while it gratifies the proprietor's love of appropriating, will please the eye of the traveler, who views the country as a whole, and delights to observe the harmony and beauty of its principal features.

Having disposed of the whole, and of the parts, as far as respects their general effect and connection, what remains to be considered is, the sort of tree, manner of disposing the plants, fences, and future management.

The object in view, the expression of art and design, suggests the propriety of employing different species to those which are natural to, or most abundant in the surrounding country. In a country of common firs, the spruce and silver fir, and cedar, afford a choice. In a country of oaks or elms, chestnuts, limes, and planes, form suitable contrasts. Where the plantations are extensive, the value of the timber must always be a principal object; and, therefore, the contrasted trees should be chosen accordingly. Some species, however, are so happily adapted for this style, and as ornamental trees in both styles, that they ought seldom to be admitted near the house. Such, for example, as the horse chestnut, lime, Spanish chestnut, plane, larch, oak, cedar, stone pine, &c. As the four last species mentioned are in exposed situations, liable to injury from extraordinary severe winters, a few hardier sorts, resembling them in general appearance, should be interleaved in the plantation, to preserve the larger masses in case of accident, but to conform with the general effect in colour and style of foliage, as well as in form. Different species ought not in general to be mixed together in the masses; one, or at most two, conforming varieties is sufficient, more would destroy the breadth of colour of the mass, and the character of its surface. Different masses, avenues, and more minute parts, may, however, be planted with different species of trees; rare sorts may be also introduced in lines, along the front of many of the masses, ranged along stars, pâtés-d'oeufs, &c. The snow-drop tree, from its beautiful blossoms, and the birch and hazel, for the display of their catkins during winter, are well calculated for walks adapted to the season of the year, and should be intertiled in front of firs, or other evergreens. Such also is the principal situation for flowering shrubs, and no plants can be more showy than the horse chestnut, common lilac, acacia, guelder-rose, Portugal laurel, holly, bird-cherry, mespilus, and laburnum, in similar situations, and for general purposes. In distributing the species of trees in general masses, the same general principles of composition must be attended to, which we have pointed out as far as respects form. The colours and character of the heads of the trees must be connected, and, at the same time, to a certain degree contrasted, in order to produce an artificial and yet harmonious effect.

It may perhaps be asked here, whether the new varieties of American, and other shrubs, obtained since the introduction of landscape gardening, are to be admitted under this style of improvement? We answer, certainly. There can be little doubt they would destroy part of the allusion to an ancient place; but we do not contend for the revival of the ancient style, as producing imitations and illusive characters, or on account of its antiquity, but as a distinct mode of gardening. We would therefore not copy its faults, or study its defects, but add to its beauties from all the resources furnished by the present improved state of the arts of design, as well as by the continued accession to our stock of trees and shrubs.
The manner of disposing the plants is influenced by the same principle of avowed art; in rows, equidistant masses, in squares, or in quincunx, and in every case so as never to be mistaken for trees or shrubs sprung up accidentally.

Fences.—Here the ancient style has a grand advantage over the modern, in which, as far as respects the imitation of nature, all fences are to be considered as temporary, and therefore to a certain degree looked on as nuisances to be afterwards removed. Besides, their irregular and circuitous line is displeasing to many who do not understand ground plans, with a view to picturesque beauty, when the trees are grown up. But in geometric gardening, fences are to be considered in many cases as objects, and when not regarded in this light, their directions and limits are so minutely pointed out by the determined outline of the plantations, that the eye acquires them in their situation and use. Fences of any common and economical description are employed to protect the trees of open avenues, open groves, and single open rows. But the more common kind are walls, which in the prominent parts ought to be well built of shaped stone, and substantially finished by raised or flat copings, bearing some relation to the copings of the simpler parapets of the house. The gates necessary in these walls, as well as in some sorts of permanent verdant fences, supply occasion for such architectural forms and lines, as are advantageous in reflecting those of the mansion, and strengthening the prevailing idea of dignity, art, and design. Every sort of fence belonging to the modern style, may be occasionally employed in the ancient, and besides walls, half sunk walls, and raised mounds with a walk at top, we may enumerate holly, yew, laurel, and other shrubs, either simple or chequered, by alternate deciduous or evergreen species, varied by arcades and standards, shorn into shapes, or in their natural growth. Hedges of flowering shrubs may also be introduced; of creepers on open palisades; and various others of great beauty may be invented, or are to be found in books on this style of gardening.

Management.—In this respect, also, the advantage is greatly in favour of the ancient style; for as all operations of pruning and thinning in the other should be done under the eye of the landscape gardener, so all these operations here may be performed by any labourer; the object being simply to produce a straight upright smooth stem, to ascertain height according to circumstances, and allow each particular tree to attain its full size. Shearing or clipping is always a mere mechanical operation; plain hedges, and close alleys, require only a line for a guide; and in the case of arcades, or verdant sculpture, there is, or always should be, a frame of trellis work of correct design to guide the gardener.

From the comparative brevity of this view which we have taken of planting under the ancient style, the reader will perceive, that we are far from supposing it to take the lead of the natural method to which we now proceed, referring for more particular information to Le Blond, and other French authors; and to Switzer's Ichnographia Rustica.

Part II. Planting under the Modern Style, or with a view to Picturesque or Natural Beauty.

This subject we shall consider as it respects the effect of the whole, the parts, the natural surface, species of tree, manner of planting, fences, and management.

1. The effect of the whole, as we have had repeatedly occasion to observe, is always the first and the grand consideration in every work of art, whether that art has for its end the creation of objects of invention or imitation. All planting, as respects the formation of a country residence, must necessarily be materially influenced by the character and situation of the house, as the capital feature in the composition. To this feature the leading masses of wood and lawn, answering the end of light and shade in painting, must invite and direct the eye in the general view of the place, Each must embrace it on one or on more sides, and diverge from it in masses suitable to its magnitude and the extent of the grounds, and in forms and characters of woody surface, suitable to the natural situation and the expression to be created. If the mansion is on a declivity, the principal light should embrace the front which looks down, rather than those which look up, or on either side. The views from the windows suggest this arrangement, and will point out in every other situation, whether a flat, a hill, or an irregular surface, on which side or sides, the leading masses are to have their origin. To determine their magnitude form, and number would be impossible, without a plan or particular case to refer to. To point out their style is sufficient, which must always be irregular like nature; generally stretch along such rising grounds as the situation affords; and, like her, always combining a certain degree of uniformity or recognizable shape, even amidst the greatest seeming deviations from this quality of figures.

As the house indicates the commencement of the masses, the character of country surrounding the scene of improvement must determine the limits and style of their termination. If the lands are laid out in regular enclosures, bounded by hedges and hedge rows, the same style must prevail in the margin of the park; at least in as many places, and to such a degree, as will produce connection; and, if possible, as much farther as will harmonize the scene within, with the country without. If it is entirely or in part surrounded by forest scenery, the termination is easily and completely effected, by adhering to the style of wood and species of tree prevailing without, for a moderate distance within the boundary. If bounded by the sea, or a large lake, an abrupt termination will be as natural as it would be formal on the margin of a cultivated surface.

2. The parts which enter into the composition of a The parts, mass of wood, and compose its varied and intricate boundary by real or apparent connection, are thickets, groups, and single plants. A single plant may either be a single tree, or a single shrub; a group, two or three plants, either of trees or shrubs, or both, connected, yet contrasted in their positions; and as they are generally planted of some size, in order to be speedily out of the reach of cattle, they ought to be contrasted in the inclination of their stems, in order, as far as art can go, to transfer a similar variety to their branches and future growth. A thicket, or as it is called by Mr. Wheatley, a clump, (though undoubtedly he never had in his mind’s eye the round and oval shapes which now pass by that name,) is a small irregular mass, or a cluster of groups, and may contain either trees alone, or trees and shrubs.

Every one of these, though considerably detached, must be considered as belonging to the nearest mass either of wood, of building, or of rocks, or some other object of magnitude which rises boldly into the air. A group, or a single tree, equidistant from every other
object, can form no part of any of them; it cannot, therefore, enter into the composition of a whole, and can only be regarded as a spot in the composition, or admired for its particular beauties. Connection, therefore, real or apparent, is the leading consideration in respect to the situation, or positions of thicketts and groups. As we have before observed, they must be either near, or apparently near to the masses to which they belong, so as to effect that loose and airy appearance in the boundaries of the mass, which the painter effects by the touches of his pencil in finishing the outline of a tree. For this purpose, groups, thicketts, and single trees, may be used at the same time. When a considerable length of unvaried line is to be broken into parts, a thicket may stand detached from it, connected by a few straggling trees in the interval between. This thicket, in its turn, may have its boundary similarly varied by detached groups, and from these may stand out one or two single trees. The next break in the line to be varied, may be effected by two or three groups contrasted in disposition; some attached; others playing easily round them at moderate distances, but still so as to slide easily into a whole. By proceeding in this way along the most formal and monotonous line, it may not only be varied, but changed in character, so as to present every variety of prominence and recess. With respect to the distances which these parts of forms, (speaking of them always with reference to their ground plan,) ought to be from the mass and from each other, almost every thing will depend on the situation. They may be at some distance on a flat, not to be viewed from an eminence considerably above its level; because the effect of vision will, at a moderate distance, in this situation, throw a surface, scattered with single trees, into a mass of wood. But on declivities, viewed from opposite declivities or distant plains, the contiguity must be greater to form a breadth of mass. But here, as in most other instances, the practice of sketching landscape, and especially trees, will afford a more correct idea of the effect and the principle, and a more apt illustration of the practice, than a volume of the justest and most minute instructions.

Thicketts may next be considered in regard to their form, that is, the form of their ground plan; and with groups and single trees in regard to the choice of species. Thicketts are produced by nature, by the inroads of cattle, or other animals, grazing or cropping the herbage, and with it the young trees in forest scenery. On levels and sheltered situations, we find their form comparatively regular, because there appears no permanent or general reason to occasion their encroachment on one side more than on the other. But on varied surfaces and soils, a preference is given by depasturing animals to certain natural plants, and the side on which they abound is penetrated more deeply than the other. The plan of the thicket therefore varies accordingly. In elevated grounds exposed to a particular wind, the thicket will exceed in length, which will be found generally to be in the direction of the storm. The cause is too obvious to be pointed out; but this effect, and every other observed in the groups and thicketts of natural scenery, always merit study, and most frequently deserve imitation in creations of landscape scenery.

The species of tree ought obviously to be those of the part of the mass to which they belong; for thicketts, groups, and single trees, ought to resemble disjointed and broken fragments from those masses. But in par-ticular cases, for rendering a prominence still more prominent, or increasing the depth of a recess, a few plants of similar or not discordant growths, but of darker or lighter greens, may at a distance add to the effect of each. By the same process, with more contrasted species, where no other mode can be put in execution, the formality of a single row may in some degree be varied in its situation and contour.

5. The natural surface, we have already hinted, must influence in a considerable degree the form and magnitude, both of groups and masses. The beauty of all verdant scenery depends, more than on any other circumstance, on the inequalities of the ground's surface. Wood will almost always add to this beauty by heightening the eminences. A few trees on the summit of a knoll, raise it to the character of a hill. A connected train of groups placed along the back of a ridge, produce at once a bolder and more varied outline, and render a feature prominent and beautiful, which was before dull or disagreeable in expression. To plant the hills, and leave bare the valleys, is therefore a good general maxim; though carried to an undue excess, or used without taste or feeling, by Brown and other popular artists. At the first introduction of the modern style of gardening, all the hills were planted, but few of them presented more than a circular clump of a few yards diameter perched on their summit. The country abounds in examples which ought to serve as beacons to all future improvers, and warn them against an ignorant adoption of any maxim, without duly studying its spirit and meaning. To plant a hill, is not to plant only its summit, but in all cases a part, and in many the greater part of its sides. Their beauty individually requires this; and the idea of a whole, renders their connection with other hills, by clothing more or less not only their sides, but the intermediate valleys or plains, an essential consideration. In extending this practice to mountain scenery, the powerful effect of wood may be nobly displayed by the hand of the master, who, following the idea of the poet, shall

4. The species of tree. Were the imitation of natural species of woods to be the object in all cases, the variety in the trees, plants would be limited to three or four native species, as a greater number are seldom found wild in Great Britain, within the limited extent of forest scenery, which would enter into the composition of a country residence. But if the style of nature be imitated in their arrangement, the variety may be much greater without interfering with general effects. Nature disseminates her plants by scattering their seeds, and the offspring rise round the parent in masses or breadth, depending on a variety of circumstances, but chiefly on the facility which these seeds afford for being carried to a distance by the wind, the rain, and by birds or other animals. So disseminated, they spring up, different sorts together, affected by various circumstances of soil and situation; and arrive at maturity, contending with other plants and trees, and with the browsing of animals. At last, that species which had enjoyed a maximum of natural advantages, is found to prevail as far as this maximum extended, stretching along in masses and singular portions of surface, till circumstances changing in favour of some other species, that takes the prevalence.
In its turn. In this way it will generally be found, that the number of species, and the extent and style of the masses in which they prevail, bears a strict analogy to the changes of soil and surface; and this holds good, not only with respect to trees and shrubs, but to plants, grasses, and even the mossy tribe.

With this principle of distribution, any number of species may be admitted into improved grounds; commencing with the rare sorts near the house, as the centre of art and refinement, and ending with the common trees of the country, at such distances as the extent and style of the whole may suggest. The portions of such trees as are only ornamental, and such as are valuable as timber, must be in some degree determined by the character of the place, but chiefly by the taste and view of the owner. Beauty alone, without utility, will not long please; and a few single groups and plants of the rarer species, in the grounds more immediately consecrated to man, will generally afford more satisfaction than a lavish display of exotics; the former will always present a more luxuriant and thrilling display of scenery than the latter, and sooner attain the maturity of beauty.

In determining the order of the sorts, regard must be had, not only to choose forms and colours which will accord and form harmonious breadth of woody surface to the eye, but to place every species as much as possible in its natural situation. The more delicate sorts should be placed in sheltered, the more hardy in exposed surfaces; the resinous tribe on hills and rocky ground; and aquatics in low valleys, banks of rivers, or dells, using caution, however, not to display an expression of moisture or bleakness, when the idea of dryness and shelter would be more desirable. In precarious situations, a thin sprinkling of the best common hardy trees, as of the oak, birch, Scotch fir, &c. should extend over the whole residence in case of accident to the others. In such cases, it is always best to depend on the native, or naturalized trees, for general effect, and confine the introduction of foreign sorts to the shrubbery or some other limited scene. Mr. Price has treated the subject with much ingenuity; and in reproaching the common practice of mixing as many different sorts as can be procured, in order to produce variety, observes, that "variety, of which the true end is to relieve the eye, not to perplex it, does not consist in the diversity of separate objects, but in the diversity of their effects when combined together, in a difference of composition and character. Many think, however, that they have obtained that grand object, when they have exhibited in one body all the hard names of the Linnaean system; but when as many plants as can be well got together are exhibited in every shrubbery, or in every plantation, the result is a sameness of a different kind, but not less truly a sameness than would arise from their being no diversity at all; for there is no having variety of character, without a certain distinctness, without certain marked features on which the eye can dwell."

5. The manner of planting is alike suggested by nature; and the plants ought to be inserted in such a way, that if any particular part were separately examined, it might present clusters of groups—not equidistant plants. The effect of this arrangement will not be that composition of low and high, oblique and upright stems, and young and old trees, and low growths, which we find in forest scenery; but it is all that can be done in imitation of it at the first planting; and subsequent thinning, pruning, cutting down, moving, ren-

serving, planting, and sowing, must be used from time to time to complete the imitation or allusion, unless the owner will rest satisfied with an inferior degree of beauty.

In plantations of trees alone, to plant thick is, we apprehend, a great error, because it leaves so much to the risk of future management; and even should this be bestowed, the first and second thinnings are of no more use than as faggot wood; but where trees and under-growths are mixed together, any degree of proximity may be admitted between the plants, because the trees will always overtop the low growths; and if thinning is attended to, the low growths will be of as much value during the first ten years as in the other case. The best general rule is, to put in the trees at such distances, as that, when so far advanced as to require thinning, they will have attained such a magnitude as to be of use, as poles or timber; and to fill up the intervals with under-growths, which may be removed or not at pleasure.

The fences, in imitative planting, are to be considered as only temporary; and therefore, as a general rule, the cheapest fence the local situation will afford will be the best, regard being had, that they shall endure till the trees, shrubs, and growths shall, in the given soil and exposure, have attained a sufficient age to protect themselves against the injury of sheep and cattle. The present improved state of the manufacture of iron offers a very desirable accommodation in this respect, affording the best guards for single plants and groups; and iron hurdles, or hurdles indeed of any sort for masses, have a light and temporary appearance, highly congenial to the idea of their speedy removal. The lines of the fences conforming to the irregular shapes of the masses will not be disagreeable to the eye, if those of the thickets are arranged with any regard to apparent connection; for any objects, whether lines or forms, however deficient in beauty of themselves, acquire a degree of interest, and even character, when connected and arranged in such a way as to form a whole.

When a plantation is finally to be composed both of trees and under-growths, thorns, sloes, hollies, barberries, and briers, may, in many cases, prevail in the margin, which, when the fence is removed, will form a picturesque phalanx, and protect the whole. Partial inroads, formed by cattle, will only heighten the variety and intricacy of such masses.

7. So much depends on the future management of Manage-
plantations, that we cannot avoid expressing our deep regret that so little attention is generally paid to the subject. To consider that as finished which is only commenced, is a common falling; but in no part of landscape gardening of more unhappy consequences, both in regard to future beauty and use, than in the article of planting. A plantation is too often allowed to grow up like a field of corn, and, like it, at the end of a few years, is fit only to be swept down in a body. The beauty, grandeur, and effect of thick plantations of trees in a neglected state, is reduced inversely as their progress to maturity; for their side branches rot and drop off, the light is seen through a rank of naked stems, whose "inglorious heads," as the poet remarks, serve only to "blot the fair horizon." Thinning and pruning are the obvious means of averting these bad consequences, where the plantation consists of trees alone, or in the greater part; and the planter, from what has been already advanced, will effect this with a joint view to the value of the timber, and the picturesque disposi-

GARDENING. 563

Of the Materials of Gardening.

Water.

Sect. III. Water.

This material is so captivating and interesting a description in the different characters in which it occurs in nature, that no view can be reckoned complete in which it does not compose a feature. It forms a part of every garden in the ancient style, in the various artificial characters which it there assumes of oblong canals, ponds, basins, and jets-d'eau; and in modern improvement, such is the value attached to its effect, that no place is deemed perfect without a river or lake; and such is the indiscriminate desire of obtaining them, that nature has been too frequently disregarded in their form and situation. Of the characters which water assumed under the geometric style, we can only observe, that their names convey, in a great degree, an idea of the forms. Their situations were near the mansion; and their marginal accompaniments of masonry, turf walks, and hedges, were determined by the architectural forms and lines of the capital feature in the scene. The choice, from the most intricate and curious fountains to the plain oblong canal, depended on the splendour of the general design; very little on natural situation. The supply was generally obtained from some concealed reservoir. In landscape gardening, the object is to imitate lakes, rivers, or rills, and their accompaniments; and of each of these natural characters, we shall remark the leading circumstances in the originals and the imitations.

All water is either running or stagnant. Lakes, ponds, and pools, are of the former class; rivers, rivulets, and rills, of the latter description. In certain situations, lakes may be created where their supply is moderate; rivers and rills only when it is abundant. Both characters, when they exist in nature, may be improved by studying the natural characteristics of each species.

The first consideration respecting water in whatever form it may appear, is its situation relatively to the character of the ground's surface. No situation in which this material may be supposed to exist and expand itself into a body, can be truly natural, that is not to be considered as a vale, flat, or hollow. Mountain streams are out of the question; and small lakes or pools, in hollows or elevated grounds, are more to be considered as accidental than as general nature. Even artificial lakes or rivers on a considerable scale, to be natural, must either be, or seem to be, situated in the lowest part of the landscape then under the eye. If otherwise, if placed on the side of a declivity over which the eye can range at the same time, it may be attractive to a stranger at first view; but the want of truth or fidelity to the thing to be imitated, will soon bring on an increasing aversion in the mind of genuine taste.

Ponds in different levels seen in the same view, are very objectionable on this principle. The little beauty they display, as spots, ill compensates for the want of propriety; and the leading idea which they suggest, is a question between their present situation and their non-existence. The choice, therefore, as to the situation of water, must ever depend more on natural circumstances than proximity to the mansion. Is then all water to be excluded, that is not in the lower grounds? We have no hesitation in answering this question in the affirmative so far as respects the principal views, and when a lower level than that in which the water is proposed to be placed is seen in the same view. But in respect to recluse scenes, which Addison compares to episodes to the general design, we would admit, and even copy these ponds on the sides or crests of hills, which we have designated as accident beauties of nature.

A beautiful lake, or part of a circuitous body of water, considered as a whole, will be found to exhibit a form, characterized by breadth rather than length; by that degree of regularity in its outline as a whole, which confers that, which, in common language, is called shape; and by that irregularity in the parts of this outline, which produces variety and intricacy. Supposing the situation to be fixed on for the imitation of a lake, the artist is to consider the broadest and most circuitous hollow as its principal mass or breadth of water, and which he will extend or diminish according to the extent of aquatic views the place may require. From this he may continue a chain of connected masses of water, or lakes of different magnitudes and shapes, in part suggested by the character of the ground, in part by the facilities of planting near them, and in part by his own views of propriety and beauty. The outline of the plan of the lake, is to be varied by the contrasted position of bays, inlets, and smaller indentations, on the same principles which we suggested for varying a mass of wood. To the irregularity of outlines so produced, islands and aits may be added on the same principle and for the same objects as thickets and groups. This will complete the character and beauty of the plan of the water; but the grand effect of this element in landscape, depends on wood as its accompaniment. The variety and intricacy of outline, the reflection of forms and colours, the shady recesses and flickering lines of light, all depend on trees. These are not to be sparingly or indiscriminately scattered around the margin, but liberally in some places, for the sake of a contrasted mass of grateful colour or shade, to relieve the brilliancy of the water; and with discrimination every where to mark the beauties, and heighten the variety of the outline, without destroying breadth of effect, or a whole, either as respects the water alone, or the entire residence.

The marginal banks of water are next to be considered.

In nature, they are tame or bold, gravelly or sedgy, stony or rocky, according to the character of the surrounding ground. Art, therefore, must imitate each in its proper place, not always by a studious picturesque arrangement of the marginal accompaniments in each case, but by excavating the ground-work, planting the trees and shrubs, and leaving the rest to the motion of the waves of the water. After the effects of one winter, stones or gravel may be deposited in spots suitable for stony or gravelly shores. But to enter into this, and many other circumstances in the imitation of lakes, would exceed the proper limits. We add two cautions. The first is, in all cases of the beautiful picturesque, so to arrange by puddling and under-draining, that a marshy appearance may not surround the lake; and that rushes, and such aquatic plants, may...
not extend farther than a few feet or yards from the margin of the water. The other respects islands, which are the greatest ornaments to lakes. But that island which is placed in the centre, or in any situation where it does not connect with other islands, or with the shore, so as to form part of a promontory or recess, is injurious to the effect of the whole, and, when properly placed.

Rivers and rills, we have said, are rather to be improved than created; for we cannot sympathise with that taste, which directs the mimicry of so noble a character as a river, or is satisfied with a nearly stagnated rill. We do not consider the river at Blenheim as an exception, because that piece of water was formed by widening a considerable brook. We allude to those wavy serpentine canals, which are never mistaken for natural scenes, and in almost every case might be advantageously exchanged for a lake.

The two leading ideas which belong to running waters, are progress and impetuosity. The first expression may be heightened by counteracting any tendency to expansion; by removing some of the circuitous and oblong projections of earth or stone in the banks; and sometimes by deepening its bed, or by substituting a more direct line for a circuitous course. The idea of impetuosity is indicated by its effects, in reverberating against high banks, or common banks, on which trees are situated, and may be increased by augmenting the cause or the effect, and thus either digging and undermining the trees, cutting down the high banks on which the water acts, or placing very slight piers as jetties on the opposite shore. Picturesque additions to the marginal accompaniments both of rivers and rills will readily suggest themselves. Cascades and waterfalls may sometimes be created; and the occasional expansion of natural brooks into pools, affords a fine hint for imitation, when this form of water comes within a scene of improvement.

Sect. IV. Rocks.

It forms no part of the geometric style of gardening to imitate rocks, which are a material of the natural style equally unsuitable to be created. But though rocks cannot readily be imitated, their expression may sometimes be heightened when desirable, and concealed when disagreeable.

The character of rocks may be savage, terrific, sublime, picturesque, or fantastic. By attending to the forms of the milder characters, and their connection with ground and trees, we shall discover whether, and to what extent, they may be improved. Savage rocks are too inhospitable to be permanently admitted, in any extent, near the eye. All rocks convey something of this idea that are not accompanied by vegetation; and, therefore, planting among or near them, is in every case an improvement, where trees do not exist. All rocks are expressive of dignity; those eminently so, are not greatly varied by projections from their surface: their beauty is to be augmented, either by increasing their surface in height or depth, or by connecting it if too scattered. The removal of a few feet of earth, or part of the bushes or trees from the bottom of a precipice or ridge, and the implantation of a line of wood along its summit, will increase its real and apparent height; a similar process with respect to the sides, will add to the idea of stability and continuation. If the parts are too much scattered, a few trees placed before, or bushes or creepers planted in the intervals between the parts, will connect them, and give the idea of a whole, partly concealed. But in this case, a considerable breadth of surface is necessary, at least in one place, otherwise dignity must give way to picturesque beauty. But the least indications of rocks that are not very fantastic in their form, even including such whose chief expression is picturesque beauty, are to a certain degree expressive of dignity. The slightest indication of a stratum or ledge appearing above the surface, conveys something of the idea, and ought not to be neglected. When they are discovered by alterations in the ground with a view to the formation of roads, fences, and water, or to the erection of buildings, occasional advantage may be taken of their appearance. A road or a declivity, may be accompanied by a ledge of rocks, instead of a bank of earth. Ground merely broken and picturesque, will display a more sufficient reason for the appearance. The walls of a terrace, evidently in part founded on a rock, will give an idea of dryness, dignity, and security to the house; and the margin of a stream displaying even large stones, increases the idea of impetuosity; or in lakes, of the action of water in washing away the earth. Among imitations of wild scenery, detached stones heighten the illusion, and carry back the mind to the aboriginal state of the country. Loose or detached fragments of rocks may often aid the effect of real or supposed masses. The appearance of a large rude stone near a wooded steep, unless of one evidently rounded by water or air, always leads the mind to the larger mass up the declivity from which it has been broken and rolled down; if partly sunk in the ground, and concealed by vegetation, the fertility of the imagination considers them as parts of magnitudes which lie buried under the surface. All this, however, can only be successfully accomplished in a country which, by the character of its general surface, does not preclude the idea of rocks. On a flat or a champaign country, the want of truth, or seeming truth, would render them disagreeable; and, indeed, did rocks exist in such a landscape, they should be hidden rather than displayed, unless of such extraordinary magnitude and effect, as to form an exception to general principles.

Sect. V. Buildings.

Buildings, as materials of scenery, are entirely under the power of man; and, from that circumstance, were carried to an unwarrantable excess in the decline of the ancient, and the infancy of the modern style. Improvements on ground are forgotten by their effect; that of planting may be accounted too distant or too slow by ordinary minds; but a building is complete the moment it is finished. It affords immediate satisfaction to the owner; and, being known as a costly object, full credit is given to him for the expense incurred. Thus wealth, confiding in its powers, multiplied garden buildings to an excess, which ended in creating a disgust, which still exists, in some degree, at their appearance in improved scenery. Buildings, as independent architectural compositions, are treated of under our article Civil Architecture. We shall here, therefore, confine ourselves to a consideration of their effect as parts in a composition of verdant scenery, and to their natural expression in scenes of improvement in both styles of gardening.

As parts of a verdant composition. Shenstone observes, that a landscape, to him, is never complete without a building or rocks; and certainly, considering it merely in the light of a picturesque view, a building, in addition to merely verdant scenery, forms a bet-
Of the Materials of Gardening.

LANDSCAPE GARDENING.

Of the Materials of Gardening.

Accidental accompaniments.

Of these, the first are roads; and of roads, the principal is the approach. This article of beauty, as well as of convenience, ought to display to advantage the beauties of that part of the place it passes through, and as many other beauties as may be displayed without shewing the principal, which are generally those of the garden front. In both styles, it ought to ascend to the house rather than descend, and pass along a flat or hollow rather than over inequalities of surface.

Approach.

In the geometric style, it was generally a wooded avenue, in one or in several lines. In the modern, it is generally a bold, free, gently waving line; every turn of which is produced either by some gentle variation in the surface, or by the position of a group, or two or three single trees. It may pass through wood only, or through forest-like scenery. The first view obtained of the house ought to be as favourable as possible, and not of any particular front, but rather an angular view, bosomed in trees. The second, or if there are two or more, the last view, on a nearer approach, should be different, and shew the entrance front, and porch, or portico; the road approaching it at such a distance, obliquely, as that the eye may now readily comprehend the whole. By an optical law, it appears, that objects are seen to most advantage when a line drawn from the centre of the eye to the summit of the building, forms, with a horizontal line also drawn from the centre of the eye, an angle of 360.

But as a knowledge of optics and perspective are absolutely necessary both for an architect and landscape gardener, we have not considered it necessary, in this rapid sketch, to apply them in the case of terraces, views from rooms, views of buildings, &c. where they are of the greatest consequence to the full effect.

Walks.

Walks are the next accompaniment to home scenes, without which they cannot be viewed but in particular states of the weather and the surface. They were straight, angular, or in regular curves, in the geometric style, and are in easy natural like lines in the modern manner. Though avowed objects of art, they ought always to bear a certain analogy to the scenes they pass through; with formal kept edges in highly finished scenery, and edges blending with the gravel in the picturesque manner, recommended by Mr. Price in more wild scenes. Taste must determine their general course, from the range of beauties to be displayed, and their particular turns, from local beauties and accidental circumstances. The principle of a sufficient reason ought never to be lost sight of, in laying out walks and roads.

One of the finest descriptions of hill or mountain walks is, where it is carried along the side of an irregular declivity on a perfect level, such as were called terrace walks in the ancient style, and two fine specimens exist at Lowther Castle, near Carlisle, and at Craige-Hall, near Edinburgh.

A walk by a wooded river, retiring from and meeting the stream, is one of the most interesting of valley walks, of which there are fine examples at Downton Castle, near Ludlow, and Dalkeith, near Edinburgh.

Fences are necessary accompaniments in both styles, and have been already considered in some degree, in treating of the permanent materials of scenery.

Animated nature. Deer, wild, and tame hares, cattle, animated sheep, game, singing birds, all belong to a residence, nature, and are necessary to complete its beauty. Pheasants and other game, ranging, undismayed by man, in garden scenes, give a high idea of seclusion and removal from common nature. The cawing of crows, the shrilling of the owl, the screams of peacocks, the notes of birds, are all desirable circumstances in certain situations, and ought to be attended to, by introducing such trees or plants as are favourable to their increase. The smoke of a cottage, or a farm house; the view of a distant village, or the spire of a church, become interesting in certain views; and, with a thousand other instances of natural expression, in a great measure beyond the reach of art, will be sought for and turned to account by the judicious artist.

CHAP. IV.

Of the union of the materials of Gardening, in forming the constituent parts of a country residence.

Having now applied the principles of natural and relative beauty to the materials of gardening separately, we shall next apply the same principles to the formation of those scenes of use, convenience, or ele-
LANDSCAPE GARDENING.

1. The Mansion and Offices first demand attention, as the central feature of art and refinement. What relates to the design of these groups of buildings, belongs to Architecture; but the situation, aspect, style, and accompaniments, are within our province.

In determining the situation, a great variety of circumstances, some of a general, and others of a local or peculiar nature, require to be taken into consideration. Natural shelter, dry subsoil, the view of the house as seen from a distance, and distant prospect, belong to the former; and removal from the boundary or a public road, suitableness of the adjoining grounds for the garden scenes which accompany mansions, trees already there, or so situated as to aid the effect, &c. belong to the latter.

The aspect of the principal rooms deserves particular attention in every case, but more particularly in bleak or exposed situations. The south-east is, most commonly, the best for Britain; and the south, and due east, the next best. The south-west Mr. Repton considers the worst, because from that quarter it rains oftener than from any other; and the windows are dimmed, and the views obstructed, by the slightest shower, which will not be perceptible in the windows facing the south or east. A north aspect is gloomy, because deprived of sunshine; but it deserves to be remarked, that woods and other verdant objects look best when viewed from rooms so placed, because all plants are most luxuriant on the side next the sun.

"The aspect due east," Mr. Repton considers "nearly as bad as the north, because there the sun only shines while we are in bed; and the aspect due west is intolerable, from the excess of sun dazzling the eye through the greatest part of the day. From hence we may conclude, that a square house, placed with its front duly opposite to the cardinal points, will have one good and three bad aspects." - Fragments on Landscape Gardening, &c., p. 108.

A mansion for the country, if a mere square or oblong, will thus be deficient in point of aspect, and certainly in picturesque beauty, or variety of external forms, lights, and shades. An irregular plan, composed with a combined view to the situation, distant views, best aspects to the principal rooms, effect from different distant points, and as forming a whole with the groups of domestic offices, and other masonic appendages or erections, will therefore be the best; and as the genius of the Gothic style of architecture is better adapted for this irregularity than the simplicity of the Grecian, or the regularity of the Roman manners, it has been justly considered that the Gothic is, on the whole, the best style for country residences. Another advantage of an irregular style is, that it readily admits of additions in almost any direction.

Convenience, as well as effect, require that every house ought to have an entrance and a garden front; and, in general cases, neither the latter, nor the views from the principal rooms, should be seen fully and completely, but from the windows and garden scenery. Not to attend to this, is to destroy their contrasted effect, and cloy the appetite by disclosing all, or the greatest part of the beauties at once. The landscape which forms the back ground to a mansion, the trees which group with it, and the architectural terrace which forms its base, are to be considered as its accompaniments, and influenced more or less by its style. The classic pine and cedar should accompany the Greek and Roman architecture, and the hardy fir, the oak, or the lofty ash, the baronial castle.

2. Terrace, Garden, and Conservatory. We observed, when treating of ground, and under the ancient style, that the design of the terrace must be jointly influenced by the magnitude and style of the house, the views from its windows, (that is, from the eye of a person seated in the middle of the principal rooms) and the views of the house from a distance. In almost every case, more or less of architectural productions will enter into these compositions. The level or levels will be supported partly by grassy slopes, but chiefly by bevelled walls harmonising with the lines and forms of the house. These, in the Gothic style, may be furnished by battlements, gateways, oriels, pinnacles, &c.; or, on a very great scale, watch towers may form very picturesque, characteristic, and useful additions. The Grecian style may, in like manner, be finished by parapets, balustrades, and other Roman appendages.

The grounds enclosed by the terrace walks are generally laid out in what may be termed terrace gardens, or borders of low select evergreen shrubs, roses, and flowers, and in a convenient place was formerly added a bowling-green. Connected with this scene, and with the library, or some other public room, should be placed the conservatory; which, in the present improved state of horticultural architecture, and chiefly by the invention of a solid iron sash bar, may be formed of any shape, extent, and dimension; and so as thus to admit the full growth of the plants, &c.*

3. Flower Garden and Green-house. When all the hot-houses, that are not mere forcing-houses, are attached to the conservatory, so as to form one extensive range, which is much the most desirable mode, the green-house may be placed in the flower-garden; and both should be at no great distance from the terrace. There are various styles of flower-gardens; from those combining some degree of picturesque beauty, to the Dutch parterre, laid out in parallelograms or oblong beds. See Horticulture.

4. Winter Garden and Hot-houses. The name suggests the proper trees, shrubs, and flowering plants of den and this scene. Where the pine, camelia, rose, exotic hot-houses, and plant stoves are not placed in the kitchen-garden, or arranged in connection with the conservatory en suite with the principal rooms, they may be placed in the winter-garden, and connected by a glazed passage with the house. The arrangement of plants in the stoves and winter-garden, may either be natural, that is, in groups of each kind, in imitation of natural scenery, or according to Jussieu's Systema Naturae. Almost any arrangement is better than the common mixture, in which the only guide is the height of the plants.

The Kitchen Garden should be placed near to, and connected with the winter-garden, with concealed entrances and roads leading to the domestic offices for culinary purposes, and to the stables and farm buildings for manure. In these, if not otherwise disposed of, may be placed the forcing-houses. For what concerns the design of kitchen-gardens and orchards, see Horticulture.

These scenes, in the ancient style, with massy stone

* See Remarks on the Construction of Hot-houses," &c. 4to. 1817; and "Sketches for Curricular Hot-houses," 1810; Harding, St. James' Street. The bar, leading to so important an improvement, is manufactured by W. and D. Bailey, 272, Holborn, London.
The and but in should be adopted as the bed-chamber of the principal gardener; from this room wires may be conducted to each forcing house, and there attached to Kewley's alarm thermometer, one of which should be placed in each house in a state of forcing. This thermometer, on the least, or on any given depression or elevation of the mercury from the desired temperature, will ring the bell, and the master gardener can then, by means of a speaking tube, communicating with the journeyman's room, issue proper instructions as to the particular house requiring an accession of fuel, &c. In like manner, if necessary, wires may be stretched across the orchard in different directions, and about three feet from the ground, which, by being pressed against by any intruder, will set off an alarm, or discharge a spring gun in the orchard, and ring a bell in the master gardener's prospect room.

The term lawn is applied to that breadth of mown turf in front of, or extending in different directions from the garden front of the house; in the geometric style, varied by architectural forms, levels, and slopes; and in the modern by a picturesque or painter-like disposition of groups, placed so as to connect with the leading masses, and throw the lawn into an agreeable shape or shapes. In very small villas the lawn may embrace the garden or principal front of the house, without the intervention of terrace scenery, and may be separated from the park, or park-like field, by a light wire fence; but in more extensive scenes it should embrace a terrace, or some requisite artificial architectural basis to the mansion, and a sunk wall, as the distant separation, will be more dignified and permanent than any iron fence. The park may come close up to the terrace garden, especially on a flat, or in many cases where the breadth of this scene is considerable.

The shrubbery is a scene in which the object is to arrange a collection of foreign trees and shrubs in a dry border, generally on the north side of a walk, or in dug groups and patches. In either case there are three leading styles of arrangement, preferable to the common mode of indiscriminate mixture, which we have mentioned under winter garden.

Whatever arrangement is adopted, one very principal consideration is, to connect, partly in appearance only, the dug patches. The distinct unconnected obscurant of such scenes is justly reproved by Mr. Price, who gives excellent instructions for creating the beautiful picturesque among dug groups, and preserving all the polish and appearance of high keeping with the most delicate culture of the plants.

The pleasure-ground is a term applied generally to the kept ground and walks of a residence. Sometimes the walk merely passes, in a winding direction, through glades and groups of common scenery, kept polished by the scythe, and from whence cattle, &c. are excluded. At other times it includes a part of, or all the scenes above mentioned; and may include several others; as episodes, verdant amphitheatres, labyrinths, a Lime-avenue, Jussuan, American, French, or Dutch flower garden, a garden of native, rock, mountain, or aquatic plants, picturesque flower-garden, or a Chinese garden, exhibiting only plants in flower, inserted in the ground, and removed to make room for others when the blossom begins to fade, &c.

The park is a space devoted to the growth of The park timber, pasture for DIY, cattle, and sheep, and for adding grandeur and dignity to the mansion. On its extent and beauty, and on the magnitude and architectural design of the house, chiefly depend the reputation and character of the residence. In the geometric style, the more distant or concealed parts were subdivided into fields, surrounded by broad stripes or double rows, enclosed in walls or hedges, and the nearer parts were chiefly covered with wood, enclosing regular surfaces of pasture.

In the modern style, the scenery of a park is intended to resemble that of a scattered forest, the more polished glades and regular shapes of lawn being near the house, and the rougher parts towards the extremities. The paddocks or regular enclosures are generally placed between the family stables and the farm. The farm face, retained in the hands of the owner for private cultivation, was, in both styles, placed without, but adjoining the park; and when circumstances admitted, near to the paddocks. In some cases, on a moderate scale, part of the park constitutes the whole, or a part of the farm, and is kept in aration. The trees in this cultivated space are arranged in natural-like masses, so as to give the idea of part of a forest scene subjected to the plough. When the park is extensive and truly forest like, the effect of the whole is much improved by the contrast, and recalls to mind those charming scenes in the woody districts of Germany where cultivation smiles in the glades and recesses of eternal forests.

The Riding, or drive, is a road indicated rather than formed, which passes through the most interesting and distant parts of a residence not seen in detail from the walks, and as far into the adjoining lands of wilderness or cultivation, as the property of the owner extends. It is also frequently conducted as much farther as the disposition of adjoining proprietors permits, or the general face of the country renders desirable.

In Plates CCCXLIII and CCCXLIV. the whole of Plates these scenes are arranged in the usual manner, and nearly as above described; the one plate representing what may be called a vertical profile of a complete residence of the first rank in the magnitude, and the other in the modern style. But though the arrangement exhibited in these plans will be found in general the most convenient in a flat surface, or one gently varied, we are far from recommending their universal adoption. Situations are always fertile in suggesting new ideas, which

"Start even from difficulties, strike from chance;"

and a mind already stored with a knowledge of every part of the subject, works from principles, and natural suggestions, rather than models. We would rather see an original idea attempted than the most beautiful arrangement imitated.

Plate CCCXLV. shows, in two general views, the effect of both styles; and Plate CCCXLVI. to be afterwards described, is the working ground plan of Plate CCCXLIV.
LANDSCAPE GARDENING.

Chap. V.

OF THE UNION OF THE constituent Scener in forming Residences of particular characters.

In the preceding chapter we have given a general idea of the parts or scenes, and their connection, which enter into a palace or a complete residence of the first order. We have now to notice their arrangements in different gradations of style, and these we must previously acknowledge are so intimately blended, that we hardly know how to separate them, and give a distinctive character to each; every country gentleman, from the occupier of the mansion to the cottage, adopting such luxuriant scenes as suits his particular taste, without reference to any thing but his own desires; and this happy circumstance contributes, perhaps as much as the difference of situations, to the variety in the beauty and style of country residences. Mansions, villas, ornamented cottages, temporary residences, and public gardens, may be said to include the leading distinctions.

1. Mansions. As a specimen of this style, we shall give the arrangement at Michel Grove in Sussex, the residence of R. Walker, Esq., from the works of Mr. Repton.

"In determining the situation for a large house in the country, there are other circumstances to be considered besides the fences and appendages immediately contiguous. These have so often occurred, that I have established in imagination certain positions for each, which I have never found so capable of being realised as at Michel Grove.

"I would place the house, with the principal front, towards the south-east.

"I would place the offices behind the house; but as they occupy much more space, they will of course spread wider than the front. I would place the stables near the offices. I would place the farm buildings at a rather greater distance from the house; but these several objects should be so connected by back roads as to be easily accessible.

"I would bring the park to the very front of the house.

"I would keep the farm or land in tillage, whether for use or for experiment, behind the house; I would make the dressed pleasure-grounds to the right and left of the house, in places which would screen the unsightly appendages, and form a natural division between the park and the farm, with walks communicating to the garden and the farm."

2. A Villa, being originally a farm house, we think that the Roman arrangement, in which the farm offices were joined to, or at least near, as to form with it and the domestic offices one group of buildings, might be adopted as a characteristic distinction of this class of residences. The farm buildings, in this case, be dignified with more architectural design than when placed at some distance; but still in due subordination to the mansion. Instead of deer, sheep may graze the park on the garden front, separated from the house by an architectural barrier, or in some situations, with a platform of gravel, and walks and knots of flowers. A glance of turf, with a light fence below the slope, will be sufficient protection from sheep or cattle, and not impede the view of the lawn from the windows. The entrance-front may be approached through grass fields, not separated with common, but with picturesque fen-

ces in the modern, and double hedges and slips of planting in the geometric style.

If a corn field is seen from the approach, it will heighten the expression of a villa or gentleman's farm.

All or any part of the other constituent parts of a mansion, such as hot-houses, gardens, orchards, pleasure-grounds, &c. may or may not be added, according to its extent, and the particular taste of the proprietor.

But the great number of villas adjoining large towns cannot have this characteristic distinction of a villa; they may therefore be designated citizens villas, as a variety of the species.

3. An ornamented Cottage, we think, might be charac-

terised by the garden front opening into a picturesque cottages.

Orchard; or a lawn, varied by groups of fruit trees, instead of a lawn or park planted with forest trees. It may contain any part of the scenes of the villa, at the will of the owner.

If the situation of the house is elevated, so as to give a view from the principal part of the farm, it will be the more desirable. A desirable foundation for this improvement is an old English farm-house; by adding to which one or two principal rooms, a very interesting group may be formed at little expense.

4. Temporary residences, as marine villas, sporting or temporary shooting boxes, seldom contain much land attached. No hot-houses, and but little pleasure-ground is here required. What land there may be, should be applied to use rather than to beauty. Speaking of hunting boxes, Mr. Marshall observes, "a suit of paddocks should be seen from the house; and if a view of distant covers can be caught, the back ground will be complete. The stable, the kennel, the leaping-bar, are the appendages, in the construction of which simplicity, substantialness, and convenience should prevail."

5. Public gardens. These, with very few exceptions, public gardens have been in all ages and countries laid out in the geometric style. The Academus at Athens, is an ancient example. The summer garden at Petersburg, a modern one. Even in China, where irregularity in gardening is so much desired in general, Mr. Ellis (Journal of the Embassy of 1816) informs us, that "the Fatee gardens at Canton, the resort of the fashionables, consists of straight walks"; and however much our gardening has been praised and copied by private persons on the continent of Europe, yet, with the exception of Count Rumford's walk at Munich, and the late Earl of Fonthaler's at Carlshad, almost all the others are very properly in straight lines.

The object of public gardens is less to display beautiful scenery than to afford free wholesome air, and an ample uninterrupted promenade, cool and shaded in summer, and warm and sheltered in spring and winter. In a limited extent, these must be attempted in one principal walk, which, for that purpose, should as much as possible be laid out in a north and south direction. In more extensive scenes, certain covered walks may be devoted to summer, and certain east and west open walks, to spring and winter. The broad, open, and narrow covered avenues of the ancient style, are valuable resources on a large scale; these are joined, and laid out in a south and north direction, give in the centre an open sheltered sunshine walk in mid-winter; and a close or covered avenue being lined out along each side of the open central one, will afford shady walks for summer, and occasional places of retreat from casual showers in spring.

Oxford and Cambridge afford some fine, open, and covered avenues, though far inferior to many on the continent.

Public squares, of such magnitude as to admit of be-

squares.
LANDSCAPE GARDENING.

cause the gentleman who constantly resides at his place, must be a better judge of the means of improving it, than the professor whose visits are only occasional; for if this reason for a preference were granted, we might with equal truth assert, that the constant companion of a sick man has an advantage over his physician.

"Improvements may be suggested by any one; but the professor only acquires a knowledge of effects before they are produced, and a facility in producing them by various methods, expeditious, and resources, the result of study, observation, and experience."

"He knows what can and what cannot be accomplished within certain limits. He ought to know what to adopt, and what to reject; he must endeavour to accommodate his plans to the wishes of the person who consults him, although in some cases they may not strictly accord with his own taste." Observations on Landscape Gardening, p. 10.

A more wise plan than that of doubting on the subject, would be to have the separate opinions of different landscape-gardeners and architects; for no opinion need followed if disapproved of; while the probability is, that there would be something valuable in each, and the proprietor might finally, aided by the artist he preferred, decide for himself, never, however, forgetting the idea of a consistent and beautiful whole. As to the expense, Girardin observes on this subject, "N'allez pas le regarder... il vous en coûtera bien d'avantage pour des variations, et des retouches continues."

The intimate connection between landscape gardening and architecture, and the propriety and advantage of the joint consultations of the landscape gardener and the architect, as to the situation, aspect, and style of the house, together with the almost unavoidable encroachments of the former on the latter, by designing and executing garden buildings, has given rise to an opinion, that the landscape gardener ought to combine the functions of the architect. Mr. Repton justifies the idea, by referring to the many excellent houses built by Brown, with no other knowledge than that acquired by observation of all the best houses; and of Kent, who was at once landscape gardener, architect, and historical painter. We are of opinion, that in the case of garden buildings and small villas, or ornamented cottages, the knowledge both of the theory and practice of architecture, which it is necessary every landscape gardener should possess, will enable him to combine the duties of both professions: but such are the advantages of a division of labour in the fine as well as in the useful arts, that in all more extensive buildings, and indeed even in those we have mentioned, we would recommend the employment of a regular architect, jointly with a landscape gardener, as a surgeon consults with a physician in important cases.

The duties of the landscape gardener resolve themselves into the formation of a plan or design, and the carrying of it into execution.

Sect. I. Of the Study of the given Situation, and Circumstances, and formation of a Plan of Improvement.

On whatever occasion the opinion of a landscape gardener is desired, he should be furnished with a written or verbal instruction as to the points to which he should chiefly direct his attention, with a complete map of the estate, an accurate detailed history and description of its localities and peculiarities. From these

CHAP. VI.

OF THE PRACTICE OF THE ART OF LAYING OUT

Grounds.

The question has been agitated by some respectable authorities, whether every proprietor ought not to become his own landscape gardener; to which Mr. Repton replies, "that had the art still continued under the direction of working-gardeners, or nursery-men, the proprietor might supersede the necessity of such landscape gardeners, provided he had previously made this art his study; but not (as it is frequently asserted) be-

VOL. XII. PART II.
LANDSCAPE GARDENING.

and such other particulars he will be able to procure from topographical and county surveys, and similar works, after a residence of a few days or weeks, according to the extent of the subject and season of the year, (spring, before the leaves expand, being the most favourable time,) every requisite information; and to establish in his memory everything relating to the situation and vicinity. He is then, and not before, to embody and mature his ideas of improvement, directing his attention first to the situation and aspect of the house and offices, the extent of the park, and the emplacement of the kitchen garden; next to the general masses of wood, and then successively to the breadth of lawn, the situation and character of water, the pleasure ground, farm, and other details. Before making up his mind on any part of the subject, he will often find it of importance to have sections taken of the grounds in different directions, levels of springs and rills, &c. and most frequently he will have occasion for stakes, for marking out lines on the ground; of flag-staffs or poles, from 6 to 50 feet high, to represent the effect of trees, and other objects; of strips of white sheeting, to shew the effect of water, by forming a white outline on a perfect level; of frames partially covered with boards, to shew the effect of buildings; and he may even require boring irons, or pits dug, in order to inquire into the nature of the soil. Being furnished with a plan of the present state of the grounds, such as for example, as of Plate CCCXLV, which represents Plate CCCXLIV, in its previous state, he will, as he makes up his mind on particular improvements, mark them down on this map in pencil; and when the whole is finally adjusted, he will put them in red, or in any distinguishing colour, as is done in Plate CCCXLVI, by dotted lines. And on one or more general or panoramic views, as well as on the particular views which he may have taken on different spots, he will also mark in red the outlines that will be made by the improvements adapted to the different situations. In addition to these, he will shew the effect, by geometrical sections taken in different directions across the grounds, several of which, to shew the ground's surface, appear in Plate CCCXLVI. His next operation is to make a vertical profile, such as Plate CCCXLV, shewing the effect of the whole, supposing the alterations to be fifteen or twenty years completed, with such corresponding, panoramic, or general views, as are contained in Plate CCCXLVI, and with particular landscapes. It remains for him to give reasons in writing for all that he proposes; a practice which no employer or artist should ever omit to have done, as such opinions remain as data, to be referred to concerning the management and future effects, as well as in point of present or future justification of the taste, both of the artist and proprietor. This may be done in the following order: 1. Recapitulating the given instructions; 2. The characteristic of features and other details of the given situation and vicinage; 3. A description of, with the reasons for, the general outline of improvement; 4. The description of, with the reasons for the detail; 5. An outline of the future management; 6. Directions for the execution; and 7. An estimate of the expense.

In all these discussions, proper references will be made to the maps and sketches. Simple language will of course be employed in describing future effects; but, above all, simple sketches, which shall owe little of their effect to shading, and none to colouring, or finishing, are essentially necessary.

Mr. Girardin seems to have been the first who suggested this mode of obtaining an opinion systematically; and his remarks on the fallacious effect of beautiful drawings instead of outlines, are well deserving of attention, "Vous tachez meme que cette esquisse ne soit qu'un simple trait, et ne presente d'abord que les formes principales, et la disposition generale des grandes masses de votre ensemble. Un dessin bien line ne manquera pas de vous seduire par l'agrement de la touche d'un habile artiste; vous vous determinez d'apres un dessin dont vous ne reussiriez peut-etre pas a obtenir l'effet dans la nature, et il faut bien mieux avoir a gagner qu'a perdre dans l'execution."

Mr. Repton has the merit of first employing this system elegantly and extensively in England, and of adopting, instead of one entire landscape to shew the previous state, and another to shew the effect of the alterations, a slip of paper of the size and shape of those parts of the landscape which require alteration. This is fixed at one edge of the entire landscape, and lies flat over part of it, so that when lifted up it shews the full effect. It must be confessed, however, that, though an elegant mode, it is not perfectly fair, since the view in which the cut paper forms a part can never look so well as the other, even from the mere circumstance of the bounding line of the paper. For some cases, however, it may be used, that in general it will be found, that two entire landscapes afford the most impartial means of judging of the effects of an improvement. The discussion and sketches of the place, and improvements being finished and bound in a book, the ground or working plan, Plate CCCXLVI, is to be put on canvass, or copied on parchment, for the common use of the gardener, or whoever sets out the work; and the profile, Plate CCCXLV, put on rollers, to be preserved along with the red-book of the place. These being delivered to the proprietor, he will determine, after mature deliberation, whether or not he will adopt the whole, or any part of the improvements, previously consulting those friends, whose taste or judgment he considers adequate to forming a judicious opinion on the whole, or on any one part of the subject. "Lorsque l'esquisse de votre ensemble sera faite, alors vous vererez, vous concerterez, vous discuterez avec des gens de gout l'ordonnance generale de la disposition qu'elle vous presentera."

In this example of forming a plan, we have chosen a dull and nearly flat site where nothing has been done; but it is evident, that the same general principles are applicable to such places as are to be altered, diminished, or enlarged.

Sect. II. Of carrying a Plan into execution.

Whether this must be done by contractors, or by the proprietor at his own risk, must depend on circumstances, both respecting the knowledge, taste, and leisure of the proprietor, and the nature and extent of the improvements. Where an entire new house and grounds are to be created, an eminent substantial contractor for the buildings, and another for the ground operations, will be found the most speedy and certain as to expense; the work, in both cases, being liable to be regularly examined at stated periods by a neutral surveyor, accompanied by the original designer of the improvements.

If this mode is not adopted, the whole, or greater part, may be done under the eye of the owner and his steward; various, and as many parts as possible, being let by the job. We shall take a cursory view of the chief objects of alteration or addition, and indicate something in each, which may in most cases be more
LANDSCAPE GARDENING.

The Art of laying out Grounds.

profitably done by the job, premising, that whenever the cost or intricacy of any piece of work is considerable, unless a contractor of some respectability is employed, the work is much better done by the labourers of the proprietor.

Buildings. All alterations or new erections, may be readily estimated and executed by contract, and almost in every case at less expense to the proprietor. The mere difference between the trade price and the gentleman's price of the materials and labour, and between the hours kept and the quantity of work done in a given time by a journeyman to a master tradesman and to a gentleman, will, (if the former should, by error in estimating, find no other gain,) afford a certain profit to the tradesman; and thus, suppose a contractor to estimate a piece of work at £1000, and which the proprietor, changing his mind, instead of letting to the contractor, executes it himself and finds the amount £1100, the contractor, had he got the job, would have actually had a profit, and the owner been a gained of £100.

The mansion, domestic and farming offices, garden, walls, and hot-houses, may all be separately contracted for.

Ground. The removal of ground, fences, or digging, may in every case be let by the job, and with decided advantage to both parties. The extent of particular contracts should, of course, be in proportion to the responsibility of the contracting parties.

Planting. The enclosures and the preparation of the soil may, in all extensive cases, be executed by contract; but the planting, or insertion of the plants, on which so much depends, should uniformly be done by day work; excepting, however, those cases in which a respectable nurseryman will engage to put in a certain number of plants of a certain kind, size, and age, and maintain them there for at least three years. In some extensive cases, the land may be prepared by fallowing, which the adjoining tenants will generally undertake at a very moderate price per acre. In most cases, the contractor for fences, or whatever description, should undertake to uphold them for a given number of years; and in cases of thorn hedges, or other live fences, until they become sufficient barriers.

Road and Walk making may frequently be contracted for; but in this case, as in every other, much will depend on the skill, activity, and experience of the gardener or general overseer.

Sect. III. Description of Plates CCCXLIII. CCCXLIV. CCCXLV. and CCCXLVI. combining a concentric view, both of the Geometrical and Modern Gardening.

These plates represent specimens of residences laid out, both in the geometric and in the modern style. Plate CCCXLIV. Fig. 1. is a profile of a complete residence in the geometric manner, the trees supposed to be of fifteen years growth. The situation, as far as respects natural surface, is dull and uninteresting, being nearly a flat, but with a gentle rise or ridge, running east and west near the centre, and on which the house, hot-houses and gardens, are placed. The surrounding country is supposed to be in a comparatively uncultivated state, either mountainous or flat, with remains of natural forest scenery. Such situations abound in Ireland and Scotland, and are to be found also in some English districts, as in Yorkshire, between Malton and Whitby.

The object of art is to create a magnificent, and at the same time a comfortable residence; and amidst such wild and uncultivated scenes, we consider this will be better effected by adopting the ancient than the modern style of gardening. For imitations of nature, surrounded by nature itself, will ever be surpassed by the original, and lose half their beauty from the want of contrast; but scenes of bold and awed art, in such a situation, raise at once a character striking and original, and convey a thousand interesting ideas of human art, industry, and refinement, which would be wanting to the other; and the wild scenery around, while it strengthens these ideas, is itself, by contrast, heightened in expression. Even on the plea of the superiority of natural to artificial beauty, it may be said in favour of adopting the ancient style in such cases, that no existing beauty is lost, while much new beauty is created. In such a situation, very few external circumstances can be supposed to influence the arrangement of the component parts of the residence. The house, therefore, is placed near the centre of the park on the ridge already mentioned, and with a south-east aspect.

No. 1. is the covered entrance, through a Gothic arcade, with the porter's lodge (No. 2.) at one end, CCAXLIII. washed by the waters of the moat, and the entrance hall (No. 3.) at the other. No. 4. is the garden, i.e. the half of the whole height of the building, and lighted from windows above the general roof. No. 5. is a chapel, with a billiard room under. No. 6. is the library, communicating with a conservatory, green-houses, and hot-houses, at No. 7., and by an elegant Gothic cloister (No. 8. under the chapel) with the drawing and dining rooms at Nos. 9. and 10. The rest of the internal arrangement is easily conceived. The whole building is supposed to be roofed flat, and covered with lead. No. 11. is the kitchen court. No. 12. The domestic stables and coach-houses, &c. No. 13. The farm-yard and farm. No. 14. The paddocks. No. 15. The walled orchard, with No. 16. a fruit-tree border surrounding it. No. 17. is the kitchen garden. No. 18. The forcing-houses, with mushroom sheds, gardeners lodges, furnaces, &c. behind. No. 19. The gardener's house, and watch room over. No. 20. The melon ground, &c. for forcing asparagus, roses, growing young pines, &c. No. 21. Heaps of compost. No. 22. Back road for manure and fuel. No. 23. Modern flower garden, covered with wire netting, and serving as an aviary. No. 24. Water engine house for forcing water to eisterns in the hot-houses. No. 25. Upper terrace garden. No. 26. a jet d'eau. 27. Under terrace, or lawn. No. 28. Descent to the water, with a view to sailing or fishing from a boat, or setting off floating-bait, &c. No. 29. House for fishing tackle, and for fishing from in hot or rainy weather. No. 30. Pleasure-ground, consisting of broad gravel walks, accompanied by an equal breadth of turf, and bordered by a phalanx of shrubs, rising in gradation to the highest trees, and arranged in the Linnear manner. One half of these walks will generally be in shade, and the other fully exposed to the sun, so that a choice may be made according to circumstances. No. 31. French parterre. No. 32. Labyrinth. No. 33. Forrester's house, with banqueting room over. No. 34. Natural forest scenery, blended and harmonized with the artificial plantations. No. 35. West entrance. No. 36. Fountain which supplies a jet d'eau in the French parterre, (No. 31.) and also in part supplies the large lake. No. 37. Large triangular field, enclosed by fences, in the directions of the bounding strips, and under the trees. No. 38. Unenclosed meadow land beyond the park, harmonized by (No. 39.) rows and scattered trees. No. 40. Open arable lands. No. 41. Public road. No.
principal entrance. No. 43. Park, which may or
may not be subdivided by hurdle fences, in the direc-
tions of the strips and avenues. No. 44. Embattled
avenue. No. 45. Avenue of platoons. No. 46. Walk
to the farm. No. 47. Winding walks in the natural
forest scenery.

Fig. 1. of Plate CCCXLV. represents a general view
of this residence.

Plate CCCXLIV. is a profile of a complete residence
in the modern style of laying out grounds; the trees,
as in the other specimen, being supposed, with the ex-
ception of such as were already there, to be of fifteen
years growth.

The situation, as far as respects surface, is supposed
to be exactly the same as the other, a flat, with a ridge or
rise in the middle; but instead of being situated in a
wild country, it is supposed to be surrounded by cul-
tivated fields, enclosed and subdivided by hedges, strips
of plantation, walls, and other fences. A magnificent
and comfortable residence is, in such a situation, to be
created by a more refined display of art and human in-
dustry than in the former case; and wild nature, now
banished from the general surface of the country by ex-
tended cultivation, is to be invited back as a more ele-
vated and distinguishing description of beauty, partly,
as being more rare, and calculated to strike, by con-
trast, and partly as being more suitable to the taste and
nations of man, after a certain progress in civilization
and refinement.

Scarcely any motive but general convenience can here
be supposed to influence the situation of the house;
the offices and gardens are disposed on the contrary
side to the other, merely to afford some difference be-
tween the two designs; but this general form, style,
and elevations, are nearly the same, in order to exclude
any classical associations which a Grecian building
might have introduced, and thus have occasioned a par-
tial judgment as to the effect of the new style of gar-
dening, compared with that of the ancients.

No. 1. Is the entrance portico for carriages to drive
under, a mode which should never, in our opinion, be
omitted either in public or private buildings; for what
can be more ridiculous and inconsistent with our gene-
ral attention to comforts and luxuries, than issuing from
a warm room, and walking half a dozen yards in the rain
or wind to enter a carriage? No. 2. Hall and grand
stair-case leading to a cloister on the first floor, extending
round the quadrangle, and communicating with No. 3.
the family stair. No. 4. Stair for married strangers.
No. 5. Stair for single strangers, &c. No. 6. Dining room.
No. 7. Library. No. 8. Drawing room. No. 9. Mu-
passage, open on both sides, with a glazed room, under
which vines may be trained, leading to No. 14. Aviary,
or garden covered by a wire netting, 40 or 50 feet from
the ground, so as to include forest trees, in which nat-
ive and foreign birds may range undisturbed, &c.
Open walk in ditto. No. 20. Covered walk formed
to blocks of evergreens. No. 21. Group of statuary
and rock work for winter and early flowering plants. No.
21. Passage to No. 22. the kitchen garden. No. 23.
Forcing houses of approved curvilinear forms, being seg-
ments of spheres. (See note to chap. v.) No. 24. Gar-
ground. No. 27. Walk to farm. No. 28. Back road
to stables. No. 29. Line of wire fence enclosing the

pleasure ground. No. 30. Part of the park fed by sheep.
No. 31. Broad gravel walk, with an equal breadth of
turf on each side for such as prefer walking on that ma-
terial, shade and cover being produced by planting trees
in the line of separation between the gravel and turf. No.
32. A similar walk in the park, or forest scenery. No.
33. Permanant sunk fence between the deer park and
that part to be grazed by sheep. No. 34. Bridge over
the lake. No. 35. Park scenery. No. 36. Cultivated
scenes, harmonized by bringing one arable field, No.
37. into the park, and extending trees, No. 38. and
grass, No. 39. among the arable lands. No. 40. Situ-
ations for furze, briars, ferns, and other low growths.
No. 41. Approach to the park, No. 42. Public road. No. 43.
Fields appropriated to the park, the fences of the pub-
lic road being sunk walls. No. 44. Barn. No. 45.
Bailiff's house and garden. No. 47. Straw yards. No. 48.
Rick yard. No. 49. Line in which a riding may be taken, or in which carriages
drive round the park, and from thence in any de-
sirable direction, with a view to enjoying the beauties of
riding.

Plate CCCXLV. Fig. 2. is a general view of this re-
sidence.

The whole extent of the park is not shown either in Fig. 2.
Plates CCCXLI. or CCCXLIV. partly because it is
unnecessary in conveying a general idea of style and
arrangement, but principally because the necessarily
limited magnitude of plates in a work of this nature,
precludes the idea, on so small a scale.

In these plans, a very slight shade is adopted as the
aerial tint for the surface of the higher grounds; and
the lower levels are darkened in proportion to their
depth. The situation of the sun is taken at south-east,
and his elevation at 45°; whence it follows, that the
shadow of every object, measured in that direction, will
shew exactly its height. In the case of trees and coni-
cal objects, the dimension must, of course, be taken
from their centre or highest points.

Plate CCCXLVI. is the working plan to Plate CCCXLIV. The first thing to be observed in this plan,
CCCXLVI. is the original positions and divisions of the fields, and
public and private roads, brook and farm houses; the
crosses thus (x) on certain lines, signifying that they
are to be removed; the dotted masses represent the forms
of the proposed plantations; and the dotted crosses ad-
joining these, the situations for single trees; and the small
circles (o) the situations for groups. The kind of tree to be
planted, is represented by capitals, and the sort of shrub
by small letters. These must refer to a prepared list of
trees and shrubs. The fences, culture, and other par-
ticulars of the plantations, will be contained in the
book of improvement, or, as it is termed by Mr. Rept-
ton's red book of the place, with which the reader
may be furnished.

No. 1. Is the site and outline of the house and offices,
which must be left for separate plans and details, or
for the architect. No. 2. Site of the pleasure ground,
terrace, gardens, kitchen-garden, hot-houses, &c. which
must be explained and executed from separate plans,
sections, and particulars, it being sufficient in this ge-
special to mark out their site, so as to admit of exe-
cuting the grand masses of plantation. No. 3. Lines of
roads and walks, which may be executed independently
of the house and pleasure grounds. No. 4. Outline
of water. No. 5. Sections of ditto, shewing the dif-
ference between the present and former surface, the line
a b, being the level of the water. No. 6. General sec-
sections across the residence, the line a b being that of
the level of the ground on which the house stands. No. 7.
Sect. IV. Of the professional Education of a Landscape Gardener.

Sir William Chambers complains, that, in his time, the art of laying out grounds was too generally left to kitchen gardeners; and Mr. Repton, (who has died since the former part of this article was written), in his introduction to Observations on the Theory and Practice of Landscape Gardening, and in his Letter to Mr. Price, states, that he stepped forward (in 1790 we believe) under the protection of some of the first characters of the country, and rescued the art from the hands of laborious, Wright, Isaac, Hamilton, and some others, according to Mr. G. Mason, must be excepted; but whether this be the case or not, no blame can be attached to this ingenious and intelligent class of men for their attempts at landscape gardening; since it is just as natural, in the infancy of art, for a kitchen gardener to become a landscape gardener, as for a mason to become an architect; and experience has shown, that the one class is not less fit for the assumed profession than the other. There is, indeed, a certain degree of practical knowledge requisite for both architects and landscape gardeners, which no person who has not studied as a carpenter, mason, or gardener, can easily if at all obtain.

Whoever is intended for a landscape gardener, should, in our opinion, be sent for at least one year to an eminent nurseryman, or horticulturist, where he may acquire a practical knowledge at once of the nature and culture of plants and trees, and the general economy of a garden. If he is to act also occasionally as an architect, he should next be sent for at least one year to an eminent carpenter and builder, during which time he ought to study the theory of carpentry, as well as the mechanical principles, and principles of design in architecture. On the supposition that he has, previously to all this, had a liberal education, he may now be placed under a landscape gardener, where, in addition to the common routine of the profession, he ought to be assiduous in sketching and studying the effect of landscape and buildings, in particular; and in studying the principles of taste and of the fine arts, in general. He may, during this time, or as soon afterwards as possible, employ great part of his time in visiting the principal gentlemen's seats, and scenes of natural beauty in great Britain; and, if to this he can add an excursion in great Britain; and, if to this he can add an excursion in great Britain; and, if to this he can add an excursion in great Britain; and, if to this he can add an excursion in great Britain; and, if to this he can add an excursion to Italy, and the south of Germany, he will richly profit from the time and expense so employed.

We may suppose the pupil, after such a course, to have attained the age of 25 years, when he may commence practising the art. Before that period of life, we doubt whether any person, however great his natural sensibility or industry, can have acquired a mature taste and a sufficient stock of theoretical and practical knowledge. Without these combined, and qualified by good sense, he may throw out occasional brilliant ideas of improvement, but cannot be relied on for a general plan that shall bear, in all its parts, the test of critical examination. But "where theoretical knowledge, and practical skill," Mr. Stewart observes, "are happily combined in the same person, the intellectual power of man appears in its full perfection, and fits him equally to conduct with a masterly hand the details of ordinary business, and to contend successfully with the untried difficulties of new and hazardous situations." Elements of the Philosophy of the Human Mind, p. 292, ed.

The following works may be advantageously consulted on the art of gardening and laying out grounds.

1. Geometric Style.

1683. Traité du Jardinage, selon les raisons de la Nature et de l'Art. 4to.
1673. Boyceau D'Argenville, Théorie et Pratique du Jardinage, ou l'on traite à fond des beaux Jardins appelés communément les Jardins de plaisir. 4to.
1702. Geometric pratique des Maisons et des Jardins, par Mallet. 4to.
1719. Ichonographia rustica. 8vo. 2 vols.
1726. Clarici del Architettura d'un Giardino. 4to.
1728. Le Blond’s Theory and Practice of Gardening.

2. Modern Style.

1764. Shenstone's Unconnected Thoughts on Modern Gardening. 12mo.
1768. Mason's Essay on Design. 8vo.
1770. Wheatley's Observations on Modern Gardening. 8vo.
1772. Chambers' Oriental or Chinese Gardening. 4to.
1776. Morel, Théorie des Jardins. 8vo.
1777. Girardin de la Composition des Paysages, ou des moyens d'embellir la nature autour des habitations en joignant l'agréable à l'utile. 12mo.
1793. Hirschfield, Théorie des Jardins, 5 vols. 4to.
1798. Price's Essays on the Picturesque. 8vo.
1807. Repton's Observations on the Theory and Practice of Landscape Gardening. 4to. (J. c. L.)

LANDSCAPE PAINTING. See Painting.

LAND-TAX, is an annual impost, which superseded all the former methods of rating either property or persons in respect of their property, whether by tenths or fifteenths, subsidies on land, hydages, seutages, or tallages.

In the beginning of the civil wars between Charles I. and his parliament, the latter, having no other sufficient revenue to support themselves and their measures, introduced the practice of laying weekly and monthly assessments of a specific sum upon the several counties.
Kirby-Stephen in Westmoreland; but the precise year of his birth has not been ascertained. Little information has been preserved with regard to the particulars of his life. His father, the Rev. Joseph Langhorne of Winston, died when his son was young; leaving him and his brother William to the care of their mother. The place of his education is not known; his name is not to be found in the list of graduates either of Oxford or Cambridge.

He first appeared as an author in 1758, when several pieces of poetry, written by him, were inserted in the Grand Magazine of the United Republic, published by Mr. Ralph Griffiths, the proprietor of the Monthly Review. His first publication was The Death of Adamis, a Pastoral Elegy, from Bion, 4to, 1659; which was followed, in the same year, by The Tears of Music, a Poem, to the Memory of Mr. Handel, with an Ode to the River Eden, 4to. Having taken orders, he became tutor to the sons of Robert Crancroft, Esq. of Hackthorne, in Lincolnshire; and, in 1760, he published, at Lincoln, a volume of Poems on several Occasions, 4to, for the benefit of a gentleman in distress. Soon after he repaired to London, where he engaged as a writer in the Monthly Review, espoused the interest of Lord Bute, and published various performances in prose and verse. In 1764, he published Sermons, in 2 vols. 12mo. In the month of December 1765, he was appointed assistant preacher at Lincoln’s Inn, probably through the interest of Warburton, to whom he had dedicated his Letters of Theodosius and Constantia. In 1766, he published his Poetical Works, in 2 vols. 12mo. About this time, he obtained the valuable rectory of Bladon in Somersetshire, which he held until his death, and was appointed a prebendary of Wells. In 1767, he married Miss Crancroft, the sister of his former pupils, who soon after died in childbirth of a daughter, and was pathetically lamented by her husband in some verses to her memory. In the year 1770, he published, in conjunction with his brother, Plutarch’s Lives, translated from the original Greek, with Notes critical and explanatory, and a new Life of Plutarch, in six vols. 8vo. He died, after a lingering illness, at Bladon House, on the 1st of April 1777.

The private character of Langborne appears to have been amiable and respectable. His works are very numerous; but of his prose writings, none have obtained much popularity, excepting his Solyman and Almena, Theodosius and Constantia, and his translation of Plutarch’s Lives. As a poet, he exhibited undoubted marks of genius, imagination, and sensibility; and some of his verses hold a respectable rank among the productions of our minor poets. His chief faults appear to be an occasional redundancy of diction, and an affectation of false and unnecessary ornament. See the Life of Langborne, in Anderson’s edition of the Poets; and the Gen. Bio. Dict. (2)

LANGRES is a town of France, and the chief place of a district, in the department of the Upper Marne. It is situated at a greater height than any town in France, and has a fine appearance at a distance, when approached from the side of Vosul. Some of the streets are wide, and many of the houses commodious and well built. The church of St. Martin, which has a lofty tower, is a large and handsome building. There is a fine promenade between the two gates on the road from Vosul. Langres is famous for its cutlery, and its scissors have long been celebrated. There are also extensive paper works in the town. Population, 7558.
LANGUAGE.

Language. (From the French Langue, and that from the Latin Lingua, "the tongue," in its proper sense, means "the expression or enunciation of human thoughts and sentiments, by means of the articulate sounds of the human voice." It has usually, however, been extended to comprehend in general, "all the means of expressing or announcing thought and feeling by sensible signs." Taken in this extended sense, language may properly be distinguished into Natural or Instinctive, and Artificial or Conventional; as the sensible signs, by which the announcement is made, may be either suggested immediately by nature, or formed by human skill and intention.

The power of communicating the inward thoughts and feelings, must be essential to a being destined to live at all in society. Without this power, each individual must for ever remain insulated and solitary, incapable of either imparting or receiving social aid or enjoyment. Nature has accordingly provided means for such communication, sufficient, in all cases, for that degree of social union in which each class of animals is to subsist. The inferior species accomplish it by certain signs and gestures, and, above all, by peculiar sounds or cries, wholly taught by instinct, and understood also, as far as necessary, by immediate instinct, without instruction, and independent of experience. This limited extent of the power of communication, is sufficient for the purposes of their being; but for man, a rational as well as social being, much more was requisite.

In common with other animals, indeed, he is furnished by nature with certain powers of employing the limbs or the voice, so as to denote, in a manner recognised instinctively by all his fellow men, many of his inward feelings, emotions, and desires: these, therefore, often serve as natural signs, for imparting to one man what passes in the mind of another. But these natural signs are few, and extremely limited in their application. They may intimate a few of the more simple feelings; but by far the greater part of what passes in the mind, cannot thus be made a subject of exhibition. If men are to hold a communication co-extensive with their faculties as rational beings, a far more extended class of signs must be formed and employed, by the conventional use of which, all the various thoughts, feelings, and emotions of the mind may be specifically declared. This necessity gives rise to what is termed Artificial or Conventional, in contradistinction to Natural Language.*

Natural Language.

Nature has established a connection between many of the feelings and passions of the human heart, and certain motions or changes in the external appearance universally known and recognised. The angry countenance, the scowling eye, the indignant frown, mark with precision what is passing within; the placid look, the composed mien, the benignant smile, give universal pleasure. The same is the case with many other feelings. These natural signs are interpreted without reasoning; neither the savage nor the polished citizen are at a loss for their meaning. They are applicable, however, chiefly to the feelings and emotions, though they may occasionally be made to express also the dictates of the understanding.

The natural signs, by which the inward thoughts and feelings can thus be externally announced, are of three natural classes: Modifications of the features of the face; variations of the limbs or gestures of the body; and modulations of the voice. These constitute a primitive and uniform language, to which recourse can be had in every society, when conventional signs are unattainable or inadequate to the particular occasion.

The expression of mental feelings by the features of the face is a matter of general observation. From this the face expression, it has been justly remarked, much of the excellence of the art of the painter, and not a little of that of the orator, is derived. A familiar acquaintance too with this class of signs, is of the highest importance to the artist; and, on many occasions, the orator will find his advantage in cultivating it. All this holds true of the expression of feelings and passions. These are often fully exhibited in the features. But not satisfied with this, many have gone farther, and maintain the countenance to be an index not of passion only but of character. Hence has arisen, what has been termed the science of physiognomy. It is well known how much this has, in all ages, engaged the attention of ingenious men, and to how many discussions and investigations it has given occasion. The examination of these belongs to the article of Physiognomy. It is sufficient to remark at present, that it is evident from universal experience, and even from the speculations, however fanciful, of the physiognomist, that a class of natural signs, indicating many of the emotions of the mind, does unquestionably exist; and this forms one branch of natural language. The particular detail of these signs themselves, constitutes the chief part of the physiognomical science.

Besides the features of the face, we have another class of gestures of natural signs, indicative of mental emotions, in the and motions gestures and motions of the body. The knowledge of the limbs and body, these, as well as of the former, must always be indispensable to the historical painter, the orator, and the actor, and ought never to be neglected by the orator. In sadness and melancholy, the head is apt to sink, and

---

* This account of the natural origin of language, proceeds upon the idea, that language was formed and invented for the purpose of announcing or communicating thoughts; and this idea we cannot but consider as just. It has indeed been ingeniously contended of late, that the communication of our thoughts is not in fact the object or purpose of language, but that its real and definite object consists in the production of thoughts in the minds of others by means of oral signs. It is readily admitted, that the production of certain thoughts in the mind of another, is, and must be, an ultimate object of the use of language; this is implied in the very act of employing it. But this ultimate object is in no respect peculiar to language; it may be equally predicated of every species of mutual or social action. The specific purpose of language is to be sought not in the ultimate object, which it aims at in common with other processes of human action, but in the peculiar manner in which it is employed for the attainment of that ultimate object. Now it seems evident, that it is solely by the emanation of the thoughts, feelings, and mental energies of the speaker, that language can serve to produce thoughts in the mind of another. We conceive ourselves therefore fully warranted, in holding the communication or annunciation of thoughts, feelings, or mental energies, the direct and specific object of the language employed.
the arms hang down; in joy, the head is elevated; in displaying pride, it is stiff and erect; in contempt and indignation, its motions are quick and irregular; in gaiety and merriment, the corners of the mouth are con-
tacted, and in some degree raised, the cheeks rather
drawn inward, and the muscles of the lower part of the
countenance in a slight measure convulsed, which gives
rise, to laughter; in admiration and surprise, the body
is thrown back, and fixed seemingly immovable in one
position; in fear, the arms are extended, the eyes opened
wide, and the limbs often affected with tremulous
and desultory movements. All these, and many other
variations of gesture, are the instantaneous and involun-
tary effects of passion. They may justly be said to be
constituted by nature as interpreters of the feelings of
the mind. This class of natural signs appears to be
more susceptible of extended application than some of
the others, and the extension and improvement of them
has given rise to the art of pantomime. The extent to
which this art has often been carried, is very great. In
ancient Rome, the exhibition of dramatic action, with
the accompaniment of words, was a common amuse-
ment, and the audience were never at a loss to follow
the action through all its parts. The modern pantomimes,
too, often exhibit both character and passion by
the medium of action and gestures alone, with a high
degree of accuracy. These exhibitions are unquestion-
ably the productions of skill and art, but they are
founded upon the natural signs of the inward feelings,
manifested in the gestures and motions of the body.
Were there no other means of communication, it is dif-
ticult to say to what perfection this class of signs might
in time be brought. Savages, ignorant of each other’s
language, can thus make known their desires and feel-
ings without difficulty; and all of us have often wit-
tessed the readiness with which dumb men can, upon
occasion, adapt their gestures to the expression of their
inclinations and wishes.

A third class of natural signs, expressive of our in-
ward feelings, is to be found in the instinctive modula-
tion or tones of the human voice. These natural cries
and moans involuntarily even at the earliest period of
life; and at every age, when the feeling is excited, they burst forth spontaneously, in spite of all
artificial refinements, without design, and without re-
gard to consequences. Joy, grief, suspicion, admira-
tion, despair, exultation, hope, fear, and many other
emotions are thus manifested. These modulations of
the voice approach to, but are by no means of the same
nature with the articulate sounds which form the ma-
terials of artificial or conventional language. They are
uttered only under the influence of passion or emotion;
they are taught by nature, and require no instruction to
explain their meaning. From their near relation to
words, however, they have obtained a place in gram-
mar, and are commonly stated as one of the parts of
speech, under the denomination of interjections. They
undoubtedly mingle in all impassioned discourse, and
often contribute to the force and effect of eloquence;
still they can only be regarded as the natural and in-
stinctive expressions of feeling. Among different na-
tions, the number of those instinctive sounds which claim
an occasional place amidst the use of conventional words,
may vary, either from different intensity of feeling, or
from the fuller adaptation of words to the expression of
passion; but in all languages they do to a certain extent
remain, occasionally employed by the orator, and fre-
nently bursting forth to indicate the strength of the
interal feelings.

These various classes of natural signs might undoubt-
edly have served for carrying on some kind of inter-
course in the rudest stages of human society; but it
cannot be disputed, that their application is extremely
limited, and if man was ever to rise above the condition
of mere animal existence, he must have a means of com-
munication more suited to his situation, and co-extensive
with his rational faculties. Hence arises the necessity
of employing a different and more enlarged class of signs,
indicating not only feelings and passions, but thoughts
and ideas, objects, actions, and relations; a class of signs,
in short, rising from natural and instinctive, to con-
tventional and artificial language.

Conventional or Artificial Language.

The situation of man as a member of society, and his
possession of powers and faculties as a rational being,
rendering a much more extended and enlarged mode
of communication necessary for him, than could be
accomplished by mere natural signs, an obvious question
arises, What means the Author of our Being has furnish-
ed for the attainment of an object so important to the
great ends of human existence? It is by no means in-
conceivable, that any one of the classes of natural signs,
or instinctive expressions of thought, might have been
adopted as the ground work of a more enlarged conven-
tional language; the features of the face, or the gestures
of the body, might perhaps have been moulded into
forms, to each of which, an arbitrary but determinate
meaning might have been attached, and these, united
with rude inarticulate cries, might have served to carry
on some kind of intercourse among men. But how in-
adequate must all these, even in their most improved
state, have been, to answer the ends to which speech is
subservient. All the variations of which they are sus-
ceptible, could mark only a few emotions, but by much
the greater and more important subjects of thought and
volition would have been beyond their reach. It be-
came necessary, then, that some other means of commu-
nication should be found, by means of which the
intercourse upon which so much of human happiness and well being
depends. And such a mean of communication had
been provided by the Divine Author of our nature.
The human voice is so framed and constituted, as to be
susceptible of articulate modulations in an almost end-
less variety, and the power of forming at least to a cer-
tain extent these modulated sounds, is possessed by all
men whose faculties are entire. In these articulate
sounds, then, we find materials furnished by nature,
and placed within the reach of all, which human inge-
nuity and industry can easily form, by the aid of expe-
rience, into a collection of conventional signs, fit to ex-
press every thought of the human mind.

But though the materials of language, as well as the
power of employing them, are thus provided by nature;
it has been made a question, how mankind were at first
induced or impelled to have recourse to this mode of
communicating thought by the fabrication and use of
articulate sounds. Children, it has been observed, learn
to speak by imitation; and it would appear by the ex-
amples of one or two solitary savages, found at different
times remote from human society, that where the op-
portunities of such imitation are wanting, the use of ar-
ticulate speech is nearly unknown. In what way then
was the use of speech, or conventional language, first in-
troduced and adopted? According to one class of writ-
ers, it was originally revealed, and taught to man by the
Author of his Being; according to others, it was entirely the fruit of human invention. The former opinion, its advocates contend, is supported by the authority of Moses, who expressly tells us, that the Creator, after he had formed the beasts of the field, and the fowl of the air, brought them to the first man that he might give them names, and that the names so given, were those by which they were afterwards called; the latter opinion however, has been held, not only by many of the ancient philosophers, but by a number of the moderns also, who admit fully the authority of Scripture, though they contend, that the Mosaic narrative does not imply any special revelation to direct our first progenitor to the use of articulate sounds. Those who consider a special revelation as necessary for the invention, allow, at the same time, that all the faculties and powers requisite for forming speech, are given as constituent parts of the human constitution, requiring only a specific impulse to bring them into action; and those who most eagerly contend for attributing the whole to human ingenuity, admit, that the invention must have been one of extreme difficulty, which could only have originated with some superior minds, who might first be led to it by the imitation of certain natural sounds with their own voice, and then gradually communicate to the other members of their tribe, the mode of forming and applying similar sounds for the expression of thought.

Much ingenuity and emulation have been expended upon this question. One side has been maintained by Simen, Cowilliers, Dr. Adam Smith, and above all, by the learned author of the "Origin and Progress of Language;" the other by Delaney, Warburton, Dr. Stanhope Smith, and others; but after all their labours, so much obscurity and uncertainty remain, that we must be content to leave the point undecided, nor in all probability will it ever receive a complete solution. Two material facts, however, we may regard as established by experience; that wherever, from defects in the organs of hearing, or from seclusion in infancy from human society, no opportunity has been given of learning by imitation to form articulate sounds, the faculty of speaking has always been found wanting, except so far as subsequently acquired, with labour and perseverance, by instruction from those who previously practised it; and that in all cases, the actual power of speech is found to be so much limited to the formation of those articulate sounds only which have been learnt in infancy, that it is with the utmost difficulty the pronunciation of any new sounds can be attained at a more advanced age. These two facts appear rather to lead to the conclusion, that besides the mere possession of the organs and faculties of speech, some impulse must have been necessary to call these into action, so as to lead to the formation of language; but to what extent, or in what manner that impulse may have first been given, it is to no purpose to inquire. On this point, the Sacred Scriptures are silent; history does not go so far back into the earliest periods of society as to furnish any information in regard to it; and neither from reasoning nor experience, can we derive satisfactory means of gratifying our curiosity.

In whatever manner articulate speech originated, we may safely conclude, that this primeval language could not be copious. It would undoubtedly extend no farther than the occasions of employing it, and as these, in the infancy of society, could not be numerous, the language in use must have been equally scanty. It was sufficient, if the immediate means of communication were provided, and a foundation laid upon which the entire super-structure could in the progress of society be reared.

The rudiments of articulate language being once formed, new occasions for communication would quickly occur; these would, of course, require the adoption of new articulate sounds for making the communications required. At all times, men are more disposed to improve, enlarge, and alter, than to invent. The new signs required would, therefore, in general, be formed from the first rudiments of speech by modification and composition; retaining still the original meaning, but with such variations superinduced as might point out the new relations to which it was to be applied, or the new associations into which it was to be brought.

Such may be stated to be the general outline of the formation and progress of language; but it is a curious subject of inquiry, by what particular steps, and in what particular times the progress was accomplished; what class of words may most properly be regarded as the ground-work of speech; and what was the march of the human mind, so to speak, in this gradual advance from the first elements, to all the varieties and forms of words. In such an investigation, we must, it is true, in a great measure rest upon conjecture, but still circumstances may be observed, which will serve to a certain degree to guide our inquiries.

Language, then, is to be observed, is the application of articulate sounds to denote and to communicate the emotions, feelings, and actions of the mind; now, the only motive for making such communications by words at first complicated, was the gratification of some desire or wish, for which the union of concurrence of others was deemed in some way necessary. When the first articulate sounds, therefore, were made use of, it is most probable, that the mental emotion or desire, the wish for the concurrence of the person addressed, and the object to which these pointed, would all be included in one significant sound; and of sounds containing this complex power, we may conceive the primeval movements of language to have been formed. Still, however, in these complex words, the wish or desire of concurrence, which was the chief impelling motive to the employment of it, would be always viewed as the predominant part, to which the other parts of the complex signification would be regarded as subservient. In the constant intercourse of men, even in the earliest period of society, the necessity of new communications, and of new modes of making them, must soon occur. Similar mental feelings or emotions might often be excited by totally different objects; and, on the other hand, the same object, under different circumstances, might give rise to very dissimilar feelings. For the expression of these variations, appropriate articulate sounds would be required, that the precise point, or the precise object to which it was wished to call attention, might be denoted. The most obvious and easy mode of accomplishing this, would be to retain the radical part of the primitive sound, and by variations or additions, to indicate the precise manner in which it was to be applied.

We have already observed, that in the complex imperative primeval sounds, the wish or desire of concurrence, mood the will of the speaker, would be viewed as the predominant part. To this, therefore, the radical sound would be specially appropriated, to intimate such desire, along with the determination to have it gratified, if that was in the speaker's power. Now, these are precisely the character-
For the accomplishing any object of desire by the concurrence of others, it is absolutely necessary, in the first place, that an action of some kind or other should be performed; action is, therefore, always implied in the use of the imperative sign, whether in the way of command or entreaty. When the person addressed is willing to comply and concur for the attainment of the desired object, he will naturally signify this by repeating the sign by which that wish was signified, but by repeating it with such a variation in form, as may at once indicate that he complies with the wish, and that he is willing to concur for accomplishing it. Hence, besides the imperative, another branch of the verb, denoting the willingness to comply, is formed. That intention of compliance may exist in various forms, it may amount to an absolute implied promise or agreement of concurrence, either instant or future; or it may amount only to an engagement, to be regulated by some intervening event. It is easy to conceive that each of these would soon come to be denoted by variations of one species or other upon the primitive imperative sign. As soon as the action was performed, this too would be communicated, and for that communication another variation would be formed, still referring to the first and radical sign.

In this manner, we can easily conceive how all the parts of the verb gradually arose from the simple imperative sign, merely by following out the communications of thought which the necessity of mutual aid must produce in any society.

Although upon these grounds verbs may, and indeed must, be regarded as the real groundwork, or radical part of language, yet there are other classes of words, also, so necessarily connected with them, that the same principles which formed the different parts of the verb must immediately suggest the necessity of some further variations. The subject of language, as already stated, is action. Now in the conception of every action, it cannot be doubted, that besides the operation itself, there necessarily must be other three component parts—the agent, the subject, and the effect produced; each of these it will soon be requisite to mark by corresponding vocal signs. The subject of the action is what first would assume a separate denomination, formed probably at first by taking, as its radical part, the denomination of that particular action, or class of actions, most commonly directed upon it, or most generally exhibited by it. Hence would arise the class of noms, the names at first of external objects chiefly, the usual subjects of action, and as such for the most part exciting the emotions and feelings of the mind, afterwards extended to the mental operations themselves, and to the abstract conceptions suggested by human actions and human conduct.

In regard to any specific action, the agent and the subject are certainly completely distinct; yet, in the course of human affairs, it continually occurs that they, as it were, change places; so that the agent in one operation becomes the subject in another. From this circumstance, it takes place, that in language, no separate class of words, in general, has been formed for marking whether an object stands in the one relation or the other; yet still the distinction is in most cases attended to, and the relation denoted either by a particular, though minute, change in some part of the word, or by such a position in the sentence, as indicates in what relation it is to be held.

To complete the idea of an action, another part still is wanting—the effect produced—that is, the change occasioned in the subject. Though this is intimately connected with it, it is by no means to be viewed in the same light with the subject itself. The subject is considered by us as the permanent material, the effect as merely the form which this material is to assume. For the expression of this, then, a class of words must be devised, nearly allied indeed to those which denominate the subject, yet so far differing, that they may be capable of adaptation to many different objects, and easily referred to any one with which, at the time, they happen to be associated. In this manner is formed the class of attributives, marking a quality or property only, which may be predicated alike of many individual subjects, and thus exhibiting a marked distinction from what is considered as permanent and possessed of that principium individuationis, which completely separates one object from every other. Each of these qualities or properties might be named at first in the view of some object in which that quality was first produced by some particular action; and hence the attributive would still retain the radical part of the primeval word, with particular modifications to mark its new application; and each attributive, when formed, would, from the natural principle of association, be applied to designate the same quality occurring in any other subject.

The radical and essential parts of language being formed in the manner described, all the other species or classes of words, as well as all the necessary variations of the radical parts themselves, would gradually follow in the constant use and habit of speaking. These, in fact, are all nothing more than either modifications immediately attached to the radical words, parts of these radical words themselves, put into a new position, or abbreviations for the sake of dispatch, easily resolvable into their constituent parts. The manner in
which all of them came to be formed and applied, as well as the particular structure and power of each, are subjects which fall properly under the head of Grammar; and, accordingly, under that head they have already been treated at considerable length. A few observations, however, in regard to them, for the completion of the theoretical history of language, may here be proper.

We have viewed the verb as originally imperative, and as such, always containing the idea of action; we have marked also, that in making a return to the command or entreaty conveyed by the imperative, the same term or sound would probably be used, but with such variation of tone, as might imply that the person addressed was willing to concur. This appears to be the first and most obvious extension of the use of language. It is, in fact, the future tense of the verb, conveying the idea of the action, combined with the intention of performing it. Instead, however, of barely signifying a readiness to concur, after a command or entreaty had been used, it is easy to see, that in many cases a simultaneous effort might be agreed upon, which would give rise to the present tense; and in many cases it might happen, that the action from some other cause had already been done, which would produce such a variation as to form the past tenses. All these different meanings, as well as the circumstance of the consent being only conditional and not absolute, or so doubtful as to demand some farther information in regard to it, could easily be marked by the various inflexions of the voice, or by additional sounds annexed to the original radix, and form either the subjunctive mood, or the interrogative form of the indicative. Hence the various parts of the verb would draw their origin; and it is easy to explain, from the tendency of men to proceed in the track to which they have been accustomed, how the same variations, which were once used to denote these peculiarities in regard to one action, would be uniformly, or at least generally employed, to denote similar variations in every other, and thus a pretty general uniformity in the form of these several modifications would arise.

Nearly connected with the verb, we find what is termed the participle. This seems to have taken rise, merely from a wish to designate the action denoted by the verb, as either permanently or occasionally characteristic of some person or object to which the attention is directed. It is easy therefore to conceive, that in a great measure it would retain the radical part of the verb, modified however in such a manner, as to suit it to assume the form and texture of an attributive.

The origin of the pronoun has been variously stated by writers on grammar; yet pronouns, in fact, are only in their real nature, abstract nouns of a peculiar species. It has become fashionable of late, among certain philosophers, to deny that the mind possesses such a faculty as abstraction, and the notion of an abstract noun is treated by them as chimerical. Without sticking for terms, we may observe, however, that it cannot surely be denied, that the mind does possess a certain power, when several objects are presented in combination, to fix its attention exclusively on one of them, and for the time to keep out of sight all the rest. That this is a power every day exercised, experience abundantly testifies. In considering any object therefore, any particular quality possessed by it may be made the sole object of attention; in viewing a marble globe, we may direct our thoughts entirely to its roundness, without taking into view its other qualities of whiteness, smoothness, or hardness; or we may think of its hardness independent of its roundness or colour. If then, we find any particular mode in which objects may be placed sufficiently important, and occurring with sufficient frequency to force much of our attention to that, we shall naturally be led to mark that mode of existence by a peculiar term applicable to such a special relation, independent of any object in which that relation or position occurs. In the employment of speech, one of the most common relations and positions in which persons and objects occur to us, and one which most forcibly arrests our attention, is the situation of the speaker, the person spoken to, and the subject spoken of. These peculiar relations perpetually recurring, would soon fix the attention exclusively upon them, while the constant variations in the subjects would irresistibly detach from the view any specific object with which they could be associated. Hence the relations alone being kept in sight, terms expressive of the relations merely would be formed, possessing all the characteristics of abstract nouns, and in the application they are susceptible of the most general of any. To these, the denomination of personal pronouns has been given; a denomination not perhaps in all respects strictly appropriate, but sufficiently descriptive for the purposes of language. How these personal pronouns were originally formed, is a matter of much uncertainty. Some have conceived, that they were derived from a word designating the hand, pointing with the hand being probably first employed before a specific vocal sign, to denote these separate relations, was introduced. This, however ingenious, is perhaps somewhat too remote a derivation. A more obvious one, we should think, may be found. Admitting, what we have endeavoured to prove, that the radical part of all language was the verb, and that necessity gradually impelled man to introduce various modifications of that radical sound, by means of accent, emphasis, elongation, or addition, to indicate its various applications, whether for assertion, interrogation, supposition, promise, or desire, it may then be easily conceived, that of these variations, some were uniformly employed to mark also the relations of speaker, person addressed, or subject of discourse. As such peculiar modifications would, from the proneness of man to imitation, be similar through the whole community, it was an easy step to detach altogether from the complete verb, that part which had received the variations, and these detached parts, of course, would form the personal pronouns.

The origin of all the other kinds of pronouns can occasion no difficulty; the possessives are merely the personal pronouns in an adjective form; the other pronouns, as well as the article, are merely definite adjectives, marking a particular position or relation in the same way as adjectives in general denote a quality considered as belonging to an object.

Of the variations of these different classes of words, of verbs by means of words, tenses, and voices; of nouns by means of cases, numbers, and genders, this is not the place to treat; these belong to Grammar, and are particularly detailed under that article.

The real nature and force, as well as the immediate origin of the other parts of speech, adverbs, prepositions, and conjunctions, have been perspicuously detailed by some late etymological writers; and we may regard it as now universally admitted, that they are in reality only nouns, adjectives, or verbs, in some abbreviated or mutilated form, employed for convenience or dispatch, and easily resolved, by skilful investigation,
Language.

No facts to be found in history for showing language actually in its rudest elements.

The foregoing detail exhibits what appears to us a fair and just deduction, from the nature of man, and the circumstances in which he is placed, of the origin and gradual formation of language. It is admitted, that it is what, from the very nature of the subject it must be, in a great measure theoretical or conjectural. It is evident, that we possess no documents from which we might learn the actual rise and advances of this interesting art. Wherever men have been found in society, there always a language of some kind, more or less perfect, yet always a formed language, has been found to prevail; the earliest rudiments, therefore, or the first efforts at regular speech, are buried in entire oblivion. If all the languages in the world were originally derived from one form of speech communicated from our first parents, it is easy to see, that however great and numerous variations might take place in it, yet the art itself would never be lost, the mode of communicating thought in articulate signs could never be forgotten. Even if we were to suppose, that language arose untaught in many separate communities, yet still as the absolute necessity of such a mode of communication must have been powerfully felt even at the very commencement of society, the progress of speech to a certain point would unquestionably be most rapid, and a language, in a great measure completely formed, would very soon be in use. Upon either supposition, then, it ceases to be matter of wonder, that no where has a community been found, who had not advanced beyond the first rudiments of speech, or among whom all the essentials of language were not actually in use.

But though, from these circumstances, it is evident we can have no direct documents in which the earliest stages of language are actually exhibited, yet particular facts occur in many existing tongues, which serve to throw some light upon their origin and primitive organization; and these, so far as they can be traced, tend to give validity to the conjectures now theoretically thrown out, as to the mode in which the various classes of words originated. It is true, as observed by a late writer, that in the more perfect and polished languages, such as the Greek and Latin, and we may perhaps add the Sanskrit and some others, the surface, so to speak, is so highly varnished, and the joints so closely fitted, that it becomes difficult to get sight of the original materials, or discover the size and shape of the pieces thus nicely adjusted; but in languages less refined, such as the Hebrew, the Celtic, and the Gothic, the structure lies more open to inspection. Accordingly it was in these less polished languages, that etymologists first succeeded in discovering the roots; but by degrees, aided by the light thus thrown upon the origin of words, men of acuteness and penetration have been able, in the best adjusted languages, even in the Greek, perhaps the most complete with which we are acquainted, to advance far in unfolding their original form and constitution.

Wherever, then, we have been able fully to develop the primitive roots, we find there ultimately resolvable into verbs. In verbs we find, further, that the imperative contains always the radix of the verb with the least possible addition, and sometimes without any addition at all. It is from verbs that the primitive nouns and attributives are immediately formed, all of them still retaining enough of the root, to mark distinctly their origin. Thus in Hebrew, where the roots of the language form an important branch of its grammar; these roots are all either verbs, or plainly resolvable into verbs. In Greek, and its corresponding language Latin, the radical parts of the language have all been traced by the most skilful etymologists to the verb. In other original languages, the same remark will apply; and it is observable, that those very philologists who assert most strongly that nouns were the parents of language, yet in the analysis of individual words, generally resolve them at last to a verb, as their ultimate source. Further, in analysing the parts of the verb, we find that in Hebrew, for instance, the second person of the imperative, and the third person of the preterite, are the same; and it is this part of the verb which all their grammarians and lexicographers unite in fixing upon as the root. In the Greek and Latin verb, the imperative of the present is that part which always approaches nearest to the root. In the Celtic and the Gothic, and the modern languages which have taken their origin from them, the imperative verb uniformly is that which expresses often, without additional terminations or particles, the full action and intention of the word; and where some short termination is added, there is every reason to think that this was not the very earliest form, but a subsequent addition. We seem warranted then in concluding, that the imperative of the verb is really the radical part, to which all the others at first were adjuncts. Afterwards, it is true, new verbs and nouns, as well as other classes of words, were formed from the primitives; but these are plainly derivatives, having their rise in an advanced state of the language.

The proof of these principles might be extended by examples from many different languages; but such a copious induction, however useful and curious, would run this article into an inconvenient length. Those who wish to go farther, will find upon examination, that in the principle now laid down, of using the radix of the verb as the imperative part of it, there is an agreement in languages nearly universal. It might be a curious object of inquiry, were it practicable to arrive at any certainty in regard to it, what was the nature of the original radical sounds or words, and from what principles did the application of the different articulate sounds to contain particular feelings, actions, or objects, at first arise? Here, however, we have so few data to proceed upon, that very little can be discovered; still something may be stated. The conjecture then, we may observe, is not improbable, that the primitive sounds by which men's feelings were announced would be very short, perhaps most of
them monosyllable. It seems evident also, that as the
vowel sounds are often uncertain and variable in their
emulation, they would frequently be interchanged in
common speech, and no variation in them would affect
the expression of the particular idea meant to be con-
vveyed; it would be to the consonant sounds alone, in
which the diversity is fixed and obvious, that recourse
must be had as the radical and uniform signs by
which the diversity of ideas or feelings was to be
marked. Each consonant sound might therefore have
a particular signification annexed to it, which it would
always retain, with whichever of the vowel sounds it
happened to be united. Further, there is surely no-	hing absurd or improbable in supposing, that when
men began to give names to what excited their feel-
ings, the same or similar feelings would be expressed
by the same, or nearly similar sounds; that the expres-
sive part of these sounds being what formed the conso-
nants, whenever the desire or necessity of indicating a
feeling or idea once signified recur, the same would
be done by a repetition of the same consonant sound
which had first been employed to make it known.
Hence each different sensation, when enunciated,
would soon come to denote a particular range of ideas,
agreeing among themselves in some common quality,
and distinct from what were expressed by any of the
others. What particular range of ideas each consonant
sound was to be applied to express, must have been
wholly arbitrary, none of them possessing any specific
aptitude to render it more applicable to one idea than
another. If ever then, any general principles are to
be traced upon which any language has been origin-
ally constructed, in regard to the application of parti-
cular sounds to particular classes of ideas, this must be
done solely by the observation of facts, as actually
found to occur in the existing primitive languages.
As yet, however, we want the materials for such an in-
ductive investigation. Perhaps further researches, con-
ducted upon philosophical views, into the real compo-
site parts of those languages which merit the appella-
tion of original tongues, as forming their roots within
themselves, may in time elucidate some parts of this
curious subject. In any such investigation, however,
it would be absolutely necessary to examine each lan-
guage separately, and trace its roots unmixed with
those of any other tongue. When the roots of different
languages have thus been investigated, a subsequent
comparison of these with one another, might enable us
to determine whether any, and what degree of affinity
exists among the languages to which they belong. A
theory founded on such an inductive process would be
by no means chimerical. Within the bounds of a par-
ticular language, etymology is a pretty safe guide.
It is only when rashly applied to various and discordant
language that it is ready to bewilders and mislead.
Could the various original languages of the globe be
brought into such a point of comparison, the much agi-
tated question, whether all are derived from one, might
perhaps be satisfactorily resolved. At present, the op-
ion of their common origin may be allowed to carry
with it a probability, strengthened by strong curi-
sious proofs of actual coincidence; but still satisfactory
evidence a posteriori is wanting—an evidence such as a
radical analysis in the manner now pointed out would
alone be capable of furnishing.

Although we cannot attain to any complete discov-
y of the actual origin and progress of the different
languages spoken in various parts of the world, yet
some interesting facts in regard to the transmission,
migration, and filiation of languages, are within our
reach. A few remarks on that subject, may therefore
with propriety be here introduced.

From the most ancient and most authentic of all his-
tritorial records, the Sacred Scriptures, we know the fact,
tive lan-
that all mankind were originally descended from a sin-
gue.

The primitive language, in all proba-
bility, continued radically the same, though enlarged
by accessions closely related to the parent stock, during
the whole antediluvian ages; and there is little reason
to doubt, when we take into view the longevity of the
patriarchs, affording opportunities to men of different
generations to mingle together, that from Adam down
to Noah the language first made use of suffered no es-
tential change. When the tremendous event of the
deluge reduced the whole population of the earth to a
single family, the primitive language, as received and
used by the patriarch Noah, would still be preserved in
his family, and form the only language then used among
men. In this state, we find that language continued
till the confusion of tongues at Babel, before which pe-
riod, we are assured by the sacred historian, "the
whole earth was of one language and of one speech."
Whether this primitive language was the same with
any of the languages of which we have still any re-
mains, has been a subject of much dispute. That the
primitive language continued at least till the dispersal
of mankind consequent upon the building of Babel,
there seems little reason to doubt. When, by an imme-
diate interposition of divine power, the language of men
was confounded, we are not informed to what extent
this confusion of tongues prevailed. It is unnecessary
to suppose, that the former language was completely
obliterated, and entire new modes of speech at once in-
troduced. It was quite sufficient, if such changes only
were effected, as to render the speech of different com-
panies or different tribes unintelligible to one another,
that their mutual co-operation in the most attempt in
which they had all engaged might be no longer practi-
cable. The radical stem of the first language might
therefore remain in all, though new dialects were form-
ed, bearing among themselves a similar relation with
what we find in the languages of modern Europe, deri-
ved from the same parent stem, whether Gothic, Latin,
or Slavonian. In the midst of these changes, it is rea-
sensible to suppose that the primitive language itself,
unaltered, would still be preserved in some one at least
of the tribes or families of the human race. Now in
none of these was the transmission so likely to have
taken place, as among that branch of the descendants
of Shem, from which the patriarch Abraham proceeds.
In these grounds, therefore, we may conclude,
that the language spoken by Abraham, and by him tran-
mitted to his posterity, was in fact the primitive lan-
gage, modified indeed and extended in the course of time,
but still retaining its essential parts far more comple-
tely than any other of the languages of men. If these
conclusions are well founded, they warrant the infer-
ence, that, in the ancient Hebrew, there are still to be
found the traces of the original speech. Whether this ancient Hebrew more nearly resembled the Chaldean, the Syrian, or what is now termed the Hebrew, it is unnecessary here to inquire; these languages, it has never been denied, were originally and radically the same, though, from subsequent modifications, they appear to have assumed somewhat different aspects.

The dispersion of mankind was a necessary effect of the multiplication and increase of the families of the human race; and in this dispersion, we shall find the great sources of new and essential changes of language. A change of situation most generally infers a change of climate operating on the organs of speech, and still more extensively affecting the productions of the earth, the nature and number of human wants, and the means of supplying them. Most frequently, too, does the change of situation give rise to new occupations and pursuits, and these to the widest and most essential differences in the state of society and the modes of life, of manners, and of thought. In all these changes, it is almost impossible that language should fail to undergo many alterations; new objects and pursuits require new expressions and new modes of speech; and if the dispersed and migrating colonies be so completely separated by barriers difficult to pass, that little or no communication with them can be had, it is easy to see, that where the languages originally brought with these colonies was scanty and incomplete, the change of language might be so great and so rapid, that the languages would soon appear to be totally different, and much attention would be required to trace out the original affinity. As these colonies diverged still farther, new differences would arise, till the original stem became often nearly imperceptible.

Of the dispersion of mankind after the flood, we have a succinct account in the 10th chapter of Genesis. The three sons of Noah spread their families in different directions; from Shem proceeded the Elamites or Persians, the Assyrians, the Syrians, and Hebrews; from Ham, the Cushites, Egyptians, Ethiopians, and inhabitants of Africa; from Japheth, the inhabitants of Northern Asia, and of the greater part of Europe. The original language carried in each of these directions must have suffered numerous changes, so that in time it is not wonderful, that the traces of mutual analogy should in a great measure disappear; still coincidences are occasionally discovered, which give a high degree of probability to the notion of the common origin of the whole.

When the first migrating colonies had established themselves in a particular territory as a permanent residence, the language which they carried with them would assume a peculiar and distinctive character; and if some ages afterwards elapsed before it was again necessary for any new colony to migrate, the particular language of that territory would be so completely formed and so firmly rooted among all the members of the community, that much of it would necessarily be carried along with any colonies that should afterwards be sent forth, and thus would form the language of any new settled territory.

It is a fact perfectly well ascertained, that migrations of whole communities in quest of new settlements were common in ancient times. Each of these national colonies, then, would bring with them their peculiar speech; so that it is not in the least wonderful that, in many regions over which successive waves of population passed, a language should in process of time arise, composed of several of the preceding ones, blended and amalgamated, as it were, into one common mass, and constructed with peculiar characters and idioms of its own. Thus, it is probable, were formed the languages of ancient Greece and Italy; and thus it is evident also arose all the languages of modern Europe.

Proceeding upon these grounds, we may conceive the original language of the family of Noah spread in various directions; carried by one set of colonies through Armenia, Persia, and the adjacent territories, into all the regions of the east, as far perhaps as Tartary and China, and forming the groundwork of the Armenian, the ancient Persian, the Sanskrit, perhaps too of the original spoken Chinese, as well as of all the languages related to each of them; carried by another set into the regions of Arabia, Egypt, Abyssinia, and the remote parts of Africa, and thence giving origin to the old Egyptian, the Coptic, the Ethiopic, and their related tongues; again carried by a third set to Scythia, or the Russian territory, Asia Minor, Ionis, Greece, Italy, and gradually through the farther parts of Europe, and thence constituting the radical groundwork of the old Pelasgic, the Gothic, the Celtic, and all their kindred or derivative dialects. Among those families whose migrations were least extensive, this primitive tongue, undergoing fewest changes, would retain most of its original form; and thus it is probable, that in the language of Jacob and his descendants, of the Phoenicians, the Chaldeans, and the communities connected with them, more of the primitive form and character remained, than among the remoter and more widely scattered tribes that spread through Africa and Europe.

If these theoretical views of the filiation of tongues cannot be fully and directly confirmed by the immediate comparison of the different languages as they now are found to exist, this is not in the least to be wondered at, considering the inevitable changes many of them must have undergone in their progress through different countries; but if we attentively mark the precise manner in which such changes might be expected to operate, and make the necessary allowances on that account, in comparing the apparent groundwork of the languages scattered over the globe, a coincidence will be found, far closer and more striking than could at first be supposed.

Changes in language, let it be observed, may take place upon single words by a sort of caprice among different tribes, introducing sometimes a transposition of letters, sometimes an insertion of letters, for the sake of a real or fancied euphony; sometimes a contraction or abbreviation of letters, probably for the sake of dispatch; and sometimes a reduplication of particular syllables, perhaps from some ideal emphasis attached to them. Of all these occurring in the same language, we have examples familiar to us, both in our own vernacular tongue, and in others with which we are generally conversant. But changes of this kind are particularly observable in the transplantation of a word from one language into another. Thus, ὑμῖν in Greek became forma in Latin; from the Latin granarium we derive our word garner; the Celtic ṣos has become our horse, just as, in common Scotch, the English grass is changed into garse, thirty into thirty, croiss into core. Consonants of the same order, too, are often interchanged; p is used instead of b, d instead of t, g for k. An aspirate is very frequently thrown in, by which p in one language becomes φ or f in another; d or t becomes th, and g or c the aspirated gh. In transplanting words, likewise, it is very com-
It is regularly formed from roots within itself, and these roots are for the most part monosyllabic, consisting generally of three letters, sometimes but rarely of four.

That this language was in fact the same with the Punic, and other languages spoken through Palestine and the neighbouring countries, in the earlier times, as far as least as Syria, Mesopotamia, and Chaldea, seems pretty generally admitted. Of the other early languages, the ancient Persian, the Egyptian, and the Chettian, we know so very little, that it would be hazardous to say more, than that their relation to the Hebrew admits of little doubt. In spreading to the westward through Asia Minor into Greece, this ancient language transplanted by the Phoenicians became, through the medium of the old Pelasgi, the parent of the Greek.

The Greek language is too well known to require Greek any particular illustration. Its copiousness, elegance, and force, have been the subject of universal panegyric. The Greek language was evidently first brought in a rude state from Phoenicia into Greece and the Grecian islands; its most ancient dialect, the colaic, the parent of the Doric, exhibits probably the earliest form in which it appeared in its new soil. Transplanted into Ionia, it assumed a softer aspect, suited to the disposition of a poetical and musical people. Carried onwards to Attica, it became the language of business and active life in an enterprising, commercial, and at the same time an intelligent and polished nation. There, accordingly, as we find in the Attic dialect, it was subjected to abbreviations and contractions, adapted for dispatch, but, at the same time, regulated on the truest principles of elegance and taste. Though the Greek language is justly regarded as forming its words from roots within itself, and has accordingly been distinctly analysed into its radical primitives, yet these very primitives exhibit so full a resemblance to corresponding roots in Hebrew, that the identity of origin cannot be doubted. The duration of the Greek language from Homer down to the times of the Lower Empire, exceeds that of most other languages; and even yet, although much corrupted, it holds its place in the countries where it once was fixed.

From the earlier Greek proceeded the Latin, which Latin is in fact little else than the colaic Greek, with a mixture probably of some Etruscan and Sabine, and perhaps some German and Gaulic words gradually received from the neighbouring countries.

While these languages we have mentioned were thus Gothic and formed in early times, it is probable that the founds Celtic of the Gothic and the Celtic were also laid. How far back, however, we are to date the first formation of these languages, and in what order they spread through the northern and western countries of Europe, has been a subject of controversy, agitated with a keenness rather disproportionately to the importance of the subject. Both of them appear evidently to have been brought, at a remote period, from the regions bordering on the Caspian and Euxine Seas, by colonies passing northward and westward in quest of a settlement. It is not improbable, that at first the two languages were not very dissimilar; and even yet many resemblances in their structure may be traced. The Gothic spread through the north of Europe, and was evidently the parent of the Danish, the Swedish, the German, and the ancient Saxon. Of one branch of the Gothic tongue, the Maso-Gothic, we have a valuable fragment in the translation of the Gospels by Ulphilas, written so early as the fourth century; which, although only
Of the original language of our own country, there is some difficulty in fixing the origin. So far as can be conjectured, it rather appears, that the earliest inhabitants spoke the Celtic language, and that, by successive impulses of the tide of population, new races of settlers spreading in different directions, superinduced certain dialects of the Gothic. Accordingly, we can collect from our venerable Saxon historian Bede, that in his day four languages prevailed in Britain—the Irish, the British or Cumraigh, the Pictish or Scandinavian, and the Anglo-Saxon. Of these, it is probable that the relation was not very distant; and if the ascending line were far enough followed up, they would all be found to terminate in one.

The languages of the various other countries of Europe underwent similar revolutions; but it would be tedious to trace them through their separate stages. In the southern states, the Latin tongue had been universally established, under the dominion of the Romans. The incursions and establishment of the northern tribes introduced new modes of speech, which, blending more or less with the native tongues, gave rise to the various modern languages of southern Europe.

Towards the north-east of Europe, the Slavonic tongue, with its affiliated dialects, Bohemian, Polish, Hungarian, Lusatian, Carinthian, Dalmatian, and the widely extended Russian, have for many centuries prevailed. The affinity of the Slavonic through its different dialects to the Macedonian Greek, is apparent in many of its inflections, but above all in its radical terms, when thoroughly analysed and stripped of the additions and mutations introduced in the channels through which it has passed.

While the primitive tongue appears thus to have been carried in various forms to the north and west, its progress eastward gave rise to a different though not less remarkable set of languages. Of these the most eminent is the Sanscrit, a polished and elegant tongue, and fixed in the writings of its classic authors at a period it is thought prior to the commencement of the Christian era. Both in the roots of verbs and forms of grammar, the Sanscrit is found to bear so close an affinity both to Greek and to Latin, that those philological writers who have attended to its structure, do not hesitate in considering it as a branch of that primeval tongue which was gradually transplanted into various climates, becoming Sanscrit in India, Pahlavi in Persia, and Greek on the shores of the Mediterranean.

The Sanscrit, though it has now in a great measure ceased to be a living tongue, is considered in India as the language of science; and it is pretty certain, that it was the immediate parent of the numerous languages still spoken through that vast peninsula as far as the borders of China. Two-and-thirty at least of those more obscure and inferior languages, have been recognised and distinguished by the missionaries at Serampore; and it is worthy of notice, that while many of those vary considerably in their inflections, the radical parts of their words exhibit a similarity sufficient to ascertain their common origin.

To the eastward of India, we find a language prevailing, totally dissimilar in many respects to those which have already come under notice, the language of China, made up in a great measure of monosyllables, and which can hardly be said to have any inflections for distinguishing nouns, verbs, or attributives. Its distinct words are very few, but these are varied in pronunciation by accent, emphasis, and other marks, to fit each of them for expressing many different ideas—a mode of speech so inconvenient and embarrassing, that recourse must often be had to the written character for indicating the particular meaning. These written characters constitute in fact the substantial part of the language; they are extremely numerous, amounting it is said to no less than eighty thousand, formed from 214 roots, termed keys or elementary characters, each of which is itself significant, and by additions to which, not to the vocal sounds, all the varieties of meaning are conveyed. In this language, from a peculiar structure, as well as in the languages of many remote tribes and islands, so many changes appear to have taken place, that the traces of the primitive language have almost ceased to be discernible.

Having thus endeavoured to take a general view of the actual progress and filiations of language in the different quarters of the globe, it remains only to notice the circumstances which constitute the excellence and perfection of language. These may in general be stated to consist in perspicuity and adequate copiousness, affording accurate expressions for all the various conceptions and separate ideas of the human mind; precision, having always one definite meaning to each word; regularity of structure; and euphony or harmony in its sounds. No language possesses all of these qualities completely; some, however, approach nearer than others to perfection. Any inquiries, however, into the comparative excellencies of each, and particularly the discussion of the much agitated question, whether those languages are to be deemed most perfect, which, like the ancient Greek or Latin, mark the changes of nouns and verbs by inflections of the words themselves; or those which, as the modern languages of Europe, have recourse to separate particulars and auxiliary words; are subjects which belong more properly to Rhetoric. The same remark applies to the discussions regarding the use of language in composition, and the various modes in which it may be best adapted to the use of the poet, the orator, the historian, and the philosopher.

It may be right here just to mention, the ingenious but visionary attempt of Bishop Wilkins to construct a philological language and real character, in which the objects of knowledge were to be arranged under certain heads and divisions, and words and characters to be formed with changes corresponding to each. The impracticability of reducing such a system to practice, and bringing into use even among the learned such a language, is too obvious to require discussion.

The writers upon language most deserving attention, are mentioned under the article Grammar; to those taken notice of there may be added, Townsend On the Character of Moses, vol. iii.; Jenisch Comparison of European Language; and Dr. Dewar's Dissertation on Language, in the 7th volume of the Edinburgh Philosophical Transactions; Bryant's Mythology; Pezron's Antiquities. (3)
The art of antiquity has conferred immortality upon this fabulous event, by one of the noblest monuments of Grecian sculpture, executed in marble by Agisander, Polydorus, and Athenodorus, the three famous artists of Rhodes. This monument was found at Rome, in the ruins of the palace of Titus, in the beginning of the 10th century, under the pontificate of Julius II. and afterwards deposited in the Farnese palace. When Italy was overrun by the French during the late revolution, this wonderful monument of ancient art was, with many others, removed from the Vatican, and placed in the Museum of Arts at Paris. Since their more recent reverses, however, it has been restored to its former owners.

Of the fact which has been so nobly represented by the efforts of the sculptor, Virgil has given us the following poetical description:

Serpentem amplectens uxorque
Implicuit, et milia venas depauperatus artus
Corripuit, splendique Ruggit invenit et jam
His medium aptissimi, his uberrima circums
Terga dat, superant capsas et cercovtis altas.

The statue, which has been generally esteemed as one of the finest remains of antiquity, exhibits the most astonishing dignity and tranquillity of mind, in the midst of the most excruciating torments. Of this group, Pliny says, "that which has been injurious to the fame of certain individuals, in spite of the excellence of their productions, is the circumstance of their having worked together on the same piece; since one alone cannot merit the honour of the whole, and we do not choose the trouble of naming them all. Such is the case respecting the Laocoon, in the palace of the emperor Titus, which must be preferred to all the efforts of the painter’s and of the statuary’s art. Agisander, Polydorus, and Athenodorus, celebrated sculptors of Rhodes, united their joint abilities, in forming out of a single block the group of the father and his sons, bound together by the beautiful folds of the serpents.”

The Laocoon, according to Dr. Gillies, may be regarded as the triumph of Grecian sculpture; since bodily pain, the greatest and most ungenovernable of all our passions, and that pain united with anguish and torture of mind, are yet expressed with such propriety and dignity, as afford lessons of fortitude superior to any taught in the schools of philosophy. The horrible shriek which Virgil’s Laocoon emits, is a proper circumstance for poetry, which speaks to the fancy by images and ideas borrowed from all the senses, and has a thousand ways of ennobling its object; but the expression of the shriek would have totally degraded the statue. It is softened, therefore, into a patient sigh, with the eyes turned to heaven in search of relief. The intolerable agony of suffering nature is represented in the lower parts, and particularly in the extremities of the body; but the manly breast struggles against calamity. The contention is still more plainly perceived in his furrowed forehead; and his languishing paternal eye demands assistance, less for himself than for his miserable children, who look up to him for help.

A variety of critical disquisitions have been written, for the purpose of ascertaining to what period of the arts this chef d’œuvre belongs. Winkelmann ascribed it to the most brilliant period of the Greeks; while Lessing, on the other hand, referred it to the times of the first Roman emperors. Visconti has since gone over to the opinion of Lessing, though he proceeds upon different grounds. Pliny says, the group was sculptured out of a single block; Raphael, however, discovered three; Mengs counted five; and it appears in reality to consist of six, including the plinth on which the altar rests, and to which the other pieces of the block are attached. The right arm of the father, and two of the arms of the children, are wanting. These deficiencies have been supplied by arms, moulded on the group in plaster of Paris. See Gillies’ Hist. of Greece, ii. 177; Winkelmann’s Inedited Monuments; Lessing’s Laocoon; the Description of the Ancient Monuments in the Museum Napoleon, published at Paris in 1805; and Plate CCXXXIV. Fig. 1. of this work. (2)

LAON, the Laodamus of the Romans, is a town of France, and the chief place of a district in the department of the Aisne. It is beautifully situated on the summit of a hill with very precipitous flanks, and is seen on all sides at the distance of seven or eight leagues. The town covers the greater part of the level summit. An old castle occupies another part of it; and on one place, the top branches out into two arms on the side towards Soissons, from which it got the name of Bilmez. On one of these arms, are the ruins of an ancient abbey, the outer walls of which still remain; and the hollow between them is covered with vines. The walls of Laon are not in good repair. There is a fine mall without the walls, and a delightful walk around them, from which there is a most extensive view. There is also a mall with young trees stretching across the summit, and separating the town from the old castle.

The streets of Laon are narrow and dirty, and the houses appear poor and gloomy. The principal ornament of the town is the cathedral, which is a large and splendid building, with five very lofty towers. The open buttresses, and the long open windows in the square towers, give a peculiar air of lightness to the building when seen from a short distance. But at a considerable distance, and particularly in the night, they give it the appearance of a scaffolding, the light coming through in every direction. The great portal is not unlike that of Rheims; but it is less elegant in the sculptures. There is a small spire on the south tower of the cathedral. The interior of the cathedral is very fine. In the nave, are ten circular pillars on each side with capitals; two of them on each side having four small columns round it. Above the choir, is a most magnificent circular window of painted glass. There is another fine circular window in the nave, above an excellent organ, and at each end of the transept. On the north side of the nave, in a small aisle, are deposited the remains of General St. Priest, who...

L A O  

... died at Lyon of the wounds he received in the campaign of 1814. A small and simple marble monument has been erected to his memory. The theatre of Lyon is a neat building, with an end front finely sculptured. The public hospital is situated out of the town, on the road to La Fere. Population 6691. For the preceding article, we have been indebted to the MS. journal of a gentleman who recently visited the town.

LAOS-LAO, or Muong-Lao, a country of Asia, is situated in the peninsula of India, beyond the Ganges, between the 12th and 18th degrees of North Latitude. It is bounded on the south by Cambodia; by Cochin-china and Tonquin on the east; by Tonquin and Laos to the north; and on the west by the kingdom of Siam; and extends about 400 miles from north to south, and between 100 and 150 from west to east. It is almost entirely enclosed by lofty mountains covered with forests. In the interior are also several mountains of considerable height, which divide it into rich and fertile valleys. Many of these mountains are so peaked, that the ascent is very difficult, and even dangerous; and the tops of some of them cannot be approached without taking a winding and circuitous direction. There are very few rivers, and no canals in this country, which forms an almost insurmountable obstacle to the exportation of its productions, and its communications with the neighbouring states. The principal rivers is the Mecen, which is of difficult access, owing to its channel being so much impeded by rocks and cataracts. This river, which has been supposed by some to be a branch of the Ganges, takes its rise in the mountains of Tartary, and directing its course southward, discharges itself into the sea in Lat. 10° north. This country yields a great abundance of rice, and timber of the finest quality, both for building and joiner’s work. It produces also aloes wood, and other precious woods, and a tree, from which is extracted a varnish not inferior to that of Japan; but as the inhabitants are entirely ignorant of the art of preparing it, it is all carried to China. Scarcely a tenth part of the land here is under cultivation, and that is employed chiefly in the production of rice, which is preferred to that of other oriental countries. The mountains of Laos contain several rich mines of copper, iron, tin, and lead; and the precious metals are explored in the sands of the rivers. There are also mines of rubies and beautiful emeralds. No country furnishes ivory in such quantities, and of such a superior quality; and this, with gum-lac, opium, and medicinal plants, form its principal articles of commerce. It exports also elephants, wax, a great variety of bamboo, and some cotton stuffs.

This country was formerly an independent kingdom; but it now forms a part of the empire of Tonquin. The manners and customs of its civilized inhabitants are in many respects similar to those of Tonquin, for which see that article; but the more barbarous part of the population live entirely secluded from strangers, and are scarcely removed from the most savage tribes. They are formed into wandering hordes, which have very little communication with each other; so much so, indeed, that the language of one horde is scarcely intelligible to another. They are entirely unacquainted with commerce, or the cultivation of the soil. They live upon the natural produce of the earth, and engage in no kind of labour but what is absolutely necessary for the supply of their most indispensable wants. There are whole families in this country, who for several generations have been employed in the capacity of beasts of burden. They carry bales of merchandise from Laos to Tonquin, and sometimes from Tonquin to Laos. Men, women, and children, as soon as they are able to endure the fatigue of the journey, are engaged in this work. They form a distinct class of the community, and there is scarcely an instance of any of the children renouncing the profession of its parents.

The capital of this country, which is called by the Chinese Mohangheng, stands on both sides of the Mecen, and is a large city enclosed with palisades. See Exposé Statistique du Tunkin, &c. London, 1811. (p.)

L A P L A N D.

LAPLAND, the most northerly country of Europe, extends from north to south about 500 English miles, and about 300 from west to east. Its limits are not very precisely ascertained; but it may be said to be included between the 64° of North Latitude and the Northern Ocean, and between the North Cape and the White Sea. It consists of three distinct divisions, Russian, Norwegian, and Swedish Lapland. Russian Lapland comprehends all that part of the country, which is situated to the east of the river Torneo, which falls into the Gulf of Bothnia, about 65° 40' North Latitude, after holding a course nearly due south; and is subdivided into three districts, one stretching along the north coast, another bordering on the White Sea, and a third inland, adjoining to the lake Enarak. Norwegian Lapland, the smallest division, is a narrow strip along the west and north coast, divided into three portions, named Norland, West Finnmark, and East Finnmark. Swedish Lapland, which is the largest and most southerly division, occupies the interior part of the country, on the west of the river Torneo; and is divided into four provinces, namely, Umea Lapmark, to the south; Pitca Lapmark, in the centre; Litna Lapmark, and Torneo Lapmark, towards the north. The city of Torneo was doubtless originally reckoned within the boundaries of Lapland; but as the Laplanders have been gradually driven northward, Merononiska, a town about 140 miles distant from Torneo, is now generally considered as the boundary between Westrobothnia, and Lapland properly so called. Lapland has been divided by Wahlberg into five zones, concentric with the Gulf of Bothnia, and differing from each other in climate and productions. The first, extending obliquely round the Gulf of Bothnia, from North Latitude 64° to nearly 69°, and forming a zone generally 80 miles in breadth, is covered with forests of the spruce and Scotch fir, and named woody Lapland. The second, higher and colder than the first, extending from latitude 65° to nearly 70°, and generally only 6 or 8 miles in breadth, contains the Scotch fir, and is denominated subwoody Lapland. The third, higher than any of the preceding, stretches, like the second, from 65° to 70° of North La-
LAPLAND.

587

Lapland.

In the north-east of Enonteki, where it is about 40°, produces the birch, but none of the pines, and is called the subalpine region. The fourth, immediately behind the third, and nearly of the same breadth, and still higher than any of the preceding, produces only the Salix glauca, a species of willow peculiar to very cold climates, and is named the lower alpine region. The fifth, the farthest from the Gulf of Bothnia, extending along the north side of Lapland, and varying in breadth according as it is indented by the sea, is the most elevated tract of the whole, the greater part of it being above the line of perpetual congelation, and covered with eternal snows, produces no trees, and scarcely any vegetation whatever, except a few hardy plants where the snow has been melted, in enumeration of the higher alpine region. The whole of woody Lapland is so level, that scarcely one of the mountains rises higher than 213 feet above the neighbouring plains; and in none of the three first zones is the height above the level of the sea considerable. In those lower districts, however, are several mountains considerably elevated; and one particularly named Quiekjock, in latitude 67°, is 1140 feet above the level of the sea. The church of Enonteki is 1429 feet above the level of the sea, and thence to the top of the Lapland Alps the ground rises constantly, but so gradually, that it is practicable to go in a boat to the lake Kiedesjarvi, which is in so elevated a situation, that the birch tree is scarcely to be found in its neighbourhood. The Lapland Alps, passing through the southern part of the country as high as the lake of Torneo, retain nearly the same elevation through the whole of their extent, and no part is considered to be lower than 2132 feet above the level of the sea; but the most elevated mountains occur in the southern parts of Norway; and one of them, named Sulitelma, which is the highest mountain of Lapland, is 4903, and, at its northern point, 6178 feet above the level of the sea. This immense glacier is situated in 67° North Latitude, and 161° East Longitude from Greenwich. Another named Olmajalos, a little to the north of Sulitelma, is 5543 feet in height; and Tulpaajena, a very extensive glacier, is 4050 feet. These mountains are more than 2700 feet above the line of perpetual congelation, and are the coldest regions of Lapland. Those of Getsejack, Perinijack, and Ridatjuck, lying to the north of the last mentioned, are supposed to be little inferior in height; but, from 68° of North Latitude, the alpine range, which continues with little interruption till it terminates at the North Cape, in the Frozen Ocean, diminishes in height; and, though covered with snow, is free from glaciers. Of the maritime Alps, which occupy the western and northern part of Lapland, the principal chain, extending from the insular promontory of Loifjosen, and the western side of the gulf of Alten, contains many mountains, which rise above the line of perpetual congelation, and bear glaciers immediately over the sea. The highest of these are the Alps of Lungen, which rise to an elevation of 4254 feet. The rest of the coast of Lapland is very rocky: but, excepting the promontory of Kumen, scarcely contains any high mountains. The promontories of eastern Finnmark, do not exceed an elevation of 2132 feet above the level of the sea; and those on its north coast are only 1279 feet in height.

"It is extremely entertaining," says Baron Von Buch, "to climb great and rapidly ascending heights in these climates." The vegetation, with which we are familiar in the valleys, gradually disappears under our feet. The Scotch fir soon leaves us: then the birches become shrivelled; now they wholly disappear; and between the bushes of mountain willows, and dwarf birches, the innumerable clusters of berry-bearing herbs have room to spread, blue-berry on the dry heights, and mountain brambles on the marshy ground. We at last rise above them: the blue-berry no longer bear; they appear singly, with few leaves, and no longer in a bushy form. At last they disappear, and they are soon followed by the mountain willows. The dwarf birch alone braves the height and the cold: but at last it also yields before reaching the limit of perpetual snow; and there is a broad border before reaching this limit, on which, besides mosses, a few plants only subsist with great difficulty. Even the reindeer moss, which rises in the woods with the blue-berry in luxuriance of growth, is very unfrequent on such heights. On the top of the mountains, which is almost a table-land, there is no ice, it is true, nor glaciers; but the snow never leaves these heights; and a few single points and spots above the level, are alone clear of snow for a few weeks." It is a melancholy prospect; nothing in life is any longer to be seen, except perhaps occasionally an eagle in his flight over the mountains from one ford to another.

On Akka Solki, one of these mountains on the western coast, which is about 3392 English feet in height, the following limits of the different productions were accurately marked:

Of the mineralogical structure of the mountains of Minerals. Lapland, little accurate information has yet been collected; but the following facts are enumerated by Professor Jameson, as the most important of those which have been ascertained by the observations of recent travellers. 1. The mountains of Norway and Lapland, are principally composed of primitive and transition rocks; felsit rocks occur very rarely; and alluvial rocks are uncommon. 2. Granite, contrary to the general belief of mineralogists, is a rare rock in Norway and Lapland: it even occurs but seldom in Sweden, and is to be considered as one of the least frequent of the primitive rocks in Scandinavia. 3. The granite frequently alternates with gneiss. 4. A newer granite sometimes occurs resting on mica slate, as at Forvik; or connected with clay slate and diabase rock, as in the island of Mageroc. 5. Besides the gneiss, which is associated with the oldest granite, there is another of newer formation, which rests upon mica slate. 6. Gneiss appears to be by far the most frequent and abundant rock in Scandinavia, all the other primitive rocks appearing in some degree subordinate to it. 7. In the island of Mageroc, and in other quarters of Norway, there appears a species of simple aggregated mountain rock, composed of compound felsit and diabase. This rock is the gabbro of the Italians, and appears in Norway to be connected with clay slate. 8. All the magnetic iron-stone of Scandinavia occurs in beds of gneiss, and not in veins, as has often been maintained by mineralogists. 9. The class of transition rocks in Nor-
way, contains, besides grey wacke, alum slate, clay slate, limestone, and other rocks, well known to mineralogists as members of that class; as granite, which sometimes contains hornblend; syenite, which contains Labrador felspar; and numerous crystals of zircon; porphyry; amygdaloid: basalt; sandstone. 10. The transition limestone of Norway is sometimes granular foliated, like that which occurs in primitive countries, and contains much tremolite. The country abounds in mines of iron; and furnishes several also of copper. Lead, zinc, and arsenic, are not uncommon; and native gold has been found at Svappavara, in Torneo-Lapmark. But the rich iron ores form the chief treasures of the country, and might assist to introduce cultivation in those desert regions. The ore is found in thick beds in the gneiss, and, when the surrounding substance is worn down, appears in many places above the surface like mountains of iron. The bed of Junos Siwando, on the boundary between Western Bothnia and Lapland, is from fourteen to fifteen fathoms in thickness. At Luossovara and Svappavara, several miles lower on the banks of the Torne river, are beds of the extraordinary thickness of 34 and 36 fathoms. But even this is still exceeded by the iron hill of Kerunaraara, about eleven English miles to the west of Jukasjerfivi, where the pure ore has been seen to the extent of 300 Paris feet. All these treasures, however, have hitherto been turned to little account, as the ore must be conveyed by a land carriage of 46 English miles with reindeer, and in small Laplandish pulkars; and the furnaces cannot be erected nearer the mines, in consequence of the want of wood. The ore itself, though exceeding in richness that of Sweden, is very difficultly fusible, and yields an iron which becomes brittle when cold, unless it has been smelted with some of the better sorts of ore from Uto or Dannemora.

The principal rivers of the country are, the Tana, which rises in the distant mountains of Lapland, and, after running through East Finnmark in a north-east direction, empties itself into a bay, or rather sound, of the same name, in the North Sea; the Alten, which runs through West Finnmark in a north-west direction, and empties itself into a bay, or rather sound, of the same name, which opens into the ocean; the Pitea, which rises in the Lapland Alps towards the west, about 67° North Latitude, and running in a south-easterly direction, falls into the sea at Pitea, near the 65° of North Latitude; the Lules, which proceeds from a long succession of lakes in the Lapland Alps, and, running nearly parallel to the Pitea, falls into the sea at Lules, in 65½° North Latitude; the Tornea, which is formed by a number of streams uniting in one channel, and running nearly due south through a long course, falls into the northern extremity of the Bothnian Gulf at Torneo. Most of the rivers in Lapland are of small size during winter; but, when the snows melt in summer, they swell to an extraordinary height, and frequently inundate large tracts of country.

The lakes of Lapland are very numerous, and many of them of great extent. The most worthy of notice are Viril-jaur and Vastinjaur, to which no others within the alpine range can be compared, either in breadth or height, which amounts to 1862 feet. Hence these lakes may be considered as the centre of the alpine country of Lapland.

The climate of Lapland is singular, especially as it affects vegetation. The temperature of the air is regulated, not as in other parts of the world, by the latitude, of the place, but by the height above the level of the sea, and the distance from the Gulf of Bothnia. Hence the temperature is remarkably similar through the whole extent of country between the Bothnian gulf and the alpine ridge of mountains, about 69° of North Latitude. But in those parts which lie between the Lapland Alps and the Northern Ocean, the heat, excepting in some of the valleys, is almost entirely regulated by the latitude. In point of temperature, therefore, Lapland may be divided into two regions, the inland and the maritime. In the former, the winter is very severe, and the summer very hot; in the latter, the winter is comparatively mild, and the summer cold; the one being influenced by the temperature of the Frozen Ocean, and the other screened from its action by the alpine ridge, forming a circle round it. The following Table furnishes a comparative view of the mean temperature in both regions, by Fahrenheit's thermometer.

Though the mean temperature at Enonteki is nearly 6° lower than at the North Cape, yet is the former place better calculated for vegetation than the latter, and even brings to maturity certain kinds of corn, which is quite out of the question at the Cape. The reason is, that the mean temperature, during the summer months, is much higher at Enonteki than at the Cape; and the power of vegetation is regulated more by the heat of summer, than the cold of winter. In those countries, also, where the ground is long covered with snow, the temperature of the earth is considerably higher than that of the air, and this preserves it in a proper state for vegetation, in spite of the intense winter-cold of the atmosphere. Thus, at Enonteki the ground is constantly covered with snow, from the beginning of October to the beginning of May; while at the Cape, in consequence of the vicinity of the sea, it is more frequently exposed to thaws. Sometimes it happens in the Lapland Alps, that, when a colder summer than usual occurs, the snows in the middle of the year, and all kinds of vegetables are completely destroyed, except a few lichens, polytrichas, and peltidea crocea. This is an event which occurs more frequently in Norwegian Lapland, where there are greater rains during summer, which reduce the temperature of the air, and prevent the dissolution of the snow, or even convert it into ice. The progress of the seasons may be readily perceived from the following Table of Observations, made at Utsjoekki, upon the river Tana, in 69° 53' North Latitude.

1797.
Jan. 21. The sun's half disk seen above the horizon.
May 5. First rain fell.
June 5. The ice disappeared upon the river Tana.
LAPLAND.

The vegetable productions are not numerous, but more various than generally imagined. Wahlenberg's edition of the Flora Lapponica describes 1087 species of plants found in Lapland, more than double the number observed by Linnaeus. Of this number only 496 are perfect plants; the remaining 591 are cryptogamous. Of grasses there are 102 species; of algae, 55; of fungi, 98; of musci, 200; and of lichens, 207. Of the perfect plants, the snowy Alps contain 93 species; the subalpine region, 125; and the woody region, about 513. Of trees (reckoning the salices) there are 26 kinds; consisting of the Scotch fir, spruce fir, birch, alder, poplar, mountain ashes, alder-cherries, and nineteen species of willows. There are no fruit trees in the country; but a variety of berries are spontaneously produced; such as black-currants, rasp-berry, cranberries, juniper-berries, bil-berries, and the Norwegian mulberry, which grows upon a creeping plant, and is greatly esteemed as an antiscorbutic.* In the gardens towards the south, are raised cresses, spinach, onions, leeks, chives, orache, red cabbage, raddishes, mustard, cullrants, barberries, elder-berries; wild-rose, columbines, rose-campion, carnations, sweet-williams; potatoes about the size of poppy-heads; French-beans, broad-beans; and tobacco when carefully managed; but neither white cabbage nor pea come to any perfection; and apples, pears, plums, and cherries, scarcely grow at all, though cultivated with the greatest attention. The most abundant native vegetables are sorrel, which is of great service on account of its antiscorbutic properties; angelica, which is highly relished as an article of food; and the lichen rangiferinus, which furnishes the chief subsistence of the rein-deer during winter, and which the Laplanders frequently boil in broth for their own use. Of the indigenous fruits, the most delicious is the berry of the rubus arcticus; which, when sufficiently ripened, is said to be superior in fragrance and flavour to the finest raspberries or strawberries. A small plateful fills an apartment with a more exquisite scent than the finest perfumes; and it is preserved in Sweden as one of the finest sweetmeats.

Except in a few sheltered vallies, and on the banks of the rivers in the southern districts, there are no agricultural labourers in Lapland. In some places, a plough of a peculiar construction, suited to ground full of large stones, is employed in preparing the land for the seed; but in general the earth is dug by the labourer. The grain, which grows best, and is chiefly sown in Lapland, is barley, or rather big; but in the lower regions rye is occasionally cultivated; and oats have been raised even in the high level of Enontekiö. It is found, that grain will not ripen in any district where the mean temperature of the three summer months does not reach to 47.2°. Its progress to maturity is extremely rapid; and the corn sown in the end of May is commonly cut down in the end of July. From the commencement of the seed time to the end of harvest, something more than sixty days elapse. As an instance of the rapidity of vegetation during the summer season of Lapland, Acerbi has affirmed, that, at Enontekiö, a tobacco plant generally increases more than an inch in circumference during the interval of 24 hours. The Finnish colonists in Lapland sow considerable quantities of turnip seed, which frequently succeeds; and of this root the native Laplanders are so fond, that they

---

* The plants on the western part of Lapland, towards the sea, are analogous to those of Scotland and Iceland; while the most abundant productions of Swedish Lapland more nearly resemble those of Siberia.
LAPLAND.

Animals.

The domestic animals of the Laplanders, are cows, sheep, dogs, goats, and rein-deer. The cows are fed during winter on hay from the meadows, or on the moss used by the rein-deer. The sheep and goats subsist on similar food; and, notwithstanding the rigour of the climate, are remarkably prolific. The she-goats constantly produce two kids, and sometimes three at a birth; and the ewes often bring forth twins twice a-year. The dogs are chiefly kept for collecting the herds of rein-deer, and are trained to obey the slightest signal from their masters. The rein-deer are the most valuable part of a Laplander's possessions, and the principal object of his attention. These animals have a considerable resemblance to stags; and their whole body is of a grey colour, which becomes whiter before the hair falls off. They cast their horns every year; the males immediately after the rutting season, in the end of November; and the females in May after they have brought forth their young. The new horns are at first flexible, and so tender as to occasion pain to the animal when roughly handled. Those of the male are often two feet and a half in length, and their points are as far distant from each other. The height of the animal, from the fore foot to the top of the back, is generally four feet; and the length, from the shoulder to the tail, two feet. The hoofs are constructed in such a manner, that, when the foot is pressed on the ground, their points are separated from each other, and striking together, at every step, there is produced the clattering noise as the animal walks along. The rein-deer eat grass during summer, and feed with avidity on the great water-horse-tail, even in a dry state; but they will not eat hay; and subsist during the greater part of the year entirely upon the lichen rangiferinus, or rein-deer moss, which grows every where in great abundance, and which the animal easily contrives to reach under the deep covering of snow, where it is protected from the frost. They are said also to feed on frogs, snakes, and lemmings, or mountain rats; and to be particularly fond of human urine, which they greedily lick up wherever it has fallen. Of these useful creatures a wealthy Laplander often possesses a thousand, or more; a person of the middle class from 500 to 700; and the poorer people from 50 to 200. The harts are commonly tamed by the children and females of the family; and are driven home, morning and evening, to be milked. For this purpose they are tied, by a rope put round their horns, to a small pole stuck in the ground; and all hands, master and mistress, men and maids, are busily employed in milking. When the milk does not come easily, they beat the udder with their hands to cause a greater flow; and each female generally yields about the same quantity as a she-goat. When the young males are about a year and a half old, the Laplander proceeds to castrate them by bruising the contents of the scrotum with his teeth, yet so as not to break the skin, which would generally prove fatal. These, if not put to work, become larger, fatter, and taller than such as are left in their natural state; and are counted of so great value to their owner, that the worth of any article is commonly expressed by equalizing it to a gelt rein-deer; and it is considered as one of the highest compliments to a friend, to tell him, that he is as estimable as a rein-deer gelding. During summer, the gelt rein-deer and the hinds are commonly required to range the woods without any attendance; and every person is able to know his own deer by a particular mark, or incision, made in the animal's ear. After seven years of age, the males are apt to die, of the weakness and emaciation which succeed the casting of the hair and horns; but the geldings live to the age of 12 or 14 years. They are subject also to various diseases; such as ulcers near the upper edges of the hoof, which often render them completely lame, and unable to keep up with the herd; a vertigo, or giddiness, causing them to run round continually, generally incurable, but sometimes removed by cutting the ears, so as to produce a free discharge of blood; ulcerations in the flesh, an epidemic disorder, supposed to prove fatal by the animal licking and swallowing the corrosive matter from his own skin, or from others of the herd; an affection of the spleen, which is accounted incurable, and so infectious, that those which are attacked are immediately killed. They are much tormented in summer by a species of gad-fly, (caenus tarandi,) which deposits its eggs in the skin, and produce ulcers in which frequently perish small fawns.

Wild rein-deer abound in Norwegian Lapland; but few are found in Swedish Lapland, except between Granen and Lycksele. They are considerably larger than the tame deer. Hares are plentiful, and in the winter season become entirely white. Three kinds of martens are found, especially in Norwegian Lapland, which are distinguished, according to the places which they frequent, by the names of stone-marten, birch-marten, and fir-marten. The glutton is common in the country, and its skin is of great value for making muffs and gloves. The beaver is also found in some parts of Lapland, and in some rare instances are of a white colour. Otters of different kinds—ermines, a species of white weasel—squirrels, which are shot with blunt arrows to preserve the beauty of their skins—mes lemna, a species of marmot peculiar to Lapland—and field-mice in immense numbers, are all natives of those high latitudes. Foxes also are extremely numerous, some of which are white, with black ears and feet—some red, or red with a black cross—some black, or black with long hairs on the back of a silver colour at their extremities; the skins of which, known by the name of silver-haired, are highly valued in the north of Europe. Wolves, generally of a tawny hue, but sometimes of a whitish colour, are also numerous, and extremely destructive to the tame rein-deer. Bears are common in Lapland, and, though subsisting principally on berries and herbs, frequently prey upon the cows, sheep, or goats; but are not able to overtake the rein-deer—and, unless provoked, would rather avoid than attack a man.

Many birds are found in Lapland, which have not yet been discovered in other countries; particularly the Lapland wood-cock, which has its beak turned up at the end; the Swedish mock-bird, remarkable for the variety of its notes, as well as the beauty of its plumage, and called by the natives the bird of a "hundred tongues;" the Lapland owl, a very rare bird; a species of magpie, called the Lapland crow; the three toed wood-pecker; the great dark coloured wood-cock, with a very long beak, of which the lower half is red, &c. The only birds which remain during winter, are partridges, crows, owls, and ptarmigans; but great multitudes resort, in summer, to the lakes and marshes for the purpose of breeding; and are well supplied with food from the berries and insects which abound at

Birds.
that season. Among these are observed the eagle and falcon tribe, some of which are entirely white, owls, one species of which is of a large size and whitish color; crows in prodigious numbers, which become extremely tame during winter; ravens, which are frequently so bold and voracious as to seize the fish hung up to dry, and to pluck out the eyes of the sheep; partridges, which become white in winter; large bustards, about the size of a full grown turkey; magpies, pigeons, plovers, thrushes; wood-cocks, snipes, snow-birds, gold-pheasants, curlews, water-wagtails, ruff and reedsways, wheat-ears, buntings, black-grous, partridges, swans, wild geese, eider-ducks, cranes, gulls, geese, goosanders, razor-bills, little eared grebes, pelicans, cormorants, &c.

The only amphibious animals are the common frogs, and lizards. The rivers abound in excellent salmon; and the lakes in pike, perch, trout, eels, and charr. Whales appear upon the coasts in astonishing numbers, especially about Candlemas; and the sword-fish, shark, and porpoise, are sufficiently common. Holibut, skate, turbot, and flounders are taken in vast quantities in the northern ocean; and, when dried, are exported to the neighbouring countries in the north of Europe. Cod, turbot, and ling are found on the coasts of Lapland during the whole year; and herrings appear in immense shoals; but from want of nets these last are taken only in small quantities, and used chiefly as bait for other fish. The seas around Lapland furnish also sturgeon, lamprey, sole, sea, greyling, gwiniard, lobsters, crabs, prawns, &c.

The insects of Lapland are more numerous than had long been suspected by naturalists; and have been particularly described by Dr. Quenzel. The most curious and unaccountable circumstance noticed by this traveller is, that phalaros, which in other countries appear only towards evening, and during the night time, follow an entirely opposite course in Lapland, flying about during the day, and disappearing when the sun is near the horizon. No venomous animal whatever is found in the whole country of Lapland.

The natives of Lapland are wholly ignorant of their origin as a people; but there can be little doubt of their having been the first inhabitants of the country which they now occupy. Their descent has been deduced by some authors from the Scythians, and by others from the ancient Hebrews; but the most probable opinion is, that their more immediate ancestors were the ancient Finns. The description at least of the Finni by Ptolemy and Tacitus, is strikingly applicable to the mountain Laplanders of the present day. They are supposed to have been the people designated by Herodotus, under the epithets, Cynocephi, Trog-, bodes, and Pigmies. They disclaim the appellation of Laplanders, which is understood to be a term of reproach, and to have been given to them by the Swedes upon the first subjugation of the country; but etymologists are not agreed about its precise import and derivation. It is deduced by some from the Latin Hippus, bleared-eyed; by others from the Swedish leppa, a patch in reference to their garment; as some interpret the word, a bat, denoting their ugliness; and by others from the Finnish leppa, exiles or runaways, supposing them to have migrated, or to have been banished from

Finland.* The Lapland language is represented as having a considerable analogie to that of the Finns, and as distinguished by certain peculiarities, resembling the idiom of the Hebrew. It is described as possessing an elegant brevity, expressing by one word what in most languages would require several. It abounds in diminutives, but is barren in proverbs. It may be noticed as one of its singularities, that the names of fluids, metals, minerals, grain, herbs, and fruits are all expressed only in the plural number.

The names of the first ten numerals are,

The conversion of the Laplanders to Christianity cannot be dated much earlier than the middle of the 17th century; and it is still so very imperfect as to consist in little more than their receiving baptism, bearing Christian names, and attending, in a manner by compulsion, on a few festivals of the church. They are said to have still retained their ancient religion almost unmingled with any of those additions, which converted nations generally make from Christianity. They, in general, acknowledge the king of Sweden as their lawful sovereign; and conform to the Swedish courts of judicature established in different parts of their country. A small number are tributary to Denmark and Russia. They are not a numerous people; and are calculated not to exceed 60,000, scattered over an extent of 150,000 square miles. Even of this number, Baron Von Buch considers, that one-sixth part only is composed of the real Laplanders, and that the rest are properly Finnish colonists, by whose gradual influx the population of Swedish Lapland is said to have doubled, in the course of thirty years. The Laplanders have a swarthly complexion, black short hair, a wide mouth, hollow cheeks, and a chin somewhat long and pointed. Their eyes are weak and watery, in consequence, it is supposed, of their smoky habitations, or the driving and glaring snows of winter, which often have the effect of depriving the natives of sight for days after returning from a hunting excursion. They possess great strength of body, and are capable of undergoing extraordinary degrees of labour. They are not less remarkable for swiftness of foot and bodily agility; and are inured from their infancy to every kind of activity and exertion. They are rather of diminutive stature, a circumstance which has generally been ascribed to the severity of their climate, and the scantiness of their diet. Their slouching gait and want of artificial heels, give them, however, the appearance of being lower than they are in reality; and, as the boys have often the air of maturer years, and are employed in driving the sledges, it is not unlikely that they may have been mistaken by many travellers for men. The smallest person observed among them by Maupertuis, was a well proportioned woman, who measured four feet, two inches, and five lines; and Högsbröm frequently met with natives of the different provinces, whose height was between five and six feet. Even their swarthy complexion is more the effect of the smoke

* The Laplanders, Samoyedas, Tsaoumaux, and Greenlanders, all found in the same northern latitude, appear to have been originally the same people. The Laplanders are supposed to have descended from the White Sea towards Norway and Sweden, while the Finns, on the other hand, ascended from Esthonia through Finland. In the north of Norway, the Laplanders are called Finns; and the Finns who have penetrated into the country, are denominated Quans.
in which they are doomed to pass so great a portion of their existence, than a natural hue of their skin; for Linnaeus affirms, that "the fairness of the bodies of these dark-faced people rivalled that of any lady whatever."

The dress of the Laplanders consists of a conical cap in the form of a sugar loaf, and of a greyish colour, made with eight seams, which are covered with stripes of brown cloth, with a tassel of various coloured shreds on the top, and a border of fur round the lower part; sometimes the colour of the cap is red, and the stripes yellow. While engaged in hunting or in tending the rein deer, they wear also a kind of riding-hood, which covers the whole head, breast, and shoulders, having only a small opening in front to look through. The men rarely wear any covering about their necks, which are exposed naked to the weather, with no other protection but what is derived from the thick collars of their coats. The coat, which serves at once as shirt and outer garment, is generally made of sheep-skin with the wool upon it turned next the skin, and reaches below the knees, when not tied up with a girdle. It is open in front half way down the bosom, below which it is fastened with hooks, as far as the lower part of the stomach. The collar is high and thick, quilted with cloth, frequently ornamented with different coloured threads, and extending a little way down the bosom on each side. Instead of pockets, they carry a little bag hanging over the breast, divided into two compartments, and containing their tobacco pipe, tinder-box, tobacco, and spoon. The great coat made of kersey or rein-deer skin, with the hairy side outward, is like the jacket, open only at the breast, and provided with an upright stiffened collar, with a running string to draw it close about the neck. The collar, the opening at the breast, the shoulder-band, the cuffs of the sleeve, and the bottom of the coat and jacket are commonly bordered with cloth or furs of different colours, and worked with threads of various hues. The mountain Laplanders also wear around their necks, when they travel, the skin of a fox's cub. They sometimes wear gloves of tanned leather; but more commonly made of the skins of the fawn of the rein deer, with the hair turned outwards, and a lining of Cyprus-grass. A finer sort is made of the skin of the black fox or of the rein-deer's foot; and the upper part, which reaches above the wrist, is formed of cloth curiously worked with tinsel wire, and trimmed with otter's skin. They use no stockings, but wear a kind of pantaloons of coarse cloth or tanned leather, or the skin of the rein-deer's legs, fitted close to the limbs. Their shoes are made from the skin of the rein-deer, the soles being taken from the forehead, and the upper leather from the legs of the animal. The hair of the sole is generally singed to render it less slippery in walking; and the inside is carefully lined with a kind of soft hay, chiefly of the _caxx _aglaia. Sometimes they buy leather from their neighbours for boots; and a finer sort is made for sale with the legs of coarse cloth neatly worked with tinsel wire, and the toe prolonged to a sharp point. They wear leather belts ornamented with tin, and with thongs of leather, to which are attached tin bells, keys, &c., hanging down behind. The women wear caps of woolen or linen cloth, with stripes and borders of yellow cloth, and ribbons of gold or silver tinsel, and use riding-hoods, when abroad, like those of the men. Their jackets and great coats resemble those of the men, except that the former is gathered into plaits before and behind, and is rather shorter than that of the other sex, while the latter is longer.

The other parts of their dress are little different from those of the men; but their gloves and shoes are generally of white skins, and their girdles more ornamented. They wear also kerchiefs, or mantles of Russian linen or cotton, and narrow aprons of the same stuff, always furnished with a fringe or border. All their articles of dress are made by the women.

The mountain Laplanders, or those who inhabit the alpine country, have no fixed habitations, but live in tents, which they move from place to place, in quest of food for their rein-deer. These tents are usually nine feet in height, and about 12 feet in length. They are constructed by means of six poles or beams of wood nearly meeting at the top, and in winter fixed at the lower extremities in a wall of snow raised around the inclosed space. The tent is covered with walmal cloths, generally in two pieces, fastened together with wooden skewers; and the door is simply a flap of cloth left between two of the main beams, but sometimes extended on a wooden frame in the form of a pyramid, with a thong of leather tying the top or point of the door to the upper part of the opening by way of hinge, while the side to windward is carefully kept close, and entrance allowed only in the opposite direction. The fire place, which consists of a square enclosure of low stones, is always in the centre of the tent, and above it is left a hole in the roof to let out the smoke, and a small beam crossing the top of the principal poles to support the iron hook by which the kettle is suspended. The summer tent is covered with canvas cloth; and a small one, of the same materials, is carried by the Laplander in his hunting excursions at all seasons. The huts of the maritime Laplanders, and of those who inhabit the woody region, nearly resemble the tents now described, in their whole form and structure; except, that instead of a cloth covering, the roof is formed of the bark of the birch tree and sods of earth. The internal arrangement is the same in both. The space between the fire-place and the door is used as a receptacle for fire-wood, and that behind the fire for the kettles and other utensils. The spaces on each side of the fire-place are divided by logs of wood, into three apartments, which may be styled the bed-chambers; of these the space farthest from the door, accounted the most honourable, is occupied by the husband and wife; that in the middle by the children; and the outer one by the servants. It not unfrequently happens that two families dwell with the utmost harmony in the same habitation, each occupying one side, and using the fire-place, with its front and back spaces, in common. The whole floor of the huts and tents is covered with the small branches of trees, and above these are usually spread the skins of rein-deer, upon which the family sit or recline, as, except in the centre, where the fire is situated, no part is sufficiently high to admit of their standing upright. A thicker covering of skins is laid in the lateral spaces which are used as bed-chambers; and, however intense may be the cold, the mountain Laplander always strips himself naked when he goes to sleep. His outer coat serves as a pillow, and a sheep's skin, with the woolly side inwards, as a blanket, above which, if necessary, is laid a woolen rug. During summer, a canvas quilt is commonly used as the upper covering, which the Laplander draws completely over his head as a protection from the mosquitoes, and keeps it raised in the middle by a leather thong tied to the poles of the tent, so as to allow a freer respiration in his hiding place. At all seasons these dwellings are constantly filled with smoke, which is considered as the best.
LAPLAND.

Furniture

protection from the gnats in summer, and from the cold in winter; but, in consequence of the wetness of the wood which they are obliged to employ as fuel, this smoke is so pitchy and dense, as to render it inconceivable how human beings should be able to exist, or, at least, to preserve their eye-sight in such a situation. In the huts there is usually a stall near the door, for the sheep and cattle, which enter by the same door, and pass the night under the same roof with the family. Both the maritime and mountain Laplanders have sheds and hovels around their dwellings as receptacles for provisions, and other household stuff, which are not in immediate request; and generally one of these is an empty space under their hay-stack, which is built on a frame of posts. Frequently, also, the mountaineers dig holes in the ground, and pave them with stones, as store-places for the flesh of the rein-deer.

The household furniture of the Laplanders consists of horn spoons, pots and kettles, made of brass or copper, sometimes of stone; wooden bowls of birch wood, capable of holding about 12 quarts; a basket for holding cheese; and a barrel for their oil, and other liquids. A few of the richer natives possess two or three pewter dishes, and silver spoons. The maritime Laplanders use a lamp made of a sea-shell, with a rush-wick; but the mountaineers have rarely any other light than what the fire affords. A few retort bags filled with milk for winter use, are suspended from the roof; and one or two racks for cheese placed along the upper part of the house. Oval fir-boxes, capable of containing a few articles, and covered by a lacing of cords, are used as panniers in transporting their goods; and two of them, weighing above two pounds each, are carried by a rein-deer. The most ornamental piece of furniture in the house of a Laplander is the cradle; which is a piece of wood properly shaped and hollowed, with a recess for the head of the child. Cords are so fixed as to pass round it and fasten it to the mother's back when she travels; and a ring of beads is suspended from the upper part to amuse the infant as it lies on its back with its hands at liberty. In this case of wood the infants are rocked or swung, a millesime and with unboiled milk through a horn. In four months they are generally able to stand on their feet; but many of them are supposed to die from improper management, and especially from an early exposure to cold.

The diet of the Laplanders consists almost wholly of animal food. Those who reside on the coast subsist chiefly on fish, with a little beef and mutton occasionally. They are fond of the cod fish roasted as soon as caught; and consider its liver, bruised and mixed with cranberries, as a very savoury dish. Salmon is split and dried, and, in that state, is eaten without any farther cooking or preparation, except dipping each piece in train oil before putting it in their mouths. When their stock of dried fish is exhausted, or falling short, they collect the heads and bones, roast them before the fire, stew them in a kettle along with slices of seal-butter, and eat the mess with a seasoning of train oil. The mountain Laplanders subsist principally on the milk and flesh of the rein-deer. Its milk is used in a great variety of ways; fresh or boiled, or boiled and congealed with sorrel; or congealed in a sour state, and so solid as to be capable of being cut into slices; or congealed together with its cream; or boiled down, when quite fresh, to the consistence of gruel, in which state it is called sweet cheese; or congealed with rennet, and boiled with meal; or drained in a napkin, when just beginning to ferment, and when sufficiently firm, eaten with sweet cream. In winter the new milk freezes as soon as drawn from the animal; and in this state is kept in small vessels of birch-wood, as an extraordinary delicacy, to be eaten with a spoon as it thaws before the fire. In autumn it is collected in casks, or other vessels, in which it speedily sours; and, as the cold weather comes on, freezes hard. It is frequently mixed also with cranberries, and put into a clean paunch of the rein-deer, when it soon congeals, and, together with the paunch, is cut into slices for use in winter. They make butter of the whole milk of the rein-deer, which the women accomplish by stirring it about with their fingers till it acquires the desired consistency. On making cheese it is necessary, on account of the extraordinary richness of the milk, to mix it with water; and the cheese, which is still remarkably fat, is used cold, boiled, or roasted. The whey, boiled with meal, forms another preparation; and sometimes it is kept for a long time merely in a vessel. Besides the calf's rennet, the Laplanders produce a similar preparation by infusing the sauid of the cod-fish, or the intestines of the rein-deer, in a quantity of butter-milk. They use a great proportion of venison in their daily fare. From the time that the dried fish is consumed, a family of four persons uses at least one rein-deer every week; and three of these animals are accounted equivalent to an ox. This venison, slaughtered as required, is cut into small pieces and boiled, which are dipped, as they are eaten, into the fat previously scummed from the pot, and washed down by a ladle full of broth taken occasionally during the repast. The legs are boiled for the sake of the marrow, which forms one of the greatest delicacies; and the entrails are cooked for food, though never along with the meat. Even the bones are most economically broken down, and stewed as long as any oil can be pressed from them. The lights and other kind of bread is prepared from the Calda palustris or water dragon, the roots of which are taken up in spring before the leaves shoot out, dried, pounded, ground, boiled, till it becomes thick like flummery, and, after standing in this state three or four days to lose its

* Some discrepancies occur in the accounts of travellers on this point. Acerbi, who chiefly follows the Danish missionary Lennius, says, that they eat all animals but swine, pork being to a Laplander an abomination; but Thomson, who takes Linnæus as his guide, affirms, that almost the only Lapland quadrupeds upon which the natives do not feed are the fox and wolf, and speaks of their fattening swine with meal made from the inner bark of the pine tree.

VOIX XII. PART II.
LAPLAND.

Lapland. bittermess, is mixed use with the meal of bark or barley. In times of great scarcity, bread is sometimes made from the ground seeds of the *Spergula arvensis,* or spurrey. The Laplanders are exceedingly fond of the Angelica sylvestris, which grows abundantly in every part of woody Lapland, and which they eat, either fresh or dried, or boiled in milk, with great avidity, as at once a delicious salad, and an antiscorbutic medicine. They use, in like manner, the *Sonchus alpinus,* a kind of small sow thistle, which has a milky stem of a very bitter taste. Among their dainties may be enumerated the inner bark of the fir-tree, fresh, smoked, or steeped in train oil; the different berries found upon the melting of the snow, thoroughly ripened in this winter repository; and, above all, tobacco, which they chew or smoke, as the highest luxury, and when they can procure no more, will even masticiate slips of the bag or chips of the cask in which it has been kept. They are greatly delighted with pepper, ginger, and other spices; and peculiarly gratified by a present of ardent spirits, of which they prepare none themselves, but procure a little brandy from Sweden or Norway. Before swallowing the liquor, they rub a little of it upon their foreheads or bosoms, in the persuasion that it will thus be prevented from injuring their head or breast. Their sole beverage, in ordinary use, is water, procured in winter by dissolving the snow; and for this purpose a quantity is kept always standing in a copper vessel in their huts. All the cookery is performed by the men, and in the dirtiest manner possible. The dishes and spoons are seldom washed, or, at most, only by squirting water upon them from their mouths, and rubbing them with their fingers.

Diseases.

The Laplanders are said to live to a great age; and it has even been affirmed, that some of them have completed a century and a half. But, as they are little skilled in the exact computation of time, much dependence cannot be placed on their own testimony; and their premature looks of old age, and general wretched tenor of life, are not very consistent with such accounts of their longevity. Their long endurance of intense cold—their coarse and precarious food—their close and smoky habitations, and their neglect of personal cleanliness—are not likely to prove conducive to vigorous health and long life. But, on the other hand, their roaming disposition—their employment in hunting, fishing, and tending the rein-deer, which habituate them to air and exercise—their partiality to various preparations of milk as an article of subsistence—their warm clothing, and careful precautions against damp or cold feet—not to mention their exemption from the dissipations of more refined states of society—are doubtless favourable to the prevention of disease, and give credibility to the statements of their being a healthy race. At the same time, as in the case of most savage tribes, it is highly probable that the great proportion of vigorous constitutions among them, may be ascribed to the circumstance of those who are of a weakly habit dying in infancy. Fevers, agues, and dropsies, are rare; chills, and gout, and jaunice, entirely unknown. Even coughs and colds, notwithstanding the severity of the climate, are very uncommon; though a few cases of consumption now and then occur. Swelled necks, or goites, similar to those in Switzerland—sores, or blear eyes, frequently inducing total blindness as old age advances—a swelling, or falling down of the uvula, cured by cutting off the affected part—colics, and other disorders of the stomach and bowels; pleurisy, and cases of hoarseness in spring and autumn—lumbago and rheumatic pains, epilepsy and headaches, scurvy and St. Antony's fire, deafness and asthma among old people, are the most frequent diseases in Lapland. The great remedy employed in most of their diseases, especially for all aches and pains, head-ache, tooth-ache, pleurisy, lumbago, &c. is the actual cauterity, which they apply by burning a piece of fine fungus, about the size of a pea, on the place affected, and thus producing a sore, by way of issue, which is allowed to remain open till it heals spontaneously. In hard imposthumes, &c. they apply a kind of plaster made from the loose sealy bark of the birch, scorched, chewed, mixed with fresh turpentine from the spruce fir, and kneaded by the hands into an uniform paste, which brings forward the suppuration, and promotes its discharge without much pain. As an ointment for burns, they boil fresh cream to a thick consistence. Most of their other medicines are mere nostrums, or charms. They pretend to cure inward complaints by swallowing the blood of the seal, or the rein-deer, as warm as possible. They touch a diseased tooth with a splinter from a tree which has been struck by lightning; and, in order to rub off the speck in a commencing cataract of the eye, they introduce a common louse within the eyelids. Before reducing a dislocated or fractured bone, they cause the patient to swallow, in a drink, a little powdered silver or brass. As a remedy for sprained ankles, or other strains, they bind the suffering part with the siew of the rein-deer's fore legs; but, at the same time, reckon it essential to the cure, that a female patient must use the sinews of the buck, and a male those of the doe.

During the winter time, and especially from the beginning of December to the end of January, a sort of apathy, congenial to the season, creeps over the natives, and they spend in sleep more than one-half of the 24 hours. Their principal care is to keep themselves warm; and little employment of any kind is carried on.

The maritime Laplanders change their habitations only twice in the year, namely, in spring and autumn; and in this case they leave their huts standing until their return. Those, also, who inhabit the woody regions are more stationary. But the mountain, or wandering Laplanders, are continually moving from place to place, to procure food for their rein-deer. About the middle of summer they move with their families and herds towards the sea coast, seldom travelling above four English miles a day. They spend great part of the summer in fishing; and, as the rivers abound in fish, they find no difficulty in catching as many as they desire, which they hang up and dry for future use. In this employment they are often attended on the lakes by large flocks of sea swallows, which direct them to the places where the shoals of fish are most abundant; and are rewarded with the small fishes, which are cast on the shore, or left for them in the boats. They come duly at the same hour in the morning, as if to inform the fishermen that it is time to begin their work, and set off with the boats as guides, ready, by their cries and plunging into the water, to point out the most proper places for casting the nets. On the approach of autumn they return to the mountains, where they may, at last occasion, require a boat, or even a canoe to the other. On their way from the coast in autumn, as the rein-deer are particularly fat in that season, they generally kill a sufficient number of them, which they deposit by the way in a kind of hovel or storehouse,
LAPLAND.

Manners and mode of life.

to remain there during winter, and serve as a supply for their families in the following spring, on their progress to the coast. In spring and autumn, when the earth is free from its covering of snow, the natives travel on foot, and convey their tents and baggage on the backs of the rein-deer; but, in the winter excursions, sledges are used for transporting themselves and their furniture. The sledge is made of birch wood, and formed like a boat with a flat stern. The ends of the side planks are fastened with wooden pegs to the roundish boards which form the back, and their points, brought together at the front, are bound with a rope. The sledges are calculated within, and frequently pitched also on the outside to keep out the water. The kind most commonly used for travelling is so light, as to be easily carried in the arms, and is no larger than to admit the legs and thighs of the Laplander. It is open from head to stern; but has occasionally a seal skin fixed to the head, which covers the legs and knees of the passenger, to which is joined a rug, spreading over his lap, and fastened by leather loops to the side, to defend him from the snow. The larger sledges, employed for conveying provisions and baggage, have generally a convex deck from head to stern, with a hatch behind, which is raised by a projecting bolt, when any thing is to be drawn out, or stowed under the deck. The sledges are drawn by the female, or by gelt rein-deer; and it requires great perseverance to break these animals to the harness. In yoking them to the sledge, a broad collar of untanned deer skin is put over the neck, from which a rope made of thongs, cut from seal skin or the hide of an ox, passes under the belly between the fore and hind legs, and is fastened to the sledge by a hole in the fore part of the keel. Another collar, or kersey cloth, and embellished with tinsel, is occasionally put on by way of ornament. A broad girth is sometimes brought round the body of the deer, with an opening below the belly to let the rope pass through, and to keep it steady in pulling the vehicle. A rein, or thong like a halter, is fastened to the head of the deer, and, while the animal is standing still, hangs on the left side. The Laplander, when placed in the sledge, ties the end of the halter about the thumb of his right hand, and then shaking it with violence from side to side, the animal springs forward at great speed, but in an irregular and serpentine course. When the driver wishes to keep to either hand, he pulls the rein to that side. When going down hill, he regulates the sliding of the sledge by the movement of his body; or, if the descent is very steep, he ties a rein-deer by the horns to the back of the sledge, which the animal is trained to keep steady by drawing backwards. When he wishes to urge the rein-deer to its utmost speed, which is at the rate of ten miles an hour, he places himself on his knees, and encourages him by certain sounds and movements; and when he is desirous to stop, he shifts the rein from the right side to the left, upon which the animal immediately stands still. In transporting baggage or provisions, a train of four or five sledges may be conducted by one man, who seats himself in the foremost, while the rein of each deer is attached to the stern of the preceding sledge; and one deer tied to the back of the hindmost, to act as a check upon their velocity in descending the declivities. The sledges, when not in use, are frequently lodged under a wooden shed; but, in general, they are merely turned upon the snow, with the keel upwards, and in this position they serve the purpose of repositories for venison, &c. For travelling on foot in winter, the Laplanders employ snow shoes, which are about six feet long, and six inches broad in the middle, tapering to a point at both extremities. The upper part of the shoe is flatish, the edge on each side sharp, the under part convex, and furrowed lengthwise; and in the middle of the broad surface is a place for the foot, with a band to fasten it firmly about the ankle. Many of the families in removing from one station to another, follow the sledges on foot, driving the herds of deer. In this way, they frequently travel by night as well as by day over an entire surface of snow, without the slightest vestige of a track to guide their way, and with the snow drifting in all directions; yet, by observing the stars, or the course of the wind, they rarely mistake their route. In these cases, they fix belts to the collars of the rein-deer, in order to keep together by the sound, when they can no longer see one another. They are always provided with a steel, flint, and matches, to light their pipes, or kindle a fire if requisite; and when obliged to stop, in consequence of the severity of the weather, or the length of the way, speedily erect a small travelling tent, and take their repose as occasion or necessity may demand.

The principal employment of the Laplander, especially in the winter season, is hunting, in which he makes much use of traps and other snares, some of which are sufficiently ingenious. In order to take partridges and ptarmigans, they form a low hedge or fence of brushwood in the thickets, with small openings about a fathom from each other, just large enough to let the birds pass through them. In these, they place a forked birch twig, in such a manner as to form a sort of arch, with the cleft stuck in the snow, and, in this arch, is suspended a noose of packthread, or horse hair, by which the birds are taken as they come running along, and attempt to pass through the open spaces. They frequently catch the pelicans, cormorants, and other sea fowl on the rocks, by means of baited hooks fastened to ropes. They take also in snares, foxes, hares, ermines, martins, &c.; and even the wild rein-deer are often caught by nooses suspended in the narrow passes, or by driving them into enclosed alleys. When the snow has fallen in large quantities, and the wild rein-deer, by sinking deep, are unable to run fast, the natives pursue them on foot in their snow shoes, and knock them on the head with clubs. But, in hunting, the Laplander makes much use also of the rifle gun; with which, and the assistance of his dog, he rouses and shoots the wild deer even in the summer and autumn seasons. The hunting of the deer is attended with excessive fatigue, on account of the animal's acute perception and extreme shyness; and the hunter, upon receiving one at half a mile's distance, takes a circuit to leeward, creeping on his hands and feet till he comes within gunshot. In this way, a single hunter frequently assails the bear in open day, especially in the autumn, when the animal is more fearless, and is continually prowling about in quest of the berries which abound at that season. The Laplander, taking his dog, with a cord tied around its jaws to prevent it barking, and holding the other end in his hand, advances to the retreat of the bear, and endeavours to keep on the leeward side, that the animal may not discover his approach by the scent. Should he miss his aim, or only wound the bear, his life is exposed to no small danger from the enraged animal. In his flight, however, he generally contrives to drop his knapsack, which the wild beast commonly seizes, and tears in pieces; so that the hunter either makes his escape in the mean
time, or takes the opportunity to fire a second shot, which usually proves effectual. At other times, when he has discovered the winter retreat of the bear, he covers the entrance of the den with branches, interweaving them so thoroughly, as to leave only a sufficient space for the animal to thrust out his head. Armed with his hatchet, he proceeds to rouse and irritate the sleeping inhabitant, who generally advances in the utmost rage to the opening among the branches; but, as soon as he pushes forth his head, the hunter levels a blow with the axe, which rarely fails, if it strike him below the eyes, to fell him to the ground. They form canoes of thin planks, fastened together by means of cords which are so light as to be easily carried on the back; and which they guide with surprising dexterity in the most rapid currents.

The maritime Laplanders, are principally employed in fishing, and particularly during the summer season, when the Russian vessels are stationed on the coast, pursuing the same object, and purchasing the fish of the natives. At this busy period, they often lie out at sea in their boats for many weeks; and, by the disposal of their fish, procure meal for their support in winter. Their condition is, however, very inferior to that of the mountain or field Laplanders; and they are always eager to exchange their boats and earnings, for the greater freedom and better living of their pastoral neighbours. Their fish, train oil, and meal, is counted wretched poverty in comparison with the fat broth and full repasts of reind-cook fished enjoyed by the mountaineers. It is only when they are forced by necessity, in consequence of the deficiency of their herds, that they betake themselves to the watery element in quest of that sustenance which they can no longer find among the mountains. With three hundred of these animals, they would be in a state of moderate prosperity; but would live very miserably on the produce of one hundred. From their predilection for the pastoral life, they rarely apply themselves to improve the benefits of the more stationary residence, which they might have on the coast. Their huts, or gamms, are only calculated for a few months duration; and are changed at least twice, and sometimes three times in the year, for the sake of procuring pasturage for the few reind-cook, or milk cows, in their possession. Some of these dwellings, which were seen by Baron Von Buch on the coast, were little calculated either for shelter or accommodation. They were not more than eight feet in diameter, and four in height, nearly resembling a bakers oven, with a square hole in the middle to serve as window and chimney. They were constructed of branches, and covered on the outside with grass, but so carelessly put on as to admit the wind in every direction. In these, during the absence of the men at sea, are crowded together as one family, a mother, daughter, daughter-in-law, and servant maids; but even in the little circle which they occupy, all confusion is prevented, by an exact allotment to each of their own space and side of the dwelling. A great part of the Swedish Laplanders in Kemi Lapmark, and especially in the Forsamling of Enare, live principally by fishing, like those on the coast; and possess few reind-cook, but generally have ten or a dozen sheep. In summer, they subsist on fish from the lakes, and drink, as a luxuriant draught, the water in which their fish has been boiled. In winter, their diet consists of dried fish, and soups made of water, bark, and reind-cook tallow, with a little ewe milk, and a few mountain bramble berries. In the lakes and larger rivers, they take the salmon by means of nets, or by striking with the spear. This latter mode is practised chiefly during the night by means of lights or fires, and is described as singularly picturesque. On the front of the boat, is an iron basket or grate fastened to the end of a long crooked stick, so that the burning wood which it contains stands far above the boat. Immediately behind the fire stands the fisher with his trident, which is a long spear, with five or six strong barbed points; and behind him sits the pilot, who moves the boat along with gentle and imperceptible strokes. The salmon is attracted by the blaze of the fire, and, raising himself slowly to the surface of the water, comes within reach of the spear. The silence of the moving boats, the crossing of the fires as they advance in different directions, the immovable figures of the fishers hanging forward over the prow in readiness for the blow, and the sudden animation imparted to these seeming statues when the salmon is struck, render these fishing scenes peculiarly interesting to the eye of a spectator. The dexterity with which the Laplanders guide their boats down the most rapid falls in the rivers, is not less remarkable, and presents a spectacle as sublime as the last mentioned is beautiful. This, however, must be given in the word of an eye witness. Baron Von Buch thus describes his passage through the fall of Elampaika, below Muonianska. "I heard the noise of the fall long before we approached it, while the river still glided on smoothly. Then followed several falls, which were not high nor long, but the stream became rough and agitated. Rocks began now to rise along both sides, and points to appear above the surface. The agitated water pressed through between the closely approaching rocks. The waves began to rear themselves up, to form, and dash over. They drove the boat with incredible rapidity down the abyss; they dash over in the most wild and alarming commotion; the sky, rocks, and woods, all disappear; and nothing is seen or heard but the foam and roaring of the water. The wave dashes the boat with one sweep against the rock; but the bold pilot guides it with a strong and steady hand with still greater rapidity than the wave, as if in sport, from one side to the other; and the next moment it is again floating on the no longer agitated current. The two men in the fore part of the boat, have a most frightful appearance. Their fixed look, their eyes, which seem to start from their sockets, endeavour to read every thought of the pilot, whether they ought to row in the fall more rapidly or more slowly. Their own preservation depends on their correct understanding of the thoughts of the pilot. Every muscle is stretched in the highest degree, and the arms only are in motion." The boats are as strong as sea boats, and their huge helms seem made for large ships. In this way, the natives proceed down to Torneo with large burdens of butter, tea, fish, and hides; and drag the boat with incredible labour along the bank, when they come to the fall in ascending the stream.

The Laplanders discover considerable ingenuity in making the various utensils which they possess. Their sledges and canoes are so artificially put together, that not a drop of water is able to penetrate their sides. From the wood of the birch tree, they form vessels of various capacities, from an ordinary drinking cup, to casks for holding the milk of the reind-cook. From the horns of the reind-cook, they manufacture spoons in a very neat manner, which they stain with figures tolerably well designed. With no other instrument than a knife, they also carve their bowls and spoons with wonderful expertness. The steel of these knives they ma-
LAPLAND.

Manufacxture for themselves, and ornament in a style of some elegance. They tan their leather with the first inner bark of the birch, which they cut into small pieces, and boil for half an hour; and, having previously freed the hides from the hair, by plunging them in warm water, burying them under ground, and scraping them with a roundish knife, they immerse them in the liquor, a little cooled; and, for two days, the liquor is warmed, and the skins replaced. By means of sir bark, they give the leather a red stain; and dye their wool of that colour, with the blood-root, or tormentil. They cement broken earthen-ware, by tying the fragments together with a thread, and boiling the whole in fresh milk. The women prepare the skins of foxes, owls, otters, and other animals for sale, by stripping off the membranous parts, and curing them with fish oil. The women make tinsel wire of different thickness, by drawing it through a machine formed of a rein-deer's skull; and with this wire they embroider coats, gloves, harness, &c. in a very fanciful style. The Laplanders manufacture thread from the tendons of the rein-deer. These they hold before the fire, and beat with wooden hammers, to render them more pliant and divisible. They lay hold of them with their teeth, and split them into filaments, moistening them occasionally with rein-deer marrow. These filaments are drawn through holes of different sizes in a wooden or metal instrument, to render them as smooth as possible. They are then twisted into threads, by rubbing them with the hand upon the thigh or knee, and moistening them time to time with saliva.

During winter, the Laplanders carry on some traffic with the Swedes, bartering skins, furs, dried fish, and venison, gloves and short boots, for coarse flannel, cloth, hemp, copper, iron, and various utensils, but particularly for tobacco, brandy, meal, and salt; besides exchanging fish for meal, from the Russians on the northern coast. Some idea of the amount of this commerce, may be furnished from the following abstract of the exports from Westrobothnia to Stockholm, which principally come down from Lapland:

The principal weapons of the Laplanders in more remote times, were bows and arrows; but now, they chiefly employ fire-arms, and are in general excellent marksmen. They still amuse themselves with throwing a javelin at a mark, as one of their sports. They are expert wrestlers and leapers. One usual mode of the former exercise, consists in fastening their hands in each other's belts, and striving who shall lift and throw his opponent; and of the latter, in leaping over a stick held by two persons in a horizontal position. Another diversion, is to strike a stuffed leathern ball into the air, and to catch it before it reaches the ground; and, at other times, two of them, or two equal parties, lay hold of a rope by means of a stick at each end, and strive to disengage it from each other's grasp, till the struggle is decided by the breaking of the rope, or the giving way of the weaker party. A more sedentary game in their long winter imprisonment, is that of the fox and geese, played with pegs, upon a board. The Laplanders are said, by some travellers, to have a sort of trumpet called lur, and pipes made of the bark of mountain ash; but Acerbi affirms, that they have no idea of harmony whatever, and that all artificial music appears to be banished from their solitary districts. He affirms, that neither by the power of money or of brandy, could he ever prevail with any of the natives, to produce any thing like a song, except a monotonous vociferation in a kind of fainting or fading voice, prolonged and repeated till the breath is exhausted. He found as little poetry as music, in the song, of which the words and notes, equally unvaried, were as follows:

—"a good journey, my good gentlemen—gentlemen—gentlemen—good journey—journey—good journey—journey—good journey—journey.

The Laplanders rarely intermarry with the Norwegians or other neighbouring nations. Their matrimonial negotiations are conducted with extraordinary formality and decorum. When a young man has selected his object, he communicates his wishes to his own family, who repair in a body to the dwelling of the young woman's parents, carrying a slight present, such as a ring or ornamented girdle to the fair one, and a quantity of brandy to entertain the friends. When arrived at the hut, the suitor is left without, till he shall be invited to enter; and as soon as the rest of the party have entered, their spokesman fills out a bumper of brandy, which he offers to the girl's father, and the acceptance of which, indicates his approbation of the match to be proposed. After the liquor has gone round the company, leave is obtained for the young man to present himself, while his advocate in a set speech opens the treaty. The lover, upon being introduced, takes his seat near the door, at some distance from the rest; and it is only when the parents of the girl have signified their full consent, that he offers her the present which he has brought, and promises wedding clothes to her father and mother. Sometimes a sum of money is given, both to the bride and to her parents; and not unfrequently considerable bargaining is employed to raise the amount. All the bride receives on this occasion becomes her own private property; and among the better class, a wife, counting all expenses, commonly costs the husband about a hundred copper dollars. Should the parents depart from their promised consent, it is an established law, that they must repay all the expenses and presents, even to the brandy which has been drunk at the first visit. After the parties have been in this manner betrothed, the young man is allowed to visit the bride, whose favour he generally entreats by conciliating, by presenting tobacco, brandy, or whatever he thinks will be most acceptable. On the marriage day, the bride appears in her best dress, but her head, commonly closely covered, is on this occasion only adorned with a bandeau or fillet, while her hair flows loose upon her shoulders. The banns are usually published only once. The marriage ceremony, which is very short, is sometimes performed before, and sometimes after the entertainment. The wedding feast is celebrated in a frugal and sober manner, without music, dancing, or any other festivity. Such of the guests as are able, make a present to the bride of money, rein-deer, or other useful article, to begin the stock, or furnish the dwelling of the young couple. In some parts of Lapland, it is the
custom that the friends and relations of the parties meet together, a few days after the marriage, and partake of a homely entertainment, consisting usually of a mess of broth, a little roast mutton, and metheglin. The bridegroom usually remains with the parents of the bride for the space of one year; and, at his departure, receives what portion they are able to give with their daughter, to establish the young people in the world. It is usual, at the birth of a child, to assign a female reindeer, with all her future offspring, as a provision for the boy or girl, who is thus, when grown up, not unfrequently the owner of a considerable herd.

Funerals.

The funerals of the Laplanders are conducted with little ceremony. The body, slightly wrapped in a coarse cloth, is carried to the grave by the friends and relatives, who are entertained with a slight repast, and a small portion of metheglin. In former times, it was the custom to raise a heap of stones over the grave; but an old sledge turned with its 'bottom upwards, is now the only monument placed over the spot of interment. Before the conversion of the Laplanders to Christianity, they placed an axe and tinder-box beside the corpse of a man, and beside that of a woman her needle and scissors, supposing them to require these implements in the other world. They likewise interred a quantity of provisions along with the dead body; and, during the first three years after the decease of a relative, were accustomed, from time to time, to deposit, in holes dug beside the grave, small quantities of tobacco, or of whatever was most agreeable to their departed friend during his life-time.

Religion.

From the time that so large a portion of Lapland fell under the dominion of Sweden, repeated attempts were made to convert the natives to the Christian faith; and the same object was diligently prosecuted by the Danish government. The Laplanders, however, continued to retain a strong attachment to their ancient mythology; and, even so late as the middle of the 18th century, a great part of the nation secretly worshipped idols, while publicly professing the Christian religion. Their ancient deities were sufficiently numerous, but may all be arranged under four classes. 1. The super-celestial, namely Radien Atzhie, the chief divinity, and Radien Kiedde, his only son, to whom was transferred the power of creating and governing the world. 2. The celestial, namely, Beive, the sun, the fountain of light and heat; Ailekes, and Ailekes Olmak, two deities to whom were dedicated the days of Friday and Saturday. 3. The sub-celestial, namely, Maderata, who kept the region of the air nearest the sun, and procreated all things; Maderakka, his wife, the protecting goddess of the Lapland women; Sarakka, and Juks-akka, their daughters, equally adored with their mother, and to the latter of whom were particularly recommended the newly born children; and Horagalles, the god of thunder. 4. The subterranean, namely, Sairvo and Sairvo Olmak, the gods of the mountains, who preserve the traveller from dangers; Saiwo Guella, the conductor of souls to the shades below; Jabme Akko, or death, who presides also over the region of departed spirits, where the good, furnished with new bodies, enjoy, in an exalted degree, all the dignities and pleasures which they had left on earth, and are prepared to attain a perfect felicity in the presence of Radien; Rota, the sovereign of the infernal regions, where the wicked are for ever banished, and the god who sends all diseases on men and beasts. The rein deer, and the rest of the brute creation, were also believed to partake of the peaceful enjoyments in the regions of Jabme Akko.

To these deities were presented various offerings and sacrifices. Upon any change of habituation, libations were made of whey or milk to conciliate the guardian divinity of the place; and of brandy to the Lares or household gods, who were supposed to reside under the fire-place. To conciliate the favour of the deities to their children, sacrifices of sheep or deer were offered before the child was born; a dog was buried alive at the moment of the birth; and some other animal killed when the infant was at the breast. Offerings and sacrifices were usually made for the removal of epidemic disorders, for success in hunting, &c. In these cases sometimes the whole of the victim was presented; sometimes only a part; sometimes merely the bones; while the blood was sprinkled upon staves, which were left on the spot, or mingled with the waters of an adjacent river or lake. The liver of a bear, the horns and other parts of a deer, taken in the chase, were very commonly consecrated to the deity of the place. Different mountains and rocks, remarkable for their shape or height, were distinguished as holy places; and, to this day, the Laplanders abstain from hunting or pitching their tents in the vicinity of these sacred spots, and sometimes pay them a respectful annual visit, dressed in their best clothes. All these sacrifices were performed by a privileged class of men, named Noaals, who divided the victims with great expertness, and wore at the time of sacrificing a peculiar habit. No woman was allowed to have any concern in preparing or solemnizing these rites; but the females had a full share in the ancient magical arts of their nation. Their skill, indeed, is now nearly extinct, and not a wind is to be purchased along the whole of the coast. But a few of these superstitious practices are occasionally observed, particularly the Runic drum, Ganic flies, and Jiouge. The Runic drum, resembling the head of a common drum, has its wooden frame hung round with brass rings, placed so near each other as to rattle together upon the slightest touch. The skin or parchment stretched over the drum is covered with painted characters, representing the different deities, and other mystical figures, to the number of forty-five symbols. These drums are esteemed according to their antiquity; and are preserved with great care and secrecy. In any affair of importance, they are consulted in the following manner:

A ring is placed upon the drum-head, which is then smartly struck with a small hammer made of deer's horn, so as to drive the ring from side to side over the painted surface: and according to the course which it takes, or the figures which it touches, the omen is interpreted as good or bad. Private families have their own drums for ordinary cases; but in matters of public import, such as an epidemic sickness among the people or cattle, the Noaals, or privileged soothsayers, regularly trained to the art, hold a public consultation of the oracle. During the ceremony, he makes a number of frightful grimaces, and takes an unusual quantity of tobacco and brandy, by which he is at length so intoxicated as to fall into a deep sleep. Upon awakening from his supposed trance, he pretends to have been conveyed to one of the holy mountains, where he had an interview with the deities, and discovers their directions as to the proper sacrifice to be offered; which is commonly that of a well fed deer; at whose immolation the soothsayer himself is always the principal guest. Should the sacrifice fail in procuring the desired object, the simple Laplander consults another Noaad, whose response commonly requires the sacrifice of another fat
The Laplanders are wholly destitute of learning; Literature and have no accurate division of time. They begin the year with the Friday before Christmas; and have names for all the festivals, of which they are reminded by the clergy, who insist rigidly upon their attendance at church on these days, even in the most stormy weather, and from the greatest distance. They use no almanack of their own; but the better instructed among them, and particularly the clergy, have almanacks from Sweden. The Laplanders employ, in place of these guides, a kind of instrument composed of seven small splinters or boards, like the ancient Runic calendar of the Goths. They have no months, but divide time by weeks. The following are their names for the days of the week:

- Sunday, 
- Monday, 
- Tuesday, 
- Wednesday, 
- Thursday, 
- Friday, 
- Saturday, 
- Sun-rise, 
- Two or three hours after sun-rise, 
- Hour of milking the rein-deer, 8 or 9 o'clock, 
- Noon, or dinner hour, 
- Afternoon, 
- Sunset, 
- Night.

Though the lot of the Laplanders is full of toil and penury, their attachment to their native country is remarkably strong. Of this the Danish missionary Læns mentions a striking proof in the difficulty which he experienced in prevailing upon any of their young men to accompany him to Copenhagen, to be presented to the king of Denmark. Notwithstanding the ingenuity and dexterity with which they construct their canoes and sledges, manufacture thread from the sinews of animals, and sew the harness of the rein-deer, they discover very little intellectual ability. In their persons they are dirty, and covered with vermin; never cutting their hair, or employing any other comb than their fingers. In their manners they are destitute of any kind of delicacy, rising naked from their beds, and dressing themselves promiscuously in the presence of either sex. They are described as very ignorant, which may well be supposed; as extremely indolent, which is the case with most nations so little removed from the savage state; as strongly addicted to the use of spirituous liquors, which is so commonly characteristic of the inhabitants of cold countries. Some travellers have further stigmatized them as cowardly, covetous, and knavish; a description which appears to be more applicable to those who inhabit the woody country bordering on Sweden, than to those who occupy the alpine regions, who are much more distinguished by their honesty and recompensing their labours among them as missionaries, by recalling them to better situations, is more likely to prove successful. 

The Laplanders still retain much of this superstitious spirit even in the Christian rites which they have adopted. They particularly regard the sacrament as a powerful charm to preserve them from the attempts of evil spirits. It is not long since they used to take a cloth with them to church, into which they were accustomed to spit out the sacramental bread, which they wrapped up with great care, and afterwards divided into as great a number as possible of small crumbs. One of these crumbs was given to every one of their cattle, in the full persuasion that the herd would thus be secure from all injury. Their very deficient acquaintance with Christianity may, in some measure, be ascribed to the very inefficient manner in which they are instructed. It has generally been the practice of the missionaries and pastors to address the natives by means of an interpreter; and the attempts of the Danish government to remedy this defect, have hitherto proved unsuccessful. Neither could the Laplanders be prevailed upon to pursue in Denmark the necessary education for officiating as preachers to their countrymen; nor could they be induced to adopt the Danish language as the prevailing dialect. The plan of encouraging young persons to study the Lapland language, and of recommending their labours among them as missionaries, by recalling them to better situations, is more likely to prove successful.
hospitality. On the other hand, their state and manners have been pictured in the most pleasing colours, as almost realizing the ancient descriptions of the golden age; as those of a people who enjoy undisturbed the blessings of freedom, contentment, innocence, and peace. There is good and grave authority, at least, for saying, that they are very attentive to religious duties, particularly observance of the Sabbath, and diligently devote during the performance of divine service; that they are uniformly respectful towards their pastors and missionaries; chaste in their manners, and free from every kind of proflavity in their speech; that beggars are unknown among them, and the wants of the aged and infirm only supplied by their neighbours and relations; that they are strangers to the vice of thieving, never needing to use such things as locks or bolts, and very generally sleeping with open doors in perfect security. See Lemmius de Lapponia Finsiiarchia Commentario, a work which is held in high estimation for its accuracy by the northern literati; Acerbi's Travels in Sweden and Lapland, where the substance of the last mentioned work is contained; Linnaeus Lachesis Lapponica, or Tour in Lapland, translated by Dr. Smith; Baron Von Buch's Travels through Norway and Lapland; Skiodlebrand's Picturesque Journey to the North Cape; Thomson's Travels in Sweden; Wahlenberg's Introduction Geographica to his Flora Lapponica. (g)

LAR. See Laristan.

LARCENY, (latrocinium,) in the law of England, signifies theft. It is distinguished into two sorts: simple larceny, or plain theft, unaccompanied with any other atrocious circumstance; and mixed or compound larceny, which includes the aggravation of a taking from one's house or person. When simple larceny is committed, by stealing goods above the value of twelvemote, it is called grand larceny; when of that value, or under, it is petit larceny. These offences are considerably distinguished in their punishment, but not otherwise. See Blackstone's Comment. b. iv. ch. 17; and Jacob's Law Dict. (2)

LARDNER, NATHANIEL, DR., was born at Hawkherst in the county of Kent, on the 6th of June 1684; and was the son of Mr. Richard Lardner, a respectable minister among the Protestant dissenters. The place where he received his grammatical education cannot be ascertained; but, after studying a short time at a dissenting academy in London, under the care of Dr. Joshua Oldfield, he was sent, in the sixteenth year of his age, to prosecute his studies at Utrecht, under professors Dr. Uries, Grovius, and Burman. After three years residence at Utrecht, he removed to Leyden, where he studied about six months; and returned to England in 1705, from which period there are no memorials concerning him till the year 1709, when he preached his first sermon in the 26th year of his age. In 1713, he was engaged as domestic chaplain in the house of Lady Treby, widow of Sir George Treby, Lord Chief Justice in the Court of Common Pleas; and at the same time as tutor to her youngest son, Brindley Treby. At the death of this lady in 1721, he seems to have been thrown into considerable perplexity with regard to his future plans, having now preached (to use his own words) many years without being favoured with the approbation and choice of any one congregation; but, about the year 1728, he was engaged, in conjunction with a number of ministers, in carrying on a course of lectures on a Tuesday evening in the Old Jewry; and the proof of the credibility of the Gospel history having been assigned to his department, he became from that time busily occupied in preparing the first part of his admirable work on that subject. It was not till the year 1729, when he was forty-five years of age, that he obtained a settlement among the dissenters at Crutchted Friars. In this situation, his time was chiefly employed in preparation for the pulpit, and in the prosecution of his great work already mentioned; but he found leisure, nevertheless, to publish several occasional pieces, which not only extended his reputation among the dissenting denomination, but also attracted the regard of the most distinguished characters in the church of England. In the year 1740, upon the decease of his colleague, Dr. William Harris, he was unanimously invited to undertake the pastoral charge of the congregation at Crutchted Friars, in conjunction with some other minister of whom they were to make choice; but, in consequence of a few years, with which he had long been afflicted, and it may be of some other reasons, he declined taking any share in the pastoral office and continued to act in the capacity of assistant preacher. In the beginning of the year 1745, he received from the Marischal College of Aberdeen the degree of doctor in divinity, a mark of respect which, being bestowed without solicitation, he did not think it unbecoming in him to accept; and in the following year he was appointed one of the corresponding members in London of the Society in Scotland for propagating Christian Knowledge. In 1751, he resigned the office of morning preacher at Crutchted Friars, chiefly in consequence of his increasing deafness, and his application to the important work in which he was engaged on the credibility of the Gospel history. This invaluable performance was finally completed in 1755, the supplement in 1757, and the Jewish and Heathen testimonies in 1767. Upon these works the laborious and learned author had employed the greater portion of his time during the space of forty-three years. In pursuance of the same design, he next applied himself to give an account of the heretics of the first and second centuries, but he did not live to complete his intentions, though he left such materials on the subject, as formed a posthumous publication of considerable value. It is rather remarkable that he experienced very limited encouragement in the prosecution of his literary labours; that few men of the wealthy dissenters purchased his volumes; that he incurred loss instead of acquiring gain by the publication of most of them; and that he finally sold the copy right of the Credibility for the sum of £150. In the summer of 1768, he was seized with an affection of the lungs, and was removed to Hawkherst, the place of his nativity, where he had a small paternal estate, in the hope that a change of air might recruit his strength. He died at this place on the 24th day of July, at the advanced age of 85 years, retaining all his faculties (with the exception of his hearing) to the last in a remarkably perfect degree. In consequence of his own particular request, no sermon was preached on the occasion of his death; but, some time after his decease, a stone, with an English inscription, was erected to his memory in Bunhill-fields, where his remains had been deposited.

Dr. Lardner's mode of life was extremely retired, in

* Particularly his "Vindication of the three Miracles, against Woolston;" his "Council of Prudence for the use of Young People;" and his "Caution against Conformity to this World."
consequence of his extreme deafness, as well as his indefatigable application to study. He was continually visited, however, by persons of various professions; and maintained a very extensive correspondence both with the learned of other nations, and with the most eminent literary characters of his own country. He was honoured with the friendship of many respectable clergymen of the church of England, and received repeated testimonies of their esteem for his character; especially from Bishop Waddington, Lord Barrington, and Archbishop Secker. His private department was peculiarly amiable and decorous; and his manners in every respect polite, gentle, and obliging. In communicating with his visitors, it was requisite for them to propound their remarks in writing; to which he replied with great frankness and cheerfulness. As a preacher he was not held in much estimation; and his pulpit discourses were seldom attended by a numerous audience. Though serious in his manner, and perspicuous in his language, he was utterly devoid of eloquence and elocution. His utterance was in fact rather unpleasing, perhaps in consequence of his deafness; but his sermons themselves, as far as can be judged from those which have been published, were too dry and didactic in their whole strain of sentiment and expression to interest ordinary hearers. In theological learning, critical skill, patient research, and sound judgment, as far as regard the external evidences of Christianity, he holds a most distinguished rank as an author; and has rendered by his writings the most essential services to the cause of revealed religion. As a private Christian, his whole character was peculiarly exemplary; and his humble piety, unostentatious benevolence, unaffected candour, unassuming disposition, meekness of temper, purity of life, and modesty of mind, may be proposed to universal imitation. He was especially devoid of all literary vanity and ambition; and uniformly shewed a disposition to estimate the virtues of the Christian spirit above all the powers of intellect and stores of learning, even when exerted in behalf of Christian truth. "I have lately published," he said on one occasion, "the seventh volume of the second part of the Credibility; but a temper and conduct worthy the doctrine of the Gospel are more valuable than any written defences and apologies for it or exposition of it. I beg that I may be more and more possessed of that temper of humility and meekness, which shall bear good fruits." He was peculiarly characterised by an ingenious and candid mind, a calm and dispassionate inquiry after truth, a temperate and humble statement of his sentiments; virtues which are the more worthy of being recorded, as being so rarely exemplified in almost all the numberless controversies which agitate the literary, the political, or the theological world. His learning was mixed with diffidence, his zeal tempered by prudence, and his faith accompanied by benevolence. Thus far all parties and persons in the Christian church concur in estimating the character of Dr. Lardner; but, while they acknowledge the excellent spirit which pervades his writings, and the eminent services which his productions have rendered to the general authority of the sacred records, they cannot fail to lament, that he should have been able to extract from the page of revelation nothing better than the creed of Socinianism; a creed which a Socrates might have taught, and almost did in fact teach, without any revelation at all." *(g)*

**LARISTAN.** is the name of a small province of Persia, which stretches along the northern shore of the gulf of the same name, from the 55th degree of East Longitude to the 55th. It is bounded by Fars on the north-west, and Kerman on the north-east. The province is diversified with plains and mountains. It is poor and unproductive, and is so extremely arid and destitute of water, that the inhabitants are barely enabled to cultivate the date tree, and a little wheat and barley. The coast is in the possession of several piratical Arab tribes, who reside in small towns and mud forts on the shores of the Gulf. Their sheiks pay a small tribute to the king.

Lars, the capital of the province, was formerly a magnificent city, but is now in ruins. It is situated in East Long. 56° 43', and North Lat. 27° 36', at the foot of a range of hills, in a wide plain, covered with palms. It contains many elegant buildings; and the bazaar is said to be the noblest structure of the kind in Persia. It is built on a much greater scale than that of Shiraz, with loftier arches, and of superior workmanship. The houses in the town are convenient, and well furnished. Each of them has a badgered and surdab; the former to cool the inner apartments, and the other as a place of retirement from the insupportable heats of summer. The residence of the khan is in the middle of the town, and is encircled with a strong wall, flanked with towers. The ruins of the famous castle of Lars, are still to be seen on the summit of a hill, immediately behind the town. The principal manufactures of Lars, are muskets and cotton cloth; and the population is about 12,000.

The city of Tarem contains about 12,000 inhabitants. It stands on a plain on the banks of a salt river, and is a mean town, consisting of a mud fort, encircled by wretched huts, formed of the branches of the date tree. The port of Congoon contains about 7000 inhabitants, and has an excellent roadstead. See Macdonald Kinneir's *Geom. Memoir of the Persian Empire*, p. 81.

**LARYNX.** See *Anatomy*, vol. i. p. 827, and vol. ii. p. 21.

**LASSA.** See *Thibet.*

**LATAKIA,** the ancient Loolica, is a sea-port town of Syria, in the pachalic of Tripoli. It stands on the southern side of a small peninsula, which runs about half a league into the sea. The harbour, which is a sort of basin surrounded by a mole, is capable of holding from 25 to 30 vessels; but it is now choked up. This place carries on a considerable trade in olives and tobacco, of the last of which about 20 cargoes are annually sent to Damietta, for which rice is obtained in return. Population about 5000. East Long. 35° 44' 15", and North Lat. 33° 22' 50". See *Volney's Travels.*

**LATHE.** See *Turning.*

**LATIMER, Henry,* bishop of Worcester, was the son of an honest yeoman at Thurstaston, in Leicestershire, and was born about the year 1470. At the age of four years, he gave so great proofs of a ready apprehension, that his parents, having no other son, resolved to educate him for a learned profession; and at the age of fourteen, he went to the university of Cambridge, where he applied himself chiefly to the theological studies of those times. Having taken priest's orders, he distinguished himself, at a very early period, by his...*
zeal for the tenets of Popery, and his invectives against the principles of the reformers; but having subsequently embraced the Protestant faith, principally through the instructions of Thomas Bilney, a devout clergyman in the university, he became equally ardent in promoting the cause of the reformed doctrines. His eminence as a preacher, and the exemplary life which he led with his friend Bilney, had a very considerable influence in prevailing the new opinions; and all the exertions of the opposite party were called forth to counteract his growing popularity. Doctor West, bishop of Ely, was at length constrained to exercise his authority as diocesan; but, being a man of great moderation, he contented himself with preaching against the heretics, and forbidding Latimer to preach in the university. Doctor Barnes, however, prior of the Augustine Friars, licensed Latimer to preach in the church of his priory, which, like most religious houses, was exempt from episcopal jurisdiction; and here, in spite of all the machinations of his adversaries, he continued for three years to address the most crowded audiences with distinguished success and applause. Even the bishop of Ely was frequently observed among his hearers, and candidly acknowledged his excellence as a preacher. About this time, King Henry VIII. desirous to conciliate the Pope, had enjoined Wolsey to put the laws in execution against heretics; and Latimer was summoned, among others, to answer for his avowed sentiments. According to some accounts, he consented to subscribe the articles which were proposed to him; but others affirm, that Wolsey was so pleased with his answers, that he dismissed him with a very gentle admonition. He had even begun to be in favour at court; and having preached before his majesty at Windsor, was noticed with more than usual affability. He was not the less resolute in his adherence to the cause of the reformed religion; and had the courage even to write a letter to the king, against a proclamation which had been issued for prohibiting the use of the Bible in the English language. Though his remonstrance, which singularly marked the sincerity and openness of his character, produced no effect, yet the king, who had before been pleased with Latimer’s plain and simple manner of address, or who had at the time other ends to serve by his aid, received it with the utmost condescension. He was afterwards still more firmly established in the royal favour by the exertions which he made, in full consistency with his principles, to support the plea of the king’s supremacy. By the friendship of Doctor Butts, the king’s physician, and of Cromwell, the prime minister, both favourers of the reformation, he was presented to the living of West Kingston, in Wiltshire; and, contrary to the advice of his patrons, he resigned all attendance at court, to devote himself to the duties of his parish. He extended his labours also with great diligence into the adjoining parts, wherever he observed a deficiency of pastoral instruction; and was rising rapidly in the estimation of all good men in those districts, when his enemies drew up a charge of heresy against him, and procured a citation for his appearance before Stokesley, bishop of London. But this step only furthered his promotion; for while he was greatly harrassed in the archiepiscopal court, by frequent examinations, and crafty interrogatories, and urgent injunctions, to subscribe their articles, the king, having been privately informed of the treatment to which he was subjected, interposed his authority, and stopped all proceedings against him. Other accounts seem to imply, that he had previously made all the submissions which the bishops required; but in whatever way the matter was settled, he does not appear to have fallen in the king’s estimation; and, soon after the date of these troubles, he was promoted to the see of Worcester, through the influence of his steady patrons, Cromwell and Butts. In this station, he applied himself with all his usual fidelity to the discharge of his office; and proceeded, with as much zeal as the state of things would admit, in correcting the tendency of Popish superstitions. In 1536, he attended the session of parliament and convocation, in which the Protestant influence so far prevailed, as to abolish form out of the seven sacraments and to authorise the translation of the Bible into English. Returning to his bishopric, and shunning all concern in state affairs, he occupied himself entirely in the silent discharge of his pastoral duties, till the year 1539, when the act of the Six Articles was passed, which reduced him to the necessity of surrendering his office, or his conscience. Instantly he resigned his bishopric, and retired to a private situation in the country; but being obliged to repair to London, in consequence of a severe bruise, which required better medical assistance than his neighbourhhood could supply, he was soon discovered by Gardner’s emissaries; and, upon an allegation of having spoken against the Six Articles, was committed to the Tower, where he suffered a severe imprisonment during the remaining six years of Henry’s reign. Immediately after the accession of Edward VI. he recovered his liberty, and found his old friends again in power; but he declined all their proposals to reinstate him in his diocese, and took up his residence with Cranmer at Lambeth. Here he occupied himself chiefly in redressing the grievances of poor persons, who flocked to him in great numbers; and assisted in preparing the first part of the English Homilies. He seldom failed, however, to appear in the pulpit on Sundays; and, besides preaching the Lent sermons before his majesty, frequently officiated at St. Paul’s cross, and other churches in London.

After the death of Somerset, he withdrew from the metropolis, and made use of the king’s licence as a general preacher, wherever his services appeared to be required. But, upon the restoration of Popery, at the commencement of Mary’s reign, he was once more silenced, together with all the Protestant teachers; and in a short time, summoned to London before the ecclesiastical council. He had long been persuaded, that sooner or later, he should be called to answer with his life for the cause which he had espoused; and, particularly, that, in the eye of Bishop Gardener, now prime minister, he was marked for proscription. Though forewarned of the designs meditating against him, and of the approach of the messenger with the citation from court; he was so far from availing himself of the opportunity to escape, (which, it is conjectured, would have been more acceptable to his enemies, than his appearance,) that he instantly made ready to accompany the officer, and addressed him in language expressive of the utmost readiness to attend his orders. The messenger, however, acquainted him, that he had no authority to seize his person; and merely delivered the citation, took his departure without delay. Latimer prepared to obey the summons, proceeded straight to the metropolis; and, on the day after his arrival, presented himself to the council, by whom he was loaded with reproaches, and committed to the tower. Notwithstanding the infirmities of his advanced age, and the severity of treatment which he experienced, he bore his confinement with the utmost patience, and even frequently indulged in his habitual jocularity.

Lauder.

Lauder.

Being denied the benefit of a fire, even in the midst of winter, he said one day to the under-keeper, "that if he did not look the better to him, perchance he should deceive him. The lieutenant, upon being informed of these expressions, became apprehensive of some intention on the part of his prisoner to effect his escape; and, coming to him in person, required an explanation of his words. "Yes, master, lieutenant," said Latimer; "for, you look, I think, that I should burn; but, except you let me have some fire, I am like to deceive your expectation, for I am like here to starve for cold."

In 1555, after half an year's imprisonment, he was conveyed to Oxford, together with Cranmer and Ridley, for the purpose of holding a public disputation with the most eminent Popish divines. At these conferences, which were conducted in a most disorderly manner, it is observable, that, though Latimer avowed his intention to shun argument as of no avail, and to content himself with offering a plain account of his faith, he nevertheless managed the controversy with more ability and consistency than his colleagues, who attempted to answer the citations from the Fathers, in the quibbling style of the schoolmen, while the other adhered to the pure strain of scripture language, and disclaimed all authority for not coming under its plain dictates.

"Then you are not of Chrysostome's faith, nor of St. Augustine's faith?" said his opponent. "I have said," replied the bishop, "when they say well, and bring scripture for them, I am of their faith; and farther Augustine requireth not to be believed." After the termination of the disputation, sentence was pronounced against the three Protestant prelates as heretics; but they remained in custody till the month of September in the following year, when Commissioners were appointed to examine them a second time, and to afford them an opportunity of retracting the sentiments which they had formerly avowed. The aged bishop adhering resolutely to his confession, was led to the stake along with his fellow prisoner Ridley, on the 16th of October 1555, where he met the painful death of his martyrdom with the utmost composure and fortitude.

"Mr. Latimer very quietly suffered his keeper to pull off his hose and his other array, which, to look into, was very simple; and being stripped into his shroud, he seemed as comely a person to them that were there present, as one should lightly see; and, whereas, in his clothes he appeared a withered and crooked silly man, he now stood bold upright, as comely a father, as one might lightly behold." As the faggots were kindling, he said to his companion in sufferings: "I have good comfort, Mr. Ridley, and play the mean; we shall this day light such a candle by God's grace in England, as I trust, shall never be put out;" and as the flame embraced his body, he repeatedly cried with a firm voice, "O Father of heaven, receive my soul!" and expired in a short time without any appearance of extreme agony.

The general character of this venerable person is most honourable to the cause which he embraced, and presents a worthy pattern to every Christian bishop. He was always more attentive to the pursuit of useful knowledge than of curious literature; and, even in his advanced years, was regularly occupied with his studies many hours before sun rise, both in winter and summer. He avoided all interference in secular or political-concerns, and devoted himself wholly to the discharge of the duties of his office as a Christian pastor. He was a celebrated and popular preacher in his time; and his manner of address in the pulpit is described as having been remarkably earnest and impressive; but his sermons, which are extant,* though frequently marked by the most affecting simplicity, abound too much in the low familiarity, and even studied drollery, which suited the taste of that age, and which had their origin with so many other deviations from apostolic example, in the most corrupt church, and darkest periods of Christendom.† See Fox's Acts and Monuments; Strype's Ecclesiastical Memoirs; Wordsworth's Ecclesiastical Biography. (g.)

L A TITUDE. See Astronomy, and Geography.

LAUDER is a royal burgh of Scotland, in the county of Berwick. It is situated on the river Leader, which runs into the Tweed below Melrose. The town consists principally of one long street, which contains

---

* The sermon, nevertheless, throw much light upon the state of morals and society in those times, and are ranked among the most curious and amusing specimens of our early literature.

† The following is the judgment of a good churchman's pulpit pleasantry may gratify the curiosity of the reader, and furnish some ideas of the taste of the age in which he lived.

"Well, I would all men would look to their duties as God hath called them, and then we should have a flourishing Christian common weal. And now I would ask a strange question. Who is the most diligent bishop and prelate in all England, that passeth all the rest in doing his office? I can tell, for I know him who it is; I know him well. But I think I see you listening and harkening that I should name him. There is one that passeth all the other, and is the most diligent prelate and preacher in all England. And will ye know who it is? I will tell you. It is the devil. He is the most diligent preacher of all others; he is never out of his diocese, he is never from his cure; ye shall never finde him unoccupied; he is ever in his parish; he keepeth residence at all times; ye shall never find him out of the way; call for him when you will, he is ever at home, the diligent preacher in all the realme; he is ever at his plough, no learding or lazying can hynder him; he is ever applying his businesse; ye shall never finde him idle, I warrant you. And his office is to hinder religion, to mayntaine superstition, to set up idolatry, to teach all kinds of wickedness, as can be done by any way, as can be done to deface the glory of God. Where the devil is resident, and hath his plough going, there, Away with books, and up with candles! Away with Bibles, and up with beads! Away with the light of the gospel, and up with the light of candles, yea at noon days! Where the devil is resident, that he may prevail. Up with all superstition and idolatry, sensins, paying of images, candles, palples, ashes, holy water, and new service of man's inventing!—as though man could invent a better way to honour God with, than God himself hath appointed. Down with Christ's cross, up with popishe pick-purse! up with him, the Popish purgatory I mean. Away with clothing the naked, the poor, and impotent; up with dicing of lymens, and gaff garnishing of stocks and stones! Up with man's traditions and his laws! down with God's traditions, and his most holy word. But here some man will say to me, 'What, sir, are ye so privy of the devil's counsell, that ye know all this to be true?' Truly, I know him too well, and have obeyed him a little too much, in condescending to some follies. And I know him as other men do; yea, that he is ever present, and ever busy in following his plough. I know him by St. Peter, which sayth of him, transit les vagantes cirkulare quaresa quem decesset, he goeth about like a roaring lyon, seeking whom he may devour. (I would have this text well learned, and examined, every word of it. Cirratus, he goeth about in every corner of his dyocese. He goeth on visitation daily. He leaveth no place of his cure unvisited. He walketh round about from place to place, and ceaseth not. Silent Leo, as a lyon; that is, strongly, boldly and preyly, stately and fiercely, with haute looks, with his proud countenances, with his stately bragninges. Rugens, roaring; for he setteth not slip any occasion to speak, or to roar out when he setteth his tyne. Quaresa, he goeth about seeking, and not sleeping, no our bishops doe; but he seeketh diligently, he searcheth diligently all corners, whereas he may have his prey.) He rusheth abroad in every place of his dyocese; he standeth not still, he is never at rest; but ever in hand with his plough, that it may go forward. But there was never such a preacher in England as he is. Who is able to tell his diligent preaching? In the mean tyne, the prelats take their pleasures. They are lords, and no labourers; but the devil is diligent at his plough. He is no unpreaching prelate. He is no fondly.
Lauder.

some good houses, but it has no public buildings deserving of notice, and no trade. Close by the town, on the banks of the Leader, stands Thirlstane Castle, or Laudertower, a handsome building, which was erected by Edward I. of England, and is now one of the seats of the Earl of Lauderdale. Lauder unites with Jedburgh, Haddington, Dunbar, and North Berwick, in sending a member to parliament. The population of the town and parish in 1811 was 386 houses, and 1742 inhabitants.

Lauder, Sir John, Lord Fountainhall, was born at Edinburgh in 1616, of the family of Lauder of Launder Tower, of which he afterwards became the representative. He was the eldest son of John, 8th Lord of Newington, merchant, and bailie of Edinburgh. Having early displayed a predilection for the bar, he went abroad to finish his education at Leyden, and, after visiting Paris, he returned to his native country to prepare himself for the profession he had chosen, and passed advocate in 1668. There is reason to believe, that his talents as a pleader were of no mean character, and that his practice soon became considerable, for he seems to have appeared in causes of importance not long after he had put on the gown. He was one of those fifty advocates, who, disgusted with the partiality of the judges at that time composing the court of session, and more particularly with their arbitrary endeavours to crush appeals from their sentences to the king and parliament. were so spirited as to desert the court in a body, in February, 1678; and who were, in consequence of this determined step, deprived of the power of exercising the functions of their profession. He was afterwards restored, along with his companions, in January, 1679. Soon after this he had the honour of knighthood conferred upon him. Upon the occasion of Argyle's trial for the alleged treasonable interpretation of the test, in 1681, Lauder, with seven others of his brethren who formed the earl's counsel, had nearly been subjected to imprisonment by the tyrannical Scotch administration of the time, for having, merely as an ordinary piece of duty to their client, signed a favourable opinion as to the meaning of his expressions.

In 1685, he was returned to the Scotch parliament as member for East Lothian, in which county his father had purchased the estate of Fountainhall; and he represented that shire for twenty-two years. When James II. made his attempt, in 1686, to pave the way for the introduction of popery, by endeavouring to procure from his Scottish parliament the repeal of all penal laws and tests relating to religion, Sir John Lauder made a vigorous stand in the house against the royal party, and seems to have materially contributed to their defeat, in regard to the chief object of their manoeuvres. He was created a lord of session, under the title of Lord Fountainhall, by King William and Queen Mary, in 1689. In the same year he had a pension of £100 Sterling granted to him; and, in 1690, he was made one of the lords of justiciary.

His father, when in his dotage, having married for his third wife Margaret Ramsay of Idington, a designing woman, she had succeeded in persuading him to apply for a baronet's patent from James II., which she had also managed, by her clandestine intrigues, and without her husband's knowledge, to get constructed in such a manner as to make the title descend to his son by her, instead of to his proper heir. Lord Fountainhall, however, raised an action of reduction, and obtained its annihilation; and another, running in the proper line, being granted by William and Mary, he soon afterwards succeeded to it. At that period, the office of lord advocate was frequently held in conjunction with a seat on the bench. This situation was offered to Fountainhall in 1692, and was refused by him, because he was denied permission to prosecute the inhuman perpetrators of the diabolical massacre of Glencoe.

He was twice married; first, to Janet, daughter of Sir Andrew Ramsay, Lord Abbotshill—and, secondly, to a daughter of Anderson of Balram; and he had a numerous family by both these connections. Regular circuits having been established in 1677, Fountainhall, who by that time found himself too old to be equal to the fatigue of this additional duty, resigned his justice and gown to Queen Anne, though pressed by her majesty to continue to hold it; and a little time before his death, he also resigned his seat as a lord of session. In resigning these offices, he also gave up the salaries appended to them. He died in September 1722.

Lord Fountainhall was most particularly remarkable for his uncommon industry and unwearied assiduity, and for his devotion to his profession, and accuracy in recording its doctrines and precedents. Besides his occupation in the arduous duties of a lawyer and of a judge, he devoted much time to writing. Those MSS., which exist in his hand, are but a very small portion of those left at his death, as is manifest from the frequent references he makes to numerous volumes, by a variety of different letters and figures. The children of his second marriage being his executors, were too young to know the value of these writings, which was probably the cause of their being lost. Eight folios and three quartoa now remain, said to have been originally rescued from a tobacconist's shop, but which fortunately came at last into the Library of the Faculty of Advocates, who, in 1759, published from them the two printed folio volumes entitled, Decisions of the Court of Session from June 6, 1678, to July 30, 1712, containing also the Transactions of the Privy Council, of the Criminal Court, and Court of Exchequer, and interspersed with many Historical Facts, and other curious Anecdotes. There still remains much unpublished matter, of a historical nature, scattered through these MSS., which, if it is hoped, may, at some period be arranged and submitted to the press, as they display considerable observation, and afford much information regarding the political characters and transactions, as well as the manners of these interesting times.

Launceston. See Newport.

Lausanne, the Lausanne of the ancients, is a city of Switzerland, and the capital of the Canton de Vaud. It is built on three hills, and in the adjoining valleys, and is situated 432 feet above the lake of Geneva, from which it is distant about two miles. One of the principal public buildings in Lausanne, is the cathedral. It is a large Gothic building, situated in the highest part of the town, and has a lofty square tower, terminating in a small pyramid, with lesser pyramids at each angle. The portal, or entrance on the south side, contains many finely sculptured figures. The interior of the church is very fine. The south window in the transept is circular, and filled with

lytherer from his care, but a busy ploughman; so that among all the prelates, and all the pack of them that have cure, the devil shall go for my money; for he still applieth his busines. Therefore, ye unpraying prelates, learn of the devil to be diligent in doing of your office. Learn of the devil; and if you will not learn of God, nor good men, for shame learn of the devil! At erascontant wtram dire. I speake it for your shame. If you will not learn of God nor good men to be diligent in your office, learn of the devil."—Preached in St. Paul's Church, London, 1648.
the town of Thun is performed in about 3 hours, and as there is no carriage road along the banks of the lake, travellers sail along the lake to Newhaus, which is accomplished in less than three hours. The traveller arrives at Interlachen, through Unterseen, in less than an hour, and he generally ascends to a wooden pavilion, on the other side of the Aar, from which there is a charming view of Unterseen, the Aar, the lakes of Brienzi and Thun, and the mighty summit of the Jungfrau.

The journey from Interlachen to the village of Lauterbrunnen is generally performed in little more than two hours in a charabanc. The road passes through beautiful orchards and rich green fields, and then enters the valley of Zweylutschinen, defended on the right hand with magnificent and lofty rocks. The valley soon separates into two, namely, that of Grindelwald, and that of Lauterbrunnen; the Black Lutschinen running through the former, and the White Lutschinen through the latter. The valley of Lauterbrunnen is narrow, and is flanked on both sides with lofty calcareous rocks, exhibiting the most extraordinary contortions in their stratification, and generally rising to the height of 800 and 900 feet. The rocks of Eisenflue, 900 feet high, have a village of the same name on their summit, and are beautifully covered with wood. The singular cylindrical rock of Hunnenflue presents its base horizontal strata, while those above are highly inclined, and in great confusion.

The view up the valley of Lauterbrunnen from the village is extremely grand. On the right is seen the Staubbach throwing itself over a rock about 1000 feet high; and a little farther up, on the same side, the fall of the Spisbach; beyond which, on the same side, is a magnificent bare wall of rock rising to the height of 900 feet. In returning in an autumn evening from the fall of the Spisbach, the writer of this article had the good fortune to see the scenery of the valley in all its beauty and grandeur. The deep valley, and its precipitous walls of rock, were almost involved in total darkness, while the red twilight shed a bright hue over the snowy flanks of the Jungfrau, the Breithorn, and the Lauterhorn, which appeared through the extreme opening of the valley as if they were portions of a different world. This appearance was still more striking at a later hour, when Saturn appeared over the Jungfrau, and when the lights in the cottages seemed like so many stars on the dark declivities of the valley.

The valley of Lauterbrunnen is about five leagues long, and seldom half a league in width. More than twenty brooks rush over the rocks which enclose it; and it is probable, that from this cause, it has received its name, which signifies many springs. The village of Lauterbrunnen is situated 715 feet above the lake of Thun, and 2450 above the sea. See JUNGFRAU.

LAVA. See Volcano.

LAVATER, Johann Caspar, the celebrated writer on physiognomy, was born at Zurich, in Switzerland, on the 16th of November, 1741. His father, Henry Lavater, was a doctor of medicine, and a member of the government of Zurich; a man of a most respectable character, of a sound understanding, and great industry; but by no means gifted with any uncommon talents. His mother possessed more genius, a very lively imagination, and an insatiable thirst for knowledge of every description. Both his parents were remarkable for their piety.

In his early youth, Lavater appears to have exhibited no indications of superior talents; on the contrary, his progress in learning was extremely slow. His parents were exceedingly attentive to his education; but
it seems to have been very difficult to fix his mind upon any particular study. As he was not permitted to join his companions in any of their youthful sports, he spent a great part of his time in modelling all kinds of figures in wax. It is remarkable that, for a long period, he was considered as totally destitute even of the most ordinary talent of expressing his thoughts by language, and especially of the power of reasoning upon any subject; insomuch that he was often taunted by his schoolfellows on account of his apparent dulness.

In the year 1758, he was seized with a dangerous illness. During the progress of his recovery, which was slow, he amused himself with optical experiments and drawing; and throughout the whole of his subsequent life, he retained a fondness for these occupations. In other respects, this illness had a beneficial influence upon his disposition. About this time, Wieland, the celebrated poet, came to Zurich, a circumstance which excited considerable sensation in the town. Even the boys at school talked with admiration of the man who understood so many languages, whose attainments in science were so great, and whose powers of observation were so unrivalled. Lavater was so much engrossed with this subject, that he could think of nothing but Wieland; and although he only saw him once, he is said to have frequently remarked, that Wieland's image was indelibly impressed upon his mind. From this period, he began to display a fondness for reading. He had recourse to his father's library, where he perused a variety of books on different subjects, but in a desultory manner, and without adhering to any regular plan. He had neither patience nor resolution to read any work from beginning to end, whatever required laborious study or reflection disgusted him. At a later period, he endeavoured, with great difficulty, to acquire a habit of steady and regular application, and even made it an inflexible rule never to lay down a book which he had once begun, without perusing it to the end, whatever exertion it might cost him, and however small the entertainment or information he might derive from it.

Having finished his school education, he entered the academical gymnasium, or humanity college, in the year 1758. Here he formed an intimate friendship with the two brothers, Henry and Felix Hess, and Henry Fueslli, who were his fellow students of theology. Bodmer and Breitinger, who were at that time the most distinguished professors at the gymnasium, did not fail to perceive the characteristic excellencies of Lavater's understanding; and they paid particular attention to him and his friends. Bodmer especially devoted much of his time to them; a circumstance which is supposed to have had considerable influence on the poetical talents of Lavater. In the year 1759, he attended the philosophical lectures; and towards the end of that year, he was admitted into the theological class. His attention was now almost exclusively devoted to the study of divinity. About this time, too, he composed many devotional poems; some of which were afterwards inserted in his Collection of Spiritual Songs.

In the year 1762, having completed his theological studies, he entered into the ministry. About this time a circumstance occurred, which at once developed the characteristic energy of his mind, and laid the foundation of that celebrity which he afterwards enjoyed. Lavater and his friend Henry Fueslli (the celebrated painter) had heard much of the acts of injustice committed by a ruling magistrate in one of the bailiwicks of Zurich. But although the complaints of his conduct became daily louder, and his guilt more evident, yet it seemed difficult to obtain redress, as the burgo-
most consigned to oblivion, became a fashionable study, among the learned and the unlearned, throughout the whole of Europe. It was soon discovered, however, that this theory wanted consistency, and that it was founded on no just or certain principles. Lavater himself, who was more remarkable for the liveliness of his imagination, than for depth of reflection or soundness of reasoning, seems to have totally overlooked those circumstances which were most calculated to give his theory even the appearance of systematic science. He sought the indications of character chiefly in the solid parts; especially the forehead and the nose; and from these he drew conclusions with regard to the original dispositions of men. He neglected the soft and more moveable features, such as the eye, and particularly the lines about the mouth and nose; from which he might have been, perhaps, better warranted in forming conclusions respecting the acquired dispositions, the feelings, and the passions of the individual. But although he was not so much considered as the production of a fanciful, rather than a philosophical, mind, it contains undoubtedly many ingenious and interesting observations, which shew, that the author possessed much delicate knowledge of the human heart. There is in it, however, as in almost all the productions of Lavater, too great a parade of language,—many elegant and sententious passages, not greatly overburthened with meaning. Many will esteem the work as valuable, chiefly on account of the engravings; a number of which, exhibiting the heads of men and animals, are exquisitely finished, and singularly expressive. It may be proper to observe, that the French translation of Lavater's Physiognomy, from which the English version was made, was not a mere translation from the original German work, but, in many respects, a new treatise, translated under the eye, and revised by Lavater himself. An abridgment of the work, in four volumes 8vo, was published by Armbuster (1783-1796), which, according to Lavater, contains, in a less expensive form, the whole work.

In the year 1778, Lavater was appointed dean of St. Peter's church, which considerably enlarged his sphere of exertion. From this period he continued to publish numerous works, which were calculated to promote the knowledge, and advance the interests of religion. Having translated Bonnet's Inquiry into the Evidence of Christianity, he had the imprudence to dedicate the book to the celebrated Jewish philosopher, Moses Mendelssohn, with a challenge, either to refute it publicly, or to profess his conviction of the truth of its arguments, by embracing the Christian faith. Mendelssohn answered in a style at once modest and manly; and Lavater afterwards repented of the step he had taken, and acknowledged in public, that his zeal had led him beyond the bounds of discretion.

At the commencement of the French Revolution, Lavater, who had always been distinguished for his ardent love of genuine freedom, was naturally led to regard that event with a favourable eye; but after it had assumed the air of strength and destruction to the sacred and salutary principles of religion, of morals, and of social order, he loudly proclaimed his abhorrence of the enormities which it occasioned, and strove to avert the calamities which impended over his native country. During the revolutionary scenes which ensued in Switzerland, he preserved the character of a sincere and zealous patriot. He endeavoured to diffuse a spirit of moderation into all parties, and never ceased to raise his voice, freely and boldly, against all manner of oppression and injustice. His conduct, indeed, gave umbrage to the members of the Helvetic Directory, and he became a victim to that system of deportation, by which the revolutionary faction endeavoured to rid themselves of all those who ventured to call their measures in question. The sentence against him, however, was afterwards recalled, and he was set at liberty. At the storming of the city of Zurich by the French army under Massena, in 1799, Lavater had the misfortune to receive a wound in the breast. The wound was not considered dangerous, although he was obliged to confine himself to bed, and suffered great pain. Having exerted himself, however, beyond his strength, in religious and charitable duties, before his wound was completely cured, he brought on a train of dangerous symptoms, which at length terminated his life, on the 2d of January, 1801, in the sixtieth year of his age.

The character of Lavater was in the highest degree amiable; he was a zealous and upright patriot—an active and conscientious minister of religion—and a man of the most genuine benevolence. His moral conduct was, upon every occasion, most exemplary; and his whole life was spent in unceasing efforts to promote the happiness of mankind. His virtues, indeed, seem to have contributed more than his talents towards elevating him to that height in the scale of celebrity which he held during his life. So great was his popularity at Zurich, that, in his walks, the people frequently flocked around him, and kissed his hand in token of their respect.

We have already alluded to some of the works of Lavater. Among these, his physiognomical publications enjoyed a very extensive, though ephemeral celebrity. His other works, chiefly on religious subjects, are very numerous; and some of them were extremely popular in their day, though now little read. His learning was not very extensive—his powers of reasoning by no means remarkable—and, in all his productions, he seems to give full scope to the play of his fancy, and to revel in the regions of enthusiasm. His genius seemed better calculated to influence the feelings of an audience, than to display itself in writings, which were destined to be perused and cooly analysed in the closet. His Aphorisms on Man have been considered as one of the best of his miscellaneous publications; and his Schweizerlieder, (Songs of the Swiss,) and some of his devotional effusions, are still read and admired by his countrymen. See Leonard Meister's Berühmte Zurcher, and Berühmte Münzer Helvetici, 1782; K. L. von Haller, Denkmal der Wahrheit auf J. K. Lavater; J. K. Lavater's Lebensbeschreibung von seinen Tochtermann Georg Gessner, 1802, 1803; Meiner's Briefe über die Schweiz, 2d edit. Berlin, 1788; and Jordan's Lexicon Deutscher Dichter und Prosais- ten. (2)

LA VOISIER, ANTHONY LAWRENCE, the celebrated French chemist, was born at Paris, on the 29th of August, 1743. His father, being in opulent circumstances, gave his son every advantage which a liberal instruction could bestow; and the genius of LaVoisier was directed, at an early period, to the study of the physical sciences, which he cultivated with great zeal and success. In the year 1764, he drew up a memoir, in answer to a question proposed by the French government, on the best and most economical means of lighting the streets of a great city, which obtained for him the prize of a gold medal, and was printed at the expense of the Academy of Sciences, of which he was elected a member on the 13th of May, 1768. During this period, he distinguished himself as the author of several valuable treatises on philosophical subjects, which
Lavoisier.

were printed in various periodical works. His observations on the experiments made with a view to prove the possibility of converting water into earth, will be found in the Memoirs of the Academy for 1770. In the course of various journeys through different districts of France, he found opportunities of collecting copious materials for the mineralogy of that kingdom, which served as the foundation of a work on the revolutions of the globe, and the formation of the strata of the earth, of which he gave interesting sketches in the Memoirs of the French Academy for 1772 and 1787.

The brilliant discoveries in chemical science which were made, about this period, particularly by the British philosophers, attracted the attention of Lavoisier, who seems to have been fully aware of the great importance of these discoveries in the further prosecution of physical research. In his Opuscules Chimiques, which were published in 1774, he exhibited a clear and elegant view of the history of pneumatic chemistry, along with some ingenious and accurate experiments of his own. In the year 1778, he entered into an examination of Dr. Priestley's dephlogisticated air, and published his proofs that this substance is a constituent principle of all acids; and to this principle, therefore, he gave the name of oxygen. This was the first great step in his progress towards a new system of chemical science. He next proceeded to make experiments on the production of water, by burning oxygen gas with hydrogen gas, and on its decomposition into the same elements; and he at length completed his system, by his theories of combustion and oxidation, his analysis of atmospheric air, his doctrine of caloric, &c. In the year 1789, he published his Elémens de Chimie, a work which has been much admired as a model of scientific composition. In these elements, the author completely overthrew the previous theory of Stahl; and, by a beautiful chain of logical reasoning, established one more consistent with the recent discoveries. The system of Lavoisier, however, was not received without opposition; but its merit has at length been generally acknowledged, and its principles were ultimately adopted by the most eminent chemists of France and Great Britain. In order to complete the revolution in chemical science, Lavoisier and his associates invented a new nomenclature, which, after a violent controversy, has been pretty generally adopted.

The talents and scientific acquirements of Lavoisier, prompted him, upon several occasions, as a person whose services might be employed for the benefit of the public. In the year 1776, he was engaged by that enlightened minister, Turgot, to superintend the manufacture of gunpowder; and his chemical investigations of the proper mode of preparing this article, were so successful, that he increased its explosive force by one-fourth; while, by reforming the existing regulations with regard to the collection of materials for the manufacture, he quintupled the produce. To the sciences, arts, and manufactures, he rendered many other important services, both in a public and private capacity. Having been appointed to the office of treasurer to the academy, he introduced order into the accounts, and economy into the expenditure. He was the most active promoter of all useful plans and inquiries; and when the new system of measures was proposed, he endeavoured to throw some light on that subject, by contributing some new and accurate experiments on the expansion of metals. At an early period, his attention was directed towards agricultural pursuits, and he allotted a tract of 240 arpents of land, on his estate in the Vendémais, for the purpose of experimental farming. He was consulted by the National Convention with regard to the best method of manufacturing arsenic, and of securing them against forgery. Having been invited by a committee of the Constituent Assembly, in 1791, to draw up a plan for removing more simple the collection of the taxes, he produced a most valuable memoir on the various productions of the country, and their consumption, which was afterwards printed by order of the assembly, under the title of Richesses territoriales de la France. After having been one of the administrators of the Caisse D'Escompte, he was appointed one of the commissioners of the national treasury; and into this department he introduced the greatest order and regularity.

A life thus spent in the cultivation of science, and talents thus actively and beneficially devoted to the service of his country, ought to have secured for Lavoisier the lasting esteem of his fellow-citizens, and the quiet enjoyment of that reputation which he had so well merited by his exertions. But he had the misfortune to live during a period, when talents, however eminent, and virtues, however conspicuous, were insufficient to protect their possessor from the wanton outrages of lawless power. During the horrors of Robespierre's usurpation, he seems to have in part foreseen the fate that awaited him, and used to observe to Landeau, that when strip of his property, he was prepared to earn his subsistence by his labour. His opulence, indeed, was his chief crime; or that, at least, which marked him out as a proper victim to the rapacity of the existing rulers. Having been involved in charges fabricated against twenty-eight farmers-general, he was capitally condemned. A vain attempt was made to touch the compassionate feelings of the tribunal, by a description of the works, and a recapitulation of the merits of Lavoisier. The hearts of these ferocious instruments of oppression and cruelty were completely hardened against such an appeal; and he suffered on the scaffold, on the 8th of May 1794.

Such was the unmerited fate of Lavoisier; a man no less distinguished for the mildness and humanity of his private character, than for his scientific attainments. In his person he was tall, and his countenance indicated genius, intelligence, and benignity. The great influence he possessed, on account of his fortune, his talents, and his situation in the treasury, was continually employed in doing good. He was married, in 1771, to Marie-Anna-Pierette Paulze, the daughter of a farmer-general; a lady of pleasing manners, and considerable talents and accomplishments. She engraved, with her own hand, the copperplates to his last work. This lady afterwards gave her hand to the celebrated Count Rumford.

The merit of Lavoisier, as a philosopher, particularly with regard to the services he rendered to chemical science, are universally acknowledged. His own experiments were generally simple and well chosen, and performed with great accuracy; but his talents were most conspicuous in the judicious use he made of the discoveries of others, which his genius enabled him to reduce into a lucid and connected system. In the Memoirs of the Academy of Sciences, from 1772 to 1793, there are forty papers of his writing, containing many valuable observations on some of the most important subjects of physical research. One of the last of his philosophical works was a treatise on the perspiration of animals, which was first read to the Academy on the 4th of May, 1791, which contains the result of a number of curious experiments, made with great delicacy, and highly interesting to the science of physiology. See Lalande's Account of the Life and Writings of Lavoisier; Dict. Bioq-et Hist. Gen. Bioq. Dict. (2)
Few subjects are more comprehensive than that of law. It has, indeed, in every department of it, been overloaded and oppressed with a mass of commentary, sometimes contradictory, often unintelligible, commonly futile, and therefore almost always alike unprofitable to the student, and disregarded by the intelligent practitioner. But, independently of so monstrous an overgrowth, the main stem and branches of this noble science occupy a large space, and to be adequately conceived, would require a very ample delineation. Besides the principles common, or which ought to be common, to all law, (we mean the immutable principles of morality and religion,) how various and important are the modifications of the different systems instituted in different countries! How various the circumstances on which these modifications necessarily depend!—the peculiar genius of the people, from whatever causes originating; the habits and customs which have insensibly grown up among them; the inland or maritime situation of the territory; the greater or less degree of progress already made in civilization; the character of the popular superstitions, whether introduced by accident, policy, or imitation; the nature of the government; the agricultural or commercial facilities of the country; and a thousand other causes which infinitely diversify the judicial systems of different communities. It is not to be expected, therefore, that we should in this place attempt any thing like a detail of so comprehensive a subject. We must confine ourselves to such branches of it as appear to be of paramount importance, or of which a detail, as far as our limits will admit, may be the most generally interesting and useful. We mean to submit, therefore, 1st, Some observations on law in general; 2d, An outline of the law of nations; 3d, An institute or abstract of the law of England; and, 4th, A similar institute or abstract of the law of Scotland. For the judicial establishments of other countries, with whose institutions it is less necessary we should be intimately acquainted, we refer our readers to what they may find under the different correspondent articles of this work. We only here observe, that, with the exception of certain local customs, the laws of Ireland, and of the various extensive colonies dependent on Great Britain, are, with a few occasional modifications, similar to those of England; and that the enactments of the British Parliament reach to every quarter of the empire, either where it is expressly so provided, or where the general tenor of the enactment has indicated such to be the intention of the legislature.

PART I. OF LAW IN GENERAL.

1. Law, as applicable to human conduct in general, may be defined a rule of moral action, proceeding from a superior having right to command, and directed to inferior bound to obey. Of this authority on the one hand, and obligation to obedience on the other, the foundation, or principle, is the happiness of those to whom the rule is directed. If the rule does not substantially contemplate this happiness, it has proceeded without the correspondent authority in the superior, and is not obligatory on the inferior.

2. It is, however, a very different consideration in what manner the presence of this obligatory principle is to be ascertained. To assert that every individual is bound to obedience, according only as he may discover the connection of his happiness with the rule, would be to make ignorance the measure of submission, and to subject order to the blind caprice of inclination, prejudice, or passion. Even in the administration of the unchangeable precepts of morality proceeding from the Deity himself, it sometimes seems hard, even to the intelligent and reflecting, to reconcile the observance of them, under some particular circumstances, with the happiness of the individual; how much oftener to the vulgar, who, un instructed by contemplation, or blinded by the selfishness of vice or passion, so frequently di vide their conduct their ignorance of the presence, and their practical disbelieve in the obligatory nature of the rule. But with regard to laws of human institution, this propensity to disobedience, so far as the mere principle in question is concerned, must be greater. The source from which they proceed, even in their purest state, is ever liable to be disturbed by interest or error. There is hazard, therefore, in every instance, that the obligatory principle may be absent, whilst, in some, that absence is obvious and certain. Hence a perpetual occasion to the ignorant, that is, to the people in general of whom every community is composed, to question the obligation of the laws. The obligations of morality, indeed, can in no instance be denied, even by the intelligent and reflecting, without involving a contradiction in their conception of the divine nature, since the moral constitution of man, by which he judges of right and wrong, approves and disapproves, proceeds from the same Being who has ordained the precepts of morality themselves; but in laws of human institution, such an argument for the invariable presence of the obligatory principle, can have no place, and the intelligent must sometimes unite with the vulgar in regarding the rule as wanting the essential characteristic of its authority.

3. Of what use, then, is a principle which it may be yet not the often difficult to discover, and which is always liable to less real be misunderstood or perverted by those who stand most in need of the restraints of law? The principle itself, we answer, is not therefore the less real; nor is it possible to discover any other reasonable foundation on which, on the one hand, the authority of him who issues the rule, and, on the other, the obligation to obedience of him who is to obey, can be rested. In fact, it is for the most part sufficiently obvious, where selfish views of an exclusive interest do not interfere to mislead the judgment; and bad must be that system of law where it is not in most instances recognizable. Yet as it is often found, even where it is sufficiently apparent, to be of too fine or distant an application to effect popular control, other sanctions more direct and impressive than the mere privation of the good consequent upon obedience, are commonly superinduced.
In morality, the reproaches of conscience, and the disapprobation of our species, amounting, in aggravated cases, to direct hostility, constitute this sanction; in human institutions, it consists in the personal suffering of the offender, or the diminution of his estate by pecuniary penalties. Where the principle is less apparent, or peculiarly liable to be misapprehended or perverted, such superinduced sanction, it is obvious, becomes still more requisite to secure submission to the rule. Yet it was absurd to regard this sanction as the test, either of the superior’s right to command, or of the inferior’s obligation to obey; since, where the principle in question, that is, the good of the interior, is altogether absent from the rule, or it may be his positive hurt plainly contemplated, superinduced sanctions, and those of the severest sort, become the most indispensably necessary. Whilst, therefore, on the one hand, these superadded sanctions are necessary to secure obedience to the law, there is, on the other, no principle but the good of the inferior, by which we can measure its legitimate authority. Undoubtedly, where its enactments are on the whole beneficial, a wise people will, for the sake of the general system, yield their obedience, even in those cases where their good is obviously not contemplated; nor, whether prospective reasoning can be consulted, or the actual experience of nations, will they withhold their submission, until, by an honest and accurate estimate of all the tremendous consequences of revolution, they plainly perceive a preponderance of advantage as the result.

A. From the various relations in which the human species is placed, arise various classes or denominations of law; some more, others less general: As,

First, Religion, or the divine law, natural, revealed.

Second, From the relation in which, as partaking of one common nature, the different individuals of the species, under whatever government or in whatever region of the globe they may be placed, stand to one another, arise the obligations of morality, or ethics. Hence the duty of benevolence, or an affectionate desire of the happiness of all men, prompting us to the actual performance of every kind office within our power. Hence likewise the obligations of justice, truth, candour, and all the other duties which form the proper subject of the moralist.

Third, From the relation subsisting between men as third, in constituting different nations, communities, or bodies politic, is derived international law, or law of nations.

Fourth, From the relation subsisting between the different individuals who compose one nation, or community, arises civil, or municipal law: being that body of rules which, issuing from a supreme authority duly constituted by national consent, direct or implied, are obligatory on each individual alike, for the good of all. Thus, there are as many separate systems of civil or municipal law as there are separate and independent communities, for no people can exist in a state of union without a system of rules of some sort or another, by which their transactions and conduct may be less regulated and controlled.

5. Each of these general departments, or sorts of laws, may again be divided into distinct subordinate branches, according to the subject or class of circumstances to which they more immediately refer. Thus, civil law may be divided into political law, which relates to the principles of the constitution of the state, and the rights and duties of the governors and governed relatively to one another; into criminal law, which refers to the moral conduct of the citizens in cases of such atrocity as are thought to affect the general peace and welfare of the community; into ecclesiastical law, which relates more immediately to the police of religion, and the rights of the church and its functionaries; into civil law, in a restricted sense of the word, or those rules which, in contradistinction to ecclesiastical, criminal, and other branches of the municipal code, refer to contracts, succession, &c.; into the law of process, comprehending the structure of courts of law, and the various modes, adapted to various circumstances, by which civil suits as well as criminal procedure must be conducted. And so of the other general departments of law.

6. Like every other science, law has advanced gradually to its present state. At first, laws regarded only great inconveniences and concerns of highest importance. Criminal laws extended only to such crimes as were most dreaded, and in proportion as new and more artful disorders arose, new remedies were applied; whilst civil institutions, properly so called, regulated the public worship of the gods, the distribution of lands, marriage, succession. To detail the progress of law in different countries, and to trace the successive improvements which one country derived from another in this respect, would be sufficiently interesting and instructive. We here sketch only the outline.
LAW.

Law.

a mere ray of that moral sentiment and right reason which God has intended should, in a more advanced stage of the social progress, direct and regulate our more frequent intercourse with one another.

8. So far as regards human regulations, it is scarcely to be doubted that the first were those domestic rules which the father of a family would have occasion to observe in the control of it. Nor can these regulations, or first principles of human laws, be regarded as unimportant, since, in the earliest condition of society, families form so many distinct communities.

9. When men began to unite in villages and cities, these more private regulations would be found inadequate to restrain a more numerous society; and a body of rules, as well as an authority accompanied with greater power than the merely paternal, became necessary. Afterwards, when many towns and districts united for their common convenience and defence, the judicial regulations necessarily multiplied; and the Supreme Authority from which they emanated and were to be enforced, issued, sooner or later, in the different states thus formed, in a Monarchy, an Aristocracy, a Democracy, or a compound of two or more of these simpler forms of magistracy.

10. The conduct of the justest and wisest individuals in all their transactions of a public nature, would naturally suggest a rule of behaviour to others, whilst their counsels and advice would gradually acquire force, and be adopted as a general regulation. Thus sages and philosophers were the first authors of laws.

11. Moses, the most ancient of legislators, ordained several sorts of laws to the Jews. Besides those which, as we are bound to believe, were dictated to him by the Deity himself, commonly denominated the Decalogue, as being divided into ten commandments, he instituted ceremonial laws for the regulation of their public worship, and political laws for their civil government.

12. The lawgivers of nations bordering on that of the Jews, borrowed many of their institutions from the laws of Moses.

Egyptian lawgivers.
Osiris.

13. Osiris, one of the earliest of the kings of Egypt, regulated the worship of the gods, the distribution of lands, and the distinction of ranks. He abolished the creditor's right to reduce his insolvent debtor to slavery in acquittance of the debt; and, to insure a better chance of sound decision in the courts of law, he prohibited the use of rhetorical embellishment in public pleadings.

Amasis.

Amasis annexed the punishment of death to murder, calumny, and perjury; and they who, having it in their power to assist a fellow-subject in danger of losing his life, allowed the fact to take place, became liable to the same penalty.

Some peculiar institutions of this extraordinary people.

These extraordinary people used to deposit the embalmed corpses of their fathers with their creditors in security of their debts, and if the pledge was not redeemed some time before their own death, the deepest infamy was incurred. They had even a tribunal before which they tried men after their death, that the dread of posthumous condemnation on the one hand, and the hope of applause on the other, might impel them to the practice of virtue. Their kings themselves were subjected to certain exclusive regulations; their food, in particular, and occupations, were the objects of certain fixed rules, from which they could make no deviation without responsibility to the laws.

Minos of Crete.

14. In Crete, Minos instituted a community of tables and repasts; he required all the children in the state to be brought up together, proscribed idleness and luxury, and enjoined the greatest reverence to be paid to the divinity and to the fundamental laws of the state.

15. Lycurgus, the Lacedaemonian lawgiver, also in...
thought undeserving of the protection of the laws. It was the great purpose of Solon to protect the poorer citizens against the power and influence of the rich; and by dividing the whole body of the Athenians into separate classes, the last of which, consisting of the ordinary citizens, being permitted to speak and vote in the assemblies, though not to participate in the offices and honours of their superiors, he conferred upon them a privilege which, considerable even from the first, came at last (what he probably did not intend) to control all the affairs of government, and rendered the profligacy and injustice of the rich, for which the city was proverbial, a standard of the republic. He reformed also the Areopagus, increased the authority of the members, enjoined them in particular to inquire yearly how every citizen maintained himself, and to punish such as, living in idleness, were not serviceable to the state by the exercise of some honourable or lucrative employment. These celebrated laws were engraved on public tablets, and that the Athenians might the better retain them on their memory, they were written in verse.

17. Romulus and Numa Pomplius appear to have been the first legislators among the Romans who deserve any notice. And yet so rude and uninstructed was that people for a long period after their authentic history commences, that it was not till about the year 300 of the city, that they appear to have had any written laws. About that time the discontentes of the plebeians having risen to a great height on account of the arbitrary proceedings of their superiors, they justly conceived that a written body of law, duly promulgated, would be the surest means of controlling their oppressors, and securing their own protection. Accordingly after long and violent struggles they succeeded: deputies were sent to Athens and other Grecian states to collect the laws of Solon and of other renowned legislators, upon whose return ten persons, called Decemviri, were chosen from the senate to select and arrange the most appropriate of the institutions thus collected. The celebrated law of the Twelve Tables was the result, of which Cicero, De Orat. i. 44. observes, omnium omnium philosophorum bibliothecis antependam. Nothing now remains of this collection of laws but fragments scattered in different ancient authors, and chiefly in the writings of Cicero, but there is little doubt that it served, if not as the root, at least as the stem from which that immense variety of Roman laws afterwards sprang, which was destined to become the rule of civil conduct to so many subject nations, and ultimately to mingle itself, more or less, with the municipal code of every nation of modern Europe.

It was the object of these laws to establish a code of institutions as more curious and important than another, of which the whole has been properly denominated, a written collection of human reason applicable to almost all the relations of civil life. We shall only observe, that under several successive emperors abridged digests were made of it, and particularly under Justinian, whose collection, known by the title of the Corpus Juris Civilis, (See art. Civil Law.) is the latest and by far the fullest and most valuable that has come down to modern times.

18. The northern nations who over-ran the Roman territories, naturally introduced their own rude institutions into their new conquests, and particularly the feudal regulations, so well adapted to the views of a warlike people anxious to retain permanent possession of their settlements. It is probable that the Roman jurisprudence, which had so long flourished in Italy and some other countries, and had begun to take root in almost all the other districts of Europe, was never entirely supplanted by the customs and laws of the barbarians; and when the revival of letters brought to light the high degree of refinement to which the Roman people had attained, their civil institutions naturally claimed a pre-eminent attention. The discovery of the Pandects at Amalphi (if indeed that or any part of Justinian's Collection had ever entirely disappeared;) the importance of the science of which it treated; the beauty and excellence of its dictates, being the result of the reason acting upon the experience of the most civilized nation which the world had hitherto produced; the easy-adaptation of the greater part of it to modern circumstances; all contributed to recommend it to the attention of princes and legislators. It came therefore to be adopted in some of the countries, as the great body of their common law; in others, it was only partially received, according as its institutions corresponded with the native customs of the people; whilst in all, its maxims were more or less extensively incorporated with their own local institutions.

19. The various systems of jurisprudence which thus grew up in modern Europe, compounded partly of the original laws and customs of the respective nations who supplanted the Roman greatness, and partly of the more refined institutions of that people, form a sufficiently extensive branch of study. Fortunately it is to the general student more curious than useful. A knowledge of the laws of our own country, aided by some acquaintance with such foreign institutions only as are acknowledged excellence, or of the nearest affinity to our own, constitutes an object of paramount importance. Without, therefore, attempting any detail of that nature, we shall here content ourselves with bringing together a few observations applicable to all systems of law collectively.

20. (1.) We have said, that the obligation of law is ultimately grounded in its reference to the good of those whom it is intended to control. In like manner, the obligatory force of any inferior law may be considered as more immediately derived from that which is superior to it. Thus, with regard to families, corporations, and other subordinate societies, we can prescribe to them anything which is contrary to the law of the state of which they become a part; the municipal law of each particular state must prescribe nothing contrary to the law of nations; and this law must, in its turn, be consistent with those essential principles of morality and religion which the Deity evidently intended to be obligatory on every individual of mankind. And thus good civil laws are nothing else than natural law itself, modified, and applied by the sovereign power in a state. If the inferior law contain any contradiction to the superior, it must, by the established nature of things itself, be ultimately and substantially inconsistent with the good of those who are required to obey it; and therefore wants, by that contradiction, the proper obligation of law. Such laws, when their deviation from the principles of morals and religion is direct and immediate, excite detestation, and, in aggravated cases, horror. In the edict of proscription against the Prince of Orange, Philip II. promises to him who shall kill the prince, and to his heirs, 20,000 ecus, with the rank of nobility, and that on the word of a king and as the servant of God. Nobility for murder! and its perpetuation enjoined by a servant of God! Here insult and outrage is offered to every sentiment of honour, of
morality, and religion—which nothing but the poison of bigotry could have so entirely stifled in the breast of the tyrant who dared to publish the reward.

21. (2.) Nothing should be so dear to a people as laws when intended to be a rampart against despotism, the substance and safeguard of a rational liberty, and the means, in short, of rendering them good, wise, and happy. "The great difference," says Xenophon, "which Lycurgus created between Lacedemon and other states, consists in this—that he has, as a primary principle, secured the submission of the citizens to the laws. They fly to yield obedience at the call of the magistrate; but at Athens, a rich man would go frantic to think that his conduct depended upon the authority of any magistrate." The first act of the Ephors on entering upon their office was to issue a proclamation inviting the citizens to love, rather than enjoining them to obey the laws, that their submission to them might thus be natural and easy. In truth, among the Spartans, as well as among the earlier Romans, laws and manners appear to have been so intimately blended as to have formed, so to speak, but one body. Luxury, commerce, and the love of gain, seem to be inconsistent with such a state of public sentiment.

22. (6.) All new laws which it may be proposed to introduce, should bear reference to the state of circumstances in which the people may at the time be actually placed; to the nature of the government already established; to the climate; the character of the soil; the extent and local situation of the territory; the manner of life of the inhabitants, as consisting in agricultural, commercial, or other pursuits; their customs; their prejudices; their superstitions. Yet laws may contribute much to form the morals, manners, and character of a nation. All that is meant is, that we ought not to attempt a direct change, in any of these respects, by violent enactments. This were the highest impolicy, if not rather a species of tyranny. Following rather the example of Solon, legislators should impose such laws only as the people are fit to receive, not such as are most perfect in the abstract; since it is better to leave disorders altogether untouched than to ordain laws which will either be imperfectly obeyed, or altogether neglected; and thus the whole body of the law incur disrespect.

23. (4.) Those who enact and who administer law, should themselves, of course, be bound by it indiscriminately with the rest of the people. It is the law, and not men, who ought to rule. This constitutes the essential difference between a free and an arbitrary government. "Law," says Plutarch, "is queen over mortals and immortals." The edict, 1409, of Louis XII., is a rare instance of magnanimity in a prince possessing the absolute disposal of the laws; "the law only," says he, "is to be obeyed, notwithstanding any orders to the contrary which importunity may elicit from the monarch."

24. (5.) In the best system of laws some are found which relate to matters beneath the dignity of law, and some which are altogether useless. Such laws are always unwise, because, treating of things trifling or indifferent, they lead men's minds to regard as trifling or indifferent what is essentially important.

26. (7.) Perhaps laws ought always to commence with the enactment. Preambles, originally intended to clear the way, have often been improperly introduced, and no doubt for the justification of the legislature and the satisfaction of the people, are often unsatisfactory, because not containing a sufficiently strong and explicit reason for the enactment; often imperfect, because not reaching to the whole of the enactment; always superfluous, because if the law is bad, that is contrary to the general welfare, it ought not to be enacted; if good, there is no occasion for an apology. But if a reason be at any time thought necessary, either in the enactment itself, or in the writings of those who are authorised to expound it, that reason ought, 1st, to be worthy of the law: A law of Rome declares, that no blind man shall exercise the office of advocate, because, says the law, he cannot see the decorations of the magistrate—a paltry reason when so many better were obvious. 2d, The reason alleged should be true: Charles IX. of France was declared mad at the commencement of his 14th year, in place of its termination; because, says the Chancellor Hospital, the law respects the beginning year as finished, where the acquisition of honours is in question—as if the government of a people included nothing but the honour of him who was to govern. Finally, It should be deduced by reasoning from what is real to what is real, and not from what is figurative to what is real, or from what is real to what is figurative. A law of the Lombards, l. ii. tit. 37, prohibits every woman from marrying who turns nun; "for," says this law, "if the man who, by the ceremony of the ring, has merely contracted, without consummating, a marriage, cannot without a crime marry any other woman than her with whom he has contracted, a fortiore she who has become the spouse of God, cannot."

27. (8.) Laws, to be obeyed, must be known. Hence promul- gation, the absurdity, once so prevalent in some countries of Asia, of expressing laws in a language of which the people are ignorant. The English acts of parliament were at one time written in Latin, at another in French—a proceeding equivalent to a concealment of the very rules to which obedience was required. Among some nations of early antiquity, laws were composed in verse and sung to popular airs, that they might be the more generally known as well as easily retained on the memory. The Athenians engraved their laws on plates of brass, which they fixed up in public places; and, among the Romans, to commit to memory the Twelve Tables was an indispensable branch of the education of children.

28. (9.) The laws which are borrowed from other countries, sometimes appear to be the same with those of the countries from which they have been derived, in one case, but they are materially different. The Greeks and Romans punished the receiver of stolen goods with the same pains as the thief himself; and some modern nations follow the example. In the former case, this state of the law was just, in the latter it is the code of another; for among the Greeks and Romans, a pecuniary penalty was the only punishment of theft, and it is just that every man concerned in occasioning damage to another, should be obliged to repair it; but in England, in Scotland, and in France, (at least before the Revolution,) the thief being punished with death, it is impossible in most instances, without confusing crimes, to punish the receiver with the same severity. The receiver may often be altogether ignorant of the
Law.

10. Pertaining principle of a criminal code should be to adapt punishment to nature of offence.

29. (10.) There is a principle, capable of being reduced to considerable precision, which will serve as a general rule for estimating the merits of the criminal code of a people. A capital excellence in such a code, consists in the punishment being drawn from the peculiar nature of the crime committed, and a correspondent defect in a deviation from this principle. Nothing can tend more to connect the idea of punishment with guilt, as well in the breast of him who is about to commit the crime, as of them who are witnesses of his punishment, whilst also it naturally conducts to a just proportion between the punishment and the offence. Upon this principle Montesquieu has sketched the outline of a criminal code.

"There are," says he, "four sorts of crimes: the first sort offend against religion; the second, against manners; the third, the peace of society; and the fourth, the security of the citizens. The punishments proper to each of these sorts of crimes, should be derived from the nature of each.

"The class of crimes which relate to religion, should comprise such only as directly attack it, as are all cases of simple sacrilege; for crimes which disturb merely the exercise of religion, belong to the class either of those against the public peace, or the security of the citizens. That the punishment of these acts of simple sacrilege may be derived from the nature of the thing, it ought to consist in depriving the guilty person of all the advantages which the national religion confers; such as exclusion from places of public worship, excommunication, &c. In matters relating to the public peace, or the security of the citizens, acts, though of a less open or direct nature, may be the proper subject of human justice; but in matters relating to the Divinity, where there is no public act, there is no ground for accusation. In that case, the matter is solely between God and his creature; and to God alone it then belongs to make the measure and the time of his vengeance. But if, confounding the nature of things, the magistrate is industrious to detect such private devotions from the national standard, he introduces an inquisition which is not only unnecessary but highly impolitic, and destroys the liberty of the citizens by arming against them the united seal of every timid and every intolerant conscience. The evil arises hence, that it is deemed necessary to avenge the Deity— as if it should not be our study rather to honour the Deity than to avenge him. Proceeding upon this idea, where shall punishments stop? If human laws are to avenge an infinite Being, they ought to be regulated by adequate notions of his infinitude, not spring from the imbecility, the ignorance, and the caprices of human nature.

The second class of crimes, or those against manners, are such as violate public or private decency in the mode of gratifying the senses. The punishment of these should in like manner be drawn from the nature of the thing. Deprivation of all those advantages which society has connected with purity of manners; shame; necessity of withdrawing from the view of the citizens; public infamy; expulsion from the city, or even from the community; in short, the different sorts of punishment which are properly corrective, should suffice to repress the shamelessness of either sex. In truth, such offences are less founded in criminality, or an intention to injure another, than in forgetfulness or contempt of one's self. But we must here keep in view those offences which affect manners only, not those crimes which, affecting also the security of the citizens, such as the abduction of women, and rape, fall properly under the fourth class.

"The crimes of the third class are those which relate to the public peace. And here also the punishment ought to refer to the nature of the offence, and be strictly corrective, as confinement, exile, and such penalties as tend to reform unquiet spirits, and bring them back to established order. But neither must such offences be confounded with those which include a violation of the public security, but must be confined to a simple breach of police.

"The penalties of the fourth and last class of crimes, relate to the public peace. And here also the punishment ought to refer to the nature of the offence, and be strictly corrective, as confinement, exile, and such penalties as tend to reform unquiet spirits, and bring them back to established order. But neither must such offences be confounded with those which include a violation of the public security, but must be confined to a simple breach of police.

2. Against manners.

* See Théorie des Peines et des Rémèpenses, par J. B. Bentham, who has enlarged upon this sketch of Montesquieu.
† Les sacrilège simple—by which we suppose Montesquieu means, all violent and grossly indecent attacks upon the doctrines of the received religion; which, being hallowed in the public mind, and adopted as a part of the law of the land, cannot be insulted without insulting the law itself, and the whole body of the people.
‡ Let sacrilège exiite.
derogatory to the legislature, and inconsistent with liberty. It is only in favourable cases that a liberal interpretation can be allowed; in all others the evil should be tolerated until an express enactment can be made to supersede it.

31. (12.) But a custom perfectly established by a long succession of examples, and thus unequivocally adopted by the people, supplies the defect (which in this case must be supposed to be intentional) of the enactment, holds the place of a statute, and becomes tacitly a law by prescription.

32. (13.) To enable courts of law to arrive at a just and accurate decision, forms of procedure are indispensable. The misfortune is, that it is the interest of practitioners, sometimes of the judge, to multiply these forms, and to baffle every attempt of the most upright magistrate, as well as of the legislature, to simplify and abridge them. Thus forms are everywhere so numerous as to embarrass the operation of the very laws which have established them; a suit becomes an inheritance; property remains uncertain; and the parties and their heirs are ruined in their endeavours to ascertain the right.

33. (14.) After the example of the Athenians, such 14. Revision laws should from time to time be carefully collected as of the laws. are superannuated, contradictory, or useless, that the national code may thus be purified and diminished, lest that contempt which awaits or has already overtaken such laws, should like a gangrene overspread those also which are truly excellent. Yet let this reformation be wrought with much precaution and solemnity, that the people may perceive the sacredness of the law, which requires so much formality even to correct it.

PART II. OF THE LAW OF NATIONS.

Introduction.

I. Each nation being considered as a moral being living in a state of nature, the obligations of one nation towards another are no more than those of individuals modified and applied to nations; and this is what is called the natural law of nations. It is universal and necessary, because all nations are obliged by it, and whether they will or no. The foundation of this natural, universal, and necessary law, is the relation which a human being, as such, bears to God, to himself, and to the rest of the species. Hence writers on international law commonly begin with a statement of the obligations arising from these three relations, or a view of the law of nature; and this law they apply as the rule in all questions between independent states, where special convention or custom is silent. For this part of the foundation of international law, we refer the reader to our articles RELIGION (Natural), and MORAL PHILOSOPHY.

2. But as the simple law of nature is insufficient, even in questions between individuals, and still less between nations when they come to have intercourse and to carry on commerce with one another, their common interest obliges them to soften the rigour of the law of nature, to render it more determinate, and to depart from that perfect equality of rights which must ever, according to that law, be considered as extending itself even to the weakest. These changes take place in virtue of conventions (express or tacit) or of simple custom. The whole of the rights and obligations thus established between two nations, form the positive law of nations between them. It is called positive, particular, or arbitrary, in opposition to the natural, universal, and necessary law.

3. On the example of two nations, all the nations of Europe might, by common consent, make treaties to regulate their different rights; and then these general treaties would form a code which might be called the positive law of nations. But there never yet existed such a general treaty, either between all the powers of Europe or even a majority of them. In this sense, then, there exists no positive law of nations, and perhaps none such ever will exist.

But on the other hand it is clear, that what has become a law between two or three, or even the majority of the powers of Europe, either by treaty, or from custom, can produce neither rights nor obligations among the rest. However, by comparing the treaties which the powers of Europe have made with one another, we discover certain principles that have been almost universally adopted by the different powers that have made treaties on the same subjects. It is similar with respect to custom—a custom received among the majority of the powers of Europe, particularly among the great powers (when it is not founded upon their particular constitutions) is naturally adopted by other powers, as far as it can apply to them; and, in general, all nations give a certain degree of attention to the customs admitted by others, although it cannot be proved that they have ever been admitted by themselves. It is true, we cannot say as much of express conventions. It nevertheless often happens, that a treaty made with a particular power serves as a model for the treaties of the same sort to be made with other powers; and very often what takes place in one nation in virtue of treaty, is admitted in others as a custom; so that, in many points, the law of nations is founded on treaty in one country, and on custom in another.

It is then the aggregate of the rights and obligations established among the nations of Europe (or the right of them) whether by particular but uniform treaties, by tacit convention, or by custom, which forms the general positive law of nations.

4. We find some vestiges of a positive law of nations in history, among the ancients, particularly among the Greeks and Romans; but it is needless for us to go back so far. The political situation of Europe is so much changed, since the fifth century in particular; the introduction of the Christian religion, of the hierarchical system, and all its other important consequences; the invention of gunpowder; the discovery of America, and of the passage to the East Indies; the ever increasing taste for pomp and luxury; the jealous ambition of powerful states; the multiplication of all sorts of alliances; and the introduction of the custom of sending ambassadors in ordinary; have had such an influence in forming our present law of nations, that, in general, it is necessary to go no farther back than the middle centuries of the Christian era: and, indeed, on many points, no information can be obtained by going farther back than the time of Henry the Great, the peace of Westphalia, or even the beginning of the 18th century.

It is, then, in the general history of Europe during the latter centuries, and of the particular states of which it is composed, that we must look for the existing law of nations.
Of Treaties.

1. As sovereign powers acknowledge no legislator over them but God, they can have no rights and obligations between them but such as the divine laws impose. But they may add to these primitive obligations, by renouncing voluntarily a part of their rights, or taking on themselves new obligations, after which they stand engaged to do, not to do, or to suffer, what they were not absolutely obliged to do, not to do, or to suffer. The basis of these new rights and obligations which form the positive law of nations, is then the mutual will of the nations concerned. This will may be declared by words, gestures, or other marks received as the signs of thought, or by actions from which consent may be deduced; or it may be presumed. For instance, what a nation has always done hitherto we may presume it will do for the future. Hence the different foundations of the positive law of nations, viz. express covenant, tacit covenant, and custom.

2. Express covenants made between nation and nation, are called public covenants, or treaties.

3. For a covenant to be obligatory, five things are necessarily supposed: First, That the parties have power to consent. Second, That they have consented. Third, That they have consented freely. Fourth, That the consent be mutual. And, Fifth, That the execution be possible.

First, The parties must have power to consent. The treaty must have been contracted in the name, and by the authority, of the sovereign power. Any thing that has been promised by the chief, or his agent, beyond the limits of the authority with which the state has entrusted him, is, at most, no more than a simple promise, which only obliges the person who promises to use his endeavours to procure its ratification, without binding the state, which, of course, may refuse such ratification. On the contrary, every thing that has been stipulated by an agent in conformity to his full powers, ought to become obligatory on the state, from the moment of signing, without even waiting for the ratification. However, not to expose a state to the errors of a single person, it is now become a general maxim that public conventions (but not simple military arrangements in time of war) do not become obligatory till ratified. The motive of this custom clearly proves that the ratification can never be refused with justice, except when he who is charged with the negotiation, keeping within compass with respect to his public full powers, has gone beyond his secret instructions, and consequently has rendered himself liable to punishment; or when the other party refuses to ratify.

Second, That they have consented. The consent must have been fully and clearly declared, either by words, or by signs, to which custom has attributed the same value. It is totally indifferent as to the obligation, whether the words have been actually articulated, or whether they have been committed to writing. Now-a-days, however, in order to facilitate the proof, they are always committed to writing. The form of the treaty is of no consequence: a simple promise, declared and accepted, has the force of a treaty between nations as of a contract between individuals.

Third, That they have consented freely. The consent

must have been a voluntary act of each contracting party. What has been extorted by physical necessity is not obligatory, because the party has not consented. What has been extorted by moral necessity, that is, by the fear of a greater evil, is obligatory, if the violence employed by the other party was just; but if it was unjust, the obligation ceases through default of title in him who wants to acquire the right. However, the security, liberty, and independence of nations, could not subsist, if, in default of a superior judge, and in default of a right to judge in their own cause, they did not acknowledge as just (with respect to external effects) all violence employed by each other. Therefore, the plea of fear cannot be opposed to the validity of treaties between nation and nation, except at most in cases where the injustice of the violence employed is so manifest as not to leave the least doubt.

Fourth, That the consent be mutual. The consent must be mutual, and must be given for the same object. When an error takes place with respect to the object of the covenant, it excludes the consent. It is of no consequence whether the error be involuntary, or owing to the insincerity of the contracting parties, or one of them, or to a third person.

The injury on the contrary that a nation may sustain from a treaty is not a justifiable reason for such nation to refuse complying with its conditions. It is the business of every nation to weigh and consult its own interests; and as nothing hinders a nation from acquiring a right by a covenant with another, and it being impossible for any one to determine the degree of injury requisite to set a treaty aside, or to judge, in an obligatory manner, of the injury sustained, the security and welfare of all nations require that no exception should be admitted which would sap the foundations of all treaties whatever.

Fifth, That the execution be possible. The execution of the treaty must be physically and morally possible: so that if the accomplishment be physically impossible, either from the nature of the promise or from circumstances, or if the accomplishment interferes with the interests of a third party, or tends to ruin the nation which has promised, the covenant becomes void, or at least ceases to be obligatory.

4. Treaties serve either to confirm to a nation the rights which belong to it by the law of nature, or to change into a positive right what was before a natural one. There are some treaties that are fulfilled at once; as treaties of boundary, of exchange, &c. And others which can be fulfilled successively only and as the occasion presents itself; such as treaties of commerce, alliances, &c. These latter are called treaties in a more particular sense, (fiedera), in opposition to transitory covenants (pacta transitoria). To this may be added, that treaties are sometimes mixed, including articles of both sorts.

5. Treaties, properly so called, are either personal or real. They are personal when their continuance in force depends on the person of the sovereign with whom they have been contracted. They are real when their duration depends on the state, independently of the person who contracts; consequently all treaties between republics must be real. All treaties made for a time specified, or for ever, are also real. With respect to those which are made for an indefinite time, attention must be paid to the terms of the treaties themselves, to circumstances, and to the constitutions of the contracting states, in order to decide to which class they belong. Of late, sufficient care has
been taken to express this matter so fully as to leave no room for dispute.

6. Treaties cease to be obligatory when the sovereign power with whom they were concluded ceases to exist, and when the state passes under the dominion of another power. Sometimes they cease when the state changes its constitution; and always when a war, on whatever account, breaks out between the contracting parties; except provisions be contained in them specially in reference to the event of a war. Such provisions, for instance, as relate to the treatment of each other's subjects, their vessels, merchandise, &c. in the case of a rupture. All treaties, then, existing between belligerent powers, previous to the war, must be renewed at the peace, if the parties wish to continue them.

7. In order to secure the observation of treaties, the contracting parties had recourse formerly to a great number of accessory covenants, some of which were ridiculous enough. They almost always made use either of oaths, hostages, pledges, or guarantees, for which the subjects or vassals of the contracting states were often chosen. But now oaths are laid aside in treaties between sovereigns. Hostages are yet made use of, but this is generally in military arrangements, or for the fulfilment of some particular article of a treaty of peace. The custom of choosing subjects and vassals for guarantees has changed by little and little since the sixteenth century, till it is now become an established rule to solicit foreign powers to take on them that office: Hence our modern guarantees, which, after all, are perhaps more frequent than useful.

Chap. II.—Of Tacit Covenants, Custom, and Analogy.

1. As express consent supposes words, or signs which have the same value as words, so tacit consent supposes actions, which, though not the signs substituted for words, prove the will of the party that makes use of them. By these are formed what we call tacit covenants. They have the same force as express covenants, with regard not only to the nature of the obligation they produce, but to their irreviolability also. There are an infinity of actions from which we may deduce consent to what is of a transitory nature; and there are also actions by which a power engages itself tacitly for the future. But for an action to produce this effect, it must, first, have been undertaken or omitted freely and knowingly; second, the party must have believed himself in duty bound to act thus; or, at least, third, the action must be of such a nature that it cannot be omitted, or committed, once, without giving the other party a right to require its continuation for ever after.

When these three circumstances, or at least the two first concur, one single action is enough to prove a tacit consent; a repetition of it serves only to facilitate and strengthen the proof.

2. A single action, absolutely arbitrary, or dictated merely by the common principles of humanity, decency, or politeness, is by no means sufficient to prove that the party making use of it engages to do the same for ever after, when a like occasion presents itself; nor even if, during whole ages, a nation has continued to repeat such an action, can that repetition ever amount to an engagement for the future: nor can it ever take from one nation the right of changing its conduct in that respect as often as it thinks proper, without consulting any other. All that can be built on such actions is, a presumption that the nation will continue to act as it hitherto has done as long as it does not declare its intention to the contrary, and as long as circumstances do not change. This presumption may be founded on a single action, if the action be of a presumptive nature. It is naturally strengthened by time; and a frequent repetition of actions uniformly undertaken, grows at last into an established custom. A custom does not consequently rest on tacit consent, but on the presumed will of the party that observes it.

One nation having a right to presume on the will of another, implies an obligation on the other side to give timely notice before it abolishes, or deviates from, a custom; so that no other nation may be induced, by such custom, to take a step that might be contrary to its interests. This obligation, although imperfect in itself, has much weight with nations united by treaties of friendship, and is generally acknowledged and observed by all the powers of Europe.

3. Analogy often forms the basis of decisions in the analogy of affairs of nations. It is no more than the application of what has been determined by the treaty or custom in certain cases, to other cases which resemble them, and which have not yet been decided. The weight and justice of an analogous decision depends, therefore, on the resemblance of the two cases.
accepted, applies to the latter in the same manner as to the former, they must both be regarded as the subject of the science of the European positive law of nations. The number of sovereign and demi-sovereign states in Europe has varied at different epochs. Sometimes it has been augmented by the division of a state into two or more, or by revolutions ending in the independence of some hitherto subjected part of a state; at other times the number has been diminished by the union (often caused by the extinction of families) of many states into one.

2. There was no general connection existing between the states of Europe, till the Romans, in endeavouring to make themselves masters of the world, had brought the greatest part of the European states under their dominion. From that time there necessarily existed a sort of connection between them, and this connection was strengthened by the famous decree of Caracalla; by the adoption of the Roman laws; and by the influence of the Christian religion, which introduced itself insensibly into almost all the subdued states. After the destruction of the empire of the West, the hierarchic system naturally led the several Christian states to consider themselves, in ecclesiastical matters, as unequal members of one great society. Besides, the immediate descendant that the Bishop of Rome had the address to assume, as spiritual chief of the church, and his consequent success in elevating the emperor to the character of its temporal chief, brought such an accession of authority to the latter, that most of the nations of Europe showed, for some ages, so great a deference to the emperor, that in many respects Europe seemed to form but one society consisting of unequal members subject to one sovereign. This order of things remained till the different powers, perceiving that their rights were violated, and shaking off the yoke of the Pope or diminishing his influence, reduced all the prerogatives that the emperor enjoyed over the other crowned heads to the mere point of precedence. Since that time there has subsisted no such general unequal connection between the powers of Europe, either in spiritual or temporal affairs. An exception might indeed be made, with respect to spiritual affairs, of those states which still remain attached to the Romish church; but as to temporal affairs, every sovereign state enjoys an equal degree of independence. However, the resemblance in manners and religion, the interchange of commerce, the frequency of treaties of all sorts, and the ties of blood between sovereigns, have so multiplied the relations between each particular state and the rest, that one may consider Europe (particularly the Christian states of it) as a society of nations and states, each of which has its laws, its customs, and its maxims, but which it cannot put in execution without observing a great deal of delicacy towards the rest of the society. There exist, moreover, particular relations between some members of this society, which bring them, more or less, near to each other. Some states are held together by equal connections; as where several states belong to the same sovereign, or where there exists a perpetual treaty, in virtue of which a particular system is established between states. The connections between others are unequal, such as those existing between Catholic states in spiritual matters, or between the several members of a compound state: and there are other states which have neither treaties nor commerce with each other. In short, these relations are almost as various as are the conditions of the particular states relatively to their power and constitutions.

Chapter II.—Of the States of Europe, classed according to their Dignity, Power, &c.

1. The states of Europe may be distributed into different classes, as great, little, royal, sovereign, demi-sovereign, &c.

2. The division of the great states according to their local situation, into northern, southern, eastern, and western powers of Europe, has less to do with law than with politics, and with the particular interests that sometimes actuate neighbouring states. But there is another division which, though it depends in some measure on the local situation of states, ought not to be neglected in treating of the law of nations; we mean the division into maritime powers, and powers not maritime.

It is common enough to call every state maritime that is situated on the borders of the sea, and is capable of carrying on commerce on that element; but a maritime power, properly speaking, is a power that keeps up a fleet of ships of war; and in this acceptance of the term, there are only Great Britain, the Seven United Provinces, Spain, Portugal, the Sicilies, Denmark, Sweden, Turkey, the republic of Venice, and, since the beginning of the eighteenth century, France and Russia, which can be called maritime powers. The other powers have either never been maritime, or have ceased to be so. But this term, in a more restricted sense, is applied to those powers only whose principal strength consists in ships of war, or whose power by sea has a preponderance over that of the other powers on the same element. In this double sense, England and the United Provinces have, since the end of the seventeenth century, been exclusively distinguished by the appellation of the maritime powers.

Book III.

Of the internal Constitution of a State, as far as it relates to Foreign Powers and their Subjects.

Chapter I.—Of the Rights of a State with respect to its internal Government and Constitution.

1. The internal constitution of a state rests, in general, on these two points: viz. On the principles adapted with respect to him or them in whose hands the sovereign power is lodged, not only at present, but for the future also; and on those adopted with respect to the manner in which this sovereign power is to be exercised. Both these depend on the will of the state, foreign nations having no right to interfere in arrangements which are purely domestic. However there are some exceptions to this rule. In case a dispute should arise concerning either of the points above mentioned, a foreign power may, first, offer its good offices, and interpose them if accepted; second, if called in to the aid of that of the two parties which has justice on its side, it may act coercively; third. It may have a right, from positive title, to intermediate; and fourth, if its own preservation requires it to take a part in the quarrel, that consideration overbalances its obligations to either of the parties. These exceptions, and particularly the two last, have been so extended by the practice of European nations, that no internal dispute of importance can now arise in any of them but foreign powers find some pretence to take a
part in it, without looking upon their interference as a violation of the law of nations.

2. Suppose that the interior troubles of a state come to an open rupture between the sovereign and his subjects, and that the whole nation, or part of it, should wish to drive him from the throne; or suppose that a province or territory, subjected to another state, refuses obedience to it, and endeavours to render itself independent; in either of these cases there are two points which must be separated in determining on the conduct that foreign powers ought to observe: first, The conduct to be observed towards the old or new sovereign, or towards the people who, after having revolted, have declared themselves independent; second, The assistance to be given to either party.

With respect to the first of these, a foreign nation, not under any obligation to interfere, does not appear to violate its perfect obligations, nor to deviate from the principles of neutrality, if, in adhering to the possession (without examining into its legality) it treats as sovereign him who is actually on the throne, and as an independent nation, people who have declared, and still maintain themselves independent. The opposite party, however, never fails to complain of this conduct, as long as he does not himself acknowledge, by treaty, the validity of such possession or independence.

As to the second point, namely, the assistance to be given to either party, when once obedience has been formally refused, and the refusing party has entered into the possession of the independence demanded, the dispute becomes similar to those which happen between independent states; consequently, any foreign prince has a right to lend assistance to the party whom he believes has justice on his side, whether he be obliged so to do by treaty or not; provided, however, that he has not promised to observe a strict neutrality. But as to expose an unjust cause is unlawful, and as it is impossible that the opinions of the two parties should not differ with respect to the justice of their cause, it is also impossible that those against whom succours are directed, should not consider such a step as a departure from neutrality, and as an injury. In fact, whether we speak of the passive conduct observed in such circumstances, or of the succours furnished by foreign powers, it is state policy that commonly decides whether he who feels himself offended shall dissemble, or at most complain of the injury, or whether he shall seek retaliation by other means.

When a nation acknowledges, expressly or tacitly, the independence of the revolted state, or a prince renounces the throne he occupied, foreign powers have no longer right to oppose the revolution, nor is even their acknowledgment of its validity necessary.

**CHAP. II. — Of the different Rights of Sovereignty belonging to the internal Government, in relation to Foreign Powers and their Subjects.**

1. The sovereign has a right to forbid all foreigners to pass through, or enter his dominions, whether by land or sea, without express permission first obtained, even if such passage or entry should not be prejudicial to the state. Now, however, no power in Europe refuses, in time of peace, to grant such permission to the subjects of another power; nor is it even necessary for such subjects to ask permission to enter a state and bring their property into it. Thus then the liberty of entry and passage may be considered as generally established between the powers of Europe; and it is particularly so among the states of the German empire.

But as this liberty ought not to become prejudicial to the state, every power has reserved to itself the right, first, To be informed of the name and quality of every foreigner that arrives; and to this end, passports taken at the place from whence a foreigner comes ought to be regarded as authentic, provided they have been granted by persons having authority to grant them, such as sovereigns, magistrates, or foreign ministers; second, Each state has a right to keep at a distance all suspicious persons; third, Each state has a right to forbid the entry of foreigners, or foreign merchandises of a certain description, for a time or for ever, as circumstance may require; fourth, The liberty of entry and passage extends to individuals only. A number of armed men, before they enter the territory of a foreign state, must have an express permission from the sovereign. This takes place also with respect to vessels of war entering a port to take shelter under the cannon of a fortress, unless this permission has already been granted by treaty.

2. The expenses of government ought to be defrayed by all those who enjoy the protection of the state. Of the right of taxing foreigners and their property, impôts must be raised. A foreigner, enjoying the protection of the state, cannot, while he remains in it, expect to be entirely exempted from imposts. Besides, it may be made a condition of his admission. He may even be loaded more heavily than the native subjects of the state, if no treaty between this state and his own specifies the contrary. Yet, as far as concerns personal imposts, it is customary not to exact them from foreigners till they have for some time been inhabitants of the state. Impôts on real estates, on the contrary, and duties on the entry and consumption of merchandises, ought to be paid indiscriminately by foreigners as well as subjects, unless they can prove an exemption. Consequently the tolls that are imposed for the maintenance of institutions of public utility, such as turnpike-roads, canals, &c. are collected indiscriminately from those who profit from such institutions.

3. One of the most essential rights in the hands of the sovereign, is the judiciary power. It extends indiscriminately to all who are in the territory, and the sovereign only is the source of it. But it must be remembered first, That there are persons whose exteriority exempts them from this jurisdiction, such as foreign princes and their ministers, with their retinues; second, That the sovereign sometimes grants to foreigners the privilege of being tried by their own judges, under the name of consuls, or some other title.

The tribunals of a state being intended to supersede all acts of violence between individuals, foreigners, even though they should not live in the territory, are obliged to address themselves to these tribunals to obtain justice against the subjects of the state; and if those against whom they proceed should be only temporary subjects, they must nevertheless plead at the same tribunals. But, on the other hand, the sovereign is, to all intents and purposes, obliged to administer justice to them as promptly and as impartially as if they were his own subjects.

Foreigners have never a right to demand a preference in judicial proceedings, nor have they a right to demand judgment by a special court. And if (in cases where the competence of the judge is indisputable) the cause has been determined according to form, and
the judge is not suspected of having acted contrary to his duty, the sentence that he has pronounced in the last resort cannot be called in question by any foreign power whose subjects may be dissatisfied with the decision. This principle is justified by the reciprocal advantage of nations.

But a formal refusal of justice, or an unusual delay, is a violation of the law of nations. And if a foreign subject has reason to complain of it, his sovereign may not only retaliate, but may make use of all the means employed by nations when their rights are invaded by others. He may make reprisals and even declare war to oblige the state, which has thus failed in its duty, to make a proportionate satisfaction.

4. In determining the effect that a sentence pronounced in one state may have in other states, it is necessary to distinguish two points: its execution and its validity. With respect to the first, no sovereign is positively obliged to execute in his territory a sentence that has been pronounced out of it. Nevertheless, first, the particular connection subsisting between several states, and in virtue of which they form a compound state, may oblige them to execute reciprocally every sentence pronounced by a competent judge. Second, sometimes states enter into reciprocal engagements by treaty, for the purpose of executing sentences. Third, friendship and utility often induce a state not to refuse the execution of a sentence pronounced by a competent judge, when the usual request has been made with an offer of rendering the like service.

With respect to the validity of a sentence pronounced in a foreign territory, if such sentence has been pronounced by a judge every way competent, and is the result of a trial conducted in the usual mode, according to the laws that ought to serve as a basis for the decision, and if the cause has been judged definitively, no foreign judge can admit of a second suit on the same cause, between the same persons: the sentence has the same force as the awards of arbitrators fixed on by the parties ought to have in a state of nature.

5. The end of civil society requires that the sovereign should have a right to forbid actions hurtful to the state and its members, to award penalties for such actions, apprehend and judge the criminals, and execute the sentence pronounced on them. These rights collectively taken, together with their necessary concomitants, form the criminal power. This power extends to every one in the territory, whether subject or foreigner. So that though foreign sovereigns and their ministers may not be subject to the jurisdiction of the state, yet the sovereign is justifiable in taking such measures even against them as are necessary to save the state from the dangers into which their crimes would otherwise plunge it.

A sovereign can punish foreigners whether they have committed a crime in his dominions, or whether, after having committed it in a foreign country, they seek shelter in his dominions. In neither case is the sovereign perfectly obliged to send them for punishment to their own country, nor to the place where the crime was committed; not even supposing they have been condemned before their escape. According to modern custom, to send a criminal back to the place where the crime has been committed, is more frequently granted on the request of a power who offers to render the like service, than to send one from the place where the crime has been committed to his own country, or to some court of justice of his own country. This latter is never granted except in virtue of treaty; or if it be, the sovereign must have an extraordinary deference for the power that makes the request.

6. On the other hand, the sovereign, owing the protection of the state to foreigners as well as to his subjects, is obliged to punish with the same scrupulousness, and with the same rigour, all crimes committed against the persons and properties of foreigners living in his territories, as he would punish the same crimes if committed against the persons or properties of his own subjects. But with respect to crimes committed out of his territories, the sovereign is not perfectly obliged to punish the criminal who seeks shelter in his dominions, nor to execute a sentence pronounced against his person or property. However, the general good seems to require that those who attack immediately the safety of a state, should not go unpunished; and accordingly, in case of requisition, no sovereign refuses directly to take cognizance of such crimes.

7. The criminal power being confined to the territory, no act of its authority can be exercised in foreign countries without violating their rights. Consequently neither the pursuit of a criminal by armed men, nor a seizure or carrying away by force, nor the conducting of a criminal by an armed force, can take place on a foreign territory without permission from the sovereign.

8. The right of cancelling a criminal suit, or of pardoning the criminal, can be exercised by no sovereign beyond the limits of his territory. A prince may pardon a crime committed in his own or a foreign territory, but this pardon cannot hinder a foreign sovereign from prosecuting the same person, for the same crime, when he can seize him. The prince who first pardoned him has no means of hindering the effects of such prosecution, but those of interest; except in cases where the manifest innocence of the accused party authorises coercive means.
sort, and of giving such as ought to be satisfactory, even to states less powerful; that is to say, when such explanations can be given with sincerity, and when they have been asked for in a becoming manner. Very often a sovereign informs before hand the powers in friendship with him, that he finds it necessary to take such or such measures of security. It is, in general, only when a satisfactory answer cannot be given, that a sovereign pleads that independence of nations which dispenses with his giving any at all.

On a principle established on this custom, it is understood that those powers who take umbrage at the extraordinary armaments of their neighbours, should ever precede hostilities by an amicable explanation; and indeed this, to a certain degree, is acknowledged by the law of nature.

2. Every state has a natural right to augment its power, not only by the improvement of its internal constitution and resources, but also by external aggrandizement; provided that the means employed are lawful; that is, that they do not violate the rights of another. Nevertheless it may so happen, that the aggrandizement of a state already powerful, and the preponderance resulting from it, may, sooner or later, endanger the safety and liberty of the neighbouring states. In such case there arises a collision of rights which authorises the latter to oppose by alliances, and ever by force of arms, so dangerous an aggrandizement. This right is still more essential to states which form a sort of general society, than to such as are situated at a great distance from each other; and this is the reason why the powers of Europe make it an essential principle in their political system, to watch over and maintain the balance of power in Europe.

3. In all ages nations have regarded with a jealous eye the disproportionate aggrandizement of any one amongst them. We see that many enterprises were undertaken by ancient nations, to diminish the overgrown preponderance of some particular state; but they seem never to have made the maintenance of a balance of power a systematic part of their policy. The greatness of the Romans, and, since the migration of the northern nations, that of Charlemagne, and perhaps that of Henry V, are convincing proofs that it was very long before the nations of Europe saw the necessity of attending constantly to the prevention of dangers of this sort. It was not till the sixteenth century,—when the immense addition to the power of the House of Austria, and to that of the King of France, roused them from their lethargy. They then began to fear that one or the other of those powers might establish a universal monarchy; and since that time, following the example of England, the other nations of Europe have never lost sight of the system for maintaining a balance of power. Some of them, however, consulting their immediate interests only, have occasionally deviated from this system.

The greatest part of the states of Europe at present look upon this right of maintaining the balance of power, as a right that belongs to them.

It is for politicians to determine when this balance is in danger, and to point out the means of re-establishing it: the history of Europe proves how many vicissitudes it has undergone since the beginning of the sixteenth century.

4. The principle treated of in the last section, may authorize the powers of a certain part of Europe to oppose the immoderate aggrandizement of any state among them. Hence the system for maintaining a balance of power among the eastern powers of Europe, among those of the west, or those of the north; among the states of Germany, or those of Italy; among the Europeans in America, &c. The same principle may be applied to commerce, and more particularly to navigation; but it never can be carried so far as to hinder a state from extending its commerce by lawful means, or from augmenting the number of its vessels of war, at least while it does not abuse its power by exercising or extending an usurped empire over the seas.

5. Every free sovereign state has a right to form Right of treaties, by which, and by which treaties whatever powers whatever treaties may appear to be concluding treaties do not Treaties not violate the rights of another. Foreign powers cannot force a treaty upon a free state, nor can they dispose of its rights by treaties made between themselves.

This liberty is reciprocally acknowledged by all the powers of Europe, as far as the theory goes; but, in practice, first, Modern history furnishes examples of a combination of powers having forced independent states to accede, against their will, to treaties made by the combination; and even of their having put such states among the contracting parties without deigning to consult them beforehand. Second, In surveying the weaker states of Europe we see that they are far from being able to exercise that liberty in relation to treaties which the universal law of nations attributes to them; and that there are but too many of these little states which, enjoying a nominal independence, are really dependent on their too powerful neighbours. Third, Sometimes it happens that nations have themselves contracted their liberty of making treaties, by treaties they have already made with other powers; and the demi-sovereign states are subjected to certain laws, which sometimes act as restraints on their liberty of making treaties.

CHAP. II. Of Commerce.

1. The commerce carried on with foreign nations of commerce being one of the most efficacious means of augmenting the riches, and power of a nation, it general is one of the first importance to examine what are the rights of nations with respect to it. External commerce, that is, commerce between nation and nation, has several branches. It consists in selling the superfluity; in purchasing articles of necessity, as well productions as manufactures; in buying from one nation and selling to another; or in transporting the merchandise from the seller to the buyer, to gain the freight.

2. Men being by nature obliged to assist each other, reciprocally, there exists a sort of general obligation on them to carry on commerce with each other. This obligation, however, is only an imperfect one; it does not go to hinder a nation to consult its interests in the adoption of certain conditions or restrictions in the commerce that it finds convenient to carry on. Suppose even that one nation has, for a long series of years, carried on commerce with another, it is not obliged to continue so to do, if there are no treaties or agreements which require it. Still less can one nation oblige another to trade with it alone. It is permitted to impose one nation not to trade with such or such other nation; but, this case excepted, if two nations think proper to trade with each other, a third has no right whatever to hinder it. In this sense, the li-
LAW.

Necessity of treaties of commerce.

3. The mere general liberty of trade, such as is acknowledged at present in Europe, being too vague to secure to a nation all the advantages that it is necessary it should derive from its commerce, commercial powers have been obliged to have recourse to treaties for their mutual benefit. The number of these treaties is considerably augmented since the sixteenth century. However they may differ in their conditions, they turn generally on these three points: First, On commerce in time of peace. Second, On the measures to be pursued with respect to commerce and commercial subjects in case of a rupture between the parties. Third, On the commerce of the contracting party that may happen to remain neuter, while the other contracting party is at war with a third power.

4. With respect to the first point, the custom is: First, To settle, in general, the privileges that the contracting powers grant reciprocally to their subjects. Second, To enter into the particulars of the rights to be enjoyed by their subjects who shall reside on the territory of the other power, as well with respect to their property (particularly in regard to imposts, confiscation, sequestration, &c.) as to their personal rights. Particular care is usually taken to provide for the free enjoyment of their religion; for their right to the benefit of the laws of their country; for the security of their books of commerce, &c. Third, To mention specifically the kinds of merchandise which are permitted to be imported or exported, and the advantages to be granted relatively to customs, tonnage, &c.

With respect to the rights and immunities in case of a rupture between the contracting parties, the great objects to be obtained are: First, An exemption from seizure of the person, or effects, of the subjects residing in the territory of the other contracting power. Second, To fix the time that they shall have to remove with their property out of the territory; or to point out, Third, The conditions on which they may be permitted to remain in the enemy's country during the war.

In specifying the rights of commerce to be enjoyed by the neutral power, it is particularly necessary, First, To exempt its vessels from an embargo. Second, To specify the merchandises which are to be accounted contraband of war, and to settle the penalties in case of contravention. Third, To agree on the manner in which vessels shall be searched at sea. Fourth, To stipulate whether neutral bottoms are to make neutral goods or not, &c.

5. Sometimes nations permit, either from custom or of their treaty, other nations to send consuls into their territories. We find instances of this as far back as the 12th century, when some states began to establish, at home, judges whose particular function it was to decide on matters purely commercial, and to whom was given the name of consuls. In process of time, some of the powers stipulated, in their treaties with the Mahometan and Pagan states out of Europe, for the right of sending consuls into those states to watch over the interests of their subjects trading there, and to judge and determine on differences arising amongst them touching commercial affairs, and sometimes even others. Following these examples, the Christian powers of Europe began, in the fifteenth century, to send consuls into each other's territory; but even at this day, the custom of receiving them cannot be looked upon as universally established. Besides, the rights of these consuls, where they are admitted, differ very widely in different states. Almost all the consuls who are sent out of Europe, exercise a pretty extensive jurisdiction over the subjects of their sovereign. In Europe, there are some places where the consuls exercise civil jurisdiction, more or less limited, over their fellow subjects residing there; in others, they can exercise no more than a voluntary jurisdiction; and in others, their functions are confined to watch over the commercial interests of the state, particularly the observation of the treaties of commerce, and to assist with their advice and interposition those of their nation whom commercial pursuits or connections have led to the place for which they are named. They assume their functions sometimes in virtue of credentials, but oftener by simple letters of provision and letters of recommendation. Although they are under the particular protection of the law of nations, they are far from enjoying the advantages that custom allows to ministers, either as to jurisdiction, imposts, religion, or honours; so that it is only in a very extensive sense of the word that they can be called public ministers. The greatest part of the consuls out of Europe approach much nearer to the rank of ministers; some of them are, indeed, ministers and consuls at the same time.

Sometimes consuls-general are appointed. These are to officiate for several places at the same time, or else they are placed at the head of several consuls. In other respects their functions, as well as those of their vice-consuls, differ but little from those of simple consuls.

CHAP. III. Of the Rights of Nations upon the Seas.

1. A nation may occupy and extend its dominion on the sea, beyond the immediate vicinity of its own particular waters, either in rivers, lakes, bays, straits, or the ocean; and such dominion may, if the national security require it, be maintained by a fleet of armed vessels. The empire of a nation on the seas, may extend as far as it has been acknowledged to extend by the consent of other nations, and beyond the boundary of its property. It remains then to be considered, whether or
not there are such extended limits on the European seas, acknowledged to be the property, or under the dominion, of particular nations. Among the bays, straits, and gulfs, there are some which are generally acknowledged to be free; there are others which are looked upon as under the dominion, and, in part, even the property of the masters of the coast; and there are others, the property and dominion of which are still in dispute.

2. (1.) The following are acknowledged as free:

The Spanish sea, the Aquituit sea, the North sea, the White sea, the Mediterranean sea, the Straits of Gibraltar. 

(2.) The three straits between Denmark, and Sweden, are, by the dominion, and are looked upon as the property, of the king of Denmark; St. George's Channel, between Scotland and Ireland, is under the dominion of Great Britain; the Straits of Sicily are under the dominion of the king of Sicily; the Gulf of Bothnia is under the dominion of the king of Sweden; the Black Sea, the Egee Sea, the Bosphorus of Thrace, the Propontis, and the Hellespont, are all under the dominion of the Turkish emperor. 

(3.) Other nations dispute with England her claim to the dominion, and in part to the property, of the four seas that surround her; particularly the British Channel, and the Straits of Dover. They dispute with the republic of Venice her claim to the dominion over the Adriatic; and with Genoa, her claim to the dominion over the Ligustic sea. More than one dispute has arisen concerning the dominion over the Baltic.

3. With respect to the vast ocean, and the four great seas that compose it, first, The enormous extent of each of these seas, and particularly that of the Indian Sea, about which the greatest disputes have arisen, renders it not only extremely difficult to occupy, but puts it absolutely out of the power of any of the states of Europe to maintain and defend the possession of it. And, even if this could be done, the want of a justificatory reason for keeping such possession would render it unlawful. Neither the right of discovery, nor the donation of the Holy Father, nor prescription, has been able to exclude other nations from that possession in common, which ought to be preserved. The sole dominion must exist in the theory; but it has never been acknowledged by the nations of Europe to belong to any one of them. The ocean, then, is free; and surely it ought to be so. After the vain pretensions and contestations of the Portuguese on the subject during the 16th and 17th centuries, all the powers of Europe now acknowledge the ocean and the Indian Sea to be exempt from all property and dominion, and to be the common possession of all nations. A nation may, however, renounce the liberty of navigating in the Indian, or any other sea.

4. Rivers and lakes are useful for navigation, or for fishing, or for other emoluments arising from their possession; and, therefore, the powers that are masters of the banks have a right to appropriate the use of them exclusively to themselves. In general, they do forbid foreigners to fish on them; but with respect to navigation, as such a prohibition would produce retaliation, and as it is contrary to the commercial liberty generally introduced in Europe, foreigners are now permitted, in time of peace, to navigate freely and without restraint. This liberty is founded in part on treaties, but in some semi-sovereign states on law. But in every case where it is only founded upon custom, that custom does not hinder a nation from making whatever regulations and restrictions it pleases, or from exercising over such part of its territories all the rights of sovereign dominion.

5. The sea surrounding the coast, as well as those parts of it which are land-locked, such as the roads, little bays, or gulfs, &c. as well as those which are situated within cannon shot of the shore, (that is, within the distance of three leagues,) are so entirely the property, and subject to the dominion of the master of the coast, that, first, He has the exclusive right to all the produce of it, whether ordinary or accidental, as far as relates to things unclaimed by any other lawful proprietor; second, He can forbid or restrain the navigation of foreigners in his roads, and their entry into his ports. Yet, in time of peace, this liberty is generally permitted to merchants, &c. and even to ships of war to a certain number; third, He has a right to impose duties, tonnage, fees of entry, of clearance, &c. and he can institute tolls for the benefit of his navigation; fourth, He may require the maritime honours that custom allows to those who have dominion over any part of the seas. In short, the parts of the sea surrounding the coast ought to be looked upon as forming a part of the territory of the sovereign who is master of the shore.

6. The master of the shore cannot be said to have a right to appropriate to his own use the wreck of any wrecks.

foreign vessel cast away on his coast, nor the goods, &c. that, in a moment of danger, have been thrown over board. This pretended strand-right, contrary most certainly to the laws of nature as well as those of humanity, was formerly exercised pretty generally in Europe. It has been restrained from time to time, particularly since the thirteenth century, by privileges, laws, and a number of treaties; so that it may now be considered as generally abolished in our quarter of the globe. If there still remain some relics of it in a few places, it is against such places only that it is made use of by way of retaliation.

7. The rights exercised on the sea near the coast, are exercised also in those straits which are not wider than two cannon shots. It is for this reason that the King of Denmark, by possessing the property and dominion of the navigable part of the Sound, claims there, not only the maritime honours due to him as sovereign, but certain tolls or rates for the liberty of passing. This payment is now fixed by his treaties with other nations.

8. With regard to the extent of the rights exercised on the seas adjacent to the landed territory of particular states;

First, The Turkish Emperor exercises his right of proprietor and sovereign of the Black Sea, in such a manner as not to permit even the entry or navigation of it to any nation whatever, unless he has granted it by treaty.

Second, Denmark, wishing to extend her empire and rights as proprietor over the seas adjacent to Iceland and Greenland, to the space of four miles from Iceland, and fifteen miles from Greenland, claims a right of excluding foreigners from fishing, and even navigating in that space. But this is disputed by many nations, and particularly by the United Provinces in what concerns the right of fishing.

Third, Great Britain, claiming the property and empire of certain parts of the four seas that surround her, empire over more distant parts, and maritime honours on all the seas, has very often had contestations with foreign nations, who, on their part, except bound by treaties, have never yielded her anything more than what belongs to every master of the shore.

Fourth, The republic of Venice claims empire,
and particularly maritime honours on the Adriatic; but the neighbouring states dispute them with her, and recently she has not been in a situation to maintain this pretended right. An annual ceremony is of little use towards it.

Fifthly, Genoa has no longer a naval force respectable enough to claim, with effect, the maritime honours which she pretends to be entitled to on the Ligurian Sea.

Sixthly. After many disputes with respect to the empire of the Baltic, and particularly with respect to the honours of the flag, some of the states situated on its shores have agreed to yield those honours in certain districts, and to omit them reciprocally in others.

9. The maritime honours about which there have been so many disputes, and which have often led to violent acts, and even to war, consist: first, In saluting with cannon; and on this point, it is to be determined who shall salute first, at what distance the salute shall be given, with how many guns, and if the salute shall be returned gun for gun; second, In saluting with the flag, or with the pendant; and here it is to be fixed whether it shall be furled up, lowered, or hauled quite down; third, In saluting with the sails, by lowering, or hauling down the fore-top-sail. This last way of saluting is usually made use of by merchantsmen, but vessels of war sometimes use it also.

Salutes of merchantmen.

BOOK V.

OF Embassies.

CHAPTER I.—Of Ministers, their Rights, Duties, &c.

1. By Public Minister, is commonly meant, the person whom the state has charged with its public affairs: in a more particular sense, the person who is at the head of some department of the government; and in a still more confined sense, the person whom the sovereign has appointed to superintend his affairs at some foreign court. This last sort of minister, (ambassador, in a general sense,) is that of which we are to speak here. The sending of this sort of ministers being a necessary means of treating state affairs, the right to send them becomes one of the natural rights of sovereignty. These ministers are now employed, not only to negotiate the affairs of the sovereign by whom they are sent, (though all their rights are grounded upon their acting in that capacity,) but on points of ceremony also; and, since the introduction of perpetual embassies, sometimes the principal business of such a minister is, to watch over the interests of his master, and give him an exact account of everything that passes and of which it imports him to be informed. Whatever difference a rigorous attention to theory might make as to prerogatives, &c., between negotiators and other ministers, in practice the same prerogatives that are enjoyed by negotiators are also enjoyed by embassies of ceremony, perpetual embassies, and embassies in ordinary.

2. The universal law of nations acknowledges but one order of ministers. It considers them all as public mandatories of the state which they represent, as far as relates to the business with which they are charged, and entitled to the rights essential to that quality, and to no other rights whatever. But the modern law of nations has established several orders of public minis-
time, if they are both of the same order. Sometimes, on the contrary, one minister has several letters of credence; this happens when he is sent to several sovereigns, or to one sovereign in different qualities.

5. Ministers to whom a negotiation is confined must also produce their full powers, specifying the degree of authority with which they are vested. These full powers, whether general or special, or circumstances may require. A full power may be enclosed in the letter of credence; but if it be separate from it, it is commonly drawn up in form of a letter patent. Ministers sent to a congress, without being furnished with letters of credence to any court, produce only their full powers, which they exchange with each other, and which answer the purpose of letters of credence. Sometimes the full powers produced at a congress are put into the hands of the mediators.

6. The minister who is to carry on a negotiation is furnished with instructions; these are to be his guide in his general conduct towards the court to which he is sent, and towards the ministers of other courts whom he may find there, and particularly in the manner of opening and conducting his negotiation. These instructions, as well as those that it may be necessary to dispatch to him in the course of his embassy, being intended for himself alone, are not usually produced to the court to which he is sent, unless his own court orders him to do it, or unless he, from urgent motives, thinks himself justifiable in communicating certain passages of them. Sometimes he has two sets of instructions, the one public and the other secret.

7. All ambassadors have now an indisputable right to the title of excellency; but, of all ministers, they only have that right. If it is sometimes given to the envoys extraordinary of kings, and even to other ministers of the second order, it is because it is due to them in some other quality than that of minister; or else it is given them out of mere complaisance.

8. The ambassador is distinguished from ministers of the inferior orders by many points of the ceremonial. This, however, depends so much on the particular usages of each court, that we can mention only such points as are most generally received: such is the right of going on visits, &c. of ceremony, in a coach and six, or ornamenting the horses with foals, of being saluted with military honours, of being admitted to balls and feasts, and at court on all days of ceremony. Great courts grant less to ministers of the second and third order than the little courts do; these sometimes yield as much to ministers of the third order as the former do to those of the second.

9. The audiences to which ministers of the first and second order are admitted in the course of their missions are either ordinary or extraordinary, and the latter are either private or public. These last take place when there is a notification to be made in ceremony, as also at taking leave.

10. All foreigners are under the protection of the law of nations; but foreign ministers of the different orders enjoy a higher degree of inviolability than that insured to all foreigners by the general law of nations, which extends no further than protection from injury. This inviolability they derive from the dignity of the state they represent, and from the interest that every nation takes in the honour and security of those who are to transact its affairs in foreign countries. The sovereign, then, must be careful to abstain from every kind of violence against the person of a public minister sent to his court; and he is obliged to punish, to the utmost rigour of the law, and as crimes of state, every act of violence committed against him by others; provided, however, that the offender commits such violence against the minister knowing him to be such, and provided he be subject to the jurisdiction of the sovereign. All the powers of Europe acknowledge this inviolability in ministers of all the orders from the moment they enter their territory till they quit it; so that Christian states permit even the minister of an enemy, residing at their courts at the breaking out of a war, to return home in perfect security. The Turks only have preserved the barbarous custom of imprisoning foreign ministers on account of a rupture with their courts. In the course of a war, no minister can pass through, or enter in safety, the territory of an enemy, unless express permission has been first obtained.

11. The universal law of nations acknowledges in His exteriority the minister a perfect independence in every thing that concerns, directly or indirectly, his functions as minister, and considers him in that respect as exter-riority. But that part of the law of nations which is founded on custom, extends this exteriority still further. According to it, the minister, his residence, his house, and his carriages, are usually considered with regard to the rights of sovereignty as out of the territory where the minister resides, and as in the state from which he is sent. This is what is now understood by exteriority. As it is, however, the effect of the will of nations, it is susceptible of limitation, and is, in fact, limited in many respects.

12. In virtue of this exteriority, the minister Exemption and all those belonging to his retinue, as well as his personal property, are exempted from the civil jurisdiction of the state. The minister can be cited before no tribunal except that of the sovereign who sends him; but how far he must except here, first, When he is a subject of the state to which he is sent, or when he is in the service of the state to which he is sent; second, When he has voluntarily acknowledged the jurisdiction of that state; third, When, as plaintiff, he is bound to submit to the jurisdiction to which the defendant is subject; and consequently it is obliged to plead, in case of an action against him arising from the process; fourth, With respect to property, that which belongs to him in any other quality than that of minister is subject to the jurisdiction of the state, and may be seized on for causes not connected with the quality of minister. Though, strictly speaking, the property belonging to him as minister is exempt from seizure during the time of his mission; yet, the mission once terminated, if he attempt to quit the state without paying his debts, the state may refuse to let him depart, or at least to carry away his property; and may even seize upon it. There are instances of this right having been exercised, though generally it is not.

13. Ministers and their retinue (the latter less gene- from criminally) are exempt from the criminal jurisdiction of the state to which they are sent. A crime, then, committed by a minister, does not deprive him of the special protection of the law of nations, and of that inviolability which the interest of his sovereign requires him to preserve. Nevertheless if it be some crime immediately against the safety of the state, the sovereign has a right to act against him as against an enemy of the state. If the safety of the state require it, his person may be seized, and he may even be put to death like another enemy. But, on account of the consequences, it would be dangerous to establish the principle. It is
a custom among the courts of Europe, when a minister has committed a crime of a private nature, to demand his recall; and if it be a state crime, to seize his person and keep him confined as long as the state is in danger; and when that danger ceases to exist, to release him and send him home. But even imprisonment is seldom had recourse to, unless the danger be so very pressing as to render it unsafe to send him home, or write for his recall. With regard to the retinue of ministers, it often happens that courts do not grant the same exemptions to them as to the ministers themselves.

14. The general notion of the exterritoriality of the minister, and of his dwelling, seems to give him a great degree of liberty on the point of religion, but this exterritoriality itself admits of modification on all the points not essential to the object of the mission. Every thing here, then, must depend on custom and particular conventions.

15. The exterritoriality of the minister exempts him, and all his retinue, from the personal impost to which as subjects of the state they would be liable. With respect to duties, either direct or indirect, on merchandise, an exemption from them is not essential to the quality of minister.

Formerly it was the custom to defray, either wholly or in part, the expences of foreign ministers while on their mission. Since this is fallen into disuse among the Christian powers, they have generally substituted in their room an exemption from duties. Nevertheless, the enormous abuse that has been made of this exemption at many courts has caused it to be much restrained, or entirely abolished. At courts where it still subsists, it subsists during the first months of the embassy only; and where it is entirely abolished a gratification is given in lieu of it.

It must be observed, however, that the dwelling and carriages of the minister are exempt from search, unless he consents to their being searched.

16. The immoveable property that a minister may acquire, should it be even the house in which he lives, is not exempt from the ordinary impost, any more than property of the same kind belonging to a foreign sovereign. Such moveable effects also, which it is clear a minister does not possess in his quality of minister, ought to be subject to the ordinary impost.

17. A minister cannot, any more than another foreigner, demand an exemption from the ordinary tolls, intended to reimburse the expense of a public institution of which he partakes in the advantages, for instance, for turnpikes, bridges, &c.; neither can he demand an exemption from postage for his dispatches, &c. nor is this granted to ministers in general, not even to ambassadors. There may, indeed, be some motive for exempting them from post charges in those countries where the postage is become a sort of tax, as in Great Britain.

18. Ministers being mandatories of the state, it follows that their letters of credence and full powers must become void in case of the death of their own sovereign, or of the sovereign to whom they are sent. They must then, in both cases, be provided with new credentials, without which they can neither continue to negotiate, nor perform their other ministerial functions, nor demand the honours and prerogatives due them as ministers; in such a situation, all they can claim is their inviolability till they can quit the state. Nevertheless in practice, when circumstances make it reasonable to suppose that the interruption will not continue any time, the court to which they are sent not only continues to treat them as ministers, but sometimes to negotiate with them also. But this depends wholly on the will of the sovereign at whose court they reside.

A minister whose credentials and powers authorize him to act for a certain time only, or per interim, can act no longer than during the time specified, or till the return of the minister whose place he supplies. His functions in either case cease without his being recalled in form.

19. An embassy is sometimes terminated by a recall. Real. This takes place, first, When the object of the mission is accomplished; second, On account of something that has no relation to the court at which the minister resides; third, At the request of a court, complaining against the minister and demanding his recall; fourth, For reasons of state; for instance, by way of retaliation, in consequence of an infraction of the law of nations, and, in general, in consequence of any dispute that threatens a rupture between the two powers. In the latter case, the minister is often ordered to depart without taking leave; but in the two former cases, (and sometimes even in the latter,) the minister, if present, ought to request an audience at taking leave. At this audience, which is sometimes public and sometimes private, he presents his letters of recall, and makes a speech. If the minister be absent at the time of his recall, he may take leave in writing, annexing to his own letter his letter of recall. In both these cases he receives letters from the court where he has resided, which, if there be the least room for it, contain an eulogium on his character and conduct. After this he receives the ordinary or extraordinary presents intended for him, and his necessary passports. Having thus taken leave of the court, he takes leave of the other foreign ministers, ministers of state, &c. which is done in visits made in the same manner as his visits of arrival; and this ceremony ended, he takes his departure.

20. Sometimes a minister terminates his embassy himself, by quitting the place of his residence without being recalled. This happens, first, When, in virtue of his instructions, he may take leave without waiting for a recall in form; second, When the sovereign at whose court he resides requests him to take leave, or obliges him to quit his territory. This latter is sometimes done by way of retaliation, or in consequence of the misconduct of the minister, or in case of an approaching rupture. Third, When he quits the court of his own accord without taking leave. This is done when some gross infraction of the law of nations has been committed against his person.

21. An embassy may be terminated by the death of the minister. Those who have the care of his interests have a certain right to insist on his being buried honourably; but whether a minister of a religion not tolerated in the country where he dies, is entitled to a public solemn interment in the usual burial-place, is point which, in default of particular convention, must be determined on the principles of the religion of the country where he resided at the time of his death. In case the corpse is sent home to the country of the sovereign who has sent the minister, it is customary to exempt it from the ecclesiastical dues known in some countries, commonly called jura stoles, and which are paid by subjects only.

Chap. II.—Of secret Embassies.
Secret embassies are of several sorts. Sometimes a secret embassies.
sovereign sends a person of confidence, to treat in secret of some affairs of importance, or that require dispatch, without giving him the quality of minister; or at least without permitting him to assume it only till the object of his mission be out of danger. If the court to which he is sent, be informed of the object of his mission, he ought to be granted all the inviolability due to him as minister; if not, he may be treated as a private person. Such persons can demand no part of the ceremonial due to them as ministers while they forbear to discover their quality as such; and, in general, they are looked upon by all the other ministers as private persons.

 Chap. III.—Of State Messengers.

Messengers are the bearers between sovereigns and ministers of whatever they wish to convey with dispatch. Every sovereign grants, in time of peace, a full and entire inviolability to the persons of messengers, as well as to the dispatches of which they are the bearers, whether they are sent to his own court, or are on the road to some other court; but in order to this, they must announce themselves as such, and produce, if required, the necessary passports, &c. This inviolability has often been confirmed by treaty; and to commit an act of violence against a messenger is now looked upon as an enormous offence.

They are further granted an exemption from imposts and from being searched as long as they do not abuse this favour.

In time of war, this inviolability is not so much respected. Distant powers take the liberty of seizing the messengers of their enemies, or of the allies of their enemies, where there are no treaties to the contrary. Sometimes it is agreed to grant them passports; and this very often is one of the first objects of a negotiation for peace.

BOOK VI.

Of forcible means employed by a Nation in the Defence or Pursuit of its Rights.

 Chap. I.—Of Retaliation and Reprisals.

1. In case of a difference between two sovereigns, he who complains of a violation of his natural or positive rights ought, unless his pretensions be of an indisputable nature, to begin by sufficiently proving those rights, as well as the violation of them complained of. This done, if he cannot obtain due satisfaction by amicable means, or if he foresees that it would be useless to try such means, he may, if he does not choose to renounce satisfaction altogether, have recourse to forcible means, whether it be in the defence or pursuit of his rights. Forcible means are, indeed, in such cases, the only ones that are left to sovereigns who acknowledge no judge or superior.

Forcible means are of several degrees, which differ widely from each other, and every sovereign is obliged to confine himself to the employment of the lowest degree by which he can obtain due satisfaction. Above all, he ought to distinguish carefully the means of redress proper to the mode of use in case of a violation of an imperfect obligation, from those which would be justifiable in case of a violation of a perfect obligation.

2. There are many ways of violating an imperfect obligation. In general, a sovereign violates his imperfect obligations by refusing to permit or to do what equity and humanity dictate, and by doing what in rigour he has a right to do, but which humanity and equity forbid. Particularly, first, In refusing to observe a point of simple custom; second, In introducing into his dominions some partial right or law, to the prejudice of foreigners.

From the nature of imperfect rights and obligations, it is clear that no violation of them can authorize the use of forcible means, or the infraction of perfect obligations, in the pursuit of redress; but it is no less clear that in order to obtain such redress a sovereign may make use of retaliation. He may, for instance, refuse to comply with the same custom with respect to another sovereign, that that sovereign has refused to acknowledge with respect to him; or he may refuse to comply with some other custom which is equivalent to it. He may introduce a partial right or law to the prejudice of such foreigners as have done the same with respect to him or his subjects. By these means he re-establishes reciprocity, or obliges unfriendly powers to change their conduct.

3. A sovereign violates his perfect obligations in inflicting the natural or perfect rights of another. It matters not whether these rights are original and inherent, or whether they have been acquired by express or tacit covenant, or otherwise.

In case of such violation, the injured sovereign may refuse to fulfil his perfect obligations towards the sovereign by whom he is injured, or towards the subjects of such sovereign. He may also have recourse to more violent means till he has obliged the offending party to yield him satisfaction, or till he has taken such satisfaction himself, and guarded himself against the like injuries in future.

Whether the state or its subjects be the offending party, if the state refuse to make satisfaction, the property of each of its subjects coming within the reach of the injured state, is liable to seizure, (in which case such subjects have a right to be indemnified by the state to which they belong;) and even the persons of such subjects may be seized; but the life of an innocent person cannot be taken, unless in extraordinary cases where there are no other means of obtaining satisfaction, and of preventing future violations.

There are many acts by which a sovereign refuses to do or to suffer what he is perfectly obliged to do or to allow, or by which he does what he is ordinarily perfectly obliged to omit, in order to obtain satisfaction for a real injury sustained; all these acts are called reprisals.

4. One species of reprisal the most frequently employed, is the seizure of the property and persons of the subjects belonging to the state from whom an injury has been received. This is done with a view of obtaining satisfaction by the confiscation of the property seized, if all endeavours should fail of obtaining it otherwise from the offending state.

5. Whatever difference there may be in the different species of reprisals, they resemble one another in this, that they are all determinate acts of violence, and that they are exercised separately; but when all these species of reprisals are exercised at once, they form a sort of warfare; indeed they no longer differ from actual war.

 Chap. II.—Of the Commencement of War.

1. National war, as distinguished from civil, is a conflict between nation and nation. It never can be unwar,
dertaken or carried on but by the authority of the sovereign; but he may yet the right of making war in such of his subjects as he thinks proper. Thus the India Companies of England and Holland, who enjoy a territorial superiority with respect to their possessions out of Europe, have also obtained from their sovereigns the right of making war. Their troops and vessels ought therefore to be treated as lawful enemies.

2. National wars are offensive or defensive. War is offensive on the part of the sovereign who commits the first act of violence against another, whether in entering his territory with an armed force, attacking him on the high seas, or in the territory of a third power. It is defensive on the part of him who receives the first act of violence. But it must be observed, that if a sovereign sees himself menaced with an attack, he may take up arms in order to ward off the blow, and may even commence the exercise of those violences that his enemy is preparing to exercise against him, without being chargeable with having begun an offensive war. Such measures in such a case are no more than the means of simple defence.

3. Nothing short of the violation of a perfect right, either committed, committing, or with which a nation is threatened in future, can justify the undertaking of a war. On the other hand, every such violation when proved, and when amicable means have been tried in vain, or when it is evident that it would be useless to try such means, justifies the injured party in resorting to arms.

It is impossible that the sentiments of the belligerent parties should not be in direct opposition with regard to the justice or injustice of the war; yet if it be not manifestly unjust, their own welfare induces them to consider it as lawful, as far as respects the treatment of the enemy, and the validity of conventions and treaties of peace.

4. The universal law of nations acknowledges no general obligation of making a declaration of war to the enemy, previous to a commencement of hostilities. Many ancient nations looked on such a declaration as essential, and it was practiced in Europe till the seventeenth century; but now-a-days nations content themselves with publishing a declaration of war through their own dominions, and explaining their motives to other powers in writing. The publishing of war in this manner is looked upon as so essential, that nations have often demanded a restitution of every thing taken from them by the enemy before such publication. Sometimes, however, nations over-rule such demands by insisting that the war has been tacitly declared.

5. From the moment a sovereign is in a state of war he has a right, strictly speaking, to act as an enemy not only with respect to the persons and property found in the territory of the enemy, but also with respect to his enemy's subjects and their property which may happen to be situated in his own territory at the breaking out of the war. He has a right, then, to seize on their ships found in his ports, and on all their other property, to arrest their persons, and to declare null and void all the debts which the state may have contracted with them.

Nations, however, for their mutual benefit, have been induced to temper the rigour of this right. First, In many instances nations have stipulated, in case of a rupture between them, to give each others subjects residing in their territory at the breaking out of a war, or coming to it not knowing of the declaration of war, a specified time for the removal of them-
4. From the moment we are at war, all those who belong to the hostile state become our enemies, and we have a right to act against them as such; but our right to wound or kill being founded on self-defence, or on the resistance opposed to us, we can with justice wound or take the life of none except those who take an active part in the war. So that, first, Children, old men, women, and in general all those who cannot carry arms, are safe under the protection of the law of nations, unless they have exercised violence against the enemy. Second, Retainers to the army, whose profession is not to kill, or directly injure the enemy, such as chaplains, surgeons, &c. ought not to be killed or wounded deliberately. Third, Soldiers, on the contrary, being looked upon as ever ready for defence or attack, may at any time be wounded or killed; unless when it is manifest that they have not the will or have lost the power to resist. When that is the case,—when wounded, surrounded, or when they lay down their arms and ask for quarter; in short, from the moment they are reduced to a state in which it is impossible for them to exercise further violence against the conqueror, they are obliged by the laws of war to spare their lives; except, however, first, When sparing their lives would be inconsistent with his own safety; second, In cases where he has a right to exercise the talio, or to make reprisals; third, When the crime committed by those who fall into his hands justifies the taking of their lives.

It is always justifiable to make the vanquished soldiers prisoners of war, and even those who are not of the military profession.

5. When the conqueror receives the conquered as prisoners of war, all violence between them is understood to have ceased. The ancient custom of making slaves of the conquered is no longer practised by the powers of Europe, except by way of retaliation towards barbarians. Christian powers generally keep prisoners of war under a guard till they are ransomed or exchanged by cartel, or till the re-establishment of peace. Officers are often released on their parole of honour, by which they promise not to serve against the power who releases them, for a certain time, or during the war; and to appear at an appointed place as often as they shall be duly summoned. Those who, regardless of their parole, take up arms while the convention is observed on the other side, are looked upon as infamous; and if they again fall into the hands of the enemy to whom they have given their parole, he is not by the laws of war obliged to give them quarter.

6. The conqueror has, strictly speaking, a right to make prisoners of war of all the subjects of the hostile state who may fall into his power, though they may have committed no violence against him; and of course he has a right to remove them to another country. But in modern usage, the conqueror generally carries his rights in this respect no further than to submit such subjects to his domination, to make them swear fealty to him, to exercise certain rights of sovereignty over them, such as raising and quartering troops among them, making them pay taxes, obey his laws, &c. and punishing as rebels those who attempt to betray him or shake off his yoke.

The intention with which a country or province is taken possession of, generally determines the conqueror in the alterations he makes in the form of government, if he makes any at all. It is clear that the conqueror is not obliged to preserve the constitution of a conquered country or province, nor to leave the subjects in possession of the rights and privileges granted them by their former sovereign, unless he has made them a promise to that effect previously to their submission.

7. The conqueror has a right to seize on all the property of the enemy that comes within his power; it matters not whether it be immovable or movable, precious or common. Such securities may be made, first, In order to obtain what he demands as his due, or an equivalent; second, To defray the expences of the war; third, To force the enemy to an equitable peace; fourth, To deter him, or, by reducing his strength, hinder him from repeating in future the injuries which have been the cause of the war. And with this last object in view, a power at war has a right to destroy the property and possessions of the enemy for the express purpose of doing him mischief.

The modern laws of war; however, do not permit the destruction of any thing except, first, Such things as the enemy cannot be deprived of by any other means than those of destruction, and which it is at the same time necessary to deprive him of; second, Such things as after being taken cannot be kept, and which might if not destroyed strengthen the enemy; third, Such things as cannot be preserved without injury to the military operations; to which we may add, fourth, Whatever is destroyed by way of retaliation.

8. It is in battles that the laws of war ought to be adhered to with the most scrupulous exactness, as well with regard to the arms made use of as to the treatment of the vanquished.

The victor, he who remains master of the field of battle, ought to take care of the wounded and bury the dead. It is against every principle of the laws of war to refuse or neglect to do either.

It is, however, sometimes a question, who is master of the field? and in such a case a truce is agreed on for some days, during which period both sides bring in their own wounded and bury the dead; in order to signify their respect.

9. The taking of a fortress or fortified town is effected by surprise, by a blockade, or by a siege. In the two last cases, the place surrenders by capitulation, or is taken by assault after being summoned in vain.

All the means necessary to the reduction of a fortress are justified by the laws of war; consequently, there are cases which may authorize the demolition or burning of the suburbs. But, except in cases of necessity, it is now admitted that the besiegers ought to direct their artillery against the fortifications only, and not intentionally against the public edifices, or any other buildings either within or without the ramparts.

10. If a town or fortified town surrenders by capitulation, on that capitulation depends the fate of the garrison, arms, warlike stores, and of the inhabitants, and their property.

The terms of a capitulation depend entirely on circumstances; they are usually more or less honourable as the situation of the besieged is more or less favourable; but if the place, after being duly summoned, refuses to surrender and is taken by assault, those found in it are obliged to submit to the discretion of the victor. All that the garrison can expect is to have their lives spared if they immediately lay down their arms. It is however customary for the victor to forbid pilage on such occasions.
1. The belligerent powers often enter into conventions either at the beginning or in the course of the war. By these conventions they promise not to make use of such or such arms, or such or such means of injuring each other; settle the conditions and the manner to be observed in the exchange or redemption of prisoners of war; make arrangements relative to passports, safe conducts, &c. adjust the terms of a truce, &c.

2. As a security for the fulfilment of conventions made in the course of the war, it is still customary to place hostages in the hands of the party who would suffer by a non-fulfilment. If the other party breaks his engagements, it is allowable to treat his hostages with severity, but not to take their lives, unless for some crime that they have committed, or by way of retaliation.

**Chapter V. Of Allies, Subsidies, and Auxiliaries.**

1. A sovereign may be obliged to join his forces to those of another power, sometimes in fulfilment of his treaties of alliance, and sometimes in consequence of a particular connection existing between him and such power; or he may do it from his own choice. In none of these cases does he act against the law of nations, if the cause he espouses be not unjust. To a sovereign so situated there result two sorts of rights and obligations; first, Relative to the power whom he assists; second, Relative to the enemies of that power.

2. Alliances are simply defensive, or they are offensive at the same time. An alliance is simply defensive when the allies promise to assist each other in case either should be attacked first, or be in danger of an attack by some other power; it is offensive and defensive, when they promise to assist each other, not only in case of a first attack, but even should either of them make the first attack on some other power.

Both sorts of alliances are either general or particular. They are general when they extend to all wars in which either of the allies may be engaged; and particular when directed against a particular power, or confined to a particular war.

Alliances are formed sometimes before, and sometimes after, the beginning of a war. As to their duration, it is sometimes for a definite, and sometimes for an indefinite space of time, and sometimes for ever. The allies either promise a specific number of troops, or vessels, or of both; or they promise a certain aid in money; or to assist each other with all their forces; or finally to make common cause.

3. Simple treaties of subsidy must be distinguished from alliances. A treaty of subsidy is a convention by which one power engages, in consideration of a certain sum of money, to bring into the field a specific number of troops, &c. to be in the pay and service of another power. The time for which such troops are to remain in service is sometimes determinate and sometimes not.

A power often receives a subsidy in consideration of engaging to keep a certain number of troops, &c. in readiness for service, and sometimes of engaging only to augment its own forces.

4. Strictly speaking a belligerent power has a right to treat as his enemies all the powers who lend assistance to the enemy, from whatever motive, or in consequence of whatever treaty. Policy, however, has induced the powers of Europe to depart from this rigorous principle. They now admit, first, That a sovereign who furnishes troops in virtue of a treaty of subsidy, does not thereby become the enemy of the power against which those troops act; second, That as a sovereign sends to the assistance of his ally no more than the number of troops, &c. stipulated in the treaty of alliance, and does not authorise them to serve upon any other footing than that specified in the treaty, such sovereign ought to be looked upon as an auxiliary, and not as the enemy of the power against which his troops make war; and, of course, that such sovereign ought to be permitted to enjoy his rights of neutrality. This is more especially the case when the aid of an auxiliary is the consequence of a treaty of general defensive alliance, concluded before the beginning of the war.

We have seen some powers claiming the rights of neutrality even while they were furnishing the greatest part of their troops, and contributing principally to the reexisting of the enemy and the continuation of the war; but imperious circumstances and motives of policy only can induce the enemy to treat such powers as neutral.

When two powers become allies in form, by carrying on the war in common, and with all their forces, without doubt they may and ought to be treated as enemies by the adverse party.

**Chapter VI. Of Neutrality.**

1. To observe a perfect neutrality a state must, first, Abstain from all participation in warlike expeditions. Second, It must grant or refuse nothing to one of the belligerent powers, which may be useful or necessary to such power in prosecuting the war, without granting or refusing it to the adverse party; or, at least, it must not establish an inequality in order to favour one of the parties more than the other.

The moment a neutral power deviates from these rules, its neutrality is no longer perfect but limited; and, indeed, though neutral states sometimes promise more, and enter into a sort of conventional neutrality, a limited neutrality is all that the laws of neutrality impose.

2. It is now generally acknowledged that a neutral power ought not to transport to either of the belligerent powers merchandises unequivocally intended for warlike purposes. The list of these merchandises, commonly called contraband, has been differently composed in different treaties of commerce. Sometimes this list has been swelled out with merchandises which are not evidently and unequivocally intended for the purposes of war, though they may be useful to the enemy; and at other times such merchandises have been expressly declared not contraband. This last ought to be presumed also between powers that have no treaty with each other.

Besides this, the maritime powers have begun, especially since the latter end of the 17th century, to issue declarations at the beginning of a war, advertising neutral powers that they shall look upon such and such merchandises as contraband, and forewarning them of the penalties they intend to inflict on those who shall be found conveying them to the enemy. These declarations are rather advertisements than laws; nor can their effects be by any means extended to those neutral powers with which the powers that
issue them have treaties of commerce in which the matter is settled.

3. When a prize has been made, the captor cannot appropriate it to his own use till it has been condemned as a lawful prize in a court of admiralty.

The customary, as well as conventional law, authorizes every sovereign in Europe to institute courts of admiralty and other superior tribunals vested with full power to determine on the legality or illegality of all prizes made by his subjects.

In trials of this kind the original proprietors of the prize, or those who claim in their stead, are required to prove that the prize is not a lawful one. In other respects, it is not the laws of the country where the court is held, but existing treaties and the universal law of nations that ought to be the basis on which all decisions of this sort should be founded.

4. During the latter wars of the late century, the neutral powers complained that the belligerent powers, and Great Britain in particular, had encroached on their rights of neutrality, either in swelling out beyond just bounds the list of contraband merchandise, or in giving the notion of a blockaded place a too extensive examination of their vessels, and particularly in deviating from the principle established by the customs and treaties of the seventeenth century, according to which (as was alleged) neutral vessels save neutral goods. In consequence of these imputed encroachments, the Empress of Russia drew up in 1780, at which time she was among the neutral powers, certain principles relative to neutral commerce, which she communicated to the belligerent powers, accompanied with a declaration that she would maintain them by force of arms. Hence the system of armed neutrality.

5. The principles of the system of armed neutrality are, first, That neutral powers have a right to enjoy a free trade with the ports and roads of the belligerent powers; second, That neutral vessels make neutral goods, that is, that enemy’s goods found in neutral vessels ought not to be confiscated; third, That no mercantile ship be termed contraband which have not been declared so in treaties made with the belligerent powers, or one of them; fourth, That a place shall not be looked upon as blockaded except when surrounded by the enemy’s vessels in such a manner as to render all entrance manifestly dangerous; and, fifth, That these principles shall serve as the basis of all decisions touching the legality of prizes.

6. Almost all the powers that remained neutral at the time when this system was formed successively acceded to it; and, among the belligerent powers, France and Spain did not oppose it. Great Britain has never acknowledged it.

If this system was adopted in 1780 for the then present war only, the declarations of the parties sufficiently prove their intention to have been that it should serve as a basis for a like system in future wars; and experience has fully confirmed the conjecture.

CHAP. VII. Of Making Peace.

1. The enemy ought, strictly speaking, to put an end to the war as soon as he has obtained or can obtain the satisfaction demanded, a compensation for the expences of the war, and security for the future. But it is policy that usually determines the duration of a war. Sometimes the demanded satisfaction is never obtained, and sometimes the war is carried on for vengeance or conquest’s sake, after satisfaction is or may be obtained.

The first overtures for peace are sometimes made by one of the belligerent powers, and sometimes by a neutral power, their common friend. The negotiations also are sometimes opened by the belligerent powers themselves, and sometimes by a neutral power that interposes its good offices, or becomes mediator. These negotiations are carried on at the court of one of the belligerent powers, at that of a mediator, or at any other place named by the parties as the place of assembly for the congress.

2. When the negotiators have come to an agreement on the points which are to serve as the basis of a treaty of peace, and certain difficulties remain to be done away which are not of importance enough to induce the parties to continue or renew the war, preliminary treaties are generally agreed upon. These treaties differ as to their form; sometimes they are mere minutes, and sometimes they have all the clauses usually found in formal treaties. In general, when signed and ratified, they are obligatory, even before the definitive treaty is concluded, and remain so if the definitive treaty should not be concluded, unless stipulated otherwise.

When the preliminary treaty is concluded, the parties continue to negotiate on the points that remain unsettled, in order to the conclusion and ratification of the definitive treaty.

3. In a treaty of peace, we may distinguish the general articles, which bear a strong resemblance to each other in all treaties of peace, from the particular articles, which being proper to the treaties in which they are inserted are not susceptible of comparison.

After the introduction usually follow the general articles, respecting the re-establishment of peace and friendship, the cessation of hostilities and contributions, the exchange or release of prisoners of war, and the general amnesty.

Then follow the principal particular articles, which after having specified and renewed the treaties that are to serve as the basis of the peace, treat of the matters which occasioned the war, and particularly of what concerns possession, where there are concessions or
compensations to be made, or whether the principle of the *uti possidetis* has been adopted.

The treaty concludes with specifying the time when, and sometimes the place where, the ratifications are to be exchanged.

4. Sometimes foreign powers are called in as guarantees of a treaty. A guarantee may extend to the treaty in general, or be confined to some particular article or articles of it; in the former case it is called general, in the latter particular. It may also be for one of the contracting parties only, or for all of them.

In general a guarantee engages to maintain the treaty, by promising to lend assistance to the party who shall complain of an infraction of it, and who shall demand such assistance.

A guarantee has no right to oppose the alterations that the contracting parties may afterwards make in the treaty by mutual consent; but neither is he obliged to guarantee the treaty when so altered.

5. The treaty of peace being signed and ratified, it only remains to publish and put it in execution. The former is generally done with solemnity; the latter often meets with a great deal of difficulty, particularly when an invaded territory is to be evacuated, or provinces, &c. are to be ceded to a power that is not in possession of them at the time of making the treaty of peace. These difficulties sometimes occasion particular conventions, and even congresses of execution; and it is fortunate if by such means the embers of war are entirely extinguished.

Such of our readers as may wish to extend their inquiries on this subject, may consult the following works:

Grotius, *De Jure Belli ac Pacis*. There is a translation in folio, 1738, with all the valuable notes of Barbeyrac.

Montesquieu's *Spirit of Laws*.

Mably's *Droit Publicque de l'Europe*.

Wicquefort's *Ambassadeur et ses Fonctions*.

Vattel's *Droit des Gens*, translated, with Notes, 1797, 8vo.

PART III. OF THE LAW OF ENGLAND.

Following the method of Justinian's body of the Roman law, modern writers of digests or institutes of the codes of their respective countries, have commonly arranged their subject under the three great titles of *Rights of Persons*, *Rights of Things*, and *Actions*, or the several sorts of legal process. This division is either not logical in itself, or is expressed with great inaccuracy. *All* law relates to rights of *persons* only. *Things* have no rights; and to them, therefore, as possessing rights, law can have no relation. *Actions*, also, or the different kinds of legal process, are nothing else than a particular class of *rights*, of which the several members of the community may avail themselves as much as of their rights of any other description. But if, on the other hand, Justinian, and the writers who have followed him, mean only by rights of persons, rights of things, and actions, three great classes of rights comprehending the whole subject of law, there seems no good objection to the arrangement, although the expressions they have used are sufficiently inaccurate, and liable to misapprehension.

Certain rights arise from the *status*, condition, or rank of men in society, as the *ecclesiastical* and *military* states—_from their more usual and intimate relation to one another, as governors and governed, husband and wife, &c._—and from kindred or affinity, as *parent* and *child*. From this *status*, relation, and affinity, proceed what may be called, in a more limited and peculiar sense, the *rights of persons*.

Another class of rights is more immediately connected with *property*; and this being divisible into two great species, *real* and *personal* property, hence a corresponding distribution of this class of rights into the two subordinate divisions of real and personal. This class of rights may be denominated *rights arising from property*.

A third class of rights may be arranged under the title of *actions*, being the several modes of judicial process to which every member of the state has right as of England, with the means by which he may claim or defend all or any of his other rights.

We shall, accordingly, in the following abstract, observe this threefold distribution of rights. But as it may sometimes serve to place the rights both of *persons*, strictly so denominated, and those arising from *things*, in a stronger point of view, we shall occasionally regard them in a negative or violated state, or, as it is more usually expressed, under the aspect of *private wrongs*. The several modes by which these rights are acquired and transmitted will also fall to be considered. And under *Actions*, besides what is more proper to the subject, we shall introduce some notice of the different sorts of courts, their jurisdiction, &c.

A fourth division of our subject will relate to *Crimes*; which may be regarded as the rights conferred by nature, or derived from law, in a state of such gross violation as occasions alarm, by occasioning insecurity, to every member of the community. And hence this branch of the subject has by writers on the law of England usually been denominated *public wrongs*.—We shall premise a brief Introduction on the sources and component parts of the laws of England.

Introduction.

1. The municipal law of England, or the rule of law of England, may be divided into two kinds: the *lex non scripta*, the unwritten or common law; and the *lex scripta*, the written or statute law.

2. The *lex non scripta*, or unwritten law, includes ordinary unwritten law, not only general customs, or the common law properly so called, but also the particular customs of certain
parts of the kingdom; and likewise those particular laws that are by custom observed only in certain courts and jurisdictions.

When we call these parts of the law leges non scriptae, we would not be understood as if all those laws were at present merely oral, or communicated from former ages to the present solely by word of mouth, but because their original institution and authority are not set down in writing as acts of parliament, but receive their binding power, and the force of laws, by long and immemorial usage, and by their universal reception throughout the kingdom.

3. This unwritten, or common law, is properly distinguishable into three kinds: First, General customs, which are the universal rule of the whole kingdom of England, and form the common law in its strictest and more usual signification. Second, Particular customs, which for the most part affect only the inhabitants of particular districts. Third, Certain particular laws, which by custom are adopted and used by some particular courts of pretty general and extensive jurisdiction.

4. First. As to general customs, or the common law properly so called, this is that law by which proceedings and determinations in the king's ordinary courts of justice are guided and directed. This for the most part settles the course in which lands descend by inheritance; the manner and form of acquiring and transferring property; the solemnities and obligation of contracts; the rules of expounding wills, deeds, and acts of parliament; the respective remedies of civil injuries; the several species of temporal offences, with the manner and degree of punishment; and an infinite number of minister particulars, which diffuse themselves as extensively as the ordinary distribution of common justice requires. Thus, for example, that there shall be four superior courts of record, the Chancery, the King's Bench, the Common Pleas, and the Exchequer; that the eldest son alone is heir to his ancestor; that property may be acquired and transferred by writing; that a deed is of no validity unless sealed and delivered; that wills shall be construed more favourably, and deeds more strictly; that money lent upon bond is recoverable by action of debt; that breaking the public peace is an offence, and punishable by fine and imprisonment. All these are doctrines that are not set down in any written statute or ordinance, but depend merely upon immemorial usage, that is, upon common law for their support.

5. Second. The second branch of the unwritten laws of England are particular customs, or laws which affect only the inhabitants of particular districts.

These particular customs, or some of them, are without doubt the remains of that multitude of local customs before mentioned, out of which the common law, as it now stands, was collected, at first by King Alfred, and afterwards by King Edward the Confessor: each district mutually sacrificing some of its own special usages, in order that the whole kingdom might enjoy the benefit of one uniform and universal system of laws. But for reasons that have been now long forgotten, particular counties, cities, towns, manors, and lordships, were very early indulged with the privilege of abiding by their own customs, in contravention to the rest of the nation at large; which privilege is confirmed to them by several acts of parliament.

6. Such is the custom of gavel-kind in Kent, and some other parts of the kingdom, (though perhaps it was also general till the Norman conquest,) which or-
fallen into disuse, or become disreputable; remedial, when made to supply such defects, and abridge such superfluities in the common law, as arise either from the general imperfection of all human laws, from change of time and circumstances, from the mistakes and unadvised determinations of unlearned (or even learned) judges, or from any other cause whatsoever. And this being done either by enlarging the common law where it was too narrow and circumscribed, or by restraining it where it was too lax and luxuriant, has occasioned another subordinate division of remedial acts of parliament into enlarging and restraining statutes.

12. These are the several grounds of the laws of England; over and above which, equity is also frequently called in to assist, to moderate, and to explain them. What equity is, and how impossible in its very essence to be reduced to stated rules, we shall not here inquire. We shall only observe, that (besides the liberality of sentiment with which the common law judges interpret acts of parliament, and such rules of the unwritten law as are not of a positive kind,) there are also peculiar courts of equity established for the benefit of the subject; to detect latent frauds and concealments, which the process of the courts of law is not adapted to reach; to enforce the execution of such matters of trust and confidence as are binding in conscience, though not cognizable in a court of law; to deliver from such dangers as are owing to misfortune or oversight; and to give a more specific relief, and more adapted to the circumstances of the case, than can always be obtained by the generality of the rules of the positive or common law. This is the business of our courts of equity, which, however, are only conversant in matters of property. For the freedom of our constitution will not permit, that in criminal cases a power should be lodged in any judge to construe the law otherwise than according to the letter. This caution, while it admirably protects the public liberty, can never bear hard upon individuals. A man cannot suffer more punishment than the law assigns, but he may suffer less. The laws cannot be strained by partiality, to inflict a penalty beyond what the letter will warrant; but in cases where the letter induces any apparent hardship the crown has the power to pardon.

BOOK I.

Of the Rights of Persons.

1. The most universal public relation by which men are connected together is that of government; namely, as governors and governed; or, in other words, as magistrates and people.

Parliament. Its constituent parts.

2. Parliament is the legislative branch of the supreme power of Great Britain and Ireland, consisting of the king; the lords spiritual and temporal; and the knights, citizens, and burgesses, representatives of the commons of the realm in parliament assembled. The consent of these three states is required, to make any new law that can bind the subject.

Its power.

3. The power of parliament is so transcendent and absolute, that it cannot be confined, either for causes or persons, within any bounds. It has sovereign and uncontrollable authority in making, confirming, enlarging, restraining, abrogating, repealing, reviving, and expounding of laws, concerning matters of all possible denominations, ecclesiastical or temporal, civil, military, maritime, or criminal. It is, without doubt, a court of record over which none other can have jurisdiction.

4. Every member must be above twenty-one years of age; and before he is permitted to take his seat, must take the oath of allegiance, supremacy, and abjuration. A member has privilege of speech while in the house; and proceedings in parliament cannot be impeached or questioned in any court or place out of parliament. Every member is privileged from arrest forty days after prorogation, and forty days before the next assembling. The person of a peer is always sacred; but neither peer nor commoner has privilege against an indictable offence. A member who is a trader, may be served with legal process for any just debt to the amount of £ 100; and unless he makes satisfaction within two months, it shall be deemed an act of bankruptcy, and thereupon a commission may issue.

5. The peculiar privileges of the lords (who sit in a separate house by themselves) are, to be attended by the sages of the law in matters of appeal, &c.; to make proxies; to enter protests; and to regulate the election of the sixteen peers of North Britain. But their most distinguishing privilege is that of exercising the judicial authority as a court of appeal of the last and highest resort.

6. The peculiar privileges of the commons (who sit by themselves in another house,) relate principally to the raising of taxes, and the elections of their members.

7. With regard to the first, it is the ancient indisputable privilege and right of the House of Commons, that all grants of subsidies or parliamentary aids do begin in their house, and are first betowed by them; although these grants, to be effectual, require the assent of the other two branches of the legislature.

8. With regard to the election of members, three things may be considered. 1. The qualifications of the electors. 2. The qualifications of the elected. 3. The proceedings at elections.

9. As to the qualifications of the electors. And, first, those of electors of knights of the shire. 1. By statute 8 Hen. VI. c. 7, and 10 Hen. VI. c. 2, (amended by 14. Geo. III. c. 58,) the knights of the shire shall be chosen by people whereof every man shall have freehold to the value of forty shillings by the year within the county; which (by subsequent statutes) is to be clear of all charges, duties, except parliamentary and parochial taxes. The knights of shires are the representatives of the landholders, or landed interest of the kingdom. Their electors must therefore have estates in lands or tenements within the county represented. These estates must be freehold, that is, for term of life at least. 2. No person under twenty-one years of age shall be capable of voting for any member. This extends to all sorts of members, as well for boroughs as counties; as does also the next, viz. 3. No person convicted of perjury, or subornation of perjury, shall be capable of voting in any election. 4. No person shall vote in right of any freehold granted to him fraudulently to qualify him to vote. Fraudulent grants are such as contain an agreement to recover, or to defeat the estate granted; which agreements are made void, and the estate is absolutely vested in the person to whom it is so granted. And to guard the better against such frauds, it is farther provided, 5. That every voter shall have been in the actual possession, or receipt of the profits, of his freehold to his own use for twelve calendar months before; except it came to him by descent, marriage, marriage-settlement, will, or promotion to a benefice or office. 6. That no person shall vote in respect of an annuity or rent-charge, unless
13. The king is the supreme magistrate of the realm. The crown of the united kingdoms is descen- 
dible, making no distinction of whole or half blood, to 
heirs-male or female; and when it descends upon fe-
male, the right of primogeniture prevails. The course 
of its descent is subject to limitation by parliament; 
the legal successor, upon the demise of a king, is im-
mediately invested with all the ensigns, rights, and 
prerogatives of sovereign power.

14. Whenever the royal prerogatives are suspen-
sed by indisposition or other causes,—' "The lords, spir-
Itual and temporal, and commons assembled, lawfully, 
fully, and freely represent all the estates of the peo-
ple," and it is their duty to provide the means of 
supplying that defect, and to appoint a regency under 
such limitations as may be deemed reasonable.

15. The duties incumbent upon the king are, to go-
vern his people according to law, to execute judgment the 
over, and to maintain the established religion, reign-
(which he is bound more especially to do by the cor-
onation oath,) according to the laws and customs of 
the realm. The king is assisted in his councils by his 
parliament, his peers, and his privy council; and be-
ing so provided with counsellors, is supposed inca-
able of doing wrong, but his advisers and ministers are 
punishable for wickedly deceiving him.

16. The prerogatives of the king are either direct or incidental. The direct are such positive substantial 
parts of the royal character and authority, as are rooted 
in, and spring from the king's political power. Inci-
dental bear always a relation to something else distinct 
from the king's person; as that no costs shall be re-
covered against the king; that he never can be a joint 
tenant; that his debt shall be preferred before that of 
the subject; that where his title and a subject's con-
cur, the king's title shall be preferred; an heir must 
pay the king's debt, though he be not named in the 
bond; and in all cases the king's debt shall be satisfied 
before that of a subject, and for which there is a 
prerogative writ. He is supreme head of the realm in 
matters both civil and ecclesiastical. No suit or ac-
tion can be brought against him, for the courts have 
no jurisdiction over him; so that if any person has, in 
point of property, a demand upon the king, he must 
petition him in his court of chancery. All persons 
born in any part of his dominions are his subjects; or 
in any part of the world when under his dominion. 
Under the direct prerogative is comprehended also the 
power of rejecting bills preferred to him by the lords 
and commons; making treaties and alliances with for-
ign states; coinage money; conferring titles of ho-
nour; pardoning offences, with some exceptions; send-
ing and receiving foreign ambassadors; of making war 
and peace; of issuing reprints; of granting safe con-
ducts, &c. He is considered as generalissimo over all 
the military forces in the united kingdom; has the 
power of raising and regulating fleets and armies; can 
likewise restrain his subjects from going abroad, or re-
call them from foreign parts.

17. The king is also the fountain of justice, and 
In the foun-
general conservator of the peace; all jurisdictions de-
affair their authority from him; therefore he may 
eree courts, prosecute offenders, pardon crimes, (ex-
cept impeachments by parliament), and issue pro-
clamations, if not contrary to the common law, sta-
tutes or customs of the realm, and no proclama-
tions can create an offence that was not so before. 
He is likewise the fountain of honour and of offices; 
whereby he is enabled to reward those who have

Proceedings at elections.

registered with the clerk of the peace twelve calendar 
months before. 7. That in mortgaged or trust estates, 
the person in possession, under the above mentioned 
restrictions, shall have the vote. 8. That only one per-
son shall be admitted to vote for any one house or 
tenement, to prevent the splitting of freeholds. 9. That 
no estate shall qualify a voter, unless the estate has 
been assessed to some land-tax aid at least twelve 
months before the election. 10. That no tenant by 
copy of court roll, shall be permitted to vote as a free-
holder. Thus much for the electors in counties.

10. As for the electors of citizens and burgesses, who 
are supposed to be the mercantile part or trading in-
terest of the kingdom, the right of elections in boroughs 
is various, depending entirely on the several charters, 
customs, and constitutions of the respective places, 
which is occasioned infinite disputes; though now by 
statute 2 Geo. II. c. 24, the right of voting for the fu-
ture, shall be allowed according to the last determina-
tion of the House of Commons concerning it.

11. Next as to the qualifications of persons to be 
elected members of the House of Commons. Some of 
these depend upon the law and custom of parliament, 
declared by the House of Commons; others upon cer-
tain statutes. And from these it appears, 1. That they 
must not be aliens born, or minors. 2. That they must 
not be any of the twelve judges, because they sit in the 
lords' house; nor of the clergy, for they sit in the con-
ncor; nor persons attained of treason or felony, for 
they are unfit to sit any where. 3. That sheriffs of 
counties, and mayors and bailiffs of boroughs, are not 
eligible in their respective jurisdictions, as being re-
turning officers; but that sheriffs of one county are 
eligible to be knights of another. 4. That no persons 
concerned in the management of any duties or taxes 
created since 1692, except the commissioners of the 
Treasury, nor certain other inferior officers enumerated 
in the statutes; nor any persons that hold any new of-
lice under the crown created since 1705, are capable of 
being elected, or sitting as members. 5. That no per-
son having a pension under the crown during pleasure, 
or for any term of years, is capable of being elected or 
sitting. 6. That if any member accepts an office under 
the crown, except an officer in the army or navy ac-
cepting a new commission, his seat is void; but such 
member is capable of being re-elected. 7. That all 
knaves of the shire shall be actual knights, or such no-
table esquires and gentlemen as have estates sufficient 
to be knights, and by no means of the degree of yea-
men. This is reduced to a still greater certainty, by 
ordinance. 8. That every knight of a shire shall have 
a clear estate of freehold or copyhold to the value of six 
hundred pounds per annum, and every citizen and bur-
gess to the value of three hundred pounds; except the 
eldest sons of peers, and of persons qualified to be 
knaves of shires, and except the members for the two 
universities, which somewhat balances the ascendant 
which the boroughs have gained over the counties, 
by obliging the trading interest to make choice of 
landed men; and of this qualification the member 
must make oath, and give in the particulars in writ-
ing at the time of his taking his seat. But subject 
to these standing restrictions and disqualifications, every 
subject of this realm is eligible of common right.

18. The third point regarding elections, is the me-
thod of proceeding. This is also regulated by the laws 
of parliament and the several statutes; and of the various 
minute particulars of which we must refer our readers 
to Blackstone's Commentaries, b. i. c. 2.

been meritoriously serviceable to the state. He has also the power of conferring upon any one the privilege of precedence; of converting aliens into denizens, &c. He can likewise erect corporations, is the arbiter of domestic commerce, by the establishment of markets, and the regulating of weights and measures, &c.

18. The King is head, and supreme governor of the church, regulating synods, nominating bishops, and receiving appeals in all ecclesiastical causes.

19. If an usurper obtains possession of the throne, and takes the coronation oath, the people are bound to obey him; for by statute they are compelled to obey a king de facto, and not a king merely de jure.

20. A queen regnant, is a female holds the crown in her own right, and such a one has the same powers, prerogatives, rights, dignities, and duties, as if a king.

The queen consort enjoys divers prerogatives above other women, and is considered a public person, exempt from the king; she can purchase lands, and convey them, make leases, grant copy-holds, and do other acts of ownership, without the concurrence of her lord: she has separate courts and officers, distinct from the king's; may sue and be sued alone, without joining her husband; but at her death, both her real and personal estate go to the king, if she has not previously disposed of them by will, which she can do without license from him. She is concerned in all legal proceedings as a feme sole.—A queen dowager enjoys the same privileges as a queen consort; and though an alien, is entitled to dower; but she cannot marry without the king's license, nor is it high treason to violate her person.

1. Sheriffs. 22. Sheriffs are the keepers of each county, annually appointed by the king; who are said to be vita justitiæ, to serve process, and to return juries for the trial of men's lives, liberties, lands, and goods; vita legis, to execute process, and make execution; and vita rei publicae, to keep the peace. A man nominated sheriff, should have considerable landed property, that he may be enabled to answer the king and his people if he should be guilty of neglect. To execute his various duties, the sheriff has under him many inferior officers; as under-sheriffs, bailiffs, collectors, &c.; who must neither buy, sell, nor farm their offices, on forfeiture of £600. He has the power of calling out the posse comitatus to defend his county, against the king's enemies, or to pursue and take felons and traitors.

23. Coroners are permanent officers of the crown in each county, elected by the freeholders, as sheriffs were formerly; whose office is to make inquiry where any one comes to a violent death; to inquire of lands and goods, and escapes of murderers, treasure trove, wrecks, deodands, &c.; and also in particular cases to supply the office of sheriff. He is a conservator of the peace.

2. Coroners. 24. Justices of the peace are judges of record, (for none but justices of record can take a recognition of the peace) appointed by the king's commission within certain limits, for the conservation of the peace; the principal of these is the custos rotulorum, or keeper of the records of the county; and two or more justices of the peace can inquire of, and determine felonies and other misdemeanors. They hold their sessions four times in the year, and do other acts committed to their charge, by a number of statutes.

25. Constables are officers, of hundreds and townships, sworn and appointed at the seat,—who ought to possess honesty, knowledge, and ability, to perform the office imposed upon them. They are empowered to preserve the peace, to keep watch and ward, and to apprehend offenders.

The king is the principal conservator of the peace, and can delegate power to any one to preserve it. The lord chancellor, lord treasurer, lord high steward, the justices of the King's Bench, and master of the rolls, are all conservators of the peace, and may commit the breaker's thereof, or bind them in recognizances to keep it.

26. Surveyors of the highways are officers appointed annually in every parish, to remove annoyances in and direct the repair of the public roads.

27. Overseers of the poor are substantial householders, appointed annually in every parish, to relieve of poor, such impotent, old, blind, and other persons, being poor and not able to work, as are settled in each parish, by birth, by parentage, by marriage, or by forty days residence, accompanied with notice, or with such circumstances as are held equivalent to notice.

CHAP. II. Of the Clergy; Of the Military and Maritime States; And of the Private Relations of Husband and Wife, Parent and Child, Guardian and Ward, Master and Servant.

1. The clergy comprehends all persons in holy orders, and in ecclesiastical offices. A clergyman cannot and their be compelled to serve on a jury, nor to appear at a court-leet or view of frank pledge, which almost every other person is obliged to do: but if a layman is summoned on a jury, and before the trial takes orders, he shall, notwithstanding, appear and be sworn. Neither can he be chosen to any temporal office, as bailiff, reeve, constable, or the like, in regard of his own continued attendance on the sacred functions. During his attendance on divine service, he is privileged from arrest in civil suits; in cases also of felony, a clerk in orders shall have the benefit of his clergy, without being branded in the hand; and may likewise have it more than once: in both which particulars he is distinguished from a layman. But as they have their privileges, so also they have their disabilities, on account of their spiritual avocations. Clergymen, we have seen, are incapable of sitting in the House of Commons; and by statute 21. Henry VIII. c. 13. they are not (in general) allowed to take any lands or tenements to farm, upon pain of £10 per month, and total avoidance of the lease; nor upon like pain to keep any tan-house or brew-house; nor shall engage in any manner of trade, nor sell any merchandise, under forfeiture of treble the value.

2. An archbishop or bishop, is elected by the chapter of his cathedral church, by virtue of a license from the crown, which is always to be accompanied with a letter missive from the king, containing the name of the person whom he would have them elect: and if the dean and chapter delay their election above twelve days, the nomination shall devolve to the king, who may by letters patent appoint such person as he pleases. This election or nomination, if it be of a bishop, must be signified by the king's letters patent to the archbishop of the province, if it be of an archbishop, to the other archbishops and two bishops, or to four
LAW.

bishops; requiring them to confirm, invest, and consecrate the person so elected; which they are bound to perform immediately without any application to the see of Rome. After which, the bishop elect shall sue to the king for his temporalities, shall make oath to the king and none other, and shall take restitution of his secular possessions out of the king's hands only. And if such dean and chapter do not elect in the manner by the act appointed; or if such archbishop or bishop, do refuse to confirm, invest, and consecrate such bishop elect, they shall incur all the penalties of a prevarication.

3. An archbishop is the chief of the clergy in a whole province; and has the inspection of the bishops of that province, as well as of the inferior clergy, and may deprive them on notorious cause. The archbishop has also his own diocese, wherein he exercises episcopal jurisdiction, as in his province he exercises archiepiscopal.

4. The power and authority of a bishop, besides the administration of certain holy ordinances peculiar to the sacred order, consist principally in inspecting the manners of the people, and clergy, and punishing them in order to reformation, by ecclesiastical censures. To this purpose he has several courts under him, and may visit at pleasure every part of his diocese.

5. Archbishopricks, and bishopricks, may become void by death, deprivation for any very grave and notorious crime, and also by resignation. All resignations must be made to some superior. Therefore, a bishop must resign to his metropolitan; but the archbishop can resign to none but the king himself.

6. A dean and chapter are the council of the bishop, to assist him with their advice in affairs of religion, and also in the temporal concerns of his see. The bishop is their ordinary and immediate superior; and has, generally speaking, the power of visiting them, and correcting their excesses and enormities. Deaneries and prebends may become void, like a bishoprick, by death, by deprivation, or by resignation to either the king or the bishop.

7. A parson, persona ecclesiae, is one that has full possession of all the rights of a parochial church. He is called parson, persona, because, by his person, the church, which is an invisible body, is represented; and he is in himself a body corporate, in order to protect and defend the rights of the church, (which he personates) by a perpetual succession. A parson has, during his life, the freehold in himself of the parsonage house, the glebe, the tithes, and other dues.

8. The method of becoming a parson or vicar is much the same. To both there are four requisites necessary; holy orders, presentation, institution, and induction. The method of conferring the holy orders of deacon and priest is according to the liturgy and canons.

9. One may cease to be a parson or vicar: 1. By death. 2. By cession, in taking another benefice. 3. By consecration; for, as was mentioned before, when a clerk is promoted to a bishoprick, all his other prerogatives are void in the instant that he is consecrated. 4. By resignation. 5. By deprivation.

10. A curate is the lowest degree in the church; being in the same state that a vicar was formerly, an officiating temporary minister, instead of the proper incumbent.

11. Churchwardens are the guardians or keepers of the church, and representatives of the body of the parish. They are sometimes appointed by the minister, sometimes by the parish, sometimes by both together, as custom directs. Their office also is to repair the church, and make rates and levies for that purpose; but these are recoverable only in the ecclesiastical court. They are also joined with the overseers in the care and maintenance of the poor. There are a multitude of other petty parochial powers committed to their charge by divers acts of parliament.

12. The military state is constituted of the whole soul military diery of the country. That part which is called the state militia, cannot be sent out of the United Kingdom.

13. Officers, soldiers, and mariners, who have been in the Majesty's service, are enabled at the close of the war to use any trade or occupation they are fit for in any town in the kingdom, notwithstanding any custom or statute to the contrary. Soldiers or mariners in actual service, may make nuncupative wills, and dispose of their personal chattels, without the usual forms that are at other times required: The military of the country are governed by martial law.

14. The maritime state consists of all officers and seamen employed in his Majesty's navy, who are impressed or volunteer into the service; neither soldier nor mariner can be arrested for a less sum than £20; and, if a seaman, after the debt is discharged the sheriff is bound to return him safe to some officer empowered to receive sailors; upon the sheriff's failing so to do, he is liable in a penalty of £100.

15. The law recognizes marriage simply as a civil contract; the spiritual courts take notice of all incestuous or unscriptural marriages. By this union the husband and wife become one person in law; so that, if an estate be granted to an husband and wife, and another person, the husband and wife take but one half.

16. Marriage is voidable when solemnized without license or publication of banns in the church of the parish where the parties dwell, in the time of divine service, three several Sundays, or holy days, and if the ceremony be performed before a less number of witnesses than two, besides the minister; it is also voidable where the parties are a boy under fourteen years of age, or a girl under twelve years of age; by a pre-contract, if accompanied with bodily knowledge; consanguinity; affinity by marriage; and some corporal infirmities. The common law will not allow these disabilities after either of the parties is dead. When parties contract to marry, one above the age of twenty-one years, and the other under, the one of full age is bound but the minor is not.

17. A party, marrying by license, if a minor, consent of parents or guardians, when necessary, is not valid. If not having been married before, must have the consent of a father, if living; if he be dead, of a guardian lawfully appointed; if there be no such guardian, then of the mother if she is unmarried; if there be no mother, then of a guardian appointed by the court of chancery. The guardian whose consent is interposed between that of the father and that of the mother, must either be a testamentary guardian appointed by the father's will, or a guardian appointed by chancery; but the marriage of an infant, without such consent, may still be good where banns are regularly published; unless a dissent is openly declared by the parent or guardian in the church or chapel at the time of publishing; in which case the banns are void.

18. No license can be granted by any archbishop, bishop, &c. to solemnize any marriage in any other church than that of the parish wherein the parties or either one of them shall have dwelt for the space of four weeks, immediately before the granting such license; but the statute does not prevent the archbishop of Canterbury from granting special licenses.
19. If any of the persons whose consent is necessary be non compos mentis, beyond sea, or refuse to consent, and the lord chancellor shall declare it to be a proper marriage, it shall be as effectual as if such person had consented.

20. The parties contracting in marriage must be both willing and able to contract themselves, and of sound memory.

21. Conditions against marrying generally, are void in law. A bond for the procurement of a marriage, although a good bond in law, is bad in equity.

22. It is a peculiar incident of marriages, that they are governed by the laws of the country in which they are celebrated.

23. During the civil war, marriages were frequently performed by justices of the peace; and such marriages were declared valid by Rule C. H. c. 23.

24. A natural child, during his minority, cannot legally marry without the consent of a guardian named by the court of chancery.

25. When the marriage is consummated, the law denominates the parties baron and feme; the consequences are shortly as follows:

26. A man may covenant with other persons to stand seised to her use, or make other conveyances to her use, but cannot covenant with his wife, to stand seised to her use.

27. If the feme obligat take the obligor to husband, this is a release in law. If a man promises before his marriage to leave his wife worth a certain sum of money, in case of her surviving him, it is good.

28. In trials of any sort, husband and wife are not allowed to be evidence for or against each other.

29. A husband and wife may have sureties of the peace against each other.

30. The freehold, or right of possession of all her lands of inheritance, vests in the husband immediately upon the marriage, the right of property still being preserved to her.

31. As chattels vest wholly in the husband, equity in most cases will take care of the wife's interest when called upon, and see her property provided for.

32. If a feme sole takes a husband, her debt becomes that of the husband and wife; but the husband is not liable after the death of the wife, unless there be a judgment against both during coverture.

33. Where a man marries a widow, executrix to her late husband, her evidence shall not be allowed to charge her second husband with more than she can prove to have actually come to her hands. But if a man marries an administratrix to a former husband, who in her widowhood wasted the assets of the intestate, the husband is liable to the debts of the intestate during the life of the wife; and this shall be deemed a devastavit in him.

34. A wife cannot convey either goods, lands, or any thing whatsoever, without the consent of her husband.

35. The husband must maintain his wife with necessaries according to his degree and estate, but if she contract above his degree or quality, he does not become chargeable.

36. When a woman leaves her husband by her own free will, and the separation has become notorious, whoever gives her credit does it at his peril, for the husband is not answerable unless he takes her again; or if there is a separation by consent, and the wife has a separate allowance, those who trust her do it upon her own credit.

37. The wife of a man who is civiliter martius, or of one transported for felony, may sue and be sued as a feme sole.

38. In some cases, the command of the husband, either express or implied, will privilege a wife from punishment for the crimes she may commit, if committed in his presence, unless they be mala in se, as for murder and the like.

39. A man must answer for the trespasses of his wife: if a feme covert slander any person, the husband and the wife must be sued for it, and execution is to be awarded against him.

40. Where a wife joins in a fine or recovery, she is bound. By the custom of some cities and boroughs, a bargain of sale by the husband and wife, where the wife is examined by the mayor or other officer, binds the wife after the husband's death. So in some places, a surrender of a copyhold by husband and wife, the wife being examined by the steward, binds the wife.

41. If a feme covert levies a fine of her own inheritance without her husband, it shall bind her and her heirs, because they are estopped to claim any thing in the land, and cannot be admitted to say she was covert against the record; but the husband may enter and defeat it, either during the coverture, to restore him to the freehold held jure uxoris, or after her death, to restore him to his tenancy.

42. In the civil law, the husband and wife are considered as two distinct persons, and may have separate estates, contracts, debts, and injuries; and therefore, in our ecclesiastical courts, a woman may sue and be sued without her husband.

43. If baron and feme are divorced causa adulterii, which is a divorce a mensa et thoro, they continue baron and feme; it is otherwise in a divorce a vinculo matrimonii, which dissolves the marriage.

44. If a man is bound to a feme sole, and after marries her, and they are divorced a vinculo matrimonii, the obligation is revived.

45. The most usual and direct injuries to a husband

Injuries are, 1. Abduction, or taking away his wife. 2. Criminal conversation with her. And, 3. Beating her—to each of which is assigned its proper technical form of legal redress.

46. Children are, 1. Legitimate, or those who are Parent and born in lawful wedlock, or within a competent time child. after. 2. Bastards, are those born out of lawful wedlock; and also children born above nine months after the husband has had no access to his wife. In a divorce a mensa et thoro, if the wife breeds children they are bastards, unless access be proved: in a voluntary separation, the law will suppose access, unless the contrary be shewn. If there be an apparent impossibility of procreation on the part of the husband, the issue of the wife shall be bastards.

47. In the case of a divorce in the spiritual court a vinculo matrimonii, all the issues born during coverture are bastards.

48. The duties of parents enforced by law to legitimate children are, 1. Maintenance; where they are unable to work through infancy, disease, or accident. 2. Protection. 3. Education. 49. The power of parents over children, is correction and consent to marry when under age. The duties of legitimate children to parents are obedience, protection, and maintenance.

50. The rights of a bastard are such only as he can acquire; for he is incapable of inheriting anything, the law considering him as the son of nobody; though he may gain a surname by repute, and a putative
LAW.

639

father for some purposes, that is, by a man's acknowledging it to be his child. If a man declares a child to be his in 

vente so mere, and dies before its birth, such child does not gain sufficient reputation by the declaration, to entitle it to take a bequest from its father; but if he had devised an estate to it generally, as to the child such an one is 

en vocie with, the bequest would pass to the child.

51. Guardian and ward are, pro tempore, reciprocally subject to the same rights and duties as parent and child.

52. The natural and legal guardians of a child are its parents; for if an estate be left to an infant, the father is by common law the guardian, and must account to his child for the profits; but an executor is not justified in paying a legacy left a child to its father: for if the father becomes insolvent, the executor may be compelled to pay it over again. A father may by deed or will assign a guardian to his infant children.

53. Guardians for nurture are of course father and mother till the infant attain the age of fourteen years: and in default of father or mother, the ordinary may assign some discreet person to take care of the infant's personal estate, maintenance, and education.

54. Guardian in socage, is where the minor is entitled to some estate in lands, and then by the common law the guardianship devolves upon such of his next of kin to whom the inheritance cannot possibly descend; as where an estate descends from the father's family, a relative of the mother's will be appointed; so vice versa.

55. Guardians by socage for nurture, continue only till the minor is fourteen years of age: for then, in both cases, he is presumed to have discretion to choose his own guardian.

56. Guardian by statute, is where a father appoints a guardian for his child, born or unborn, by deed or will, which he may do to any person except a Popish recusant, until it attain the age of one-and-twenty years.

57. A guardian is bound, when his ward comes of age, to give him an account of all that he has transmitted upon his behalf, and to answer for all losses through his negligence.

58. The chief injury to a parent or guardian, is the abduction of their children or wards, of which we may here take notice that the legal remedy is by action of trespass, to recover possession of them and damages.

59. The relation between master and servant arises, where one for a stipulated sum, or an implied contract for remuneration, undertakes to do certain work or services for another.

60. First, Menial or domestic servants are persons hired without any particular time limited. The law construes this hiring to be for a year; and no master can put away such servant; nor such servant leave his master after being so retained, either before or at the end of his term, without a quarter's warning; but a master may turn away his servant instantly for any breach of morality. Second, Apprentices are persons placed under a master or mistresses by deed indented, to be maintained and instructed in some particular trade or business. They may be moderately corrected for any misbehaviour, and may be discharged on reasonable cause, either at the request of themselves or masters, made at the quarter-sessions, or by one justice with appeal to the quarter-sessions. If an apprentice with whom less than ten pounds has been given, run away from his master, he is compellable to serve out his time of absence, or make satisfaction for the time, within seven years after the expiration of his original contract. Third, Labourers are hired by the day or week, do not live intrinca mania as part of the family, and are regulated by a number of statutes. Fourth, Stewards, factors, and bailiffs, whom the law considers as servants pro tempore, with regard to such of their acts as affect their master's employ.

61. Persons having served seven years as apprentices to any trade, have an exclusive right to exercise that trade in any part of England.

62. A master is answerable for the acts of his servant if done by his command, either expressly given or implied in all matters that are honest and lawful; for whatever a servant is permitted to do in the usual course of business, is equivalent to a general command; so if a man invariably deals with a tradesman in ready money, he is not answerable for what his servant takes upon trust. If a servant by his negligence, and not wilful default, does any damage to a stranger, while actually employed in his master's service, his master shall answer his neglect.

63. If any person gives a false character of a servant, or a false account of his former service; or if giving false any servant shall give such false character; or shall alter a certificate of a character, he shall, upon conviction before a justice of the peace, forfeit £20, with 10s. costs. In an action against a person who had knowingly given a false character of a man to the plaintiff, who was thereby induced to take him into his service, and this servant having soon after robbed his master of property to a great amount, for which he was executed: the plaintiff recovered damages against the defendant to the extent of the loss.

64. The most direct and ordinary injuries to a master are, 1. Retaining his servants; and, 2. Beating proper to them; the legal remedy of both of which classes of injury, is by action on the case for damages.

BOOK II.

OF REAL AND PERSONAL ESTATES.

CHAP. I. Of Corporeal and Incorporeal Hereditaments, Tenures, Freeholds, Estates less than Freeholds, Estates in Remainder, in Reversion, &c.

1. The objects of dominion or property are things, which are by the law of England distributed into two kinds; things real, and things personal. Things real, are such as are permanent, fixed, and immovable, which cannot be carried out of their place, as lands and tenements; things personal are goods, money, and all other moveables, which may attend the owner's person wherever he thinks proper to go.

2. Hereditaments, by which is meant whatever may be inherited, are of two kinds, corporeal and incorporeal. Corporeal consist of such as affect the senses, such as may be seen and handled by the body; incorporeal are not the object of sensation, can neither be seen nor handled, are creatures of the mind, and exist only in contemplation.

3. Corporeal hereditaments consist wholly of substantial and permanent objects; all which may be comprehended under the general denomination of land only. For land comprehends, in its legal signification, any ground, soil, or earth whatsoever. It legally includes also all castles, houses, and other buildings; for they consist of two things; land, which is the
LAW.

These purchase to subsisting mixed, Tithes property from also Franchises, If In a or includes.

4. Incorporal hereditaments are collateral to, and issue out of things corporeal; such as advowsons, tithes, commons, ways, offices, dignities, franchises, corodies, annuities, rents, &c. These we shall briefly consider, and then return to corporeal hereditaments.

Advowsons.—An advowson is the right of presentation to a church; and he who has such right is called the patron of that particular church. If annexed to, or in possession of the manor from whence it sprung, it is called appendant, and will pass with the manor, but if once separated, it becomes an advowson in gross, or at large, and is also either presentative, where the patron has the presentation; or collative, where the bishop and patron are one and the same person; or donee, where the king, or subject by his licence, founds a church or chapel, and ordains that it shall be solely in the gift of the patron.

6. Tithes are the tenth part of the increase of the profits of land and stock, given as a remuneration to the ministers of the gospel. They are preial, when of corn, grass, hops, and wood; mixed, as of wool, milk, pigs, &c.; personal, as of manual occupations, trades, fisheries, and the like. Animals that are feræ naturæ are not tithable.

No composition for tithes made since the 19th Eliz. c. 10. is good for any longer term than three lives, or twenty-one years. Land may be either wholly or partially discharged of tithes by custom, and such custom is either de modo decimandi, or de non decimando. A modus decimandi, is the taking of tithes in any other way than in kind; but this must be certain, invariable, and beneficial to the parson. A modus for one species of tithes will not discharge the payment of another. If a modus is so rank and large, that it could not have been made before or in the time of Richard I. it is bad.

A prescription de non decimando, is a claim to be entirely discharged of tithes, and is personally confined to the king and clergy.

Commons.—Common of pasture is the right of feeding cattle on another’s land, the property in the soil or common land being in the lord. Such common may be without stint as to number and time. Common of piscary is the liberty of fishing. Common of turbary is the right of carrying away the soil. Common of estovers is the liberty of taking necessary wood for the use or furniture of a house or farm. A tenant may take reasonable botes or estovers, unless restrained by covenant.

8. A right of way may either be enjoyed solely, or by any number of persons, is held by immediate grant or prescription, and may also be given by implication; as where I purchase a piece of ground of a man situate in the midst of his land, and at the same time acquire a right to pass over, or make a way through his land to that which I have so purchased.

9. Offices.—A man may have a right to exercise a public or private employment.

10. Dignities.—A man may have a property or estate therein.

11. Franchises are a royal privilege subsisting in the hands of a subject; as to hold court leet, manor, or lordship; to have waifs, wrecks, &c.

12. Corodies are a right of sustenance charged upon any particular person or estate.

13. Annuities are certain yearly sums chargeable only upon the person of the grantee, the security for which may be merely personal.—A rent charge is a burthen imposed upon, and issuing out of lands.

14. Rent service has corporeal service incident to it, and Rents. Rent charge is where the owner of the rent has no future interest or reversion expectant in the land. Quoit-rent (quies ad rem) is an ancient invariable sum arising out of copyhold lands. Rack rent is where an hereditament is let at its full value.—We return to corporeal hereditaments.

15. And first of tenures, or the different sorts of hold. Tenures. The feudal constitution, although nearly in substance abolished by 12. Car. 11. c. 24; still in a great measure regulates the forms by which landed property is transmitted.—Free tenure is where the tenant is wholly free, or where the landlord agrees to make no claim to any land in the tenement. In such cases the tenant has a liberty of enfranchising the land, or of surrendering it.

16. Tenure in burgage, is where the king or other person is lord of an ancient borough, in which the tenements are held by rent certain.—The youngest son inherits to the burgage tenements upon the death of the father.

17. In gavel-kind tenure, the tenant is of age sufficient to alien his estate by feoffment at the age of fifteen, and ten years. The estate does not escheat in case of an attainder and execution for felony. The lands descend to all the sons equally.

18. Pure vilinage was a precarious and slavish tenure. In pure tenure, at the absolute will of the lord, upon uncertain services: from hence by general consent or encroachment have arisen modern copyholds, or tenure by copy of court roll; in which lands may be still held at the nominal will of the lord, regulated by the custom of the manor. These are subject, like socage lands, to services, relief, and escheat, and also to heriots, wardships, and fines upon descent and alienation.

19. Privileged vilinage, or villein socage, is an expropriated species of copyhold tenure, upon base but certain legal services; subsisting only in the ancient demesnes of nage.

20. Frank-almoign is a tenure by spiritual services, and Frank—whereby many ecclesiastical and eleemosynary corporations now hold their lands and tenements.

21. Next of the different sorts of estates. An estate of freehold, liberum tenementum, is the actual possession of the soil or land, created by livery of seisin in common law; and then the occupier is said to be seised in his demesne, as of fee. Freeholds are either of inheritance or for life only, and the fee or right is either absolute or limited. Tenant in fee simple, or tenement, is the title to the lands, tenements, or hereditaments, to hold to and his heirs for ever. An estate in fee, qualified or base, is an estate to the holder of it and his heirs till a certain event happen, or to be defeated if such an event occur.

22. All tenements may be entailed. The word tenen—Estates tail.
ment comprehends all corporeal hereditaments whatsoever, and also all incorporeal hereditaments that savour
of the reality; that is, which issue out of corporeal ones, or which concern, or are annexed to, or may be
exercised within the same; as rents, es-tovers, commons, and the like, as also dignities and offices.

Estates tail are either general or special. Tail gen-
eral, is where lands and tenements are given to one, and
the heirs of his body begotten; so that the whole of the
legal issue of such a one are capable of taking in suc-
cessive order.

Tenant in tail-special, is where the gift is restrained
to certain heirs of the donee's body, as to the heirs of
his body on Mary his wife, or by any other person par-
ticularly named: here no other but such special issue
so pointed out can inherit.

The word heir is necessary to create a fee, and the
word body, or some other word of procreation, to make
a fee-tail; for without the word heirs, there can be no
inheritance; and without some body or root be pointed
out from whence the issue is to spring, on whom the
inheritance is to be limited, there can be no fee-tail.
In a bequest, words importing a perpetuity will be
constructed into those of inheritance.

23. Freeholds not of inheritance are, 1. Conventional,
or created by the act of the parties. 2. Legal, or cre-
ated by operation of law.

24. Conventional is where an estate is created by
grant or lease for the term of a man's life, or any
number of lives. These estates may determine upon a man's
civil death, if not granted for his natural life; as in the
case of a man being attainted of treason or felony, and
reprieved upon transportation for life; or if limited
upon a contingency, as to a widow during widowhood,
here, upon the contingency happening, they determine.

25. Legal, or tenure by the curtesy of England, which
is, when a man having married a woman seized of an es-
state of inheritance, and having issue by her capable of
taking at her death, he shall hold the lands for his
life. These lands must have been in her actual possession;
but possession is not required in the case of adovsons,
&c. The issue must be born alive; but if the mother
dies prior to the birth, the husband cannot become ten-
ant; for here the estate descended to the child. In
gavel-kind lands, the husband may thus become entitled
to half the lands without issue.

26. Or tenure in dower, which is where a woman
having married a man who is possessed or becomes
seized of an estate of inheritance, at any time during the
coverage, of which her issue might by any possibility
have been heir, upon the husband dying, the woman
is entitled to dower, or one-third part of such lands,
to hold for her natural life.

27. Estates less than freehold, are estates for years,
at will, at su-surance, and on condition.

28. An estate for years, is where a tenant is let into
the possession of premises for any determined period.
If only for half a year or a quarter, the law recognizes
him as a tenant for years. A person demising an he-
reditament is called the lessor, and he to whom the
lease is made the lessee. A lease for so many years as
another shall live, is void.

29. Tenants at will, or from year to year, hold by the
wills of both parties. The lessee here is entitled to em-
bellishments or profits of the crop upon his estate deter-
rmining, and is allowed reasonable ingress and egress to
carry away his goods.

30. An estate at su-surance, is where a man lawfully
enters upon an estate for a certain term, and after its ex-
piration keeps illegal possession of it. Such a one shall
pay double rent, which may be distrained for; or dou-
ble the yearly value of the premises, which can only be
recovered by action of debt.

31. Estates upon condition, are either upon condition
implied or expressed. Estates upon condition implied,
are where certain performances are connected thereto,
that must necessarily be performed; as in the case of
an office, private or public, which may become forfeit-
ed either by nonuser (neglect) or misuser (abuse); so
in the case of estates upon condition expressed, if those
conditions are legal and possible.

32. Estates upon condition expressed, are where an on condition
express qualification or provision is annexed to the
grant of an estate, on the breach or non-performance of
which the estate so granted may be defeated; as, first,
Vivum cadutum, which is where a man borrows a sum of
money from another, and grants him an estate until the
vivum, profits of that estate repay him. Second, Mortu-
radium, or mortgage, which is where a man grants an
estate in fee, for a term of years, as a security for a dis-
sum of money lent, &c. When such an estate is cre-
ated, the mortgagee may enter, but is liable to be dis-
possessed upon the performance of the conditions, which
the mortgagee may do at any reasonable time after the
time specified, provided he pays all expenses; this is
called the equity of redemption. Also a mortgagee
can call upon the mortgagee to redeem his estate, or in
default to be for ever foreclosed from redeeming it.
Third, Estates held by statute merchant or statute upon
which are very similar to those held in vivum radium, merchant,
Vadium, or mortgage, or a mortgage.

33. An executory devise is such a disposition of lands
by will, that no estate shall vest thereby at the death of
the deviser, but only upon some future contingency,
without any precedent particular estate to support it;
where one devises land to a feme sole and her heirs
upon her day of marriage. Here is a freehold in futuro,
and such a limitation would be void in a deed, but is
good by way of executory devise.

34. Recession is the returning of the residue of an
estate to the granter, to commence in possession after
the determination of the particular estate which he has
granted out of it.

35. Merger is where two estates, the one less, the
Merger,
other greater, meet together in one and the same per-
on, and in one and the same right; they then are said
to be merged.

36. Generally, is where one tenant holds in his own
Estates in
Estate in sole right, without any other person being joined with severally.

37. Joint-tenancy, is where an estate is granted to Joint-
tenancy
two or more persons; in which case the law construes
them to be joint-tenants, unless the words of the deed
expressly exclude such construction. They must have a
unity of interest, of title, of time, and of possession; they
are seised per me et per eum; so that upon the decease

641
of one, the interest remains to the survivor or survivors. By whatever means the jointure ceases or is severed, the right of survivorship, or jus accrescendi, the same instant ceases with it.

39. An estate in coparcenary, is where an estate of inheritance descends from the ancestor to two or more persons, who are then called coparceners, and they all together make one heir. The properties of coparceners are in most respects like those of joint tenants; they may be compelled to divide their estate by any of the coparceners suing out a writ of partition, or obtaining a decree in a court of equity.

40. An estate in common, is where two or more persons hold lands by distinct titles, but have a unity in the possession; as one may hold in fee simple, the other in tail. Persons thus holding lands, are styled tenants in common.

Chapter II. Of the Title to Real Estates.—By Descent, Purchase, Escheat, Occupancy, Prescription, Forfeiture.

1. There are several stages or degrees requisite to form a complete title to lands and tenements; the lowest is the mere naked possession without a shadow of right. This may happen where one forcibly, or by surprise, turns another out of the occupation: which in law is termed an actual disseisin. In all such cases the rightful owner may repossess by a variety of remedies; but if neglected by him who has the legal right, this actual possession may ripen into a perfect and indefeasible title; and, at all events, without such actual possession, no title can be completely good. A man having an actual right of possession, may exert it whenever he pleases, by turning the disseisor out.

2. Descent is the descending of an estate from an ancestor dying actually seized of the estate, to the heir-at-law, which shall descend ad infinitum, but never lineally ascends. The rules of which are, I. The males are admitted before the females. 2. Where there are two or more males, the eldest shall inherit, but the females all together. 3. The lineal descendants, in infinitum, of any person deceased, shall represent their ancestor, or stand in the same place as the person himself would have done, had he been living. 4. On forfeiture of lineal descendants, or issue of the person last seized, the inheritance shall descend to his next collateral kindred, being of the blood of the first purchaser, subject to the three last and the next succeeding rules. 5. And this collateral heir of the person last seized must be the next kinsman of the whole blood. 6. In collateral inheritances, the male stock shall be preferred, or kinsmen descending from the blood of the male ancestor shall be admitted before those from the blood of the female, unless where the lands did in fact descend from a female.

3. If a man becomes possessed of lands in any other form than they would have descended to him by act of law, he is said to take them by purchase; so where lands are devised to an heir at law saddled with the smallest limitation, he is said to take them by purchase; the consequence is, they are descendible to the owner's blood in general, and not to the blood of any particular ancestor.

By purchase.

4. Lands held by escheat, are such as revert to the lord upon the blood of the person last seized becoming extinct; upon a bastard dying intestate and without issue; and upon a man leaving no other heirs but aliens. Escheat is a subordinate species of forfeiture.

5. Occupancy is the taking possession of those things which had before no owners. The law recognizes occupancy only in the case of a tenant pour autre vie, dying during the life of cestui que vie, or him for whose life any lands or tenements are granted. For where heirs are mentioned in the limitation, the heir shall take possession as a special occupant, and it shall be assets in his lands. Where there is no special occupant in whom the estate may vest, the tenant pour autre vie may devise it by will, but it shall be subject to the testator's debts; and in the case of intestacy, it shall go to the executors as a chattel interest.—An island rising in any part of a river shall be the property of him who owns the piscary, and has the freehold of the soil. If a river suddenly changes its course, and thereby inundates a man's ground, he may claim what the river has left; but if this happens by gradual degrees, the one who loses his soil has no remedy against him who has the dereliction in his favour. Islands rising in the sea vest in the crown, as also land left suddenly dry; but if by small and almost imperceptible degrees, it shall belong to the owner of the adjacent land.

6. Prescription is a personal immemorial usage ofBy pre- Enjoying such a right as may be created by grant, ascription.

right of way or common, the law supposing a grant to have existed. Custom is a local usage, and is established by being "used so long that the memory of man runneth not to the contrary." Custom binds particular places, persons, and things concerned therein; as in the case of gavelkind lands, and borough-English.

7. Forfeiture is a punishment annexed by law to By forfei- some illegal act or negligence in the owner of things ture. real. Forfeitures are occasioned, (1.) By crimes. (2.) By alienations contrary to law. (3.) By disclaim- er. (4.) By lapse. (5.) By simony. (6.) By waste.

1. For high treason. 2. Misprision of treason. 3. Per- tit treason, or felony. 4. Assaulting a judge, or striking any one in the presence of the king's principal courts of justice. 5. Premunire. 6. Popish recusancy. (2.) Alienations, or conveyances which induce a forfeiture, are, 1. Those in mortmain, made to corporations; whereby lands become inherent in one dead hand, contrary to the statute law unless those corporations have a li- cense to hold in mortmain. 2. Alienations made to aliens. 3. Those made by particular tenants, when larger than their estates will warrant, and whereby putting the remainder in jeopardy; here the remainder- man is entitled to enter. (3.) Disclaimer, is where a man holding of a lord, and neglecting to render him due services; and upon an action being brought to recover them, and he disclaiming to hold of his lord, he incurs a forfeiture. Copyhold lands are liable to a variety of forfeitures, regulated according to the customs of the different manors. (4.) Lapse, is a forfeiture of the right of presentation to a vacant church, by neglect of the patron to present within six calendar months from the vacancy. (5.) Simony, is the corrupt presentation to an ecclesi- cal benefit, whereby the presentation becomes forfeited. (6.) Waste, is a spoil, or destruction, in any corporeal hereditament, to the prejudice of him that has the inheritance; such as removing things once fixed to the freehold of a house; reducing the number of crea- tures in ponds, close-houses, warrens, &c. cutting down timber-like trees, as oak, ash, elms.
Deeds either convey, or charge and discharge real property.

4. Livery of seizin, is the corporeal delivery of the possession of a thing conveyed, which ceremony is absolutely necessary where a freehold passes at common law: for if a man die before he has made an entry upon the hereditaments, uneeschied, his heirs shall not be entitled to enter, but the heir of him last seised; and this is one reason why a freehold cannot commence in futuro at common law; for if a freehold be expectant upon a term of years, livery must be given to the remainder-man, who is immediately seised of his freehold at the same time the termor is seized of his term. It is usual to indorse the livery of seizin on the back of the deed, specifying the manner, place, and time of making it, together with the names of the witnesses.

5. Some deeds serve to convey real property, some only to charge or discharge it.

7. Feoffment is a conveyance of the actual possession of an hereditament; therefore it can only be adopted where livery of seizin can be had of the thing conveyed; so that a person must be in the actual seizin, to Feoffment pass the seizin to another.

8. A gift is properly a conveyance of lands in tail, gift, and when founded upon no valuable consideration, is void to those that were creditors at the time of the donation, but valid as to subsequent ones.

9. A grant is the common law conveyance of those Grant, things of which no livery can be made; as of reversion and remainders, and other incorporeal hereditaments, all of which are said to lie in grant.

10. A lease is the granting possession of any tene- ment to a person for life, years, or at will. A lease for life, being a freehold, must pass by livery.

11. An exchange is a mutual grant of equal things, Exchange. as an estate of inheritance for an estate of inheritance, a chattel interest for a Chattel, chattel interest, &c.; entry is absolutely necessary to complete the exchange; for if either party die before entry, it is voidable by his heir; and if both die, it is ipso facto void.

12. A partition is the division of an estate held in Partition, joint-tenancy, in coparcenary, or in common, that each tenant may hold in severality.

13. A release is the relinquishment of a right or in- Release, terest in lands or tenements to another who has an estate in possession in the same lands and tenements.

14. A confirmation is a conveyance of an estate, or Confirmation, right in esse, that one has in or to lands, to another who has the possession thereof, or some estate therein, whereby a voidable estate is made sure and unavoidable. It is also defined to be the approbation or assent to an estate already created.

15. A surrender is the yielding up of a less estate by Surrender, one in possession, to him who has a greater estate in the same lands; as the surrendering of a particular estate to the reversioner or remainder-man.

16. An assignment is a transfer, or making over to Assignment, another, of the whole right one has in any estate.

17. A revocation is the execution of a power reserved and Revoca- tion by the grantor to himself or some other person in a tion.

former deed, of calling back the estate.—A defasance is a collateral deed made at the time of making some other conveyance, containing certain conditions, by the non-performance of which the estate becomes forfeited.

18. Conveyances by statute, depend much on the To which doctrine of uses and trusts, which are a confidence re- posed in the terre-tenant, or tenant of the land, that he may be added conveyed by statutes.

Cestui que use, (i.e. of him to whose use any other man may be enfeoffed of lands or tenements,) or Cestui que trust. The statute of uses, having transferred all uses into possession, (or rather having drawn the possession to the use,) has given birth and operation to three other species of conveyance. 1. A covenant to stand seised. 2. A bargain and sale enrolled. 3. A lease and release.

A covenant to stand seised is, where a person con- covenants to stand seised to the use of another, in consider-ation of blood or marriage. A bargain and sale differs from the covenant to stand seised, as it must be in consider-ation of money, though that consideration be only nominal; and the use so limited must be to the bargainee. As a release of lands can only be given to him who has the possession or seizin, it is necessary,
where the freehold is to be conveyed to a stranger without the formalities of livery, that an estate for a year or other definite time be made to him, that he may be capable of receiving a release.

19. Deeds, which do not convey, but only charge real property, are, 1. Obligations. 2. Recognisances. 3. Defeasances. Obligation, or bond, is a deed containing a penalty, with a condition annexed, for payment of money, performance of covenants, and the like; if without a condition, it is called single, (simple obligation,) but if there be a condition, and that condition is performed, the bond becomes void. Recognizance is an obligation of record, which a man enters into before some court of record, or magistrate duly authorized, with condition to do some particular act; as to appear at the assizes, to keep the peace, to pay a debt previously contracted, &c. A Defeasance on a bond or recognizance, is a condition which, when performed, defeats or undoes it, and may be indorsed upon the back of the bond.

20. Assurances by matter of record, are conveyances of lands and hereditaments, witnessed and substantiated by some court of record; these are, 1. Private acts of Parliament. 2. The king's grants. 3. Fines. 4. Common recoveries.

21. Private acts of Parliament, are calculated to give such reasonable powers to a person in possession of an estate, as he may be barred of by the stipulations under which it is limited; as granting leases, settling a jointure, &c.

22. The king's grants are also matters of record; these are contained in charters or letters patent directed to all his subjects. In grants by a private person, implications run strongly against the granter; but it is the custom where the interest of the crown is concerned.

23. A Fine, is an amicable composition and agreement of an actual or fictitious suit, whereby the estate in question is acknowledged to be the right of one of the parties. A fine bars the right of all strangers, unless they make claim within five years after public proclamations made; except they be free coverts, infants, prisoners, persons beyond seas, and persons of non-sane memory; who have five years further allowed them and their heirs to put in claims after their legal incapacities are removed.

24. A common recovery is an actual or fictitious suit, or action, (carried on to judgment,) for land, brought against the tenant of the freehold; who thereupon vouches another, who undertakes to warrant the tenant's title; but upon such vouches making default, the land is recovered by judgment at law against the tenant; who in return obtains judgment against the voucheer to recover lands of equal value in recompense. A recovery is an absolute bar, not only of all estates tail, but of remainder and reversions, expectant on the determination of such estates.

25. Assurances by special custom, are where copy-hold lands held in ancient demesne pass from one owner to another. This is effected, 1. By surrender, which is the yielding up of the estate into the hands of the lord to be regranted according to the custom of the manor, upon the conditions expressed in the surrender. 2. Presentment, which is made by the homage of such surrender; and usually made at the next court baron held, or by custom at any other subsequent court. 3. Admittances, which are of three kinds, 1. Upon the voluntary grant of the lord, when lands have escheated or reverted to him. 2. Admittances upon the surrender of another; and then the lord is esteemed merely as a common tenant through which the land passes to the surrenderer. 4. Admittances upon descent; when the lord takes notice of the heir as his tenant, instantly upon the death of his ancestors.

26. A devise is the disposition of a person's property to take effect after death. The deed containing this intention is called the testator's will; which, to pass real estates, must be in writing, and signed by the testator, or some other person in his presence, by his express direction, and subscribed in his presence by three or four credible witnesses. If the will is only to pass copyholds, or terms of years, and other personalities, signing only will be sufficient, without the form of witnesses.

27. The execution of a will in a court of law, is Proved by calling one of the subscribing witnesses, who proves, that the testator executed his will by signing and sealing in his presence; and in the presence of the two subscribing witnesses; but where a bill is filed to establish a will, all the subscribing witnesses living must be examined, unless they are abroad, and then their hands-writing must be proved, as if they were dead.

28. By the statute of wills, no person under the age of twenty-one years can devise any manors, lands, tenements, or other hereditaments; but a male infant above fourteen years old, and a female infant above twelve years, are capable of bequeathing personal property.

29. And here it may be remarked, that all things whether real or personal, hereditable or movenable, of which a man has the absolute property, he may by the law of England devise by will. A nuncupative or verbal will, extends only to personal property. But a codicil, which is a supplement to a will, and may be either Codicill written or verbal under the same restrictions as regards wills, is a form under which, if written and duly executed, real estates may pass.

30. The construction put upon wills shall be as favourable, and as near the intention of the testator as the rules of law will admit; and where the intention is clear, too minute a stress shall not be laid on the strict and precise signification of words.

31. An executor, is he to whom another man commits the execution of his last will and testament. The appointment of an executor is essential to the making of a will, and it may be performed either by express words, or such as strongly imply the same; but if the testator makes an incomplete will, by not naming an executor, or if he names incapable persons, or if the executors named refuse to act; in any of these cases, the ordinary must grant administration to some person, even administrators.

Where a person dies wholly intestate, without either making a will or naming executors, then general letters of administration must be granted by the ordinary to such administrator as the statutes of 31st E. III. c. 11, and 21st Hen. VIII. c. 5, direct. The office of an executor and administrator are very much the same, except that an executor is bound to perform a will, which an administrator is not, unless where a testament is annexed to his administration, and he can do nothing before letters of administration are granted; but an executor may do many acts before he proves the will; as, commence an action, assent to a legacy, &c.

32. If a stranger takes upon himself to act as an executor, he is called in law an executor of his own devise. If a stranger in- tervenes, in order to perform a will, which the executor is apt, wrong, de son tort; but, locking up the goods, or burying the corpse of the deceased, will not amount to such
an intermeddling. He cannot bring an action in right of the deceased, but actions may be brought against him.

33. By law, the appointment of an executor vests in him beneficially all the personal estate of the testator not otherwise disposed of; but wherever courts of equity have seen on the face of the will sufficient to convince them, that the testator did not intend the executor to take the surplus, they have turned the executors into trustees for those to whom the law would cast the surplus in case of a complete intestacy, i.e. the next of kin, as where the executors are expressly called executors in trust, or any other expression occur, shewing the office only to be intended them, and not the beneficial interest. So a pecuniary legacy to a sole executor affords a sufficient argument to exclude him from the residue; as it is absurd to suppose a testator to give expressly a part of the fund to the person whom he intended to take the whole. If the testator give the residuum to a person who dies in his lifetime, in consequence of which this bequest is lapse, the executor, though he has no legacy, shall be a trustee for the next of kin, because the testator has expressed a manifest intention not to give it to the executor.

34. Of injuries to real property, the following may be noted as the principal: 1. Arrears, Disposition, or ousted from the freehold. Second, Trespass. Third, Nuisance. Fourth, Waste. Fifth, Subtraction. Sixth, Disturbance.

35. Ouster is the dispossessing another of his lands or hereditaments, and may arise by the following causes, as, 1. Abatement, which is the entry of a stranger after the death of the ancestor, before the heir or devisee. 2. Intrusion, which is the entry of a stranger after a particular estate is determined, before him in remainder or reversion. 3. Disseisin, which is the wrongful putting out of him that is seized of a freehold estate. 4. Discontinuance, which is where one having an estate-tail, makes a larger estate than by law he is entitled to do, in which case the estate is good so far as his power extends who made it, but no further. 5. Defraudment, which is where the entry of the present tenant or possessor was originally lawful, but whose tenant is now become unlawful, i.e. such a tenanter of the freehold from him that has the right of property, but never had any possession under that right, as falls within none of the injuries already mentioned. Disposition or ouster of chattels real, may arise from the motion of him who holds an estate by statute merchant, recognition, legit, or years, for securing a certain sum of money; by the borrower raising the sum for which it is held before the estate is determined by lapse of time.

36. The unwarrantable entering upon another man's soil the law entitles a trespass, and a man must have a property in the soil, and actual possession thereof by entry, to enable him to bring an action of trespass. By statute 6th Anne, c. 18, if a guardian or trustee for any infant, a husband seized for unorts, or a person having any estate or interest determinable upon a life or lives, shall, after the determination of their respective interests, hold over and continue in possession of the lands or tenements, without the consent of the person entitled thereto, they are adjudged to be trespassers.

37. Nuisance is that which worketh hurt, inconvenience, or damage; and is either public or private. Nuisance to corporeal hereditaments are, such as a man's building a house so near mine that my ancient window is closed up, or the water from the roof of his house falls upon mine; by keeping animals or carrying on any noisome trade, from which a stench arises so as to render the air unwholesome; neglecting to scour a ditch, &c. So, where any one neglects to do, or does any act which inconveniences or damages another, it is a nuisance. Nuisances to incorporeal hereditaments are, such as a man's obstructing another that has a right of way, either by stopping it up or placing impediments to his annoyance; or if one sets up a fair or market within seven miles of my private fair or market, whereby I am injured.

38. Waste is the despoiling houses, lands, or woods, 4. Waste; to the prejudice of him who has a right of common, or of a remainderman or reversioner who has an inheritance in expectancy; for if such a one has only a remainder for life, he is not entitled to sue for waste; or even during the continuance of an intermediate estate of freehold to take effect before his expectancy. Accident by fire is no waste, and no person is answerable for damages that may arise therefrom, except upon special agreement.

39. Subtraction is the non-performance of suit, duty, 4. Subtraction; custom, or service, by whom it is due.

40. Disturbance is the hindering or disquieting any and 6 Disturbance in the lawful enjoyment of an incorporeal hered- tament. All these several injuries to real property are redressed by appropriate legal remedies, the technical particulars of which cannot here be detailed. Injuries to personal property.

1. Things personal are comprehended under the ge- neral name of chattels; and are, 1. Chattels real. 2. Chattels personal.

2. Chattels real are immovable; as interests in lands Chattels and tenements, that are bounded by a definite time of real, duration; as estates for years, estates at will, and estates upon condition.

3. Chattels personal are things moveable, which may or chattels be transferred from place to place. Property in chal- tels personal in possession, is where a man has not only the right of enjoyment, but has also the actual pos- session; and such possession he can have in all inani- mate things, as goods, plate, money, vegetable pro- ductions when severed from the ground, garments, &c. none of which can be divested out of the owner's pos- session but by his own consent, and if without his con- sent, he sustains an evident injury, which it is the busi- ness of the law to prevent or remedy.

4. But with regard to animals, which have in them- selves a power of motion, the law makes a material difference. Animals are classed into such as are domai- ne, and such as are free natura; in such as are domi- nian natura, as horses, kine, sheep, poultry, and the like, a man may have an absolute property; for these will not stay from a man's house or person, unless by accident or fraudulent enticement: in either of which cases the owner does not lose his right of property, until they have been sold in market overt; but in such animals as are free natura, a man can have no absolute pro- perty.

A qualified property in animals free natura, is per industrium hominis, by a man's reclaiming them by art, or by confining them within his own immediate power, so that they cannot escape and use their natural
Property in action.

6. Property in action is where a man has not occupation, but merely a bare right to occupy the thing in question, the possession of which may however be recovered by suit or action of law: it is then called a close in action, as money due on bond; and therefore choses may either be express, as a contract to pay a certain sum; or implied, as, where a covenant fails to perform an act engaged to be done, he shall pay damages to him who sustains an injury by the breach of covenant.

7. Occupancy gives the first occupant a right to those few things which have still no legal owner. 1. Such as the goods of an alien enemy, restricted however to captors authorized by the king's proclamation, and to goods brought into the country by an alien enemy after a declaration of war without a safe conduct. 2. Any thing found which does not come under the description of waifs, extrays, wreck, or treasure-trove. 3. The benefit of the elements, light, air, and water, as far as they are previously unoccupied, or may be occupied without injury to another; as where I have an ancient window overlooking my neighbour's ground, he may not erect any blind to obstruct the light, &c. 4. Animals ferus naturae, under the restriction of the game laws. 5. Property arising by confusion of goods; as where one intermixes his money, corn, or hay, with that of another, the law gives the entire property, without any account, to him whose original dominion (or property) is invaded. 6. Literary property, wherein, however, the author has an exclusive right of printing and reprinting his works for the term of fourteen years, and at the end of that term, if the author himself be living, the right shall then return to him for another term of the same duration; and a similar privilege is extended to the inventors of prints and engravings for the term of eight-and-twenty years, besides an action for damages with double costs. And many subsequent statutes have been enacted to guard the rights of literary property.

8. Succession is where a chattel interest is given to corporations aggregate of many, as dean and chapter, mayor and commonalty; in which one body of men may, by succeeding another body, acquire a property in all the moveable of the corporation; for in the judgment of law a corporation never dies. And in sole corporations which represent a number of persons, as the master of an hospital, &c. they have the same power as corporations aggregate, to take personal property or chattels in succession. But in sole corporations which represent no others than themselves, as bishops, parsons, and the like, no chattel interest can regularly go in succession; and therefore, if a lease for years be made to the bishop of Oxford and his successors, in such case his executors or administrators, and not his successors, shall have it.

9. Custom is the acquiring property by the custom 3. By custom, lying in the form of some particular place, as in the case of

10. By marriage.—The chattels of the wife are vested 4. By marriage in the husband, in the same degree of property, and hence with the same powers, as the wife (when sole) had over them, provided he reduces them to possession, by exercising some act of ownership. In real estates, he may still retain the rents and profits during coverture, (unless he takes them afterwards also by the curtesy,) but in the case of a chattel real, as a lease for years, the husband shall receive the rents and profits of it, and may sell, surrender, or dispose of it during coverture. If he survive his wife, such chattels are to all intents and purposes his own. Yet if he has made no disposition thereof in his lifetime, and dies before his wife, he cannot dispose of them by will, but they shall remain in her possession. So also in choses in action; as debt upon bond, contracts, &c. these the husband cannot have, unless he reduce them to possession; but in case the husband survive the wife, the law is very different with respect to chattels real and choses in action; for he shall have the chattels real by survivorship, but not choses in action.

11. Forfeiture.—The forfeiture of goods and chattels takes place upon conviction of the following crimes: futurity. 1. High treason, or migration of treason. 2. Petit treason. 3. Felony in general, including felony to the &c. 4. Manslaughter. 5. By conviction of execurable homicide. 6. By outlawry for treason or felony. 7. By conviction of petit larceny. 8. By flight in treason or felony, even though the party be afterwards acquitted of the fact. 9. By standing mute when arraigned of felony. 10. By drawing a weapon on a judge, or striking any one in the presence of the king's courts. By praemunire. 11. By pretended prophecies, upon a second conviction. 12. By ending, (exporting wool.) 14. By artificers residing abroad. 15. By challenging to fight on account of money lost or won at gaming. All these forfeitures commence from the time of conviction, and not from the time of committing the fact, as in forfeitures of real property. Yet a fraudulent conveyance of them to defeat the interest of the crown, is made void by statute 13 E. c. 5.

12. Judgment.—By judgment consequent on a suit 6. By judgment at law, a man may not recover, but may also originating acquire a right to personal property; for example, he agrees to buy a horse at a stated sum, the vendor or person selling, has a right to the sum agreed upon as soon as the contract is made; and the law gives him a remedy by which he may recover the possession of that right. In popular actions, commenced to recover penalties given by particular statutes to those who will sue for them, no one has an acquired right, but may originally acquire a right to the penal sum in question, on judgment; and it is not in the power of

of bankruptcy.

13. Grant.—A grant or gift is a voluntary conveyance of a chattel personal in possession, without any, or merely a nominal consideration, as five shillings; and in leases always reserving a rent, though it be but a pepper corn; any of which considerations will convert the gift more properly into a grant. These gifts or grants may be made either in writing or by word of mouth, attested by sufficient evidence, of which delivery of possession is the strongest and most essential proof; but such deeds of gift made to the use of the owner are void; and if made to any other person, with intent to defraud creditors, are also void.

14. Contract.—This is an agreement upon sufficient consideration, to do or not to do a particular thing, which may be either express or implied, either executed or executory. Express contracts are, where one agrees to buy a load of hay or any thing else for a stated price; an implied contract, where one employs another to do a certain work for him. Here the law implies, that he undertook to pay him for his labour; so, where one takes up goods of a tradesman, without a stated price, he is bound to pay the value of them. Executed, is where one agrees to change his horse, or to do any other act with another, and does it immediately. Executory, is where a contract is to be consummated at a future period. And in all contracts, where one fails on his part of the agreement, he shall pay the other party such damages as he has sustained by such neglect or refusal.

15. The most usual species of personal contracts are,

1. Sale or exchange, which is a transmission of property from one man to another, in consideration of some price or recom pense in value; for there is no sale without a compensation; there must be a quid pro quo. If it be a commutation of goods, it is more properly an exchange; but if it be a transmitting of goods for money, it is called a sale. 2. Bailment, which is a delivery of goods in trust, upon a contract expressed or implied, that the trust shall be faithfully executed on the part of the bailee; as if cloth be delivered, or (in legal phrase) bailed, to a tailor to make up a suit of clothes, he has it upon an implied contract to render it again when made, and that in a workmanly manner. If money or goods be delivered to a common carrier, to convey from Oxford to London, he is under a contract in law to pay or carry them to the person appointed. 3. Hiring or borrowing.

16. Any contract whereby a determinate sum of money becomes due to any person, and is not paid, but remains in action merely, is a contract of debt: And these debts are, 1. Of record; as where they arise upon judgment, statutes merchant and staple, &c. and are evidenced by a court of record. 2. Special contracts, or such as whereby a sum of money becomes, or is acknowledged to be due, by deed or instrument under seal. 3. Debts by simple contract, which possess neither of the two last qualities, and are proved either by real evidence or notes unsealed. Bills of exchange and promissory notes, are simple contract debts.

17. Bankruptcy.—A bankrupt is defined to be a trader, who does certain acts to defraud his lawful creditors, or secrets himself to avoid their demands, those who may become bankrupts, are persons using the trade of merchandise; and the acts whereby they may become bankrupt are, 1. Where one endeavours to avoid his creditors, or evade their just demands, as by denying himself; but this denial is not sufficient, if the debtor is sick in bed, or engaged with company, or if the denial is made to one who comes in behalf of a creditor, and not the creditor himself. 2. Departing the realm with intent to defraud creditors. 3. One procuring himself to be arrested. 4. Suffering himself to be out-lawed, with a view to defraud his creditors. 5. Departing from his dwelling-house, or otherwise abstaining himself from his creditors. 6. Making any fraudulent conveyance of his lands or goods, or in fact committing any act with intent to baffle the demands or claims of bona fide creditors.

18. The proceedings on a commission of bankrupt are, 1. By petition to the lord chancellor, by one creditor, or by two creditor to the amount of £100, or by two to the amount of £150, or by three or more to the amount of £200. such debts must be proved by affidavit, upon which the chancellor grants a commission to such persons as to him seem good, who are then styled commissioners of bankruptcy. When the commissioners have met, they are first to receive proof of the person's being a trader, and having committed some act of bankruptcy, and the amount of the petitioning creditor's debt; and then to declare him a bankrupt if proved so, and to give notice thereof in the gazette. They at the same time appoint three meetings; at one of which, an election must be made of assignees, or persons to whom the bankrupt's estate shall be assigned for the benefit of the creditors; and no creditor shall be permitted to vote in the choice of assignees whose debt on the balance of accounts does not amount to £10; and at the third meeting at farthest, which must be on the forty-second day after the advertisement in the gazette, (unless the time be enlarged by the lord chancellor) the bankrupt, upon notice personally served upon him, or left at his usual place of abode, must surrender himself personally to the commissioners.

19. If a bankrupt has made an ingenious discovery of all his effects, and has conformed in all respects to the law, and the creditors, or four parts in five of them, in number and value, (but none of them creditors for less than £20), will sign a certificate to that purpose, and it be allowed by the chancellor, or two judges by him appointed for that purpose, he shall have a decent and reasonable allowance for his future support, and to put him in a way of honest industry. And he shall be clear from all debts owing by him at the time he became a bankrupt, even though judgment shall have been obtained against him and he lie in prison upon execution for such debts.

20. The injuries by which personal property may be affected are so various and multiplied, as well as the personal technical forms by which they may be redressed, that property, we cannot here attempt even an enumeration of them. — We refer to the following book for a view of the mode by which redress is obtainable against injuries in general:

BOOK III.

Of Suits or Actions.

1. Wrongs or injuries, which are an infringement of the civil rights of individuals, are remedied either...
1. By the acts of the parties; or, 2. By the operation of law. Redress by the latter of these modes, (of which only we are here to speak) is by suit or action in the courts of justice.

2. A court is a place wherein justice is judicially administered, by officers delegated by the crown for that purpose; being either a court of record, or not of record. A court of record, is where the acts and judicial proceedings are enrolled in parchment: these rolls are called the records of the court, and are of such high and supereminent authority, that their truth is not to be called in question; nor shall any plea, or even proof be admitted to the contrary. All courts of record are the king's courts, in right of his crown and royal dignity; and therefore no other court has authority to find and imprison; so that the very erection of a new jurisdiction, with the power of fine and imprisonment, makes it instantly a court of record. A court not of record, is the court of a private person, such as the courts baron, &c.

3. The Court of Piepowre, curia petitis pulverisatis, is the lowest, and at the same time the most expeditious court of justice known to the law of England. It is a court of record incident to every market or fair, of which the steward of him who owns or has the toll of the market is the judge; and its jurisdiction extends to administer justice for all commercial injuries done in that fair or market, and not in any preceding one; so that the injury complained of, must be done, heard, and determined, before the determination of the fair or market. A writ of error lies in the nature of an appeal to the courts of Westminster, which are bound to issue writs of execution in aid of its process after judgment, where the person or effects of the defendant are not within the limits of this inferior jurisdiction.

An court baron is incident to every manor, and is a court of record, and is held by the steward within the said manor, and is of two natures; the one a customary court appertaining to the copy-holders; the other a court of common law. This may hold a plea of any personal actions where the damages do not amount to forty shillings. Proceeding may be removed from hence into the county court, by a precept from the sheriff, called a toll; and also into the superior courts, by the king's writ of prono.

4. An hundred court, is only a larger court baron, being held for all the inhabitants of a particular hundred, instead of a manor. It is no court of record; causes are liable to removal from hence, and may also be reviewed by writ of false judgment.

6. A county court, is incident to the jurisdiction of the sheriff, and is not a court of record; it may hold pleas of debt or damage under the value of 40 shillings, but special writ called a justice, the sheriff empowered, for the sake of dispatch, to do the same justice in his county court, as might otherwise be had at Westminster. Proceedings may be removed from hence into the king's superior court, by writ of prono or recordaria.

7. The court of common pleas, or common bench.—The judges of this court are at present four in number, one chief, and three puisne justices, created by the king's letters-patent, who sit every day in the four terms to hear and determine all matters of law arising in civil causes, whether real, personal, or mixed and compounded of both. These it takes cognizance of, as well originally, as upon removal from the inferior courts before mentioned. A writ of error, in the nature of an appeal, lies from this court into the court of King's Bench.

8. The court of King's Bench is the supreme court of common law in the kingdom, consisting of a chief justice, and three puisne justices, who are by their office the sovereign conservators of the peace, and supreme coroners of the land. Though the king used to sit here, and still is supposed to do, he did not, neither by law is he empowered to determine any cause or motion by the mouth of his judges. This court may follow the king at his pleasure.

This court keeps all inferior jurisdiction within the extensive bounds of their authority, and may either remove their proceedings to be determined there, or prohibit their progress below. It superintends all civil corporations in the kingdom. It commands magistrates and others to do what their duty requires of them, in every case where there is no other specific remedy. It protects the liberty of the subject by speedy and summary interposition. It takes cognizance both of criminal and civil causes; the former, in what is called the crown side, or crown office, the latter in the plea side of the court. But on the plea side, or civil branch, it has an original jurisdiction and cognizance of all actions of trespass, or other injury alleged to be committed "in et armis"; of actions for forgery of deeds, maintenance, conspiracy, deceit, and actions on the case, which allege any falsity or fraud; but no action of debt, or dehine, or other mere civil action, can, by common law, be prosecuted by any subject in this court by original writ out of chancery; though an action of debt given by statute, may be brought in the King's Bench as well as in the Common Pleas.

This is also a court of appeal, into which may be removed, by writ of error, all determinations of the court of appeal of Common Pleas, and of all inferior courts of record in England, and to which also a writ of error lies from the court of King's Bench in Ireland. Yet even this is not the dernier resort of the subject, for if he is not satisfied, he may remove his suit by writ of error into the House of Lords or Court of Exchequer, according to the nature of it.

9. The Court of Exchequer is inferior in rank, not Court of only to the court of King's Bench, but to the Common Exchequer Pleas also; but is an ancient court of record, of law, and equity. The preliminary business of this court was to bring actions to recover debts due to the crown; but as by a fiction almost all sorts of civil actions are now allowed to be brought in King's Bench, in like manner, by another fiction, all kinds of personal suits may be prosecuted in the Court of Exchequer.

10. The High Court of Chancery, in which the lord Court of of chancellor presides, consists, like the court of exchequer, Chancery, of two distinct tribunals; the one ordinary, being a court of common law; the other extraordinary, being a court of equity. This latter court is now before the court of the greatest judicial consequence; and from this court of equity, as from the other superior courts, an appeal lies to the House of Lords. But there are these differences between appeals from a court of equity, and writs of error from a court of law; 1. That the former may be brought upon any interlocutory matter; the latter upon nothing but a definitive judgment. 2. That on writs of error, the House of Lords pronounces the judgment; on appeals it gives direction to the court below to rectify its own decree.

11. The Court of Exchequer Chamber, has no original Court of jurisdiction, but is only a court of appeal to cor-Exchequer Chamber.
rect the errors of other jurisdictions, and to determine causes by writs of error from the common law side of the Court of Exchequer. From all the branches of this court a writ of error lies to, 12. The House of Peers, which is the supreme court of judicature in the kingdom, to rectify any injustice of the law committed by the courts below, and in all dubius cases referring themselves to the opinion of the judges, who are summoned by writ to advise them. 13. The courts of assize and nisi prius are composed of two or more commissioners, who are sent twice in every year round the kingdom (except London and Middlesex, where courts of nisi prius or sittings are held in and after every term before the chief or other judges of the several superior courts, and excepting the four northern counties where the assizes are held once a year) to try by a jury of the respective counties the truth of such matters of fact as are then under dispute in the courts of Westminster-Hall. They usually make their circuits in the respective vacations after Hilary and Trinity terms. 14. Ecclesiastical courts (which were separated from the temporal courts by William the Conqueror,) or the Court of Deans, which is the lowest court in the whole ecclesiastical polity; from whence an appeal lies to that of the bishops. 2. The court of the bishops' consistory, which is held in their several cathedrals for the trial of all ecclesiastical causes arising within their respective dioceses; whence an appeal lies to the archbishop of each province respectively. 3. The court of archbishops, which is a court of appeal belonging to the archbishop of Canterbury; whence an appeal lies to the king in chancery (that is, to a court of delegates appointed under the king's great seal) as supreme head of the church. 4. The court of peculiers, which is a branch of and annexed to the court of archbishops; whence also an appeal lies to the king in chancery. 5. The prerogative court, which is established for trial of all testamentary causes where the deceased has left bona notables within two different dioceses; the judge is called the judge of the prerogative court, from whom an appeal lies to the king in chancery. 6. The court of delegates (judges delegati) which is the great court of appeal in all ecclesiastical causes, appointed by the king's commission under his great seal, and issuing out of chancery, to represent his royal person, and hear all appeals made to him. 7. A commission of review, which is a commission sometimes granted in extraordinary cases, to revise the sentence of the court of delegates. 15. Of courts military, the only one is governed by the laws of chivalry; but even this one seems now in disuse. Courts martial are annually established by act of parliament, being only temporary. 16. Maritime courts are, 1. The court of admiralty, which has jurisdiction over offenses committed upon the sea, or in parts out of the reach of the common law; and, 2. The court of delegates; and, 3. The lords of the privy council, and others authorised by the king's commission for prize causes. 17. Courts of a private or special jurisdiction are, 1. The forest courts, including the courts of attachments, regard, suciunote, and justice-seats, all of which are now in disuse. 2. The court of commissioners of sewers, whose jurisdiction is to overlook the repairs of sea banks, and sea walls, the cleansing of rivers, public streams, &c. 3. The Marshalsea, and the palace court, having jurisdiction twelve miles round the king's palace. 4. The courts of the principality of Wales. 5. The court of the duchy of Lancaster. 6. The courts of the counties palatine, and other royal franchises.

7. The stannary courts of Cornwall and Devon, to administer justice among the miners. 8. The courts of London, and other corporations; to which may be referred the courts of requests, or courts of conscience, and the modern regulations of certain courts baron, and county courts. 9. The courts of the two universities, which enjoy the sole jurisdiction, in exclusion of the king's courts, over all civil actions and suits whatsoever when a scholar or privileged person is one of the parties, except in such cases as where the right of freehold is in question.

18. Injuries to the rights of persons are redressed by suits or actions, which are defined to be the legal demands of one's right, and these are, 1. Personal. 2. Real, either, 3. Mixed. 19. (1.) Personal actions are, where a satisfaction is (1.) Peremptory claims of damages for some injury done either to personal; son or personal property.

(2.) Real actions concern real property only, such (2.) Real; as lands, rents, commons, and other hereditaments, or.

21. (3.) Mixed actions partake of the nature of both. (3.) Mixed; such as actions for waste, brought by him who has the inheritance in remainder, or reversion, to recover the land or lease, the waste has been committed, and treble damages in pursuance of the statute of Gloucester.

22. The general and orderly parts of a suit in the courts of common law are, 1. The original writ. 2. The issue or process. 3. The pleadings. 4. The issue or demurrer, action in 5. The trial. 6. The judgment and its incidents. 7. The proceedings in nature of appeals. 8. The execution.

23. (1.) The original writ must be regulated accord- ing to the circumstances upon which the action is founded, either detinue, trover, trespass vi et armis, writ. &c. An original writ is from the court of chancery directed to the sheriff of the county wherein the injury is committed, or supposed so to be, requiring him to command the wrong-doer either to do justice to the complainant, or else to appear in court and answer the accusation against him. Whatever the sheriff does in pursuance of this writ, he must return or certify to the court, together with the writ itself, it being the king's warrant for the judges to proceed to the determination of the cause.

24. (2.) The process is the means of compelling the defendant to appear in court to answer the original writ. This is called original process, when founded upon the original writ, to distinguish it from mesne or intermediate process, which issues pending a suit, as to summon juries, witnesses, &c.

The primary step in process is to give notice to the party to obey the original writ. This notice is given, step, and consequence of defendant's disobedience.

The primary step in process is to give notice to the party to obey the original writ. This notice is given, step, and consequence of defendant's disobedience.

The primary step in process is to give notice to the party to obey the original writ. This notice is given, step, and consequence of defendant's disobedience.

The primary step in process is to give notice to the party to obey the original writ. This notice is given, step, and consequence of defendant's disobedience.
LAW.

650

If he appears.

If suit for a debt contracted, arrest may follow.

Persons exempt from arrest.

Consequences of arrest, and of non-appearance to justify bail above.

Pleadings.

25. (3.) Pleadings are the mutual altercations between the plaintiff and defendant, delivered in writing into the proper office; under which are comprised, 1. The declaration, or count on which the cause of complaint is set forth. 2. The defence, which is either to action, or a dilatory plea, such as questioning the jurisdiction of the court, the ability of the plaintiff, he being an alien, outlaw, infant, &c. A plea to action is either by silence, and thereby suffering judgment to go by default; or traversing, that is, by acknowledging some part, and denying the rest. The defendant may plead a set off, by stating that the plaintiff owes him a sum of money, and deducting such sum from the plaintiff's demand, and paying the remainder into court, which is done by motion; and if the plaintiff do not recover more than the sum paid in, he shall pay the defendant's costs. Pleas that totally deny the cause of complaint, are either the general issue, or special pleas in bar, which deny at once the whole declaration; as nil debet to a debt; non est factum to a bond; in real actions, a general release, or a fine; in personal actions, an accord, arbitration, nonage, statute of limitations, &c. An estoppel is likewise a special plea in bar; this happens where a man has done some act, or executed some deed that stops or precludes him from averring any thing to the contrary.

In all pleadings, it is necessary to observe, 1. That they be single, and without duplicity. But a man, with leave of the court, may plead two or more distinct matters or single pleas; as in an action of assault and battery, not guilty, son assault dementes, and the statute of limitations. 2. That the plea be direct and positive; and not argumentative. 3. That it have convenient certainty of time, place, and persons. 4. That it answer the plaintiff's allegations in every material point. 5. That it be so pleaded as to be capable of trial. When the plea of the defendant is thus put in, if it does not amount to an issue, or total contradiction, but only evades the allegation, the plaintiff may plead again, and in his replication may totally traverse the defendant's bar, by denying the facts adduced. To the replication, the defendant may rejoin, or put in an answer called a rejoinder. The plaintiff may answer the rejoinder by a sur-rejoinder; upon which the defendant may rebut, and the plaintiff may answer him by a sur-rebutter.

26. (4.) Issue and demurrer. Issues is where the parties in a course of a pleading come to a point affirmed on one side and denied on the other, which, if it be matter of law, is called demurrer, and confesses the fact to be true, but denies that the plaintiff has any legal remedy; a demurrer may also arise from informality in the course of pleadings. The party thus demurring, if it be special, must set forth where such deficiency lies, and the opposite party must aver it to be sufficient, which is called a joinder in demurrer; and then the parties are at issue in point of law, which issue in law is determined by the judges of the court wherein such action is brought. An issue of fact is where the fact only, and not the law is disputed. And where he that denies or traverses the fact pleaded by his antagonist has tendered the issue thus, "and this he prays may be inquired of by the country;" it may be immediately subpoenaed by the other party, "and the said A. B. doth the like." Which being done, the issue is said to be joined; the action is then to be tried by the country (per patriam,) that is by jury.

27. (5.) Trial, and the several species of trial. Trial is the examination of any fact put in issue. The trial of an issue of law, or demurrer, is by the opinion of the judges of the court. The trial of an issue of fact is,

1. By the record. 2. By inspection. 3. By witnesses, several sorts:

Trial by the record is had where the matter of record as the is pleaded in action; as a fine, judgment, or where record such a manor is held of ancient demesne, &c. and the opposite party pleads "nulla tcl record;" that there is no such record.

Trial by inspection or examination, is had when the by examining the question is the evident object of the senses; then whereas the judges of the record shall decide upon their own investigation. Trial by certificate is allowed when the fact in question lies out of the cognizance of the court; as whether such a one was absent in the king's army; this shall be tried by certificate under seal. Whether defendant be a citizen of London, here the certificate of the sheriff of London is sufficient.

The trial by witnesses, without the intervention of a by-witness jury, is the only method of trial known to the civil law, as without and is used only upon the writ of dower, when the direct issue is whether the husband be dead; and in a
few collateral circumstances, as whether a juror, or

tenant to such action, was duly summoned.

Trial by wager of battle, in civil cases, is only had
on a writ of right; but in lieu thereof the tenant may
have, at his option, the trial by the grand assise.

Trial by wager of law, is only had where the matter
in issue may be supposed to have been privately trans-
acted between the parties themselves, without the in-
tervention of witnesses, and may happen upon ac-
tion of debt, detinue, account, and the like. He that
has wagered or given security to make his law, brings
with him into court eleven of his neighbours as com-
purgators; he is there admonished of the consequence
and iniquity of perjury: he then swears to the fact,
upon which his compurgators swear to his veracity.

Trial by jury, in civil causes, is either extraordinary
or ordinary. The former mode is now seldom used.
We confine ourselves therefore to the latter. A jury is
composed of twelve men, being equals or peers to the par-
ties litigant. The cause being in court, the jury is sworn
in, unless challenged by the party. Challenges are of
two sorts: challenges to the array, and challenges to
the poll. Challenges to the array are at once an ex-
ception to the whole pannel, which may be quashed from
any appearance of the impanelling. If either party be
an alien he may challenge the array, and have one half
denizens, and the other foreigners, for more impartial
trial. Challenges to the polls in capitis are ex-
ceptions to particular jurors, the principal of which are,
for suspicion of bias or partiality, and for some crimes
or misdemeanors that affect the juror’s credit, as con-
viction of perjury, treason, felony, conspiracy, hav-
ing been pilloried, or in any other manner rendered
infamous.

The jury being impanelled, the pleadings are opened
by the party who holds the affirmative: the counsel
briefly states what has been transacted in the court
above, the parties, and the nature of the action, and
upon what point the issue is joined: he next states the
nature of the case and the evidence intended to be pro-
duced. When this evidence is gone through, the ad-
vocate on the other side opens the adverse case, and
supports it by evidence; and then the party which be-
gan is heard in reply.

Evidence to a jury, in written proofs, are records or
writings, and deeds of sufficient antiquity; modern
deeds and other writings must be attested and verified
by parol evidence; no hearsay evidence will ever be
admitted. One witness, if credible, is sufficient evi-
dence; and in some cases the party himself takes what
is called the supplementary oath, and is then allowed to
give evidence, and if that evidence does not impeach him-
selves, it is of no weight.

When the evidence is gone through the judge sums
up the whole to the jury, and gives them his opinion
in matters of law arising upon that evidence: When
the jury are agreed, the foreman delivers their verdict.
In some difficult cases the jury give a special verdict;
that is, they state the fact, but leave it to the court to
judge of the law.

28. (6.) Next follows the judgment of the court upon
what has previously passed. Judgment may be here
suspended or finally arrested, for it cannot be entered
till the next term, and that upon notice to the other
party. So that in case of any defect in point of fact, or
law, or excessive damages, the party may have relief in
the court above, or by obtaining a new trial; which is
the rehearing of the cause before another jury, but with
as little prejudice to either party, as if it had never
been heard. Judgments are either interlocutory or
final; interlocutory, when given in the middle of a
suit, costs, or expenses, follow judgment, and shall
be paid, after taxation, by the vanquished party.

29. (7.) Proceedings in nature of appeals are, 1. Writ
of deceiv which may be brought in the court of Com-
ings by ap-

peal.

2. Writ of audita querela, to discharge a defendant upon
some matter having arisen since judgment: where the party
would be enti-
tled to an audita querela, the court, upon motion, will
give a summary relief. 3. Writ of error, which lies
from the inferior courts of record in England, into the
King’s Bench, to correct judgments erroneous in point
of law, and not helped by the statutes of amendments,
and sequestration. The parties bringing a writ of error must,
except in some peculiar cases, find substantial pledges
for prosecution.

30. (6) Execution. If judgment be not superseded Execution.
or reversed, the next step is the execution, or
putting in force that judgment.

31. Proceedings in the courts of equity. The pro-
cedings in the court of Chancery correspond nearly to
the practice in the court of Exchequer, the two great
courts of equity. In describing, therefore, the proce-
dure of the former, we sufficiently describe that of the
latter. The business of equity is almost infinite, but is
chiefly to give relief in matters of fraud, accident, and by
trust; secundum conscientiam et arbitrium bona vi ris.
Proceedings are by bill, setting forth the circumstances
of the case at length, “and that orator is wholly with-
out remedy at common law,” praying therefore relief,
and also process of subpœna against defendant, to com-
pel him to answer upon oath all the matter charged in
the bill; if it be to stay, waste, or to stop proceedings
at law, an injunction is also prayed. The bill must
call all necessary parties, however remotely interested,
before the court, otherwise no decree can be made to
bind them, and must be signed by counsel.

32. When the bill is filed in the office of the six
Injunction
clerks, an injunction may be prayed, which may stay may be
execution on excessive judgment; and if the defendant prayed;
does not put in his answer within the stated time allo-
lowed, an injunction issues of course. If for waste or
other urgent injuries, then upon filing the bill, and
a proper case supported by affidavit, the court will grant
an injunction immediately, to continue until defendant
has put in his answer. It is then determined upon argu-
ment, whether the injunction shall be taken off or
not.

33. If the defendant upon service fails to appear If defen-
within the time limited, and plead, demur, or answer dis not put in his answer within the stated time al-
lowed, an injunction issues of course. If for waste or
other urgent injuries, then upon filing the bill, and
a proper case supported by affidavit, the court will grant
an injunction immediately, to continue until defendant
has put in his answer. It is then determined upon argu-
ment, whether the injunction shall be taken off or
not.

Upon non est inventus being returned, a commission of rebel-

lion is awarded against him; upon non est inventus be-
ing again returned, the court sends a serjeant at arms
in quest of him; and if the defendant eludes him, then
a sequestration issues to seize all his personal estate,
and the profits of his real estates, and to detain them, sub-
ject to the decision of the court. After an order for se-
questration has issued, the plaintiff’s bill is to be taken
pro confesso, and decree to be made accordingly. If
the defendant is taken upon any of these proceedings, he is committed to the Fleet, till he puts in his appearance or answer. The process against a body corporate is by *distinctas*, to restrain them by their goods and chattels, in order to compel them to obey the summons. If a peer be a defendant, the chancellor sends a letter missive to him; and if he neglect to appear, he may be served with a subpoena; and if he still continue in contempt, a sequestration issues without any of the *mesne* process of attachment. The same process issues against a member of the House of Commons, except only that the lord chancellor sends him no letter missive.

If a defendant absconds, as is believed, to avoid being served with a subpoena, a day is appointed for him to appear to the bill of the plaintiff; which appointment is to be inserted in the London Gazette, and read in the parish church where the defendant last lived, and fixed up at the Royal Exchange; and if the defendant does not appear upon that day, the bill shall be taken *pro confesso*.

34. If a defendant appears and takes a copy of the bill, he is next to *demur, plead, or answer*. If on demurrer the defendant prevails, the plaintiff's bill shall be dismissed. If the *demurrer* is overruled, the defendant is ordered to plead. A plea may either be to the jurisdiction or to the person; as that the plaintiff is an outlaw, &c. or in bar; as an act of parliament, fine, release, or former decree. The truth of this plea the defendant is bound to prove, if put upon it by the plaintiff. In bills containing various matter, a man may plead as to part, demur as to part, and answer as to the residue: no exceptions to formal *ministertum* will be allowed; for the parties, upon discovery of any errors, may correct them. An answer is the usual defence to a bill, a given upon oath, or honour of a peer or peeress. Answers in amicable suits are usually taken without oath, by consent of the plaintiff.

35. If the plaintiff finds sufficient matter confessed in the defendant's answer to ground a decree upon, he may proceed to the hearing of the cause upon bill and answer only; but in that case, he must take the defendant's answer to be true in every point. But if the issue be joined upon the contradiction of facts, such facts are proved by the examination of witnesses, and their depositions are taken in writing. For such purpose interrogatories are framed in writing, which, and which only, are to be asked of the witnesses: such interrogatories must be short- and pertinent. For those witnesses who live in the country, a commission to examine is granted to four persons, two named on each side; and a commission may be had to examine persons residing beyond sea.

36. The chancellor's decree is either interlocutory or final. It seldom happens that the first decree is final; for if any matter of fact is strongly controverted, the fact is usually directed to try at the bar of the King's Bench, or at the assizes upon a former issue. And if a question of mere law arises, it is the practice of this court to refer it to the opinion of the judges of the King's Bench, or Common Pleas, upon a case stated for that purpose. When all issues are tried and settled, and all references to the master ended, the cause is again brought to hearing upon the matters of equity reserved; and a final decree is made; the performance of which is enforced, if necessary, by commitment of the person, or sequestration of the party's estate. And if by this decree either party think himself aggrieved, he may petition the chancellor for a rehearing. But after the decree is once signed and enrolled, it cannot be reheard or rectified but by bill of review, or by appeal to the House of Lords.

37. A bill of review may be had upon apparent error in judgment, or discovery of new matter or evidence.

38. An appeal to the House of Lords is effected by petition to the house.

BOOK IV.

Of Crimes.

I. Where only the rights of an individual are infringed, coupled with no violence, it is a civil injury; where the rights of society are invaded by the commission of violence, it is a crime or misdemeanor. The king, being the supreme head of the community, is the person injured upon any infraction of the public rights, and therefore is, in all cases of public crimes and misdemeanors, the proper prosecutor. Misdemeanors comprehend all indictable offences not amounting to felony. A crime, or misdemeanor, may arise either from the omission or commission of any act, in violation of public law; as where a man digs a ditch across a highway, he is guilty of a public misdemeanor; and if any injury thereby happens to an individual, he is compellable to make satisfaction for the civil injury, and indictable for the public offence. The law considers it not so flagrant an enormity to attempt an unlawful action, as the absolute perpetration; and the violence of passion, or temptation by hunger, may be in some degree extenuate a crime. Circumstances may also tend to aggravate an offence; as where a servant robs his master, or stealing privately from one's person the value of twelve-pence, is a capital offence; but even the carrying off a load of corn from an open field, is punished merely with transportation.

II. All persons are capable of committing crimes, unless there be in them a defect of will; for, to constitute a legal crime, there must be both a vicious will and a vicious intention; and such vicious intention or *overt act* is demonstrated by some evident premeditation. So where an act is the effect of idiotism, insanity, lunacy, chance-medley, compulsion, or necessity, there cannot be a vicious intent. *Infants under the age of discretion*, ought not to be punished by any criminal prosecution whatever. The discretion that accompanies the perpetration or secretion of a crime, will determine how far the infant possessed discretionary powers. Under the age of seven years an infant cannot not be guilty of felony. In some cases of omission and commission, the law privileges an infant, if such action arise from his legal incapacity, but not for such acts as a breach of the peace when above the age of fourteen years. Persons of *non-sane memory*, cannot be tried for what they have done in sound memory, and if after trial they become mad, judgment cannot be pronounced upon them; or if they become deranged after judgment, execution shall be stayed, and a jury shall determine, where there is any doubt; whether a party be *compos or not*. *Drunkenness* is a voluntary madness, and is consequently an aggravation of an offence. The parties stand excused of accidents by *chance medley*, arising from the performance of some lawful act; but there is no excuse where accidents happen from the performance of an illegal act. The law seems to protect the wife in all felonies committed by her in company with her husband, except for murder and manslaughter. *Theft from necessity or starvation* cannot be justified by the law of England; for in this country the poor laws are established, to ameliorate the condi-
tion of the distressed. The law will not presume the king capable of doing any thing inconsistent with his station and dignity; it therefore considers him incapable of committing any crime.

III. A principal in a crime is he who commits the fact, or is present at aiding, or in any way maliciously abetting the commission. An accessory is he who doth not commit the fact, nor is present at the commission, but is in some sort concerned therein either before or after. In high treason there are no accessories, but all are principals. In petit treason, murder, and felonies, with or without benefit of clergy, there may be accessories. There are no accessories in petit larceny, and all crimes under the degree of felony either before or after the fact. An accessory before the fact is one who, being absent when the crime is committed, has procured, counselled, or commanded another to commit it. An accessory after the fact is where a person, knowing a felony to have been committed, receives, relieves, comforts, or assists the felon with the means of escape, to the hinderance of public justice. The receivers of stolen goods are accessories, (where the felony admits of accessories,) and may be prosecuted for the misdeemeanor even if the principal be not taken; and if committed in some cases transported for fourteen years.

IV. Offences against divine law.

1. Reviling the Christian faith.
2. Or the established church and its ordinances.

3. Penalties of Popery.

4. Blasphemy.
5. Common swearing.
6. Pretending a knowledge in the occult sciences or witchcraft, is punishable by a year's imprisonment and the pillory.
7. Religious impostors, such as falsely pretend an extraordinary commission from heaven, are punishable with corporal correction and imprisonment.
8. Profanation of the Lord's Sabbath, such as selling merchandise, or frequenting any place or interlude upon any holy day, infracts a forfeit of three shillings and fourpence to the poor. Any one working upon such days shall forfeit 5 shillings; nor shall any drover, carrier, or the like, travel upon such days under pain of 20 shillings. Any baker exercising his occupation except between the hours of nine and one o'clock, shall forfeit 10 shillings for the use of the poor.
9. Drunkenness is also punished with the forfeit of 5 shillings, or set in the stocks for six hours.
10. The offence of notorious lewdness, as exposition of person, or frequenting houses of ill fame, is punished by fine and imprisonment.

V. Offences against the law of nations, are 1. The violation of safe conduct, or passports expressly granted by the king or his ambassadors to the subjects of a foreign power in time of mutual war; or committing acts of hostilities against such as are in amity, league, or truce with the nation, which by the law of England is high treason, and restitution shall be made to the party injured.
2. The rights of ambassadors are cognizable by the common law, and it will immediately stop all legal process sued out against them, or their domestic servants; so that all persons executing such process against the said book, or preventing the reading of it, he is subject to pecuniary penalties. The penalties for Protestant dissenting, are suspended by the toleration act during their compliance with the conditions therein enacted; and any one disturbing such congregation shall be bound over to keep the peace, and forfeit £ 20.
3. Piracy, or robbery, and depredations upon the high seas, is felony in a subject. Mutineers, or those aiding or making a revolt on board ship, are considered pirates. The widows of seamen slain when protecting a vessel against the attack of pirates, are entitled to a bounty; and seamen wounded in such defence, shall be entitled to a pension from Greenwich Hospital.

VI. Another great branch of offences, relates to the high supreme exécuteor magnate; of these high treason is the treason principal. This crime, (so far as distinguished by 25th Edw. III. c. 2.) is, 1. “Where any one doth compass or imagine the death of our lord the king, or our lady his queen, or their eldest son and heir.” In this description it is held, that a queen regnant is included, but not her husband. Even an usurper, who has got possession of the throne, comes within the meaning of the statute; for allegiance is due to him also for his temporary protection of the public rights; and all subjects are excused from any penalty or forfeiture who assist and obey a king de facto. Composing or imagining the death of the king, is even the mind or will to accomplish his death, and not an actual perpetration; the malicious intent must be demonstrated by some overt act,
to constitute high treason. Endeavouring to imprison the king, is an overt act of treason. 2. Violating with or without force the queen consort, the king's eldest daughter unmarried, or the wife of his eldest son. 3. Levying war against the king in his realm. 4. Committing, assisting, or giving information to the king's enemies. 5. Counterfeiting the king's great or privy-seal. 6. Counterfeiting the king's gold and silver money, or importing counterfeit coin. 7. Killing the chancellor, treasurer, king's justices of any of the benches, justices of assize, and all other justices assigned to hear and determine causes, being in their places doing their offices.

2. High treasons, created subsequent to 25th Ed. III. are, 1. Such as relate to Papists in certain circumstances; as the repeated defence of the Pope's jurisdiction; the returning from beyond sea of a natural-born Popish priest, unless driven in by stress of weather; the renouncing of one's natural allegiance and reconciliation to the Pope. 2. Any person falsely counterfeiting, or importing and uttering counterfeit, such coin of gold or silver, as is not the proper coin of this realm, (counterfeiting the coin of the realm, being already provided against, by 25th Ed. III.) but shall be current within this realm by consent of the crown; or forging the sign manual, privy signet, or privy-seal; or clipping, washing, rounding, or filing the current money of the realm, or having in his possession implements for coining, or falsifying any coin of the realm; shall be deemed guilty of high treason. And, 3. Writing or printing in derogation of the act of settlement, or of the power of parliament to limit the descent of the crown, shall also be deemed high treason.

3. The punishment of high treason in males, is to be, 1. Drawn. 2. Hanged. 3. Embowelled alive. 4. Beheaded. 5. Quartered. 6. The head and quarters to be at the king's disposal. But in cases relating to the coin, only to be drawn, and hanged till dead. In the case of females, this last is the punishment for every species of high treason.

VII. Felonies injurious to the king's prerogative.

1. Second offence of uttering counterfeit coin, &c.
2. Assaulting, &c. a privy-councillor.
3. Enlisting into foreign service.
4. Embezze-ling the king's stores.
5. Desertion in times of war; or enlisting false oaths.
6. Taking or administering false oaths.
VIII. Pre-munire.

out the consent of the crown. A person convicted of pre-munire, is out of the king's protection, his lands and tenements, goods and chattels, are forfeited to the king; and his body remains in prison at the king's pleasure.

IX. Misprisions comprehend a further class of offences against the king and his government. They may be either negative, which consist in the concealment of something that ought to be revealed; or positive, consisting in the act of doing something that ought not to be done. 1. Under the negative, comprehended: 1. Misprision of treason, or the bare knowledge and concealment of treason; for, by giving the least countenance to a traitorous proceeding, the party becomes guilty of high treason. The punishment of misprision of treason, is loss of the profits of lands during life, forfeiture of goods, and imprisonment for life. 2. Misprision of felony, or the concealment of a felony which a man knows, but never assented to; and 3. The concealing of treasure trove, which belongs to the king or his grantees; in both of which misprisions the penalty is fine and imprisonment.

2. Misprisions, which are merely positive, are denominated contemptis, or high misdemeanours. 1. Mal-adminis- tration of public trusts and employments, is punished by parliamentary impeachment, issuing in banishment, imprisonment, fines, or perpetual disability. 2. Contempts against the king's prerogative, as acting as judge against his councils, or person in his wars, or neglecting to joint a war, or to comitatus. Penalty, fine, and imprisonment, at the discretion of the king's courts of justice. 3. Contempts and misprisions against the king's person and government, as speaking or writing against them, or doing any thing that may tend to lessen him in the esteem of his subjects. Penalty, fine, imprisonment, and pillory. 4. Contempts against the king's title, are by denying his right to the crown in common discourse. Penalties, fine, imprisonment, and disability, being nearly equal to the punishment of pre-munire. 5. Contempts against the king's palaces or courts of justice are high misprisions, such as maliciously striking another in the king's palace, whereby blood is drawn. Penalty, perpetual banishment and fine at the king's pleasure, and loss of the offender's right hand. Striking in the king's superior courts of justice in Westminster-hall, or at the assizes, is not only a contempt of the king's majesty, but is also a disturbance of the public justice; therefore, the mere assault without the use of any weapon, is punished with the loss of the right hand, imprisonment for life, and forfeiture of goods and chattels, and of the profits of his lands during life. A rescue from any of these courts subjects the party to the like penalty. Using reproachful words, or contemptuous behaviour to a judge when in execution of his office, is punished with fine and imprisonment. Also, injurious treatment to those who are immediately under the protection of the court, and in execution of their office; or in any manner tampering with a witness, subjects the offender to the same punishment.

X. Offences against the public justice, are, 1. Vitiating or falsifying records, or personating others in courts of justice; it is felony without benefit of clergy. and 1. Viti- ating re- cords; 2. False witnesses on compulsion; 3. Disturbing the execution of lawful process, or abusing any officer in his endeavours to execute his duty; 3 obstruct-
4. An escape of a person arrested upon criminal process, before he is put in hold. Penalty, fine, and imprisonment. An officer negligently permitting a felon to escape, is considered guilty of an offence of equal degree with that of the felony committed, and is liable to be punished accordingly, if the felon be retaken and convicted; if, not, to be fined and imprisoned.

5. Breach of prison, or any place of security, when lawfully committed for treason or felony, is felony at common law; and to break prison when confined for any other inferior charge, is punished with fine and imprisonment as a high misdemeanor.

6. Rescue is the forcibly and knowingly freeing a person from an arrest or imprisonment; and is of equal magnitude as the guilt of a gaoler voluntarily permitting a prisoner to escape; consequently liable to similar punishment.

7. Returning from transportation before the expiration of the term for which the offender was transported, or ordered to transport himself. Penalty, felony without benefit of clergy.

8. Taking a reward under the pretence of helping the owner to his stolen goods; the offender shall suffer the same punishment as the felon is liable to who stole the goods, unless he give evidence against the principal felon.

9. Receiving stolen goods, knowing them to be stolen, is a high misdemeanor; such offender may be dealt with as an accessory to the theft and felony, if the principal felon be first taken and convicted.

10. Theft-bote, is where a party robbed, not only knows the felon, but takes his goods again, or other amends, upon agreement not to prosecute. Penalty, fine and imprisonment. Even to advertise a reward for the return of things stolen, with no questions asked, or words to the same purport, subjects the advertiser and the printer to a forfeiture of £50 each.

11. Common barterry is the stirring up suits or quarrels, either at law or otherwise. Penalty, fine and imprisonment. If any one who has been convicted of forgery, perjury, subornation of perjury, or common barterry, shall practise as an attorney, solicitor, or agent in any suit, the court upon complaint and proof shall direct the offender to be transported for seven years.

12. Maintenance is an officious intermeddling, or assisting in a suit that in no way belongs to one. Penalty, fine and imprisonment.

13. Chancery (campe-paritido) is a bargain with the defendant or plaintiff to divide the land or other matter sued for between them, if either prevail at law; which is also punished with fine and imprisonment.

14. Compounding of information upon penal statutes. Penalty, fine, pillory, and rendered incapable of ever after suing upon any popular action.

15. Conspiracy to indict an innocent man of felony, who is accordingly indicted and acquitted, is a farther abuse and perversion of public justice, and is punished by fine, imprisonment, and pillory. Also sending threatening letters to extort money or other valuables, upon which the same punishment follows.

16. Perjury is where one swears wilfully, absolutely, and falsely to an oath, administered by those having lawful authority so to do. Subornation is the procuring another to take a false oath. For the latter offence, the penalty is perpetual infamy, and a fine of £100, on the subornor; and in default of payment, imprisonment for six months, and to stand with both ears nailed to the pillory. For perjury, six months' imprisonment, perpetual infamy, and a fine of £20, or to have both ears nailed to the pillory.

17. Bribery, or the giving a reward to influence a judge, or other person concerned in the administration of justice, is punished in inferior officers by fine and imprisonment, as also those who offer a bribe, though not taken. But judges forfeit their office, are punished at the king's will, and discharged from the king's service for ever.

18. Embracery is an attempt to influence a jury corruptly to one side, by promises, persuasions, entreaties, money, entertainments, and the like. Penalty, fine and imprisonment: and for the jury, perpetual infamy, imprisonment for a year, and forfeiture of tenfold the value of the bribe.

19. False verdict of juries is punished by attain.

20. Negligence of public officers, as sheriffs, coroners, constables, and the like. Penalty, fine and imprisonment.

22. Extortion by officers. Penalty in both cases, imprisonment, fine, and sometimes forfeiture of the office.

21. Felonious breaches of the peace, are

1. The riotous assembling of twelve persons, or more, and not dispersing within an hour after proclamation made for that purpose, or opposing the reading of such proclamation by force.

2. Appearing armed, in disguise, or with blackened faces.

3. Extorting money by sending threatening letters; each of which three offences is felony, without the benefit of clergy.

4. Maliciously to damage or destroy any banks, sluices, or other works on a navigable river. To destroy any turnpike, gate, or fence, toll-house or weighing-engine thereunto belonging, erected by authority of parliament. Penalty, transportation for seven years.

5. Affrays, or the fighting in public of two or more persons in some public place, and these affrays are more heinous according to the aggravation used, or the sacredness of the place wherein they are commenced. Penalty, fine and imprisonment.

6. Riots, route, and unlawful assemblies, must have three persons to constitute them, and assembled to do some unlawful act, as to pull down enclosures, &c. Penalty, fine and imprisonment.

7. Tumultuous petitioning. By 13 Car. II. st. i. c. 5. Tumultuous petitioning.

8. forcible entry and detainer, as violently taking or 8. forcible entry and detainer, as violently taking or keeping possession of lands and tenements, with force, and arms, without the authority of law. Detainer. Penalty, fine and restitution, without inquiring into the merits of the title; for the law only recognises a peaceable entry.

9. Riding or going armed with dangerous or unusual weapons. Penalty, forfeiture of arms and imprisonment.
10. Spreading false news to create discord. Penalty, fine and imprisonment.

11. False and pretended prophecies, with intent to disturb the peace. Penalty for the first offence, fine of £10, and one year's imprisonment; for the second, forfeiture of goods and chattels, and imprisonment during life.

12. Challenge to fight is an excitement to commit a felony, therefore is a misdemeanor.

13. Libels are the malicious defamation of any person, which becomes more heinous when a magistrate is the object ridiculed, either by printing, writing, signs, or pictures, in order to provoke him to wrath, or expose him to public hatred, contempt, and ridicule. Penalty, fine and corporal punishment. And for the greater facility in discovering persons who attempt publicly to defame others, it is enacted, "that every printer shall print upon the front of every paper which is printed on one side only, and upon the first and last leaves of every publication which contains more than one leaf, his name and place of abode; and in case of omission, shall forfeit for every copy printed, £20; and every person who prints for profit, shall keep one copy of every paper so printed, on which shall be written or printed the name and place of abode of the person by whom such printer shall be employed, and shall produce the same to any justice of the peace, who shall within the space of six months require to see the same, and upon neglect or refusal shall forfeit £20.

XI. Offences against public trade are,

1. Owling, which is the transporting wool or sheep out of the kingdom. Penalty, forfeiture of both sheep and vessel, and £3 for every sheep, imprisonment for three months, and three shillings for every pound of wool, fuller's earth, or pipe clay.

2. Smuggling, or importing goods without paying the duties imposed thereon. Penalties, fine, loss of goods; and when accompanied with any forcible act, or even in disguise, felony without benefit of clergy.

3. Fraudulent bankruptcy, or any act that tends to defraud the creditors of a bankrupt. Penalty, felony without clergy.

4. Usury in the extorting more than £5 per cent. per annum for the loan of money. Penalty, such usurious contracts vitiated, and the lender shall forfeit the sum so lent.

5. Cheating or deceiving another by artful means. Penalty, fine, imprisonment, and pillory.

6. Forestalling the market, is also an offence against public trade.

7. Regrating, or buying corn and selling it again in the same market, for the purpose of enhancing the price.

8. Engrossing is also the buying up large quantities of corn or other victuals, with intent to sell again. Penalty for each of these three offences, fine and imprisonment.

9. Monopolies and combinations to raise the price of provisions, or commodities, or rate of labour. Penalty, fine and imprisonment; pillory for the second offence, and increased fine; for the third, pillory, loss of one ear, and perpetual infamy.

10. Exercising a trade without having served an apprenticeship, or otherwise become free. Penalty, fine of 40 shillings per month.

11. Seducing artificers to reside abroad, or transporting them, or engines for the manufacture of woollen cotton, linen, or silk, and the residing abroad of such artificers. Penalty, fine, imprisonment, forfeiture, incapacity of bearing any public office.

XII. Offences against the Public Health are,

1. When persons infected with the plague, or dwelling in any infected house, being commanded to keep within such house by the mayor or constable, or other head of the place, shall disobey the injunction, they shall be punished as vagabonds, by whipping; and if they have upon them any infectious sore, are guilty of felony. Ships coming from any country, visited with any infectious disease, are liable to be placed under quarantine for forty days; and persons coming from a ship, while under quarantine, are subject to fine and imprisonment.

2. Selling unwholesome provisions, or brewing unwholesome liquors, &c. come under the same class of offences. The penalty is amercement, pillory, imprisonment; and for the fourth offence, abjuration of the town wherein the offence was committed.

XIV. Offences against the Public Police and Economy are,

1. Clandestine marriages. To solemnize a marriage except where banns are usually published without licence, and to solemnize marriage in such place without due publication of banns, is felony; and the person so solemnizing, liable to transportation for fourteen years; the marriage also being void. To destroy or deface a marriage register, is felony without clergy.

2. Bigamy, or polygamy, is the having more wives than one at the same time; such second marriage is void. Penalty, transportation.

3. Idle soldiers or mariners wandering about the country, are esteemed vagabonds, and come within the meaning of the vagrant act.

4. Also Egyptians, or gypsies and impostors, shall be Egyptian rogues and vagrants.

5. Common nuisances are, 1. Such annoyances as render highways or bridges impassable, either by obstructions, or from the want of necessary reparations. Persons so offending are proceeded against by indictment, and are liable to fine, besides reparation. 2. All disorderly inns or ale-houses, bawdy-houses, gaming-houses, stage-plays, unlicensed booths and stages for rope-dancers and mountebanks, are also declared public nuisances; and may, upon indictment, be suppressed, and the owners fined. 3. Letting off fire works, or making and selling them. Penalty, fine. 4. The keeping or carrying too large a quantity of gunpowder at one time. Penalty, fine and forfeiture.

6. Persons living at play more than £100 at any one time, are not compellable to pay the same; and the winner shall forfeit the value, one moiety to the king, the other to the informer. All bonds and other securities, given for money won at play, or for money lent at the time to play with, shall be utterly void. If any person at any sitting loses £10 or upwards at play, he may sue the winner, and recover it back by action of debt; and if he does not sue, any other person may recover treble the sum so lost; and in case of cheating, five times the sum won shall be forfeited, the winner rendered infamous, and besides be subject to whipping. No plates or matches under £20 shall be run for by horses, except at Newmarket, under heavy penalties.

7. Killing or destroying game, or keeping engines for that purpose, or having the possession of game not being duly qualified, is prohibited under a variety of penalties and forfeitures.
Hitherto we have spoken of offences that affect the society generally. We proceed to consider those which affect it through the medium of injuries committed more immediately against individuals.

XV. Crimes more immediately feeling the individuals. 1. Homicide.

(1.) Justifiable homicide must arise from necessity, without any will, intention, or desire, and without negligence; as where a proper officer in the endeavour to take a felon, is prevented, he is thereby justified in using violence to make the capture; and if homicide should thereby ensue, either to the prisoner, or those opposing the process of justice, the officer stands excused; or if a man be killed in the attempt to murder, rob, or break open a house in the night, it is justifiable homicide; as also where a woman or her relatives slay another to preserve her chastity.

(2.) Executable homicide is either per infortunium or se deendo. Per infortunium, as where one doing a lawful act without any intention of hurt, unfortunately kills another. Sedendo, or chance-medley, as where one kills another in his own defence, that is, after he has retreated so far as he possibly can from the wrath of his antagonist; and this must be at the very time of the assault.

(3.) Criminal or felonious homicide, is the killing a human creature without justification or excuse. 1. A fello de se is one who deliberately puts an end to his existence; and he that advises another so to do, is an accessory before the fact, if the murder absolutely takes place. A fello de se is ignominiously buried, a stake driven through his body, and his goods and chattels forfeited. 2. Manslaughter is the unlawful killing another, without malice either expressed or implied. As, where two persons suddenly fight and one kills the other; this must arise from the heat of the moment, and sudden impulse of the passions. Penalty, felony, with benefit of clergy, forfeiture of goods and chattels, and fine. But mortally stabbing is punished as murder, though done upon sudden provocation. 3. Murder is where a person of sound memory and discretion, unlawfully kills any reasonable creature in being, and under the king’s peace, with malice aforethought, either express or implied; or does any act that evinces the consequence of which will be the death of some one. The seconds, as well as principals in a deliberate duel, which terminates fatally, are all deemed murderers in law. Punishment, death, the body anatomized, and the forfeitures of felony. Petit-treason, is where a servant kills his master; the wife her husband; or an ecclesiastical his superior. Punishment, to be drawn and hanged, with the other penalties of murder.

2. Mayhem. 2. Mayhem is the violently depriving another of the use of such of his members as may render him less able to fight or defend himself; and even the lying in wait unlawfully, with malice aforethought, to cut off or disable any limb or member of any person, with intent to maim or to disfigure him, is felony without clergy; or any one maliciously shooting at, stabbing, or cutting another with intent to murder, rob, maim, disfigure, or disable him, or with intent to aid the escape of any person stabbing or cutting, is guilty of a felony without clergy.

3. The forcible abscission or marriage, or taking of an heir, is where a person for lucre takes any woman, whether maid, widow, or wife, contrary to her will, and afterwards she is married to such misdoer, or by his consent to another, she having substance either in goods or lands, or being an heiress. The offenders and their procurers and accessories, are guilty of felony without clergy.

4. Marrying any woman-child under the age of six years, against the will of her father, mother, guardians, or governors, infers the penalty of imprisonment for five years, and the forfeiture of the woman’s lands during the life of the husband to her next of kin.

5. Rape, or the forcible carnal knowledge of a woman 5. Rape, against her will, and the abuse of a female child under the age of ten, with or without consent, is felony without clergy.

6. The infamous crime against nature, committed either with man or beast, is likewise felony without clergy.

7. Assault, battery, wounding, and kidnapping, or the forcibly taking away the king’s subjects, are punished by fine, imprisonment, and pillory.

XVI. Of offences against the habitations and property of individuals, we may enumerate, 1. Arson ab ar-endo, which is the malicious and willful burning of the house, or out-house of another man; and is felony without benefit of clergy. The willful firing one’s own house in a town is punishable with fine, imprisonment, and pillory; and it with intent to deprave any person, felon without clergy.

2. Burglary is the forcible entry into a mansion or 2. Burgla-dwelling-house, church, or wall or gate of a town by night, with a felonious intent. If there be day light enough to discern a man’s face, it is no burglary. The breaking open an out-house that is attached to a dwelling house, or within the same common fence, is burglary. But the breaking open a shop that is let apart from a house of which it is parcel, is no burglary, unless some person usually sleep there; penalty, felony, without benefit of clergy, for abettors, accessories, and principals.

3. Larceny, is the felonious taking and carrying 3. Larceny, away the goods of another; and it is either, (1.) Grand larceny, where the property taken is (1.) Grand above the value of twelve pence; which is felony, in some cases within, in others without clergy.

(2.) Petit larceny, where the value is twelve pence. Petit lar-then, which is also felony, but not capital, being pun- only, which is also felony, but not capital, being pun- nished with whipping or transportation; or.

(3.) Mixed or compound larceny, which is that where- (3.) Mixed in the taking is accompanied with the aggravation of larceny, being either, 1. From the house, or 2. From the person. Larcenies from the house, by day or night, are felonies without clergy, when they are, 1. Above twelve pence, whether the house be properly a dwelling-house, church, booth, &c. any person being therein. 2. When the value is five shillings, the house being broken open, though no person be therein. 3. Larcenies of forty shillings, from a house without breaking, and though no person be therein. 4. Larcenies of five shillings from a shop, warehouse, out-house, &c. whether broken or not, and though no person be therein. Larceny from the person, is 1. By privately stealing from the person of another above the value of twelve pence. 2. By robbery, or the felonious and forcible taking from the person of another, goods or money of any value, by putting him in fear. These are also felonies without clergy. As attempt to rob is felony.

4. Malicious mischief, such as the destroying dikes, 4. Malicioust public navigations, bridges, &c.; breaking open any public house or shop to destroy goods in the loom, or utensils used in manufacturing such goods; burning any barn or stack of corn or grain; killing any horses, sheep, or
other cattle; cutting down trees or hop-binds; setting
fire to a coal-mine, &c. are felonies without clergy;
and if the offender be not convicted, the hundred shall
be charged with the damages. Likewise the burning,
or in any manner causing advising the destruction of
any ship, with intent to defraud the insurers, is felony
without clergy.

5. Forgery is the fraudulent making or altering a
writing to the prejudice of another's right, which is fel-
ony without clergy. Forgery the superscription of a
letter to evade the payment of postage, subjects the of-
fender to transportation for fourteen years.

So much for the different species of crimes: we next
consider the trial of them.

XVII. Trial
of crimes.

1. Public courts, are, 1. The High Court of Parlia-
ment, which is the supreme court in the kingdom, and
proceeds by impeachment. 2. The court of the Lord
High Steward of Great Britain, which is a court held
in the recess of parliament, constituted for the trial of
peers, for treason or felony, or misprision, upon indict-
ment found by a grand jury of freeholders, transmitted
from the assizes or court of King's Bench by writ of
certiorari, to be determined before his grace the steward
and the peers. 3. The court of King's Bench takes
cognizance of all criminal causes, from high treason
down to the most trivial misdemeanor or breach of the
peace. The judges of this court are the supreme cor-
oners of the kingdom. 4. The court of Chivalry.
5. The court of Admiralty, held before the lord high
admiral of England or his deputy, who is styled the judge
of the admiralty. These five courts may be held in any
part of the kingdom. The following are of a local jur-
isdiction. 6. The courts of oyer and terminer, and gen-
eral goal-delivery, which are held before the king's com-
missioners, (usually two judges of the courts of West-
minster,) in every county, in every county in the
kingdom except the four northern ones, where they
are held only once; but in London and Middlesex they
are held eight times. In cases of urgency, the king
issues a special or extraordinary commission of oyer
and terminer, and goal delivery, confined to those of-
fences which stand in need of immediate inquiry and
punishment. 7. The court of the General Quarter
Sessions, is held once in every quarter of the year to try
small felonies, and all trespasses whatever. 8. The She-
riff's town, or rotation, is a court of record, and held
twice every year. 9. The Courtleth, or view of frank-
pledge, is a court of record, held once a-year within
a particular hundred, lordship, or manor, before the
steward of the leet. 10. The court of the coroners, held
where a person comes to sudden or violent end, super
visum corporis. 11. The court of the clerk of the market,
incident to every fair and market in the kingdom.

2. Courts of a special juri-
scription.

1. The court of the Lord Steward, Treasurer, or
Comptroller of the King's Household, which has con-
nizance of offences committed within the limits of any
of the palaces and houses of the king. 2. The University
courts.

3. Prosecutions, or proceedings in criminal courts,
are either summary or regular. Summary proceedings,
are such as are directed by particular acts of parlia-
ment, whereby a man may be convicted without the
intervention of a jury: as for frauds upon the excise,
contempt of court, &c.

4. The first step in regular proceedings is by arrest,
which is the apprehending a person for such an offence
as will at least justify holding him to bail: and in gen-
eral an arrest may be made four ways: 1. By warrant,
which may be granted in extraordinary cases by the
privy-council, or secretaries of state; but ordinarily by
justices of the peace, either directed to a peace officer
or private person. 2. By officers without warrant, as
where any one commits a felony or breach of the peace
in their presence. 3. By a private person who is present
when any felony is committed. 4. Upon hue and cry
raised upon a felony committed. Divers acts of par-
liament have given rewards to those who apprehend
delinquents and prosecute them to conviction.

5. Commitment must be upon good grounds of suspi-
cion, or the prisoner must be discharged; and if he be
committed upon good grounds of suspicion, he must be
sent to prison, or give bail (if the offence is not of a ca-
Bail; pital nature) for his appearance to answer the charge
against him. If the offence be not bailable, or the party
cannot find bail, he is committed to the county goal by
mittimus from the justice.

6. The accusation of offenders is, 1. By presentment, Accusation
which is the notice taken by a grand jury of any offence
from their own knowledge or observation; as upon inqui-
sitions of felo de se, of flight in persons accused of felo-
y, or deceaditi, &c. 2. By Indictment, which is a writ-
ten accusation of one or more persons for a crime or mis-
demeanor, preferred to a grand jury, who are pre-
viously instructed in the articles of their inquiring by
a charge from the judge who presides upon the bench, or
3. By information, which may be at the suit of the
king and a subject upon a penal statute, or at the suit
of the king only, differing from indictments in this,
that it is exhibited by the informer or the king's officer
for misdemeanors only, and not on the oath of the
grand jury.

7. If the offender appears or is in custody, the next Arraign-
ment, the next stage of the indictment. If he stands mute, the court will impanel a jury to in-
quire whether it is by the visitation of God; for if that
is the case, the trial shall proceed as if he had pleaded
not guilty; but upon his standing obstinately mute he
is considered as convicted, and judgment and execution
shall be thereupon awarded, as if he had made an ac-
tual confession of the indictment.

8. Plea, or defensive matter alleged by the prisoner, Defence
may be, 1. A plea to the jurisdiction; as where an plea of
indictment is taken before a court that hath no cognizance
of the offence. 2. Demurrer to the indictment, which
is where the fact alleged is allowed to be true; but the
prisoner joins issue upon some point of law in the in-
dictment, by which he insists that the fact as stated is
no felony, treason, or whatever the crime is alleged to be.
3. A plea in abatement which is principally for a misno-
mer, or false addition to the prisoner; and if the fact is
found by a jury, then the indictment shall be abated.
4. Special pleas in bar, as autrectoys acquit, or an former acquittal. 5. The plea of autrectoys convit, or a former conviction for the same identical crime, though no judg-
ment was ever given, or perhaps will be, (being sus-
pended by the benefit of clergy or other cause,) is a
good plea in bar to an indictment. 6. The plea of au-
trectoys attaint, or a former attainder. 7. Plea of par-
don, which, if pleaded before sentence is passed, pre-
vents the corruption of the blood. 8. The general issue
or plea of not guilty, which brings the point of guilt or
innocence immediately to issue. In this case, the clerk
of the arraigns asks the prisoner how he will be tried?
if he answers "by God and my country," the trial shall proceed; but if he refuses to answer in these words, or stands obstinately mute, conviction as in the case of refusing to plead will follow.

9. The old methods of trial founded upon superscription, are now superseded by the trial per patriam, or by jury; and by the peers of Great Britain in the court of parliament, or in the court of the lord high steward.

Proof must be by witnesesses.

10. In all cases of high treason, petit treason, and misdemeanour, against the coin of the realm, two lawful witnesses are required to convict a prisoner, unless he shall willingly and without violence confess the same. But in almost every other accusation one positive and unobjectionable witness is sufficient.

11. If the jury find the prisoner not guilty, he is then for ever quit and discharged of the accusation. But if the jury find him guilty, he is then said to be convicted of the crime whereof he stands indicted.

Benefit of clergy.

12. After trial and conviction, the judgment of the court regularly follows, unless suspended or arrested by some intervening circumstance, as the benefit of clergy, which is a mortified remnant of Popish abuse. After conviction, if for a clergyable offence, the culprit, instead of burning in the hand as formerly, is either transported, or employed for a definite term upon some work of public utility. By the same privilege, the offender regains the possession of his lands as if he had never been convicted; but upon a second conviction of any clergyable offence, he can have no benefit of clergy. All clergymen actually in orders, are discharged on praying the benefit of the statute without any infamous punishment, and this as often as they offend. And all lords of parliament and peers of the realm shall be discharged in like manner for their first offence.

Judgment.

13. Judgment immediately follows conviction for those crimes which are either too high or too low to be included within the benefit of clergy; but before judgment is passed, the prisoner is asked whether he has any thing to offer why judgment should not be awarded against him? If he has nothing to offer, the court must pronounce that judgment which the law has annexed to the crime; a consequence of which is attaintment, whereby a man becomes dead in law, his real and personal estate is irrecoverably forfeited to the king, and if attainted for treason his blood becomes corrupt; but if the culprit dies before he is attainted, neither forfeiture nor corruption of blood takes place.

14. Judgment may be reversed, 1. By matter dehors or foreign to the record, without a writ of error; as judgment, where the judgment was given by persons who had no good commission to proceed against the person condemned. 2. By writ of error, which lies from all inferior criminal jurisdictions to the court of King's Bench, and from the King's Bench to the House of Lords. 3. By act of parliament. 4. By the king's Pardon, which may be either absolute, commonly called a free pardon; or conditional, as that the convict shall be transported, or undergo some other species of punishment inferior to that to which he has been sentenced. Reprieve is only a temporary suspension of the execution of judgment for some supervening or equitable cause, as pregnancy, insanity, &c.

15. The execution of judgment must in all cases be executed by the legal officer, the sheriff, or his deputy, and in strict conformity to the terms of the warrant of execution.

The following are the most approved institutional writers on the law of England: Coke's Institutes of the Laws of England, with Notes, by Hargrave and Butler, 7 vols. 8vo. 1809. Woodeson's Systematical View of the Laws of England, 3 vols. 8vo. 1792. Wood's Institutes of Do. 1772. Sullivan's Lectures on Do. quart, 1775. Wynne's Enomus, or Dialogues concerning the Law and Constitution of England, 4 vols. 8vo. 1774. And above all, Blackstone's Commentaries on Do. with Mr. Christian's Notes, 4 vols. 8vo. latest edition. To which may be added, De Lollme On the Constitution of England; and the late Professor Miller's Historical View of the English Constitution, from the time of the Saxons to the Revolution 1688, with Dissertations connected with the History of the Government from the Revolution to the present time, 4 vols. 8vo. 1803. Besides what the reader will find in some of these authors on the subject of crown or criminal law, he may further consult, Hale's Pleas of the Crown, with Notes by Mr. Dogherty, 2 vols. 8vo. 1800. Hawkins's Do. with the Additions and Notes of Mr. Leach, 4 vols. 8vo. 1795. Foster's Reports and Discourses on some branches of the Crown Law. Leach's Cases in Crown Law, 2 vols. 8vo. 1800. And East's Treatise of the Pleas of the Crown, vols. i. and ii. (being all yet published) 8vo. 1803.

PART IV. OF THE LAW OF SCOTLAND.

I present a view of the law of Scotland we shall retain, as nearly as the genius of the two systems will admit, the distribution observed in our abstract of the law of England. We will only remark, that the law relating to the king, parliament, &c. or what is commonly understood by the public law of the realm, being in most respects the same in both quarters of the island, we shall here touch upon it only so far as there is any peculiarity in the law of Scotland, referring our readers to Book I. of the foregoing Part, and to the several articles distributed under our general alphabet.

INTRODUCTION.

Of the Sources, or component Parts, of the Law of Scotland.

1. The municipal law of Scotland like that of England, and indeed of all other countries which have any fixed institutions, consists partly of statutory or written law, which has the express authority of the legislative power; and partly of customary or unwritten law, which derives force from the presumed or tacit consent of that power.

2. Under the statutory or written law is comprehended, first, Acts of parliament, not those only which were made in the reign of James I. of Scotland, and from thence down to the union with England in 1707, but such of the British statutes enacted since the union as concern this part of the united kingdom.

3. The remains of the ancient written law of Scotland were published by Sir John Skene, clerk-register, in the beginning of the last century, by license of parliament. The books of Regiam Majestatis, to which the whole collection owes its title, seems to be a system of Scotch law written by a private lawyer at the com
Law of Scotland.

L A W.

Law of Scotland.

The commencement of David I.; and though no express confirmation of that treatise by the legislature appears, yet it is admitted to have been the ancient law of the Scots, by express statutes 1471, c. 47—1487, c. 115. The borough-laws, which were enacted by the same king David, and the statutes of William, Alexander II. David II. and the three Roberts, are universally allowed to be genuine. The Scottish parliaments once and again appointed commissioners to revise and amend the Regalia Majestatem, and the other ancient books of their law, and to make their report; but as no report appears to have been made, nor consequently any ratification by parliament, none of these remains are received, as of proper authority, in the Scotch courts; yet they are of excellent use in proving and illustrating ancient customs.

Acts of Sederunt.

4. The written law comprehends, second, the Acts of Sederunt, which are ordinances for regulating the forms of proceeding before the Court of Session in the administration of justice, made by the judges, who have a delegated power from the legislature for that purpose, 1540, c. 98. Some of these acts touch upon matter of right, which declare what the judges apprehend to be the law of Scotland, and what they are to observe afterwards as a rule of judgment.

5. The civil and canon laws, though they are not perhaps to be deemed proper parts of the written law of Scotland, have undoubtedly had the greatest influence in that kingdom. The powers exercised by the Scottish sovereigns and judges, have been justified upon no other ground than that they were conformable to the civil or canon laws, 1495, c. 51—1540, c. 69, &c. And a special statute was deemed necessary upon the Reformation, to rescind such of their constitutions as were repugnant to the Protestant doctrine, 1567, c. 31. From that period the canon law has been little respected, except in questions of tithes, patronages, and some other articles of ecclesiastical right. But the Roman continues to have great authority in all cases where it is not derogated from by statute or custom, and where the genius of the law suffers it to be applied, 1493, c. 51—1540, c. 51—1567, c. 31.

6. The unwritten or customary law of Scotland, is that which, without being expressly enacted by statute, derives its force from the tacit consent of king and people; which consent is presumed from the ancient custom of the community, as the laws of primogeniture and succession, the legitim, terce, courtesy, &c. No precise time can be fixed as necessary for constituting this sort of law, because some things require in their nature longer time, and a greater frequency of acts to establish them than others. Custom, as it is equally founded in the will of the lawgiver with written law, has therefore the same effects. Hence as one statute may be explained or repealed by another, so a statute may be explained by the uniform practice of the community, and even go into disuse by a posterior contrary custom. But this power of custom to derogate from prior statutes, is generally confined by lawyers to statutes concerning private right, and does not extend to those which regard public policy.

7. A uniform tract of the judgments or decisions of the Court of Session, is commonly considered as part of the customary law; and without doubt where a particular custom is thereby fixed or proved, such custom of itself constitutes law; but decisions, though they bind the parties litigating, have not in their own nature the authority of law in similar cases; yet where they continue uniform, great weight is justly laid on them. Neither can the judgments of the House of Lords of Great Britain reach farther than to the parties in the appeal, in since these the peers act as judges, not as lawgivers. Nevertheless where a similar judgment is repeated in the court of the last resort, it must have the strongest influence upon the determinations of inferior courts.

BOOK I.

Of the Rights arising from the state or condition of Men in Society, and from their more intimate relation, or more usual connection with one another; usually called Rights of Persons.

TITLE I.—Of Ecclesiastical Persons.

1. Upon the abolition of the Pope's authority at the Reformation, the regular clergy were totally supressed; and in place of all the different degrees which distinguished the secular clergy, the Scots had only at first parochial presbyters or ministers, and superintendents who had overseeing of the church within a certain district. Soon thereafter the church government became Episcopal, by archbishops, bishops, &c. 1506, c. 2; and after some intermediate turns is now Presbyterian, by kirk-sessions, presbyteries, synods, and general assemblies.

2. He who founded or endowed a church, was entitled to the right of patronage of it, or advocatio ecclesiae; whereby among other privileges, he might present a churchman to the cure in case of a vacancy. The presentee after he was received into the church, had a right to the benefice proprio jure; and if the church was parochial, he was called a parson. The Pope claimed the right of patronage of every kirk to which no third party could shew a special title; and since the Reformation, the crown, as coming in place of the Pope, is considered as the universal patron where no right of patronage appears in a subject. Where two churches are united which had different patrons, each patron presents by turns.

3. Where a fund is gifted for the establishment of a Patronage second minister, in a parish where the care is thought too heavy for one, the patronage of such benefice does not belong to the donor, but to him who was patron of the church; unless either where the donor has reserved to himself the right of patronage in the donation, or where he and his successors have been in the constant use of presenting the second minister without challenge from the patron. The right of presenting incumbents was, by 1696, c. 23, taken from patrons, and vested in the heritors and elders of the parish, upon payment to be made by the heritors to the patron, of 600 merks; but it was again restored to patrons, 10 Ann. c. 12; with the exception of the presentations sold in pursuance of the former act.

4. That kirkis may not continue too long vacant, the Patrons patron must present to the presbytery, (formerly to the must presbytery,) a fit person for supplying the cure within six months from his knowledge of the vacancy, otherwise the right of presentation accrues to the presbytery jur delevolito. Since the final abolition of Episcopacy at the Revolution, a judicial act of admission by the presbytery, proceeding either upon a presentation, or upon a call from the heritors and elders, or upon their own jure devolutum, completes the minister's right to the benefice.
5. Soon after the Reformation, the Popish churchmen were prevailed upon to resign in the sovereign’s hands a third of their benefices; which, by 1567, c. 10, was appropriated, in the first place, for the subsistence of the reformed clergy. To make this fund effectual, particular localities were assigned in every benefice to the extent of a third, called the assumption of thirds; and for the farther support of ministers, Queen Mary made a grant in their favour of all the small benefices, not exceeding 500 merks, which was confirmed by 1572, c. 52. Bishops, by the act which restored them to the whole of their benefices, 1606, c. 2, were obliged to maintain the ministers within their dioceses, out of the third; and in like manner the late titulars, who got grants of the teinds, became bound, by their acceptance of them, to provide the kirkis within their erections in competent stipends.

6. But all these expedients for the maintenance of the clergy having proved ineffectual, a commission of Parliament was appointed in the reign of James VI. for planting kirkis, and modifying stipends to ministers out of the teinds, 1617, c. 3, to which a power was soon superadded of dividing large parishes and erecting new churches, by 1621, c. 5: a second commission was appointed, 1639, c. 19, not only for modifying stipends, but for the valuation and sale of teinds. After the Restoration, several new commissions were granted by Parliament, with more ample powers of dismembering and annexing churches as they should find just, 1651, c. 61, &c.; but the powers of all these were, by 1677, c. 9, transferred to the Court of Session, with this limitation, that no parish should be disjoined, new church erected, or old one removed to a new place, without the consent of three fourths of the heritors, computing the votes not by their numbers, but by the valuation of their rents within the parish. The judges of the Session, when sitting in that court upon the causes so devolved upon them, are considered as a commission of Parliament, and have their proper clerks, masers, and other officers of court, as such. Their judgments in that capacity may be appealed to the House of Lords as in ordinary cases. And the powers and duties of this commission have been lately defined and regulated by 48 Geo. III. c. 136.

7. The lowest stipend that could be modified to a minister by the first commission 1617, c. 9, was 500 merks, or five chalderes of victual, unless where the whole teinds of the parish did not extend so far; and the highest was 1000 merks, or ten chalderes. The Parliament, 1633, c. 8, raised the minimum to eight chalderes of victual, and proportionally in money; but as neither the commission appointed by that act, nor any of the subsequent ones, was limited as to the maximum, the commissioners have been in the practice of augmenting stipends considerably above the old maximum, where there is sufficiency of free teinds, and the curé is burdensome, or living expensive.

8. Few of the reformed ministers were, at first, provided with dwelling-houses; most of the Popish clergy having, upon the first appearance of the Reformation, let their manses in feu, or in long tacks: Ministers, therefore, got a right, by 1563, c. 72, to as much of these manses as would serve them, notwithstanding such feu or tacks. When there was no parson’s or vicar’s manse, one was to be built by the heritors, at the sight of the bishop, (now the presbytery,) the charge not exceeding £1000 Scots, nor below 500 merks, 1649, c. 45—1663, c. 21. Under a manse are comprehended stable, barn, and byre, with a garden; for all which it is usual to allow half an acre of ground. Every incumbent is entitled, at his entry, to have his manse put into good condition.

9. All ministers, where there is any landward or glebe country parish, are, over and above their stipend, entitled to a glebe, which comprehends four acres of arable land, or sixteen soms of pasture ground where there is no arable land, (a som is what will graze ten sheep, or one cow,) and is to be designed or marked by the bishop or presbytery, out of such kirk-lands within the parish as lie nearest to the kirk, 1593, c. 165—1606, c. 7. As the benefit intended by these acts to the clergy must have been lost where there were no kirk-lands in the parish, it was provided, by 1644, c. 31, that, in default of kirk-lands, the glebe should be designed out of temporal lands; and this act, though falling under the act recisory of Charles II, seems to have been considered as still in force by 1663, c. 21, which takes it for granted, that all ministers, except those in certain royal boroughs, have right to glebes. A right of relief is competent to the heritors whose lands are set off for the manse or glebe, against the other heritors of the parish.

10. Ministers, besides their glebe, were entitled to grass for a horse and two cows, by 1649, c. 45, which is revived, by 1663, c. 21; and if the kirk-lands, out of which the grass may be designed, either lie at a distance, or are not fit for pasture; the heritors are to pay to the minister £20 Scots yearly, as an equivalent. Ministers have also freedom of foggage, pastureage, fuel, fear, divot, loaning, and free ish and entry, according to use and wont, 1593, c. 165—1663, c. 21. What these privileges are, must be determined by the local custom of the several parishes. Besides the above mentioned burdens which are imposed upon heritors, the parishioners were obliged to provide communion cups and lavers, 1617, c. 6, and to repair the kirk and kirk-yard dikes, 1572, c. 54—1597, c. 239; but these burdens are now for the most part undertaken by the heritors.

Title II.—Of Husband and Wife.

1. Persons, when considered in a private capacity, marriage are chiefly distinguished by their mutual relations; as husband and wife, tutor and minor, father and child, master and servant. The relation of husband and wife is constituted by marriage, which is the conjunction of man and wife vowing to live inseparably till death.

2. Marriage is truly a contract, and so requires the null with consent of parties. Idiots, therefore, and furious persons cannot marry. As no person is presumed capable of consent within the years of pupillarity, which, by our law, lasts till the age of fourteen in males, and twelve in females, marriage cannot be contracted by pupils; but if the married pair shall cohabit after puberty, such acquiescence gives force to the marriage. Marriage is fully perfected by consent; which, without consummation, founds all the conjugal rights and duties. The consent requisite to marriage must be de praesenti. A which must promise of marriage (stipulatio sponsalitatis,) though it be de praesenti was guarded by certain penalties in the Roman law, senti. L. 5. c. de spons, may, by ours, be safely resiled from, as long as matters are entire; but if any thing be done by one of the parties, whereby a prejudice arises from the non-performance, the party resiling is liable in damages to the other. The canonists, and after them our
court of justice, explain a copula subsequent to a promise of marriage into actual marriage.

3. It is not necessary that marriage should be celebrated by a clergyman. The consent of parties may be declared before any magistrate, or simply before witnesees. And though no formal consent should appear, marriage is presumed from the cohabitation, or living together at bed and board, of a man and woman who are generally reputed husband and wife. One's acknowledgment of his marriage to the midwife whom he called to his wife, and to the minister who baptized his child, was found sufficient presumptive evidence of marriage, without the aid either of cohabitation or of habilc and repute.

The father's consent was, by the Roman law, essential to the marriage of children in familia. But by our law, children may enter into marriage without the knowledge, and even against, the remonstrances of a father.

Consent of parents not necessary.

4. Marriage is forbidden within certain degrees of blood. The Romans reckoned a degree for every person generated; by which rule, a father and a son are in the first, brothers in the second, and first cousins in the fourth degree of consanguinity. The canon law computes by the persons generated upon one side only, which, in the direct line of ascendants and descendants, comes to the same account with the Roman computation; but in the traverse or collateral line, makes a considerable variation from it. By 1507, c. 15, which adopts the law of Moses, Levit. c. 18, into ours, seconds in blood, and all remoter degrees, may lawfully marry. By seconds in blood are meant first cousins, according to the computation of the canon law, which was at that time the common way in Scotland of reckoning degrees. Marriage in the direct line is forbidden in infinitum; as also in the collateral line in the special case where one of the parties is loco parentis to the other, as grand-uncle, great-grand-uncle, &c., with respect to his grand-niece, &c. The same degrees that are prohibited in consanguinity are prohibited in affinity; which is the tie arising from marriage between one of the married pair and the blood relations of the other. Marriage, also, where either of the parties is naturally unfit for generation, or stands already married to a third person, is ipso jure null.

5. To prevent bigamy and incestuous marriages, the church has introduced proclamation of bans; which is the ceremony of publishing the names and designsations (addition) of those who intend to intermarry, in the churches of the parishes where the bride and bridegroom reside, after the congregation is assembled for divine service, that all persons who know any objection to the marriage may offer it. Not bishops only, but prebendaries, assumed formerly a power of dispensing with proclamation of bans on extraordinary occasions. Act Abs. 1693, Sec. 25, which has not been exercised since the Revolution. When the creed of the church is observed, the marriage is called regular; when otherwise, clandestine. Clandestine marriage, though it be valid, has statutory penalties annexed to it, affecting not only the parties, but the celebrator and witnesses, 1661, c. 34—1693, c. 12—1698, c. 6. and, over and above, the parties were punished with the loss of certain conjugal rights; the husband lost his jus maritii, and the wife her jus relieta, by 1672, c. 9. This last act, which also inflicted penalties against the then non-conforming clergy, was rescinded in the lump with other acts for conformity by 1690, c. 27; in respect of which the penalties of the act 1672 against clandestine marriages were found to be taken off. *Fountainhall, 11th Dec. 1705, Carruthers.

6. By marriage, a society is created between the married pair, which draws after it a mutual communication of their civil interests, in as far as is necessary for maintaining it. As the society lasts only for the lives of the socii, therefore rights that have the nature of a perpetuity, which our law styles heritable, are not brought under the partnership or communion of goods, as a land estate, or bonds bearing a yearly interest: it is only moveable subjects, or the fruits produced by heritable subjects during the marriage, that become common to man and wife.

7. The husband, as the head of the wife, has the sole right of managing the goods in common, which is called jus maritii. This right is so absolute, that it bears but little resemblance to a right of administering a common subject; for the husband can, in virtue thereof, sell, or even gift at his pleasure, the whole goods falling under communion; and his creditors may affect them for the payment of his proper debts; so that the jus maritii carries all the characters of an assignment by the wife to the husband, of her moveable estate. It arises ipso jure from the marriage, and therefore needs no other constitution.

8. From this right are excepted paraphernal goods, Paraphernalia excepted from this right.

Burdens of the husband, not moveable estate, is burdened with the moveable debts contracted affecting his wife before marriage: And as his right is universal, so is his burden; for it reaches to her whole moveable debts, though they should far exceed her moveable estate. Yet the husband is not considered as the true debtor in his wife's debts. In all actions for payment she is the proper defender; the husband is only cited for his interest, that is, as curator to her, and administrator of the society goods. As soon, therefore, as the marriage is dissolved, and the society goods thereby suffer a division, the husband is no farther concerned in the share belonging to his deceased wife; and consequently is no longer liable to pay her debts, which must be recovered from her representatives, or her separate estate.

10. The husband, by marriage, becomes the perpetual curator of the wife. From this right it arises, that no suit can proceed against the wife till the husband be cited for his interest: And if she is married during the dependence of a process against her before an inferior court, and if the husband dwells within another territory, he must be called by letters of supplement, which are granted of course by the Court of Session. 2. All debts done by a wife, without the husband's consent, are null; neither can she sue in any action without the husband's concurrence. When the husband refuses, or by reason of forfeiture, &c., cannot concur, or where the action is to be brought against the husband himself for performing his part of the marriage-articles, the judge will authorise her to sue in her own name. To prevent the necessity of applying for the court's authority, care is generally taken in marriage-contracts, to name certain trustees, at whose instance execution may pass against the husband. The effects arising from this curatorial power...
discover themselves even before marriage, upon the publication of bans; after which the bride, being no longer sui juris, can contract no debt, nor do any deed either to the prejudice of her future husband, or even to her own. But it is in his right for that purpose that the bans have been published at the bride's parish-church; the notification must be also made at the bride's, in order to interpel persons from contracting with her.

11. If the husband should either withdraw from his wife, or turn her out of doors, or if continuing in family with her, he should by severe treatment endanger her life, the commissaries will authorize a separation a mensa et foro, and give a separate alimony to the wife, suitable to her husband's estate, from the time of such separation, until either a reconciliation or a sentence of divorce.

12. A wife, while she remains in family with her husband, is considered as proposita negotios domesticiæ; and, consequently, may provide things proper for the family; for the price whereof the husband is liable, though they should be misapplied, or though the husband should have given her money to provide them elsewhere.

A husband who suspects that his wife may hurt his fortune by high living, may use the remedy of inhibition against her, by which all persons are interpelled from contracting with her, or giving her credit: After the completing of this diligence, whereby the propositura falls, the wife cannot bind the husband, unless for such reasonable furnishings as he cannot instruct that he provided her with aliunde. As every man, and consequently every husband, has a right to remove his managers at pleasure, inhibition may pass at the suit of the husband against the wife, though he should not offer to justify that measure by an actual proof of the extravagance or profuseness of her temper.

13. As to the rights granted by the wife affecting her estate; she has no moveable estate, except her paraphernalia; and those she may alien or impignorate, with consent of the husband as curator, otherwise not. She can even, without the husband, bequeath by testament her share of the goods in communion; but she cannot dispose of them inter vivos, for she herself has no proper right to them while the marriage subsists. A wife can lawfully obligate herself, in relation to her heritable estate, with consent of her husband; for though her person is in some sense sunk by the marriage, she continues capable of holding a real estate; and in such obligations, her estate is considered, and not her person. A husband, though he is curator to his wife, can, by his acceptance or intervention, authorize rights granted by her in his own favour; for a husband's curatorship is not intended only for the wife's advantage, but is considered as a mutual benefit to both.

14. By the law of Scotland, agreeably to the rules of our holy religion, marriage cannot be dissoluted till death, except by divorce, proceeding either upon the head of adultery, Math. xix. 8, 9. Mark x. 11. or of wilful desertion, 1 Cor. vii. 15.

15. Marriage is dissoluted by death, either within year and day of its being contracted, or after year and day. If it is dissolved within year and day, all rights granted in consideration of the marriage become void, and things return to the same condition in which they stood before the marriage. The tocher returns to the wife, or those from whom it came; and all the inter-
est, either legal or conventional, arising to the wife in the husband's estate, returns to the husband or his heirs.

16. Upon the dissolution of a marriage after year and after year day, the surviving husband becomes the irrevocable and day; proprietor of the tocher; and the wife, where she survives, is entitled to her jointure, or to her legal provi-
sions of terce, and just relictia. If a living child is created of the marriage, who has been heard to cry, the marriage has the same effect as if it had subsisted beyond the year. The disputes that might arise from the dissolution of a marriage within the year, are generally prevented by a clause in marriage-contracts, that the interest of the husband and wife shall continue, though the marriage should be dissolved sooner without a living child.

17. Divorce is such a separation of married persons Dissolution during their lives, as loses them from the nuptial tie, by divorce and leaves them at freedom to intermarry with others. Marriage being by the canonists numbered among the sacraments, is reckoned a bond so sacred that nothing can dissolve it. In the case of adultery itself, they allow only a separation from bed and board; and even by our law, neither adultery nor wilful desertion are grounds which must necessarily dissolve marriage; they are only handles, which the injured party may take hold of to be free. Cohabitation, therefore, by the in-
jured party, after being in the knowledge of the acts of adultery, implies a passing from the injury; and no divorce can proceed which is carried on by collusion betwixt the parties, lest, contrary to the first insti-
tution of marriage, they might disengage themselves by their own consent. As by divorce the nuptial tie itself is loosened, the guilty person as well as the innocent may contract second marriages; but in the case of di-

Dissolution of marriage; its effects.

18. Where either party has deserted from the other for four years together, that other may by 1578. c. 55, upon wilful issue for adherence before the commissaries, whose decree the session may enforce by letters of herning. If these have no effect, the church is to proceed first by admonition, then by excommunication; all which previous steps are declared to be a sufficient ground for pursuing a divorce. In practice, the commissaries pronounce sentence in the adherence after one year's des-
tion; but four years must intervene between the first desertion and the decree of divorce. But the in-
structions, 1666, c. 2, the inferior commissaries can only judge in the previous action of adherence; the di-

by death within year and day;
LAW.

Title III.—Of Tutors and Curators, Parent and Child, Master and Servant.

Pupillarity. 1. The stages of life principally distinguished in law, are pupillarity, puberty or minority, and majority. A child is in pupillarity from the birth till 14 years of age if a male, and till twelve if a female. Minority begins where pupillarity ends, and continues till majority, which by the law of Scotland is the age of twenty-one years complete both in males and females; but minority in a large sense includes all under age, whether pupils or puerers. Because pupils cannot in any degree act for themselves, and minors seldom with discretion, pupils are put by law under the power of tutors, and minors may put themselves under the direction of curators. Tutority is a power and faculty to govern the person, and administer the state of a pupil. Tutors are either nominate, of law, or dative; which answers to the tutores testamentarii, legitimi, and dativi, of the Roman law.

Tutor nominate. 2. A tutor nominate, is he who is named by a father in his testament or other writing, to a lawful child. As the right of naming tutors proceeds from the fatherly power, those who are named by a mother or stranger are not proper tutors; their powers are limited to the special estate left to the pupil; and therefore their being named cannot hinder the pupil from getting one who may defend his person, and manage his other estate. The nomination of tutors being entirely pendent on the will of the father, may be altered at his pleasure, even though it should have been engrossed in a writing of its nature irrevocable, as a disposition. A tutor nominate is not obliged to give caution for the faithful discharge of his office, because his fidelity is presumed to have been sufficiently known to the father.

Tutor of law, who? 3. If there be no nomination by the father, or if the tutors nominate do not accept, or if the nomination falls by death or otherwise, there is place for a tutor of law; so called, because he succeeds by the mere disposition of law. This sort of tutor devolved by the ancient Roman law, and devolves also by ours, upon the next agnate; but the word agnate is differently understood in our law and in theirs. Agnates in the sense of the Roman law, were those whose propinquity was connected by males only; in the relation of cognates, one or more females were interposed. We understand by agnates, all those who are related by the father even though females intervene; and by cognates, those who are related by the mother.

Where there are twenty-five years of age. 4. Where there are two or more agnates equally near to the pupil, he who is entitled to the pupil's legal succession falls to be preferred to the others, because it is presumed that he will be the most diligent in preserving the estate. But as the law suspects that he may not be over careful to preserve a life which stands in the way of his own interest, this sort of tutor is excluded from the custody of the pupil's person, which is commonly committed to the mother, while a widow, until the pupil be seven years old; and on default of the mother to the next cognate. The tutor-of-law must be at least twenty-five years of age. He is served or declared by a jury of sworn men, who are called upon a brief issuing from the chancery, which is directed to any judge having jurisdiction. He must give security before he enters upon the management.

5. If no tutor-of-law demands the office, any person, even a stranger, may apply for a tutor-dative. But, because a tutor-of-law ought to be allowed a competent time to decide whether he will serve or not, no tutor-dative can be given till the elapsing of a year from the time at which the tutor-of-law had first a right to serve, i.e. till a year after the death of the deceased, if the father has named no tutors; and if he has named tutors, who have accepted, not till a year after the nomination falls by the death or incapacity of the nominees. It is the king alone, as the father of his country, who gives tutors-dative, by his Court of Exchequer; and no gift of tutority can pass in Exchequer without the citation or consent of the next of kin to the pupil, both by the father and mother; nor till the tutor gives security, recorded in the books of Exchequer. There is no room for a tutor-of-law, or tutor-dative, while a tutor-dative can be hoped for: And tutors-of-law, or dative, even after they have begun to act, may be excluded by the tutor-dative, as soon as he offers to accept, unless he has expressly renounced the office.

If a pupil be without tutors of any kind, the Court of Session will, at the suit of any kinman, name a factor for a (steward) for the management of the pupil's estate, minor, who must conduct himself by the rules laid down, Act who? S. 18. Feb. 1730.

6. After the years of pupillarity are over, the minor is considered as capable of acting by himself, if he has confidence enough in his own capacity and prudence. The only two cases in which curators are imposed upon minors, are, 1. When they are named by the father in liege pouste, or in a state of health, in consequence of 1696, c. 8. 2. Where the father is himself alive; for a factor is ipso jure, without any service, administrator, that it is, both tutor and curator of law to his children, in relation to whatever estate may fall to them during their minority. This right in the father does not extend to grand-children, nor to such even of his immediate children as are forisfamiliated; Neither has it place in subjects which are left by a stranger to the minor, excluding of the father's administration. If the minor chooses to be under the direction of curators, he must raise and execute a summons, citing at least two of the next of kin to appear before his own judge-ordinary, upon nine days warning. At the day and place of appearance, he offers to the judge a list of those whom he intends for his curators: Such of them as resolve to undertake the office, must sign their acceptance, and give caution; upon which an act of curatory is extracted.

7. These curators are styled ad negotium, to distinguish Curator ad them from another sort called curators ad lites, who are lites, authorised by the judge to concur with a pupil or minor in actions of law, either where he is without tutors and curators, or where tutors or curators are parties to the suit. This sort is not obliged to give caution, because they have no intermeddling with the minor's estate: They are appointed for a special purpose; and, when that is over, their office is at an end. Women were, by the Roman law, debarred from the offices both of tutority and curatory, except in special cases; With us they are capable, under the following restrictions: Who debarred from tutori and curatory? 1. The office of a female tutor or curator falls by her marriage, even though the nomination should provide otherwise; for after she is herself subjected to the power of a husband, she is incapable of having any person under her power. 2. No woman can be tutor of law; for that sort is marked out, purely on the score of blood, without any regard to personal qualities. Pa-
11. It is the duty of tutors and curators to take proper care of the minor's person and education, and to disburse the expense necessary for that purpose. Tutors ought not to employ a yearly sum exceeding the interest of the minor's stock, or the rent of his estate, for his education and maintenance; but curators may pay more on the stock itself, where it is small, or the son: employ the whole of it if less will not do, for putting the minor in a way of business. It is also their duty to his revenue—employ the minor's rents and interests profitably.

12. Though no person is obliged to accept the office of tutor or curator, yet having once accepted, he cannot throw it up or renounce it without sufficient cause. But if he should be guilty of misappropriating the minor's money, or fail in any other part of his duty, he may be removed by the actio, or rather accusatio, suspici tuto- riae, which was by the Roman law, popularis, but with us can be pursued only by the minor's next of kin, or by a co-tutor or co-curator. The office of tutor and curator expire also by the pupil's attaining the age of puberty, or the minor's attaining the age of twenty-one years complete; and by the death either of the minor or of his tutor or curator.

13. Deeds either by pupils or by minors having curators, without their consent are null; but they oblige the granters, in so far as relates to sums profitably applied to their use. A minor under curators can indeed make a testament by himself; but whatever is executed in the form of a deed inter vivos, requires the curator's consent. Deeds by a minor who has no curators, are as effectual as if he had had curators, and signed them with their consent; he may even alienate his heritage, with the interposition of a judge.

14. Minors may be granted deeds; Realisation in their minority that are hurtful to them. Deeds of minors, in themselves void, need not the remedy of restitution; but where hurtful deeds are granted by a tutor in the pupil's affairs, or by a minor who has no curators, as these deeds subsist in law, restitution is necessary: And even where a minor having curators, executes a deed hurtful to himself with their consent, he has not only action against the curators, but he has the benefit of restitution against the deed itself, both by the Roman law, and by ours.

15. The persons of pupils are protected from imprisonment in civil debts, by 1696, c. 41. Pupils cannot be imprisoned for debt.

16. Curators are given, not only to minors, but in general to every one who, either through defect of judgment, or unfitness of disposition, is incapable of rightly managing his own affairs. Curators may be also granted to lunatics, and even to persons dumb and deaf, though they be of sound judgment, when it appears that they cannot exert it in the management of business.

17. The law concerning the state of children falls Parent and next to be explained. Children are either born in wed- child-lock, or out of it. All children born in lawful marriage Lawful or wedlock are presumed to be begotten by the person children to whom the mother is married, and consequently to be lawful children. This presumption is so strongly founded, that it cannot be defeated but by direct evidence that the mother's husband could not be the father of the child, e.g. where he is impotent, or was absent from the stock within six lunar months of the birth. The canonists indeed maintain, that the concurring testimony of the husband and wife, that the child was not procreated by the husband, is sufficient to elide this legal presumption for legitimacy; which doctrine is adopted by Craig, 371, § 20. and Lord Stair, 11. 3. §
20. Colliers, coal-bearers, and salters, and other persons necessary to the collieries and salt-works, as they are particularly described, 1661, c. 56, were, like the adscripti globus of the Roman law, tied down by our former law, to perpetual service at the works to which they had once entered. Upon a sale of the works, the right of their service was transferred to the new proprietor. All persons were prohibited to receive them into their service, without a testimonial from their last master; and if they deserted to another work, and were redeemed within a year thereafter, he who had received them was obliged to return them within twenty-four hours under a penalty, 1661, c. 11. But by the stat. 15 Geo. III. c. 28, and 29th Geo. III. c. 56, all colliers, coal-bearers, and salters, are now emancipated from servitude; and it is declared, that none shall be bound to a colliery or salt-work, in any other way than as a common servant or labourer.

21. The poor make the lowest class or order of persons. Indigent children may, by 1617, c. 10, be made children, compelled to serve any of the king's subjects without wages till the age of thirty years. Vagrants and sturdy beggars may also be compelled to serve any manufacturer, gars, by 1663, c. 16. And because few persons were willing to receive them into their service, work-houses are, by 1672, c. 18, ordained to be built for setting them to work. The poor who cannot work, must be maintained by the parishes in which they were born, 1535, c. 22; and where the place of their nativity is not known, that burden falls upon the parishes where they ed have had their most common resort for the three years immediately preceding their being apprehended, or their applying for the public charity, 1663, c. 16—1695, c. 21. Where the contributions collected at the churches to which they belong are not sufficient for their maintenance, they are, by 1672, c. 18, to receive badges from the minister and kirk-session; in virtue of which, they may ask alms at the dwelling-houses of the inhabitants of the parish.

BOOK II.

Of the rights arising from Property, usually called Rights of Things.

Title I.—Of Heritable, as distinguished from Moveable Rights.

1. For the better understanding the doctrine of this title it may be observed, that, though, by the Roman law, the person or persons next of blood to one dying intestate, succeeds to the right of his whole estate, of whatsoever subjects it might have consisted; yet, by the law of Scotland, and indeed of most nations of Europe, since the introduction of feus, wherever there are two or more in the same degree of consanguinity to the deceased, who are not all females, such rights as are either properly feudal, or have any resemblance to feudal rights, descend by law wholly to one of them, who is considered as the proper heir of the deceased; the others, who have the name of next of kin or executors, must be contented with that portion of the estate which is of a more perishable nature. Hence has arisen the division of rights to be explained under this title; heritable, partly movable.
LAW.

2. All rights of or affecting lands, under which are comprehended houses, mills, fishings, teinds; and all rights of subjects that are fundo annua, whether completed by seisin or not, are heritable ex sua natura. On the other part, every thing that moves itself, or can be moved, and in general whatever is not united to land is movable; as household furniture, corns, cattle, cash. Arrears of rent and of interest, even though they should be due on a right of annuity; for though the arrears last mentioned are secured on land, yet being already payable, they are considered as cash. When a feu duty like other arrears are moveable, and consequently belong to the superior's executors. In rights bearing a tract of future time, i.e. rights which cannot be fulfilled at once, and which carry a yearly profit to the creditor while they subsist, e.g. an annuity for a certain term of years, though the arrears due before the creditor's death are moveable, yet the rights themselves are heritable, both because they yield an annual profit, and because nothing falls under executory but what is instantly payable, and can be gathered in and distributed among those that have interest in it. So that admitting them not to be heritable ex sua natura, the heir is the only person that can take them. Leases of lands are moveable, both as they have a tract of future time, and as statute has given to them in certain respects the effect of real rights of land.

3. Debts (nomina debitorum) when due by bill, promissory note or account, are moveable. When constituted by bond, they are moveable as to succession, but heritable as to the fisk and the relict, that is, though by the general rule moveable rights fall under the commutation of goods consequent upon marriage, and the moveables of dementi persons fall to the crown or fisk by single escheat, yet bonds bearing interest do neither, but are heritable in both respects. When constituted by bond having a clause of infallibility, they are heritable.

4. Where lands are voluntarily sold, either by a formal disposition, or even by a minute of sale, the price, if it be not heritably secured, must as a moveable subject go to the seller's executors. But in judicial sales for the behoof of creditors, the debts continue heritably secured on the price till payment or the conveyance to the purchaser; and therefore in so far as they are not paid to the creditor himself, they must go to his heir.

5. All questions whether a right be heritable or moveable, must be determined according to the condition of the subject at the time of the ancestor's death. If it was heritable at that period it must belong to the heir; if moveable it must fall to the executor, without regard to any alterations that may have affected the subject in the intermediate period between the ancestor's death and the competition.

Title II.—Of the Constitution of Heritable Rights, of Holdings, and of the respective Rights of the Superior and Vassal.

1. Heritable rights are governed by the feudal law, which owes its origin, or, at least its first improvements to the Lombards, whose kings, upon having penetrated into Italy, the better to preserve their conquests found it their interest to make grants to their principal commanders of great part of the conquered provinces, to be again subdivided by them among the lower officers, under the conditions of fidelity and military service.

2. In feudal questions we are governed, in the first place, by our own statutes and customs; where these fail us, we have regard to the practice of neighbouring countries, if the genius of their law appears to be the same with ours; and should the question still remain doubtful, we may have recourse to the written books of the feus, as to the original plan on which all feudal systems have proceeded.

3. This military grant got the name, first of beneficium, and afterwards of feudum; and was defined, a gratuitous right to the property of lands, made under the conditions of feudal and military service, to be performed by the vassal to the superior, i.e. on the lands still remaining in the grantee. Under lands in this definition, are comprehended all rights or subjects so connected with land, that they are deemed a part thereof; as houses, mills, fishings, jurisdictions, patronages, &c. Though feus in their original nature were gratuitous, they soon became the subject of commerce; services of a civil or religious kind were frequently substituted in place of military; and now, of a long time, services of every kind have been entirely dispensed with in certain feudal tenures. He who makes the grant is called the superior, and he who receives it the vassal. The subject of the grant is commonly called the feu, though that word is at other times in our law transposed to signify one particular service. The interest obtained by the superior in the feu, is styled dominium directum, or the superiority; and the interest acquired by the vassal dominium utile, or the property. The word fee is prominently applied to both.

4. Wullodial property is opposed to feus, by which is understood, property enjoyed by the owner independently of a superior. All moveable goods are alodial; but with us no lands are alodial except those of the king's own property, his superiorities, and manors and glebes, the right of which latter is completed by the presbytery's designation, without any feudal grant.

5. A vassal, though he has only the dominium utile, who can can sub-feu his property to a sub-vassal by a subtertium grant feudal right, and thereby raise a new dominium directum in himself, subordinate to that which is in his superior, and so in infinitum. The vassal who thus sub-feus, is called the sub-vassal's immediate superior, and the vassal's superior is the sub-vassal's mediatrix superior.

6. Every heritable subject capable of commerce may be granted in feu. From this general rule is excepted, 1. The annexed property of the crown, which is not alienable without a previous dissolution in parliament. 2. Tailored lands, which are devised under condition that they shall not be aliened. 3. An estate in hereditate jacent e cannot be effectually aliened by the heir apparent (i.e. not entered); but such alienation becomes effectual upon his entry, the supervening right accruing in that case to the purchaser.

7. The feudal right, or as it is called investiture, is feudal constituted by charter and seisin. By the charter, we charter, understand that writing which contains the grant of the feudal subjects to the vassal, whether it be executed in the proper form of a charter or of a disposition. Charters by subject-superiors are granted, either 1. A me de superio, charter noem, when they are to be holden not of the grantor himself but of his superior. This sort is called a public holding, because vassals were in ancient times publicly received in the superior's court, before the pues curiae or co-vassals. Or 2. De me, where the lands are to be holden of the grantor. These were called sometimes their rights, from bon, lower, and sometimes private, because before the establishment of our records they were easily concealed from third parties: the nature of all which will be more fully explained in the following Title. An origi-
natural charter is that by which the fee is first granted; a charter by progress is a renewed disposition of that fee. The constituent parts of a charter are, the narrative or recital, which expresses the causes inducing the grant; the dispositive clause, in which the subjects made over are described by such characters as may sufficiently distinguish them, and here also the order of succession and limitation of the fee is expressed; the clause of tenendas, declaring the particular tenure by which the lands are to be held; the clause of warrantice, by which the grantee solemnly promises himself that the right conveyed shall be effectual to the receiver; and the precept of seisin, which is the command of the superior or grantor of the right, to his bailee, for giving seisin or possession to the vassal or his attorney, by delivering to him the proper symbols of that possession.

8. A seisin is the instrument or attestation of a notary, that possession was actually given by the superior or his bailee to the vassal or his attorney; and it sometimes gets the name of infestament, though that word in its proper sense signifies the whole feudal right. For a long time, the appending of the bailee's seal to the superior's charter or precept, and sometimes his separate declaration that he had given seisin, completed the vassal's right, without the attestation of a notary. But afterwards a notarial instrument came to be considered as a necessary solemnity, not supposable either by a proof of real possession or preemption, or even of the special fact, that the vassal was duly entered to the possession by the superior's bailee.

9. All seisins and other real rights mentioned in 1617, c. 16, must be registered within sixty days after their date, either in the general register of seisins at Edinburgh, or in the register of the particular shire appointed by the acts, which, it must be observed, is not in every case the shire within which the lands lie. Unregistered seisins are ineffectual against third parties, but they are valid against the granters and their heirs.

10. The attestation of the keeper of the records on the back of the seisin that it was registered, was deemed a sufficient registration 1686, c. 19. But as this weakened the security intended from the records to singular successors, the actual booking of seisins and of other writings presented for registration, is now required, 1696, c. 18. Seisins regularly recorded are preferable, not according to their own dates but the dates of their registration.

11. Seisin necessarily supposes a superior by whom it is given; the right, therefore, which the sovereign, who acknowledges no superior, has over the whole lands of Scotland, is constituted jure corona without seisin. In several parcels of land that lie contiguous to one another, one seisin serves for all, unless the right of the several parcels be either held of different superiors, or derived from different authors, or enjoyed by different tenures under the same superior.

12. A charter not perfected by seisin, is a right merely personal, which does not transfer the property; and a seisin of itself bears no faith without its warrant. It is the seisin and charter joined together that constitutes the feudal right, and secures the receiver against the effect of all posterior seisins, even though the charters on which they proceed should be prior to his; and still more against all qualities burdening his author's right, contained in latent personal declarations or back-bonds, which have not been rendered litigious before his seisin.

13. No quality which is designed as a lien or real burden on a feudal right, can be effectual against singular successors, if it be not inserted in the investiture.
tenure of those holden of subjects, into feu for payment of such yearly feu-duty in money, victual, or cattle, in place of all services, as shall be fixed by the Court of Session.

21. The only casualty, or rather forfeiture, proper to feu-holdings, is the loss or tinsel of the feu-right, by the neglect of payment of the feu-duty for two full years. 1597, c. 246.

22. The casualties common to all holdings, are non-entry, relief, liferent, escheat, disclaimer, and purpresse.

Non-entry. What non-entries due before citation; after citation; after payment of due entries duties debita fundi, which the superior, as creditor, may recover by a poinding of the ground; but the right which he has to the full duties that fall after citation, does not accrue to him as creditor, but as inter minibus of the rents; in which character he can make the rents effectual by a petitory action against tenants and intromitters, improperly called a special declarator.

23. The heir, from the death of the ancestor till he be cited by the superior in a process of general declarator of non-entry, loses only the rent duty of his lands; and he forfeits these, though his delay should not argue any contempt of the superior, because the casualty is considered as falling as a condition implied in the feudal right, and not as a penalty of transgression. But while the delay proceeds not from the heir, but from the superior, nothing is forfeited, not even the rent duties.

24. The heir, after he is cited by the superior in the action of a general declarator, is subjected to the full duties till his entry, because his neglect is less excusable than his negligence after citation. The rent duties due before citation are debita fundi, which the superior, as creditor, may recover by a poinding of the ground; but the right which he has to the full duties that fall after citation, does not accrue to him as creditor, but as inter dominus of the rents, in which character he can make the rents effectual by a petitory action against tenants and intromitters, improperly called a special declarator.

Relief. Relief is that casualty which entitles the superior to an acknowledgement or consideration from the heir for receiving him as vassal. It is called relief, because by the entry of the heir his fee is relieved out of the lands of the superior. The superior can recover this fee either by a poinding of the ground, as a debita fundi, or by a personal action against the heir, who, if the lands held of the crown, is subjected by his taking a precept of seizin from the chancery, though he should not infect himself upon it. In blench and feu-holdings, where this casualty is expressly stipulated, a year's blench or feu-duty is due in name of relief, besides the current year's duty, payable in name of blench or feu-farm.

Escheat. Escheat (from esceoir, to happen or fall) anciently signified any casualty or forfeiture by which a right fell from the proprietor, or accrued to another; but it has since been restricted to that special forfeiture which falls through a person's being denounced rebel. It is either single or liferent. Single escheat, though it does not accrue to the superior, must be explained in this place, because of its coincidence with liferent.

27. After a debt is constituted, either by a formal decree, or by registration of the ground of debt, (which, to the special effect of execution, is in law accounted a decree) the creditor may obtain letters of horning, issuing from the signet, commanding messengers to charge the debtor to pay or perform his obligation within a day certain. Where horning proceeds on a formal decree of the Session, the time indulged by law to the debtor is fifteen days; if upon a decree of the commission of teinds, it is ten: Where it proceeds on a registered obligation, which specifies the number of days, that number must be the rule; and if no precise number be mentioned, the charge must be given on fifteen days, which is the term of law, unless where special statute interposés; as in bills, upon which the debtor may be charged on six days.

28. The messenger must execute these letters, (and indeed all summons) against the debtor, either personally or at his dwelling-house. If payment be not made within the days mentioned in the horning, the messenger, after proclaiming three oyes at the market-cross of the headborough of the debtor's domicil, and reading the letters there, blows three blasts with a horn, by which the debtor is understood to be proclaimed rebel to the king for contempt of his authority; after which he must affix a copy of the execution to the market-cross. This is called the publication of the diligence, or a denunciation at the horn. Persons denounced rebels have not a persona standi in judicio; quae noenae, they cannot sue nor defend in any action. Persons cited to the Court of Justiciary may be also denounced rebels, either for appearing there with too great a number of attendants, or, if by failing to appear, they are declared fugitives from the law. By the act abolishing hold-wards, the casualties both of single and liferent escheat are discharged when proceeding upon denunciation for civil debts; but they continue when they arise from criminal causes. All moveables belonging to the rebel at the time of his rebellion (whether proceeding upon denunciation or sentence in a criminal trial), and all that shall be afterwards acquired by him until relaxation, fall under single escheat.

29. The rebel, if he either pays the debt charged or, or suspends the diligence, may procure letters of relaxation from the horn, which, if published in the same place, and registered fifteen days thereafter, in the same register with the denunciation, have the effect to restore him to his former state.

30. The rebel, if he continued relaxed for year liferent and one after rebellion, is considered to be civilly dead; escheat. And, therefore, where he holds any feudal right, his superiors, as being without a vassal, are entitled each of them to the rents of such of the lands belonging to the rebel as hold of himself during all the days of the rebel's natural life, by the casualty of liferent escheat; except where the denunciation proceeds upon treason or proper rebellion, 1535, c. 32, in which last case the liferent falls to the king.

31. Disclamation is that casualty whereby a vassal disclaims his whole feu to his superior, if he disowns or renounces him without ground, as to any part of it. Purpresse draws likewise a forfeiture of the whole purpresse after it, and is incurred by the vassal's conduct or situation, upon any part of his superior's property, or attempting by building, enclosing, or otherwise, to make it his own. In both these feudal delinquencies, the least colour of excuse saves the vassal.

32. Under the dominium utile which the vassal acquires by the feudal right, is comprehended the property of whatever is considered as part of the lands reserved by it, whether houses, woods, enclosures, &c. above ground; or coal, limestone, minerals, &c. under ground.

33. There are certain rights naturally consequent on property, which are deemed to be reserved by the conveyance of the same.
crown as regalia, unless they be specially conveyed. Gold and silver mines are of this sort; the first universally, and the other where three half-pennies of silver can be extracted from the pound of lead, 1424, c. 12, (three half-pennies in the reign of James I. is equal to about two shillings five pence of our present Scots money, according to Mr. Ruddiman, Pref. to Diplom. Scot. p. 82.) These were by our ancient law annexed to the crown; but by an unprinted act, 1592, No. 12, they are dissolved from it; and every freeholder, (that is, as to this question, every proprietor, though he should hold his lands of a subject. 8th Dec. 1799, D. Argyll,) is entitled to a grant of the mines within his own lands, with the burden of delivering to the crown a tenth of what shall be brought up, 12th Jan. 1756, E. Hope ton. This unprinted statute mentions also tin and copper minerals, as if these were inter regalia.

and salmon fishing:

Salmon fishing is likewise a right understood to be reserved by the crown if it be not expressly granted; but forty years possession thereof, where the lands are either erected into a barony, or granted with the general clause of fishing, establishes the full right of the salmon fishing in the vassal. A charter of lands, within which any of the king's forests lies, does not carry the property of such forest to the vassal.

and forestry:

35. All the subjects which were by the Roman law accounted res publicae, as rivers, highways, ports, &c. are, since the introduction of feus, held to be inter regalia, or in patronio principis; and hence encroachment upon a highway is said to infringe purpurest.

Pertinences belong to vassal:

36. The vassal acquires right by his grant, not only to the lands specially contained in the charter, but to those that have been possessed forty years as pertinence thereto.

Privilege of brony, what:

37. As barony is a name universitas, and unites the several parts contained in it into one individual right, the general conveyance of a barony carries with it all the different tenements of which it consists, though they should not be specially enumerated (and this holds even without erection into a barony, in lands that have been united under a special name.)

Right to levy rents:

38. The vassal is entitled in consequence of his property, to levy the rents of his own lands, and to recover them from his tenants by an action for rent before his own court, and from all other possessors and intruders, by an action of mails and duties before the sheriff. He can also remove from his lands tenants who have no leases, and he can grant tacks or leases to others.—A tack is a contract of location, whereby the use of land, or any other immovable subject is set to the lessee or tacksman for a certain yearly rent, either in money, the fruits of the ground, or services. It ought to be reduced into writing, as it is a right concerning lands. Tacks, therefore, that are given verbally, to endure for a term of years, are good against neither party for more than one year.

Tack or lease:

Verbal tacks:

39. The tacksman's right is limited to the fruits which spring up annually from the subject matter, either naturally, or by the industry of the tacksman; he is not, therefore, entitled to any of the growing timber above ground, and far less to the minerals, coal, clay, &c. under ground, the use of which consumes the substance. All tacks were, by 1449, c. 7, for the encouragement of agriculture, declared effectual to the tacksman for the full time of their endurance, into whose hands savor the lands might come.

40. Tacks necessarily imply a delectus persona, a choice by the settor of a proper person for his tenant. Hence the conveyance of a tack not granted to assignees, is ineffectual without the landlord's consent.

41. It is not a fixed point whether a tacksman may sublet the lands without an express power of subletting. Lord Stair, II. 9, 22, and Mackenzie v. H. affirm he cannot; but it was adjudged, Hare, 555, that he might, even where the tack excluded assignees per expressum—far more ought he to have this power where the exclusion of assignees is only implied.

42. If neither the settor nor tacksman shall properly discover their intention to have the tack dissolved, at the term fixed for its expiration, they are understood or presumed to have entered into a new tack upon the same terms with the former, which is called tacit relocation, and continues till the landlord warn the tenant to remove, or the tenant renounce his tack to the landlord. This obtains also in the case of moveable tenants, who possess from year to year without written tacks.

43. In tacks of land, the settor is commonly bound to put all the houses and office-houses necessary for the farm, in good condition at the tenant's entry; and the tenant must keep them and leave them so at his removal. But in tacks of houses, the settor must not only deliver to the tenant the subject set, in tenableable repair at his entry, but uphold it in that repair during the whole years of the tack; and if it should become insufficient before the ish, though without the settor's fault, the tack-duty must either be entirely remitted, or suffer an abatement in proportion to the damage sustained by the tenant.

44. A tenant, if his landlord should refuse to accept obligations of the victual-rent when offered in due time, is liable only for the prices as fixed for the sheriff-fairs of that year; but if he has not duly offered his rent in kind, he must pay the value at the ordinary prices of the country; and over and above make good to the heir the damages incurred by him through the not delivery, if, e.g. he should be thereby disabled from performing a contract with a merchant to whom he had sold his farms. If the inclemency of the weather, inundation, or calamy of war, should have brought upon the crop an extraordinary damage (plus quam tolerabile) the landlord had, by the Roman law, no claim for any part of the tack-duty; if the damage was more moderate, he might exact the full rent. It is nowhere defined what degree of sterility or devastation makes a loss not to be borne, but the general rule of the Roman law seems to be made ours, by Diril. 108. Tenants are obliged to pay no cesses or public burdens to which they are not expressly bound by their tacks; but the law itself divides the burdens of the schoolmaster's salary equally between the proprietor and his tenants, 1066, c. 26.

What in case of sterility?

Quid juris as to particular bar dens.

45. Tacks may be evacuated during their currency, Dissolution of tacks during their currency:

1. In the same manner as feu-rights, by the tacksman's running in arrear of his tack-duty for two years together; but it may be prevented by the tenant's making payment at the bar before sentence. 2. Where the tenant either runs in arrear of one year's rent, or leaves his farm uncultivated at the usual season, the judge-ordinary, when applied to by the proprietor, is required by the Act S 14th Dec. 1746, to ordain the tenant to give security for the arrears, and for the rent of the five following crops, if the tack shall subsist so long; otherwise to deprive him of, as the tack was at an end. 3. Tacks may be evacuated at any time by the mutual consent of parties, e.g. by the tacksman's renunciation accepted by the proprietor; but verbal renunciations may be rescinded from.
46. The tenant who intends to quit his possession at the ish, or his tack, ought to make a renunciation thereof to his landlord, either in writing or otherwise; forty days before the end of the Whitsunday, or immediately preceding the ish. But if a landlord wants to remove a tenant, he is, by 1553, c. 39, required to move him, upon a precept signed by himself, forty days preceding the term of the Whitsunday before described, personally or at his dwelling-house, to remove at that term with his family and effects. This precept must be executed on the ground of the lands, and thereafter, read in the parish church where the lands lie, after the morning service, and affixed to the most patent door thereof. Whitsunday, though it be a moveable feast, is, in questions of removing, fixed to the 15th of May, by 1690, c. 39. In warnings from tenements within burghs, it is sufficient that the tenant be warned forty days before the ish of the tack, whether it be Whitsunday or Martinmas; and in these the ceremony of chalking the door is sustained as a warning, when proceeding upon a verbal order from the proprietor, though without the warrant of a magistrate. Where the tenant is bound by an express clause of his tack to remove at the ish of it, without warning, such obligation is, by the above-quoted act of sederunt, 14th Dec. 1756, declared to be a sufficient warrant for letters of horning; upon which, if the landlord charges his tenant forty days before the said Whitsunday, the judge is authorized to eject him within six days after the term of removing expressed in the tack.

47. The landlord has in security of his tack-duty, over and above the tenant’s personal obligation, a tacit pledge of hypothec, not only in the fruits, as he had by the Roman law, but in the cattle pasturing on the ground. The corn and other fruits are hypothecated for the rent of that year whereas they are the crop; for which they remain affected, though the landlord should not use his right for years together. The whole cattle on the ground considered as a quantity, are hypothecated for a year’s rent, one after another successively, provided the hypothec be applied within three months from the last conventional term of payment of each year. In tacks of houses, breweries, shops, and other tenements which have no natural fruits, the furniture and other goods brought into the subject set (in re, ita et illata,) are hypothecated to the landlord for one years rent.—The king’s prerogative process takes place on the landlord’s hypothec.

Title III. Of the Voluntary Transmission of Heritable Rights by Confirmation and Resignation.

1. A vassal may transmit his feu either to universal successors as heirs, or to singular successors, i.e. those who acquire by gift, purchase, or other singular title. This last sort of transmission is either voluntary, by disposition; or necessary, by adjudication.

2. Dispositions to be holden of the disposer are transmissions only of the property, the superiority remaining as formerly. This sort does not necessarily require a confirmation by the grantor’s superior, because his vassal continues the same notwithstanding the subordinate right granted to the subvassal; but because the subvassal’s property is exposed to the hazard of all the casualties falling by his superior, where confirmation is not admitted, it is commonly applied for.

3. Dispositions to be holden of the grantor’s superior, may be perfected either by confirmation or resignation; and therefore they generally contain both precept of seisin and procurator of resignation. When the receiver is to complete his right in the first way, he takes seisin upon the precept; but such seisin is ineffectual without the superior’s confirmation; for the dispoee cannot be deemed a vassal till the superior receive him as such, or confirm the holding.

Resignations is a form of law by which a vassal surrenders his feu to his superior; and is either ad perpetuam remanentiam, or in favorem. In resignation ad perpetuam remanentiam, where the feu is resigned to the effect that it may remain with the superior, the superior, who before had the superiority, acquires by the resignation the property also of the lands resigned; and as his investment of the lands still subsisted, notwithstanding the right by which he had given his vassal the property, therefore, upon the vassal’s resignation, the superior’s right of property revives, and is consolidated with the superiority, without the necessity of a new investment; so that resignations ad remanentiam are truly extinctions, not transmissions, of a right.

5. Resignations in favorem are made, not with an intention that the property resigned should remain with the superior, but that it should be again given by him in favour either of the resigner himself, or of a third party. They have not therefore the effect, like resignations ad remanentiam, of divesting the resigner; for the surrender is not attended with any purpose, or causa habita of transferring the property to the superior, but is only used as a step to convey to another; consequently the fee remains in the resigner till the person in whose favour the resignation is made, gets his right from the superior perfected by seisin.

6. Formerly, one who was vested with a personal transmission of right of lands, i.e. a right not completed by seisin, effectually disposed himself of it by disposing it to another; rights not after which, no right remained in the disposer which could be carried by a second disposition, because a personal right is no more than a jus obligationis, which may be transferred by any deed sufficiently expressing the will of the grantor. But this doctrine, at the same time that it rendered the security of the records extremely uncertain, was not truly applicable to such rights as required seisin to complete them; and therefore it now obtains, that the grantor of a personal right of lands is not so divested, by conveying the right to one person, but that he may effectually make it over afterwards to another; and the preference between the two does not depend on the dates of the dispositions, but on the priority of the seisins following upon them.

Title IV. Of Redeemable Rights, and of the two great classes of Burdens affecting Lands—Servitudes and Teinds.

1. An heritable right is said to be redeemable when it contains a right of reversion or return in favour of the person from whom the right flows. Reversions are either legal, which arise from the law itself, as in adjudications, which law declares to be redeemable within a certain term after their date; or conventional, which are constituted by the agreement of parties, as in wadsets, rights of annualrent, and rights of security. A wadset is the act of a vassal to pass his fee into a waadlend; and subject to the conditions stated in the wadset, the fee is in remission, the vassal having the right of reversion; all such rights are called reversionary.

2. Wadsets are either proper or improper. A proper, proper;
wadset is that whereby it is agreed that the use of the land shall go for the use of the money; so that the wadsetter takes his hazard of the rents, and enjoys them without accounting in satisfaction or in solutum of his interest. Though, therefore, the rent of the lands should be less than the yearly interest of the sum lent, the lands are redeemable upon payment of the base principal sum, without any claim for bygone interests; if it amounts to more, the wadsetter is not obliged to impute the surplus (in sortem) towards the extinction of the principal sum. Where the wadsetter thus subjects himself to all the chances by which the fruits may be lost, it is a proper wadset, though the reverser should be obliged to pay the public burdens.

improper,

3. In an improper wadset the reverser, if the rent should fall short of the interest, is taken bound to make up the deficiency; if it amounts to more, the wadsetter is obliged to impute the excess (as sortem) towards extinction of the capital. And as soon as the whole sums, principal and interest, are extinguished by the wadsetter's possession, he may be compelled to renounce or divest himself in favour of the reverser. Where the wadsetter, in place of possessing by himself, grants a back-tack of the lands to the reverser for payment of the interest of the wadset sums, as the tack duty, the wadset is thereby rendered improper; for the wadsetter has in that event no chance of getting more than his interest; and consequently the redemption is burdensome, not only with the payment of the principal sum, but of interest and tack duties remaining unpaid. But this burden is ineffectual against singular successors, if it be not expressed in the right of reverser, or if the back-tack be not recorded in the proper register.

4. Infestments of annalurent are also redeemable rights. A right of annalurent does not carry the property of the lands, but it creates a real nexus or burden upon the property, for payment of the interest or annalurent contained in the right; and consequently the bygone interests due upon it arc debita fundi.

5. Infestments in security are another kind of redeemable right, (now frequently used in place of rights of annalurent,) by which the receivers are infest in the lands themselves, (and not simply in an annalurent forth of them,) for security of the principal sums, interest, and penalty contained in the rights. These rights when they are granted, not to the creditors for payment of their debts, but to cautioners for relief of their engagements, are called infestments of relief. If an infestment in security be granted to a creditor, he may thereupon enter into the immediate possession of the lands or annalurent for his payment; whereas rights of relief are conditional, and have no operation till the cautioner either pays the debt, or is distressed for it.

6. All rights of annalurent, rights in security, and generally whatever constitutes a real burden on the fee, may be the ground of an adjudication, which is preferable to all adjudications or other diligences intervening between the date of the right, and of the adjudication decreed on it, not only for the principal sum contained in the right, but also for the whole past interest contained in the adjudication. This preference arises from the nature of real debts, or debita fundi, and is expressly reserved by the act 1661, c. 62, establishing the pari passu preference of adjudications; but in order to obtain it for the interest of the interest accumulated in the adjudication, such adjudication must proceed on a process of poinding the ground.

7. Servitude is a burden affecting lands or other heritable subjects, whereby the proprietor is either restrained from the full use of what is his own, or is obliged to suffer another to do something upon it. Servitudes are either natural, legal, or conventional. Nature itself may be said to constitute a servitude upon inferior tenements, whereby they must receive the water that falls from those that stand on higher ground. Legal servitudes are established by statute or custom from considerations of public policy: among which may be numbered, the public restraints laid upon the proprietors of tenements within the city of Edinburgh, by 1521, c. 26, and 1698, c. 8. There is as great variety of conventional servitudes, as there are ways by which the exer- cise of property may be restrained by paction in favour of another. They are constituted either by grant, where the will of the party burdened is expressed in writing; or by prescription, where his consent is presumed from his acquiescence in the burden for forty years.

8. Servitudes are either predial (sometimes called real) or personal. Predial servitudes are burdens imposed upon one tenement in favour of another, and are divided into rural servitudes, or of land; and urban servitudes, or of houses. The rural servitudes of the Romans were tier, actus, scutus, aquae haurient, and jus pascendi pecorum; and similar servitudes are recognized in the law of Scotland. A servitude of a foot road, horse road, cart road, dana and aqueducts, watering of cattle, and pasturage. The chief servitudes of houses among the Romans were those of support, viz. tigni immittendi, and oneris ferendi. The first was the right of fixing in our neighbours a wall a joist or beam from our house; the second was that of resting the weight of one's house upon his neighbour's wall. To these may be added the servitudes altius non tollendi, et non officiendi luminibus vel prospectu, restraining proprietors from raising their houses beyond a certain height, or from making any building whatsoever that may hurt the light or prospect of the dominant tenement,—which several servitudes are also known in the law of Scotland.

9. But besides these, there are two predial servitudes usual in Scotland to which the Romans were strangers, viz. that of fuel or feal, and divot, and of thirlage. The first is a right, by which the owner of the dominant tenement may turn up peats, turfs, or divots, from the ground of the servient, and carry them off either for fuel or thatch, or the other uses of his own tenement. Thirlage is that servitude by which lands are astricted or thrilled to a particular mill, and the possessors bound to grind their grain there, for payment of certain cultures and sequels, as the agreed price of grinding.

10. Servitudes are extinguished, 1. Confusion, when the same person comes to be the proprietor of the dominant and servient tenements; for res sua nominis servit; and the use the proprietor thereafter makes of the servient tenement is not jure servitutis, but is an act of property. 2. By the perishing either of the dominant or servient tenement. 3. Servitudes are lost non utendo, by the dominant tenement's neglecting to use the right for forty years, which is considered as a dereliction of thirlage, though he who has the servient tenement should have made no interposition by doing acts contrary to the servitude.

Personal servitudes are those by which the property of a person is burdened. The personal servitude known in our Liberent law, is usufruct or liferent, which is a right to use and enjoy a thing during life, the substance of it being preserved. A liferent cannot therefore be constituted upon things which perish in the use; and though it may
11. Liferents by law.

The terce (tertia) is a liferent competent by law to widows who have not accepted of special provisions, in the third of the heritable subjects in which their husbands died intest. Baggage-tenements and superiors are excluded from it. Courtesy is a liferent given by law to the surviving husband, of all his wife's heritage in which she died intest. A marriage, though of the longest continuance, gives no right to the courtesy if there was no issue of it. As in the terce the husband's seisin is the ground and measure of the wife's right, so in the courtesy the wife's seisin is the foundation of the husband's; and the two rights are in all other respects of the same nature, except that the courtesy extends to baggage holdings and to superiors.

12. Liferents are divided into conventional and legal.

Conventional liferents are either simple, or by reservation. A simple liferent, or by a separate constitution, is that which is granted by the proprietor in favour of another; and this sort requires seisin, in order to affect singular successors. A liferent by reservation, is that which a proprietor reserves to himself, in the same writing by which he conveys the fee to another. It requires no seisin; for the grantee's former seisin, which virtually included the liferent, still subsists as to the liferent which is expressly reserved.

13. Liferents by law are the terce and the courtesy.

The terce (tertia) is a liferent competent by law to widows who have not accepted of special provisions, in the third of the heritable subjects in which their husbands died intest. Baggage-tenements and superiors are excluded from it. Courtesy is a liferent given by law to the surviving husband, of all his wife's heritage in which she died intest. A marriage, though of the longest continuance, gives no right to the courtesy if there was no issue of it. As in the terce the husband's seisin is the ground and measure of the wife's right, so in the courtesy the wife's seisin is the foundation of the husband's; and the two rights are in all other respects of the same nature, except that the courtesy extends to baggage holdings and to superiors.

14. Liferent is extinguished by the liferenter's death.

That part of the rents which the liferenter had a proper right to before his death falls to his executors; the rest, as never having been in bonis of the deceased, goes to the heir. Martinmas and Whitsummer are by our customary law the term of the seisin of the deceased, his executors are entitled to the half of that year's rent, because it was due the term before his death; if he survives Martinmas they have a right to the whole.

15. Ecclesiastical rights are called benefices— an appellation transferred from secular fees to church livings, because they were given to churchmen in consideration of their spiritual functions. They are of two kinds, either personal, or of property in or to land of lands; the first is called the temporality, the other the spirituality of the benefice. Teinds or tithes are that liquid proportion of our rents or goods which is due to churchmen for performing divine service, or exercising the other spiritual functions proper to their several offices. Personal teinds, i.e. the tenth of what one acquires by his own industry or employment, are not acknowledged by our law, though they have been found due when supported by forty years possession. Prebend teinds are, by the usage of Scotland, either parsonage or vicarage. Parsonage teinds are the teinds of corn; and they are so called, because they are due to the parson or other titular of the benefice. Vicarage teinds are the small teinds of calves, leet, hemp, eggs, &c., which were commonly given by the titular to the vicar, who served the cure in his place. The first sort was universally due, unless in the case of their infeudation to laity, or of a pontifical exemption; but by the customs of almost all Christendom, the lesser teinds were not demanded where they had not been customarily paid. By the practice of Scotland, the teinds of animals, or of things produced from animals, as lambs, wool, calves, are due, though not accustomed to be paid; but roots, herbs, &c. are not titulable unless by use of payment be proved.

16. After the Reformation, James VI. considered himself as proprietor of all the church lands; partly because the objects for which they had been granted were declared superfluous, and part because of a resignation which he and Queen Mary his mother had procured from the beneficiaries. And even as to the teinds, though our reformed clergy, after the example of the canonists, claimed them as the patrimony of the church, our sovereign did not submit to that doctrine farther than it extended to a competent provision for ministers. He therefore erected or secularised several abbeys and priories into temporal lordships; the grantees of which were called sometimes lords of erection, and sometimes titulares, as having by their grants the same title to the erected benefices that the monasteries had formerly.

17. Proprietors of land may sue the titulares for a valuation, and if they think fit, for a sale also of their teinds before the commissioners named for that purpose. The rate of teind, when it is possessed by the proprietor jointly with the stock, for payment of a certain duty to the titular, and so does not admit a separate valuation, is fixed at a fifth part of the constant yearly rent, which is accounted a reasonable surroquam, in place of a tenth of the increase. Where it is drawn by the titular, and consequently may be valued separately from the stock, it is to be valued as its extent may be ascertained upon a proof before the commissioners; but in this last valuation, a fifth part is to be deducted from the proved teind in favour of the proprietor. Where the proprietor insists also for a sale of his teinds, the titular is obliged to sell them at nine years' purchase of the valuable teind-duty; and upon receiving the price, to execute a disposition in the purchaser's favour, containing procuratory of resignation and precept of seisin.

18. Some teinds are more directly subject to an allocation for the minister's stipend than others. The teinds in the hands of the lay titular fall first to be allocated, who since he is not capable to serve the cure in his own person, ought to provide one who can; and if the titular, in place of drawing the teinds, has set it in tack, the tack-duty is allocated: This sort is called free teind. Where the tack-duty, which is the titular's interest in the teinds, falls short, the titulary himself is binded, or, bygone teinds are subject to the surplus teind over and above the tack-duty: But in this case the court of commission of teinds is empowered to recompense the tacksman, by prorogating his tack for such a number of years as they shall judge equitable. Where this likewise proves deficient, the allocation falls on the teinds heritably conveyed by the titular, unless he has warranted his grant against future augmentations; in which case, the teinds of the lands belonging in property to the titular himself, must be allocated in the first place.

19. Teinds are debita fractionum, not fundi; for as by Teinds are their first condition, the beneficiary might, if he used the proper diligence, make them effectual, by drawing them out of the several crops, so he needed no real security. The action, therefore, for bygone teinds, is only personal against those who have intermedled either with the teind by itself, or with stock and teind jointly; unless where the titular is infel in the lands, in security of the valued teind-duty.

20. After a minister's death, his executors have right to the annat; which, in the sense of the canon law, was a right reserved to the Pope, of the first year's fruits of every benefice: But the word annat or ann, as the word now understood, is the right which law gives to
the executors of ministers, of half a year's benefice, over and above what was due to the minister himself for his incumbency. So that if the incumbent survives Whitsunday, his executors have the half of that year for the deceased's incumbency, and the other half as annat; if he survive Michaelmas, they have that whole year for his incumbency, and the half of the next in name of annat. The executors of a minister need make up no title to the ann by confirmation: Neither is the right assignable by the minister, or affectable for his debts; for it never belonged to him, but is a mere gratuity given by law to those for whom it is presumed the deceased could not sufficiently provide: And law has given it without distinction to the executors of all ministers, even where the stipend is made up, not of teinds, but of the public revenue of a borough, or of a voluntary contribution.

**Title V. Of the Transmission of Heritable Rights by the Diligence of the Law; or of Inhibitions and Adjudications.**

1. The constitution and transmission of feudal rights being explained, and the burdens with which they are chargeable, it remains to be considered how these rights may be affected at the suit of creditors by legal diligence. Diligences are certain forms of law whereby a creditor endeavours to make good his payment, either by affecting the person of his debtor, or by securing the subjects belonging to him from alienation, or by carrying the property of these subjects to himself. They are either real or personal. Real diligence is that which is proper to heritable or real rights; personal is that by which the person of the debtor may be secured, or his personal estate affected. Of the first sort we have two. 1. Inhibition. 2. Adjudication.

Real diligence of inhibition. How perfected.

2. Inhibition is a personal prohibition, which passes by letters under the signet, prohibiting the party inhibited to contract any debt, or to do any deed, by which any part of his lands may be aliened or carried off in prejudice of the creditor inhibiting. It must be exercised against the debtor personally, or at his dwelling-house, according to the order prescribed in the case of summonses by 1540, c. 75, and thereafter published and registered in the same manner with interdictions. It secures the creditor who inhibits against all deeds of alienation, even onerous ones that are granted posterior to the publication of the letters, provided he shall, within the time statuted, proceed to perfect his diligence by registration.

Limited to heritage. Does not affect necessary deeds. Purging of inhibitions. Real diligence of adjudication.

3. Though inhibitions by their uniform style 'disable the debtor from selling his moveable as well as his heritable estate, their effect has been long limited to heritage, from the interruption that such an embargo upon moveables must have given to commerce.

4. This diligence only strikes against the voluntary debts or deeds of the inhibited person. It does not restrain him from granting necessary deeds, i.e. such as he was obliged to grant anterior to the inhibition.

5. Inhibitions may be reduced upon legal nullities, arising either from the ground of debt, or the form of diligence. When payment is made by the debtor to the inhibitor, the inhibition is said to be purged.

6. Adjudication is a form of diligence, by which creditors proceed against the lands of their debtors, by way of action before the Court of Session. Such part only of the debtor's lands is to be adjudged as is equivalent to the principal sum and interest of the debt, with the composition due to the superior and expences of infemment, and a fifth part more in respect of the creditor is obliged to take land for his money; but without penalties or sheriff-fees. The debtor must deliver to the creditor a valid right of the lands to be adjudged, renounce the possession in his favour, and ratify the decree of adjudication. And law considers the rent of the lands as precisely commensurate to the interest of the debt, so that the adjudger lies under no obligation to account for the surplus rents. In this, which is called a special adjudication, the legal, or term of redemption, is declared to be five years; and the creditor, attaining possession upon it, can use no further execution against the debtor, unless the lands be evicted from him.

7. Where the debtor does not produce a sufficient general ad- right to the lands, or is not willing to renounce the possession, and ratify the decree, (which is the case that has most frequently happened,) it is lawful for the creditor to adjudge all right belonging to the debtor, in the same manner, and under the same reversion of ten years, as he could by the former laws have apprised it. In this last kind, which is called a general adjudication, the creditor must limit his claim to the principal sum, interest, and penalty, without demanding a fifth part more.

There are two other kinds of adjudication, those on a decree cognitio causa, otherwise called contra hereditatem jacientem, and adjudications in implement. Where the debtor's apparent heir formally renounces the succession, the creditor may obtain a decree cognitio causa, in which, though the heir renouncing is cited for the sake of form, no sentence condemnatory can be pronounced against him, in respect of his renunciation; the only effect of it is to subject the hereditas jacient to the creditor's diligence. Adjudications in implement are deduced against those who have granted deeds without procuratorship of resignation or precept of seisin, and refuse to divest themselves,—to the end that the subject conveyed may be effectually vested in the grantee.

8. There is a further diligence by which land estates Judicial may be affected for the recovery of debt, called judicial sales of bankrupt estates. The word bankrupt is in our law sometimes applied to persons whose funds are not sufficient for their debts; and sometimes not to the debtor, but to his estate. There was no method known in our law for the proper sale of a bankrupt estate, as the price might be divided among the creditors, till 1681, c. 17, by which the Court of Session was empowered, at the suit of any real creditor, to try the value of the debtor's estate, and name commissioners to sell it for the payment of his debts. But as the commissioners named by the Session, in pursuance of this act, were generally backward to undertake so ungrateful an office, and as the consent of the debtor, which the statute required where his right of reversion was not expired, could seldom be obtained, it was enacted, by 1690, c. 20, that decrees of sale of bankrupt estates should be pronounced by the Court itself, and that such sales might proceed in all cases without the consent of the debtor.

**Title VI.—Of Moveable Rights, or of Obligations and Contracts.**

1. The laws of heritable rights being explained, obligations moveable rights fall next to be considered, the doctrine of which depends chiefly on the nature of obligations. An obligation is a legal tie, by which one is bound to pay or perform something to another. Every obligation on
LAW.

LAW.

Law
of
Scotland.

Different
between
real
and
personal
rights.

the person obliged, implies an opposite right in the creditor, so that what is a burden in regard to the one, is a right with respect to the other; and all rights founded on obligations are called personal. There is this essential difference between a real and a personal right, that, in the nusus in re, whether of property, or of an inferior kind, as servitude, entitles the person vested with it to possess the subject as his own, or if he is not in possession, to demand it from the possessors; whereas the creditor in a personal right has only a nusus ad rem, or a right to compel the debtor to fulfil his obligation, without any right in the subject itself.

2. Obligations, when considered with regard to their cause, were divided by the Romans into those arising from contract, quasi-contract, delict, and quasi-delict: But there are certain obligations, even full and proper ones, which cannot be derived from any of these sources, and to which Lord Stair gives the name of obediential. Such is, among others, the obligation of parents to aliment or maintain their children; which arises singly from the relation of parent and child, and may be enforced by the civil magistrate. Under parents are comprehended the mother, grandfather, and grandmother, in their proper order. This obligation on parents extends to the providing of their issue in all the necessaries of life, and giving them suitable education. It ceases when the children can earn a livelihood by their own industry; but the obligation on parents to maintain their indigent children, and reciprocally on children to maintain their indigent parents, is perpetual.

3. All obligations arising from the natural duty of restitution fall under this class: Thus things given upon the view of a certain event must be restored, if that event does not afterwards exist, e.g. what is paid in contemplation of a marriage which never followed: And on the same principle, one upon whose ground a house is built or repaired by another, is obliged without any covenant to restore the expence laid out upon it in so far as it has been profitable to him.

4. A contract is the voluntary agreement of two or more persons, whereby something is to be given or performed upon one part, for a valuable consideration either present or future on the other part. Contracts were, by the Roman law, perfected either re, by the intervention of things; or by words; or by writing; or by sole consent. The real contracts of the Roman are (1) loans or leases; (2) sales and agreements of sale.

5. Loan, or mutuum, is that contract which obliges a person who has borrowed any fungible subject from another, to restore to him as much of the same kind, and of equal goodness. Whatever receives its estimation in number, weight, or measure, is a fungible; as corn, wine, current coin, &c. The only proper subjects of this contract are things which cannot be used without either their extinction or alienation; hence the property of the thing lent is necessarily transferred by delivery, to the borrower, who consequently must run all the hazards either of its deterioration or its perishing, according to the rule, rix perit suo domino.

6. Commodity is a species of loan, gratuitous on the part of the lender, where the thing lent may be used without either its perishing or its alienation. Hence, in this sort of loan, the property continues with the lender; the only right the borrower acquires in the subject is its use, after which he must restore the individual thing that he borrowed.

7. Deposition is a contract, by which one who has the custody of a thing committed to him, (the deposi-
tary) is obliged to restore it to the depositor. If a re-
ward is bargained for by the depository for his care, it resolves into the contract of location. As this contract is gratuitous, the depository is only answerable for the consequences of gross neglect; but after the deposit is redeemed, he is accountable even for casual misfor-
mation.

An obligation arises, without formal pactum, barely by a traveller’s entering into an inn, ship, or stable, and there depositing his goods, or putting up his horses; whereby the inn-keeper, shipmaster, or stabler, is accountable, not only for his own facts and those of his servants, (which is an obligation implied in the very exercise of these employments,) but of the other guests or passengers.

8. Pledge, when opposed to wadset, is a contract, by and by, which a debtor puts into the hands of his creditor a spe- cial movables subject in security of the debt, to be rede-
ivered on payment. Where a security is established by law to the creditor, upon a subject which continues in the debtor’s possession, it has the special name of an hypothec; as in the case of owners of ships, who have an hypothec on the cargo for the freight.

9. There is nothing in the law of Scotland analogous verbal con-
to the verborum obligatio of the Romans, which was created by the parties uttering certain verba solennia, or words of style; And therefore the appellation of verbal may be properly enough applied to all obligations to the constitution of which writing is not essential, which includes both real and consensual contracts; but, as these are afterwards explained, obligations by word may here be restricted, to promises, and to such verbal agreements as have no special name to distinguish them. Agreement implies the intervention of two different parties, who come under moral obligations to one an-
other. Where nothing is to be given or performed but on one part, it is properly called a promise, which, as it is gratuitous, does not require the acceptance of him to whom the promise is made. An offer, which must be distinguished from a promise, implies something to be done by the other party; and consequently is not bind-
ing on the offerer till it be accepted, with its limitations or conditions, by him to whom the offer is made, after which it becomes a proper agreement.

10. Writing must necessarily intervene in all obliga-
tions and bargains concerning heritable subjects, though they should be only temporary; as tacks which, when they are verbal, last but for one year. In these no ver-
bal and no nuncupative testaments are rejected by the Scotch law; but verbal legacies are sustained where they do not exceed £100 Scots.

11. All writings carrying any heritable right, and How writ-
ner deeds of importance, must be subscribed by the principal parties, if they can subscribe, otherwise by two
otaries before four witnesses specially designed, (or distinguished.) In the case where the parties themselves subscribe, two witnesses are sufficient, and in all cases the witnesses must also subscribe. Custom has established obligations for sums exceeding £100 Scots, to be “obligations of importance.”

12. A new requisite has been added to certain deeds. Must be on
since the Union, for the benefit of the revenue; They paying a certain duty to the crown.

13. Certain privileged writings do not require the or-
inary solemnities. 1. Holograph deeds (written by
the grantor himself) are effectual without witnesses.

Privileged

1. Holo-
graph writ-

ings.
2. Testaments, if executed where men of skill in business cannot be had, are valid, though they should not be quite formal. 3. Discharges to tenants are sustained without witnesses, from their presumed necessity or ignorance in business. 4. Missives letters in re mercantile commissions, and fitted accounts in the course of trade, bills of exchange, and also inland bills, though they be not holograph, are, from the favour of commerce, sustained without the ordinary solemnities.

14. A bill of exchange is an obligation in the form of a mandate, whereby the drawer or mandant desires him to whom it is directed, to pay a certain sum, on the day and place therein mentioned, to a third party. An inland bill is a similar mandate, but implying that both the drawer and acceptor live in the same country. In either case, the bill is valid without the designation either of the drawer, or of the person to whom it is made payable: it is enough, that the drawer's subscription appears to be truly his; and one's being possessor of a bill marks him out to be the creditor, if it bears the name given it by the drawer. A creditor in a bill likewise may transmit it to another merely by indorsement, or writing his name on the back of it.

15. A writing, while the granter keeps it under his own power or his doer's, has no force; it becomes obligatory only after it is delivered to the grantee himself, or found in the hands of a third person. But the following deeds are effectual without delivery: 1. Writings containing a clause dispensing with the delivery. 2. Deeds in favour of children, even natural ones; for parents are the proper custodiers or keepers of their children's writings. For a similar reason, postnuptial settlements by the husband to the wife need no delivery. 3. Rights which are not to take effect till the granter's death, or even where he reserves an interest to himself during his life; for it is presumed he holds the custody of these merely to secure to himself such reserved interest. 4. Deeds that the granter lay under an antecedent natural obligation to execute, e. g. rights granted to a cautioner for his relief. 5. Mutual obligations, e. g. contracts; for every such deed, the moment it is executed, is a common evident to all the parties contractors. Lastly, the publication of a writing by registration is equivalent to delivery.

16. Contracts consensual, i. e. which might by the Roman law be perfected by sole consent, without the intervention either of things, or of writing, are sale, permutation, location, society, and mandate. Where the subject of any of these contracts is heritable, writing is necessary.

17. Sale is a contract, by which one becomes obliged to give something to another, in consideration of a certain price in current money to be paid for it. Permutation differs from a sale chiefly in this, that in permutation, one subject is given in barter or exchange for another; whereas the price in a sale consists of current money.

18. Location is that contract, where an hire is stipulated for the use of things, or for the service of persons. It may, without impropriety, be considered as a species of sale, in which the subject sold is the use or service; and the price is the hire, which, as in a proper sale, generally consists of money.

19. Society, or copartnership is a contract, whereby the several partners agree concerning the communication of loss and gain arising from the subject of the contract. It is formed by the reciprocal choice that partners make of one another; and so is not constituted in the case of co-heirs, or of several legateses in the same subject. A copartnership may be so constituted that one of the partners shall, either from his sole right of property in the subject, or from his superior skill, be entitled to a certain share of the profits, without being subjected to any part of the loss; but a society where one partner is to bear a certain proportion of loss, without being entitled to any share of the profits, is justly repudiated. All the partners are entitled to shares of profit and loss proportioned to their several stocks, where it is not otherwise covenanted.—A joint trade is joint trade, not a copartnership, but a momentary contract, where two or more persons agree to contribute a sum to be employed in a particular sort of trade, the produce whereof is to be divided among the adventurers according to their several shares after the voyage is finished.

20. Mandate is a contract, by which one employs and another to manage any business for him; and, by the date. Roman law, it must have been gratuitous. It may be constituted tacitly, by one's suffering another to act in a certain branch of his affairs, for a tract of time together without challenge.

21. Quasi contracts are formed without explicit consent, by one of the parties doing something that by its nature either obliges him to the other party, or the other party to him.

22. There are certain obligations which cannot subsist by themselves, but are accessions to, or make a part of, other obligations. Of this sort are satisfaction, and the obligation to pay interest. Cautionary, or fiduciary obligations applicable to the use of money, or to perform a deed. Interest (usura) is the profit due, by the debtor of a sum of money, to the creditor for the use of it. Soon after the Reformation, our legal interest was fixed at the rate of ten per cent. per annum, 1567. c. 32. from which the debt was gradually reduced, till at last, by 12th Ann. Stat. 2. c. 16. it was brought to five per cent., and has continued at that rate ever since.

23. Donation, so long as the subject is not delivered to the donee, may be justly ranked among obligations; and it is that obligation which arises from the mere good will and liberality of the granter. Donations imply no warrandice but from the future facts of the donor. Donations made in contemplation of death, or mortis causa, are of the nature of legacies, and like them revokable; consequently, not being effectual in the granter's life, they cannot compete with any of his creditors, not even with those whose debts were contracted after the donation.

24. Obligations may be dissolved. 1. By specific performance. 2. By the consent of the creditor, who, without full implement, or even any implement, may renounce the right constituted in his own favour. 3. Where the same person is both creditor and debtor to another, the mutual obligations, if they are for equal sums, are extinguished by compensation; if for unequal, still the lesser obligation is extinguished, and the greater diminished, as far as the concourse of debt and credi-
tion goes. 4. Obligations are dissolved by novation. 5. By novation whereby one obligation is changed into another, without changing either the debtor or creditor. The first obligation being thereby extinguished, the cautioners in it are lost, and all its consequences discharged; so, that the debtor remains bound only by the last. Obligations are extinguished, lastly, composition, where the debt and credit meet in the same person, either by suc-
cession or singular title, e. g. when the debtor succeeds to the creditor, or the creditor to the debtor, or a stranger to both; for one cannot be debtor to himself.
LAW.

TITLE VII. Of the Voluntary Transmission of Moveable and Personal Rights; or of Assignments.

1. Heritable rights, when they are clothed with infestment, are transmitted by disposition, which is a writing containing procuratory of resignation and precept of seizin; but those which either require no seizin, as servitudes, patronages, reversions, &c. or on which seizin has not actually followed, and also all moveable rights, are transmissible by simple assignation. He who grants the assignation is called the creditor, and he who receives it, the assignee or cessionary. If the assignee conveys his right to a third person, it is called a translation; and if he assigns it back to the creditor, a retrocession. Certain rights are, from the uses to which they are destined, incapable of transmission; as almonry rights: Others cannot be assigned by the person vested in them, without special power given to him, as tacks, &c. The transmission of a third sort is not presumed to be intended, without an express conveyance, as of paraphernal goods, which are so proper to the wife, that a general assignation by her to her husband or all that did or should belong to her at her decease, does not comprehend them. A different right is, by its nature, incapable of a proper transmission; but its profits may be assigned while it subsists.

2. Assignments must not only be delivered to the assignee, but intimated by him to the debtor. Intimations have been probably first introduced merely as an interpellation or prohibition to the debtor, that he should not pay to the original creditor; but they came afterwards to be considered as likewise necessary for completing the conveyance.

3. Certain conveyances need no intimation. 1. Indorsations of bills of exchange; for these are not to be fettered with forms introduced by the laws of particular states. 2. Bank-notes are fully conveyed by the bare delivery of them; for as they are payable to the bearer, their property must pass with their possession. 3. Adjudication, which is a judicial conveyance, and marriage, which is a legal one, carry the full right of the subjects thereby conveyed, without intimation.

TITLE VIII. Of the Transmission of Moveable Rights by the Diligence of the Law; or of Arrestments and Pounding.

1. The diligences whereby a creditor may affect his debtor's moveable subjects, are arrestment and pounding. By arrestment is sometimes meant the securing of a criminal's person till trial; but, as it is understood in the rubric of this title, it is the order of a judge, by which he who is debtor in a moveable obligation to the arrested's creditor, is prohibited to make payment or delivery till the debt due to the debtor be paid or secured.

2. All debts in which one is personally bound, though they should be heritably secured, are grounds upon which the creditor may arrest the moveable estate belonging to his debtor; for every creditor, whatever the nature of his debt may be, ought to have the whole of his debtor's estate subject to his diligence. Arrestment may proceed on a debt, the term of payment whereof is not yet come, in case the debtor be ad ius inipiam. If a debt be not yet constituted by a decree or registration, the creditor may raise and execute a summons against his debtor for payment, on which pending action arrestment may be used, in the same manner as inhibition, which is called arrestment upon a dependence.

3. Certain debts are not arrestable: 1. Debts due by bills, for those pass from hand to hand as bags of money. 2. Future debts. 3. Alimentary debts, for these are granted on personal considerations, and so are not communicable to creditors.

4. Arrestment is only an inchoated or begun diligence; to perfect it there must be an action brought or ar by the arrested against the arrestee, to make the debt or subject arrested forth coming. In this action the common debtor must be called for his interest, that he may have an opportunity ofExcepting to the lawfulness of the extent of the debt on which the diligence proceeded.

5. Pounding is that diligence affecting moveable subj ect, by which their property is carried directly to the creditor. It may have for its warrant either letters of hornig, containing a clause for pounding, and then it is executed by messengers; or precepts of pounding, granted by sheriffs, commissaries, &c. which are executed by their proper officers. No pounding can proceed till a charge be given to the debtor to pay or perform, and the days thereof be expired.

6. In the execution of pounding, the debtor's goods Form of must be appraised, first on the ground of the lands pounded, where they are laid hold on; and a second time at the market-cross of the county, by the stated appraisers; or if there are none, by persons named by the messenger or other officer employed in the diligence.

Next the messenger must, after public intimation by three eyeses, declare the value of the goods according to the second appraisement, and require the debtor to make payment of the debt, including interest and expenses. If payment shall be offered to the creditor, or in his absence to his lawful attorney; or if, in case of refusal by them, consignation of the debt shall be made in the hands of the judge-ordinary, or his clerk, the goods must be left with the debtor; if not, the messenger ought to adjudge and deliver them over, at the appraised value, to the use of the diligence, towards his payment; And the debtor is entitled to a copy of the warrant and executions, as a voucher that the debt is discharged in whole or in part, by the goods pounded.

TITLE IX.—Of Prescriptions:

1. Prescription, which is a method both of establishing and of extinguishing property, is either positive or negative. Positive prescription is generally defined as lives or negatival. The Roman usucapio, the acquisition of property, (it should rather be when applied to our law, the securing it against all further challenge,) by the possessor's continuing his possession for the time which law has declared sufficient, for that purpose. Negative is the loss or omission of a right, by neglecting to follow it forth or use it during the whole time limited by law.

2. Positive prescription was first introduced into our Positive law by 1617, c. 12, which enacts, that whoever shall have possessed his lands, annualrents, or other heritages, peaceably in virtue of infestments for forty years continually after their dates, shall not thereafter be disquieted in his right by any person pretending a better title. The act requires, that the possessor produce, as his title of prescription, a charter of the lands preceding the forty years possession, with the seizin following on it; and where there is no charter extant, seizes, one or more, standing together for forty years, and proceeding either on returns, or precepts of claret units...
3. The negative prescription of obligations by the lapse of forty years, was introduced into our law long before the positive, by 1469, c. 29—1474, c. 55. This prescription is now amplified by the foresaid act 1617, which has extended it to all actions competent upon heritable bonds, reversions, and others whatsoever, unless where the reversions are either incorporated in the body of the wadset right, or registered in the register of reversion. And reversions so incorporated or registered, are not only exempted from the negative prescription, but are an effectual bar against any person from pleading the positive.

4. A shorter negative prescription is introduced by statute in certain rights and debts. Actions of spulzie, ejection, and others of that nature, must be brought within three years after the commission of the fact on which the action is founded. Servants’ fees, house rents, men’s ordinaries, (i.e. money due for board,) and merchants’ and writers’ accounts, alimentary debts, and workmen’s wages, fall under the like prescription as to the mean of proof by witnesses, i.e. these debts may be proved after the three years either by the writing or oath of the debtor. The right of reducing erroneous returns prescribed in twenty years. Ministers’ stipends and mutesures, prescribe in five years after they are due; and arrears of rent (or mails and duties,) five years after the tenant’s removing from the lands. Bargains concerning moveable goods, or sums of money which are provable by witnesses, prescribe also in five years after the bargain. But these different debts may also, after the five years, be proved either by the oath or the writing of the debtor. No person binding for or with another, either as cautioner or co-principal in a bond or contract for a sum of money, continues bound after seven years from the date of the bond, provided he has either a clause of relief in the bond, or a separate bond of relief intended to the creditor at his receiving the bond. But the act declares, that all diligence used within the seven years against the cautioner shall stand good. And as this is a public law, intended to prevent the bad consequences of rash engagements, its benefit cannot before the lapse of seven years be renounced by the cautioner. Holograph bonds, missive letters, and books of account not attested by witnesses, prescribe in twenty years, unless the creditor shall thereafter prove the verity of the subscription by the defender’s oath.

**Title X. Of Succession in Heritable Rights.**

1. Singular successors are those who succeed to a person yet alive, in a special subject, by singular titles; but succession, in its proper sense, is a method of transmitting rights from the dead to the living. **Heritable rights** descend by succession to the heir properly so called; **moveable rights** to the executors, who are sometimes said to be heirs in moveables. Succession is either by special destination, which descends to those named by the proprietor himself; or legal, which devolves upon the persons whom the law marks out for successors, from a presumption that the proprietor would have named them had he made a destination. The first is in all cases preferred to the other, as presumption must yield to truth.

2. In the succession of heritage, the heirs at law are otherwise called **heirs-general, heirs whatsoever, or heirs of line;** and they succeed by the right of blood in the following order: First, **Descendants,** whose preference before ascendants or collaterals is established by the universal consent of nations. The Romans divided the succession equally among all the immediate descendants of the deceased; but we, from our close attention to the feudal plan, prefer sons to daughters, and the eldest son to all the younger. Where there are daughters only, they succeed equally, and are called **heirs-portioners.** Failing immediate descendants, grand-children succeed; and, in default of them, great-grand-children; and so on in infinitum, preferring, as in the former case, males to females, and the eldest male to the younger.

3. Next after descendants, **collaterals** succeed; among whom the brothers german of the deceased have the rank, first place, i.e. brothers both by father and mother; for the full blood excludes the half blood. But as, in no case, the legal succession of heritage is, by the law of Scotland, divided into parts, unless where it descends to females; the immediate younger brother of the deceased excludes the rest; according to the rule, **heritage descends.** Where the deceased is himself the youngest, the succession goes to the immediate elder brother, as being the least deviation from this rule. If there are no brothers-german, the sisters-german succeed equally; then brothers consanguineus equally. Next the father succeeds, though by our ancient usage he was excluded, Cr. 321. 46. After him his brothers and sisters, according to the rules already explained, then the grandfather; failing him, his brothers and sisters, and so upwards, as far back as propriety can be proved. Though children succeed to their mother, a mother cannot to her child, nor is there any succession by our law through the mother of the deceased; insomuch, that one brother-uterine, i.e. by the mother only, cannot succeed to another, even in that estate which flowed originally from their own common mother.

4. In heritage there is a right of representation, by which one succeeds, not from any title in himself, but in the place, and as representing some of his deceased ascendants. Thus where one leaves a younger son, and a grandchild by his eldest; the grandchild, though farther removed in degree from the deceased than his uncle, excludes him as coming in place of his father the eldest son. Hence arises the distinction between **succession in capita, where the division is made into as many equal parts as there are capita or heirs, which is the case of heirs-portioners; and succession in stirpes, where the remotest heirs draw no more among them than the share belonging to their descendant, or stirps, whom they represent; an example of which may be found in the case where a man leaves behind him a daughter alive, and two grand-daughters by a daughter deceased. Though the right or succession does in no case fall to the mother of the deceased, nor to his relations by her, yet as children succeed to their mother, therefore in every case where the mother herself would have succeeded, had she been alive, her children also succeed as representing her.

3. Ascendants.

**No succession by representation in heritage.**

4. In the succession of **heirs-portioners,** indivisible Succession rights, e.g. titles of dignity fall to the eldest sister. A of heirs-portioners is single right of superiority goes also to the eldest; for it hardly admits a division, and the condition of the vassal ought not to be made worse by multiplying superiors upon him. Where there are more such rights, the eldest may perhaps have her election of the best; but the younger sisters are entitled to a recompense, in so far as the divisions are unequal, at least where the superiors yield a constant yearly rent, e.g. a yearly feu-duty. The principal seat of the family falls to the eldest, with the garden and orchard belonging to it.
without recompense to the younger sisters; but all other houses are divided amongst them, together with the lands on which they are built, as parts and portions of these lands.

6. Those heritable rights to which the deceased did himself succeed as heir to his father or other ancestor, get sometimes the name of heritage in a strict sense, in opposition to the feuda nata, or feus of conquest, which he had acquired by singular titles, and which descend not to his heir of line, but of conquest. This distinction obtains only where two or more brothers or uncles, or their issue are next in succession; in which case the immediate younger brother, as heir of line, succeeds to the proper heritage, because that descends; whereas the conquest ascends to the immediate elder brother. It has no place in female succession, which the law divides equally among the heirs-portioners. Where the deceased was the youngest brother, the immediate elder brother, whether of the same or of a former marriage, is heir both of line and of conquest. An estate, disposed by a father to his eldest son, is not conquest in the son's person, but heritage; because the son would have succeeded to it though there had been no disposition. The heir of conquest succeeds to all rights affecting land which require seisin to perfect them, and consequently to dispositions or heritable bonds, though they should not be actually followed by seisin. But teinds go to the heir of line, because they are merely a burden on the fruits, not on the land. Tacks do not fall under conquest, because they are complete rights without seisin; nor personal bonds taken to heirs excluding executors, both for the reason just mentioned, and because they are heritable, not ex sua natura, but by the force of destination; and therefore that heir is understood in the destination, who is heir in the most proper sense.

7. The heir of line is entitled to the succession, not only of subjects properly heritable, but to that sort of moveables called heirship, which is the best of certain kinds, 1474. c. 54. This doctrine has been probably introduced that the heir might not have a house and estate to succeed to, quite dismantled by the executor.

As to succession by destination, no proprietor can settle any heritable estate in the proper form of a testament, not even bonds excluding executors, though these are not heritable ex sua natura. But where a testament is in part drawn up in the style of a deed ante vivum, such part of it may contain a settlement of heritage, though executors should be named in the testamentary part.

9. All heirs by destination may properly enough be called, by a general name, heirs of talizie, from talizer to cut, because the linal succession is cut off in their favour; but they are usually distinguished into heirs of talizie and of provision. The appellation of talizie, or entail, is chiefly used in the case of a land-estate, which is settled on a long series of heirs, substituted one after another; whereas heirs pointed out in contracts of marriage, or in bonds containing clauses of substitution, are more commonly called heirs of provision.

The person first called in the talizie is the institute, the rest the heirs of talizie, or the substitutes.

10. Heirs of provision are those who succeed to any subject, in virtue of a provision in the investiture or other deed of settlement, and the appellation, as has just been observed, is given most commonly to heirs of a marriage. These are more favourably regarded than heirs by simple designation; for heir of a marriage, because their provisions are constituted by an onerous contract, cannot be disappointed of them by any gratuitous deed of the father; and they may sue him or his cautioner to purge incumbrances, or to make good their provisions in the event of his death.

11. An heir is, in the judgment of law, cadae personae cum defuncto, and so represents the deceased universally, not only in his rights, but in his debts. In the first view, he is said to be heir active; in the second passive. From this general rule are excepted heirs substituted in a special bond; and even substitutes in a disposition omnium bonorum, to take effect at the grantee's death; for such substitutes are considered as singular successors, and their right as an universal legacy, which does not subject the legatee ultra valorem. But heirs male or of talizie, though their right be limited to special subjects, are nevertheless liable, not merely to the extent of the subject entitled or provided, but in solidum, because such rights are designed to carry an universal character, and so infer an universal representation of the grantee.

12. Before an heir can have an active title to his ancestor's rights, he must be entered by service and return.

The service of heirs is either general or special. A general service vests the heir in the right of all heritable subjects, which either do not require seisin, as rever- sions, bonds excluding executors, heirship moveables, &c., as have not been perfected by seisin in the person of the ancestor, as dispositions, heritable bonds, &c., but it can carry no right clothed with infallibility, nor even the personal obligation contained in a right of annulment on which seisin had followed, so as to be a title to demand payment from the debtor. A special service, followed by seisin, vests the heir in the right of the special subjects in which the ancestor died intestate. All services proceed on briefs issuing from the chancery, and the judge to whom they are directed is required to try the matter by an inquest of fifteen sworn men.

13. Practice has introduced an anomalous sort of entry by precept of clare constat, without the interposition of an inquest, by the sole consent of the superior, who, if he be satisfied that the person applying to him is the next heir, grants him a precept (called clare constat, from the first words of its recital), certifying to him, that he is descended from the ancestor died intestate. If any person can be declared an heir by private authority, they cannot bar the true heir from entering after twenty years, as a legal entry would have done. Of the same by hasp and staple is the entry by hasp and staple, commonly used in burgage tenements of houses, of which the bailiff, without calling an inquest, cognosces and declares a person heir upon evidence brought before himself; and, at the same time, inflicts him in the subject by the symbol of the hasp and staple of the door.

14. An heir, by inquiring into his ancestor's estate Passive, viz., without entry, subjects himself to his debts as if he were in fee in good and lawful title.

15. Our law, from its jealousy of the weakness of mankind while under sickness, and of the importunity of friends in that conjuncture, has declared that all deeds affecting heritage, if they be granted by a person on deathbed, (i.e. after contracting that sickness which ends in death,) to the damage of the heir, are ineffectual. And the privilege of setting aside deeds ex copiae leciti, is competent to all heirs, not to heirs of line only, but of conquest, talizie, or provision; and not only,
LAW.

680

Law of Scotland.

to the immediate but to remote heirs, as soon as the succession opens to them, though the deed in dispute should not appear hurtful to the immediate heir of the grantor. But where it is consented to, or ratified by the immediate heir, it is secured against all challenge even from the remotest; for such consent has the effect of a fidelio brevis manus, the dying person being considered as disposing to the heir, and he to the stranger in whose favour the deed was really granted.

Title XI. Of Succession in Moveable Rights.

1. In the succession of moveable rights, it is an universal rule that the next in degree to the deceased (or next of kin) succeeds to the whole; and if there are two or more equally near, all of them succeed by equal parts, without that prerogative which takes place in heritage, of the eldest son over the younger, or males over females. Neither does the right of representation already explained, obtain in the succession of moveables, except in the single case of a competition between the full blood and the half blood; for a niece by the full blood will be preferred before a brother by the half blood, though she is by one degree more remote from the deceased than his uncle. Where the estate of a person deceased consists partly of heritage and partly of moveables, the heir in the heritage has no right to the moveables if there are others as near in degree to the deceased as himself. But where the heir in such case finds it his interest to renounce his exclusive claim to the heritage, and betake himself to his right as one of the next of kin, he may collate or communicate the heritage with the others, who, in their turn, must collate the moveables with him, so that the whole is thrown into one mass, and divided equally among all of them. This doctrine holds, not only in the line of descendants, but of collaterals; for it was introduced that the heir might in no case fare worse than the other next of kin.

2. One may settle his moveable estate upon whom he pleases, excluding the legal successor by a testament; which is a written declaration of what a person wills to be done with his estate after his death. No testamentary deed is effectual till the death of the testator, who may therefore revoke it at pleasure or make a new one, by which the first loses its force; and hence testaments are called last or latter wills. Testaments, in their strict acceptance, must contain a nomination of executors, i.e., of persons appointed to administer the succession according to the will of the deceased.

3. A legacy is a donation by the deceased, to be paid by the executor to the legatee. It may be granted either in the testament or in a separate writing. Legacies are not due till the grantor's death; and consequently they can transmit no right to the executors of the legatee in the event that the grantor survives him.

4. Minors after puberty can test without their curators; wives without their husbands; and persons interdicted without their interdictors; but bastards cannot test, except in the cases afterwards mentioned.

5. If a person deceased leaves a widow, but no child, his testament, or in other words the goods in commissio, divide in two; one half goes to the widow, the other is the dead's part, i.e., the absolute property of the deceased on which he could have tested, and which falls to his next of kin if he died intestate. Where he leaves children, one or more, but no widow, the children get one half as their legacy; the other part is the dead's part, which falls also to the children if the father has not tested upon it. If he leaves both widow and children, the division is tripartite; the wife takes one-third by herself; another falls as legum to the children, equally among them, or even to an only child, though he should succeed to the heritage; the remaining third is the dead's part. Where the wife predeceases without children, one half is retained by the husband, the other falls to her next of kin. Where she leaves children, the division ought also to be tripartite by the common rules of society, since no legitum is truly due on a mother's death; yet it is in practice tripartite; two-thirds remain with the surviving father, as if one-third were due to him proprio nomine, and another as administrator of the legum of his children; the remaining third being the wife's share, goes to her children, whether of that or any former marriage; for they are all equally her next of kin.

6. For preserving an equality among all the children who continue entitled to the legitum, we have adopted the Roman doctrine of collatio honorum; whereby the child who has got a provision from his father is obliged to collate it with the others, and imparte it towards his own share of the legitum; but if, from the deed of provision, the father shall appear to have intended it as a praecipuam to the child, collation is excluded. A child is not bound to collate an heritable subject provided to him, because the legitum is not impaired by such provision.

7. As an heir in heritage must complete his titles by Confirmation, so an executor is not vested in the right of the moveable estate of the deceased without confirmation; which therefore is called by some lawyers, though improperly, the addito hereditatis in movilibus. Confirmation is a sentence of the commissary or bishop's court, empowering an executor, one or more, upon making inventory of the moveables pertaining to the deceased, to recover, possess, and administer them, either in behalf of themselves or of others interested therein.

8. The legitim and relict's share, because they are Legitim and rights arising ex lege, in consequence of the communio of goods, and of the natural obligation upon fathers to give a certain portion of their estate to their issue, which is transmitted to the relit by operation ipso jure upon the father's death in favour of the relit and children; and consequently pass from them, though they should die before confirmation, to their next of kin: Whereas the dead's part, which falls to the children or other next of kin in the way of succession, remains, if they should die before confirming, in busts of the first deceased; and so does not descend to their next of kin, but may be confirmed by the person who, at the time of confirmation, is the next of kin to the first deceased. Special assignments, though neither intimated nor made public during the life of the grantor, carry to the assignee the full right of the subjects assigned, without confirmation; and so also special legacies, as being also really assignments.

9. The only passive title in moveables is vitiatus intro-mission, which may be defined an unwarrantable intermeddling with the moveable estate of a person deceased without the order of law. This is not confounded as the passive titles in heritage are, to the persons interested in the succession, but strikes against all intrumiters; because even strangers, when attending on dying persons, have frequent opportunities of intermeddling with moveables, which are more easily abstracted than heritage. The bare intermeddling infects not this passive title, though the thing intermeddled with should not be applied to any use by the intrumitter. Where an executor confirmed, intermeddles with more than he has confirmed, he incurs a passive title; fraud
LAW.

being in the common case presumed, from his not giving up in inventory the full subjects intermeddled with. Vitious intromission is presumed, by Act S. 23, Feb. 1693, in the special case where the repositories of a dying person are not sealed up as soon as he becomes incapable of sense, by his nearest relations; or, if he dies in a house not his own, they must be sealed by the master of such house, and the keys delivered to the judge ordinary, to be kept by him for the benefit of all having interest. But vitious intromission is excluded by any probable title, or by any circumstance that takes off the presumption of fraud.

10. Where a vassal dies without leaving any heir who can prove the remotest propensity to him, it is not the superior as the old law stood, but the king, who succeeds as last heir, both in the heritable and movable estate of the deceased, in consequence of the rule, quod nullius est, cedit domino regi.

11. A bastard can have no legal heirs, except those of his own body; since there is no succession but by the father, and, a bastard has no certain father. The king therefore succeeds to him, failing his lawful issue, as last heir. Though the bastard as absolute proprietor of his own estate, can dispose of his heritage in his life-time, (that is, exempt from the disease of which he afterwards dies,) and of his moveables by any deed inter vivos; yet he is disabled, ex defectu natalium, from bequeathing by testament without letters of legitimation from the sovereign. If the bastard has lawful children he may test without such letters, and name tutors and curators to his issue; for in such case, the king can have no interest to object, the bastard's children being his lawful heirs.

12. A bastard is not only excluded, 1. From his father's succession, because law knows no father who is not marked out by marriage; and, 2. From all heritable succession, whether by the father or mother, because he cannot be pronounced lawful heir by the inquest in the terms of the brief; but, also, 3. From the movable succession of his mother; for though the mother be known, the bastard is not her lawful child, and legitimacy is implied in all succession deferred by law. A bastard, though he cannot succeed jure sanguinis, may succeed by destination, where he is specially called to the succession by an entail or testament. Aliens are, from their allegiance to a foreign prince, incapable of succeeding in feudal rights, though not in moveables, without naturalization. Papists may get free from their disabilities on taking the oath of abjuration, and making the declaration prescribed by 23. Geo. III. c. 44.

BOOK III.

OF ACTIONS.

1. Hitherto of the rights arising from the relation of persons, and of those arising from things, the two first objects of law. Actions are its third object, whereby persons make their rights effectual. An action may be defined, A demand regularly made and insisted in before the judge competent, for the retaining or recovering of a right.

2. The supreme power, which has the right of enacting laws, falls naturally to have the right of erecting courts and appointing judges, who may apply these laws to particular cases. But in Scotland, this right has been from our earliest times intrusted with the crown, as having the executive power of the state. In our supreme courts of session and exchequer, not only process but execution of diligence runs in the name of the sovereign, notwithstanding which these courts have a proper jurisdiction, seeing all their necessary writs, both of process and execution, issue under their own direction.

3. Jurisdiction is a power conferred upon a judge or judicial magistrate, to take cognizance of and decide causes according to law, and to carry his sentences into execution. That tract of ground or district within which a judge has the right of jurisdiction, is called his severality; and every act of jurisdiction exercised by a judge beyond his territory, either by pronouncing sentence, or carrying it into execution, is null.

4. All judges must at their admission swear, 1. The Oaths to be oath of allegiance, and subscribe the assurance, 1693, taken by c. 6—2. The oath of abjuration was first imposed by the judges, An. c. 14, and has been since continued by several British statutes. Lastly, The oath de fideli administration.

5. By the treaty of union 1707, c. 7, art. 3, the parliaments of Scotland and England are united into one, a parliament of Great Britain. From this period, the British House of Peers, as coming in place of the Scots parliament, is become our court of the last resort, to which appeals lie from the supreme courts of Scotland.

6. The Court of Sessions, or college of justice, the Court of supreme civil tribunal of Scotland, was originally formed in the reign of James V. but has since undergone several important changes. It at present consists of fifteen judges, who are vested with an universal civil jurisdiction, and who are distinguished into three classes; one principally occupied in the preparation of civil causes, called the Outer-House judges; and two others into the First and Second Divisions. Though the jurisdiction of the sessions and first and second division be properly limited to civil causes, the judges have always sustained themselves as competent to the crime of falsehood, either from its necessary connection with civil right, or perhaps because the summary proceedings of the court of justiciary were not well adapted to the tedious proofs frequently brought in imputation, when pursued in the indirect manner. This court, besides its original jurisdiction, has a power of review over inferior courts, by the processes of advocation, suspension, and reduction.

7. Five lords of session, as commissioners of justiciary, the justice-general, and justice-clerk, form the justice- court, or supreme criminal court of Scotland. The Justice-general, if present, is president of the court, and in his absence the justice-clerk. By the late jurisdiction act, 20 Geo. II. circuit courts are to be held twice in the year in place of once as formerly, with a power to his majesty to add to, or alter the places or districts at which these courts are to be held, and to appoint their times of meeting. One judge may by this statute, proceed to business in the absence of his colleague.

8. The Scots court of exchequer, as the king's cham- Court of ex- berlain court, judged in all questions of the revenue, chequer. By 6 An. c. 26, (passed in pursuance of 1707, c. 7, art. 19,) that court is abolished, and a new court erected, consisting of the lord high treasurer of Great Britain, and a chief baron, with four other barons of exchequer. This court has a private jurisdiction conferred upon it as to the duties of customs, excise, or other revenues appertaining to the king or prince of Scotland, and as to all honours and estates that may accrue to the crown; in which matters they are to judge by the forms of pro-
ceeding used in the English court of exchequer, under the following limitations; that no debt due to the crown shall affect the debtor's real estate in any other manner than such estate may be affected by the laws of Scotland, and that the validity of the crown's titles to any honours or lands shall continue to be tried by the court of session.

9. The high admiral is declared the king's justice general upon the seas, on fresh water within the flood mark, and in all harbours and creeks. His civil jurisdiction extends to all maritime causes, and so comprehends questions of charter-parties, freights, salvages, bottomries, &c. He exercises his supreme jurisdiction by a delegate, the judge of the high court of admiralty; and he may also name inferior deputees, whose jurisdiction is limited to particular districts, and whose sentences are subject to the review of the high court. The admiralty has acquired by usage a jurisdiction in mercantile causes, even where they are not strictly maritime, cumulative with that of the judge ordinary.

10. At the Reformation, all Episcopal jurisdiction, exercised under the authority of the bishop of Rome, was abolished by an act 1560, ratified by 1567, c. 2. As the cause of justice in consistorial causes was thereby stopped, queen Mary, besides naming a commissary for every diocese, did by a special grant mentioned in Books S, 1, March 1563—4, establish a new commis
cary court at Edinburgh, consisting of four judges or commissaries, whose grant is ratified by an unprinted act, 1599, c. 25. This court is vested with a double jurisdiction; one diocesan, which is exercised in the special territory contained in the grant, viz. the counties of Edinburgh, Haddington, Linlithgow, Peebles, and a part of Stirlingshire; and another universal, by which the judges confirm the testaments of all who die in foreign parts, and may reduce the decrees of all inferior commissaries, provided the reduction be pursued within a year after the decree. They have an exclusive power of judging in declarators of marriage, and of the nullity of marriage, in actions of divorce and of non-adherence, of adultery, bastardy, &c. because all these matters are still considered properly consistorial.

11. Sheriff is the judge ordinary constituted by the crown over a particular division or county. He judges in all actions upon contracts, or other personal obligations, to the greatest extent, and indeed in most other actions. His criminal jurisdiction extends to certain capital crimes, as theft, and even murder, though it be one of the pleas of the crown; and he is competent to most questions of public police, and has a cumulative jurisdiction with justices of the peace in all riots and breaches of the peace. He has also a cumulative jurisdiction with magistrates within borough.

12. Justices of the peace are magistrates named by the sovereign over the several counties of the kingdom, for the special purpose of preserving the public peace.

13. A borough is a body corporate, made up of the inhabitants of a certain tract of ground erected by the sovereign, with jurisdiction annexed to it. Boroughs are erected, either to be holden of the sovereign himself, which is the general case of royal boroughs, or of the superior of the lands erected, as boroughs of regality and barony. Bailies of boroughs have jurisdiction in matters of debt, services, and questions of possession between the inhabitants. Their criminal jurisdiction extends to petty riots; and by special statute, to reckless (not intended) fire-raising. To constitute a baron in the strict law sense, his lands must have been erected, or at least confirmed by the king in liberum baroniiam; and such a baron had a certain jurisdiction, both civil and criminal, which is now greatly abridged. His civil jurisdiction is reduced to the power of recovering from his vassals and tenants the rents of his lands, and of condemning them in mill services; and of judging in causes where the debt and damages do not exceed 40s. Sterling. His criminal jurisdiction is limited to assaults, batteries, and other smaller offences, which may be punished by a fine not exceeding 40s. Sterling, or by setting the offender in the stocks in the day time, not above three hours.

15. The office of the lyon king of arms was chiefly ministerial, to denounce war, proclaim peace, carry public messages, &c. But he has also a right of jurisdiction, whereby he can punish all who usurp arms contrary to the law of arms, and deprive or suspend messengers, heralds, or pursuivants, who are all officers named by himself. We now proceed with actions, prosucutable in one or other of these courts. Actions are either real or personal. A real action is that which arises from a right in the thing itself, and which therefore may be directed against all possessors of that thing. Thus an action for the recovery of a moveable subject, when founded on a jus in re, is, in the proper acceptation, real; but real actions are in vulgar speech confined to such as are directed against heritable subjects. A personal action is founded only on an obligation undertaken for the performance of some fact, or the delivery of some subject; and therefore can be carried on against no other than the person obliged or his heirs. Both rights are included in an infestation of annexment, which contains not only a personal obligation on the grantor to pay, but a right of hypothec on the subject itself; and therefore the creditor can either sue the grantor or his representatives in a personal action; or he may, if for his payment, insist in a real action of pointing the ground against the possessors of the subject affected, though they should not represent the grantor. Pointing of the ground, though it be properly a diligence or an execution, is generally considered by lawyers as a species of real action; and is so called to distinguish it from personal pointing, which is founded merely on an obligation to pay. Every debitum fundi, whether legal or conventional, is a foundation for this action. It is competent to all creditors in debts which make a real burden on lands; and is directed against the goods that are found on the lands burdened, even though the original debtor should be divested of the property in favour of a singular successor.

17. Actions are either ordinary or recusatory. All actions are, in the sense of this division, ordinary, which are not recusatory. Recusatory actions are divided into actions of proper impropriation. 2. Actions of reduction-impropriation. 3. Actions of simple reductions. Proper impropriations, which are brought for declaring writings false or forged, are treated of in Book IV. Reduction-impropriation is an action, whereby a person reduction- who may be hurt or affected by a writing, insists for producing or exhibiting it in court, in order to have it set aside, or its effect ascertained, under the certification that the writing, if not produced, shall be declared false and forged. This certification is a fiction of law, introduced that the production of writings may be the more effectually forced, and therefore it operates only in favour of the pursuer; so that the writing,

bargains,

which have known engagements naturally arising from
them, concerning moveable goods. 2. In facts performed in satisfaction even of a written obligation,
where such obligation binds the party precisely to the
performance of them. 3. In facts which with diflSculty admit of a proof by writing, even though the effect of such proof should be the extinction of a written
obligation, especially if the facts import fraud or vio«

in

what

admitted.


lence. Thus a bond is reducible ex dolo, on a proof by
witnesses. Lastly, All intromission by a creditor with the
rents of his debtor’s estate payable in grain, may be
proved by witnesses.

29. No person whose near relation to another bars
him from being a judge in the cause, can be admitted
as a witness for him, but he may against him. For-
merly domestic servants and moveable tenants, i. e. te-
nants who have no written tacks, were disallowed, from
the presumed influence of their masters and landlords
over them; but now our practice admits them. The
testimony of infamous persons is rejected, i. e. persons
who have been guilty of crimes that the law declares
infer infamous, or who have been declared infamous
by the sentence of a judge. Pupils are incapable wit-
tesses, being in the judgment of law incapable of the
impression of an oath. The testimony of women was
formerly received with reluctance, but it is now as ad-
missible as that of men, except in the single case of
acting as instrumental witnesses.

30. Decrees of the court of session are either in foro
contradictorio, where both parties have litigated the
cause, or in absence of the defendant. Decrees of the ses-
sion in foro cannot in the general case be again brought
under the review of the court, either on points which
the parties neglected to plead before sentence, (which
we call competent and omitted,) or upon points pleaded
and found insufficient, (proposed and repelled.) But
decrees, though in foro, are reversible by the court,
where either they labour under essential nullities, e. g.
where they are ultra petita, or not conformable to their
grounds and warrants, or founded in an error in calculo,
&c. or where the party against whom the decree is
obtained, has thereafter recovered evidence sufficient to
overturn it, of which he knew not before.

31. The sentences of inferior courts may be review-
ed by the court of session before decree, by advocacy,
and after decree by suspension or reduction; which
last are also the methods of calling in question such de-
crees of the session itself as can again be brought under
the review of the court.

32. Reduction is the proper remedy, either where the
decree has already received full execution by payment,
or where it ordains nothing to be paid or performed,
but simply declares a right in favour of the pursuer.
Suspension is that form of law by which the effect of a
sentence-condemnatory that has not yet received ex-
ceution, is stayed or postponed till the cause be again
considered. If the reasons of suspension be repelled,
the court find the letters of diligence orderly proceeded,
i. e. regularly carried on; and they ordain them to be
put to further execution.

33. An appeal lies in the last resort to the House of
Lords; and by an order of that house, 24th March
1725, no appeal is to be received by them from ses-
tences of the session, after five years from extracting
the sentence, unless the person entitled to such an appeal
be minor, clothed with a husband, non compos mentis,
imprisoned, or out of the kingdom.

34. Decrees are carried to execution by diligence,
either against the person, or against the estate of
the debtor. The first step of personal execution is by let-
ters of horning, which are granted by warrant of the
court of session, not only on their own decrees, but on
those of magistrates of boroughs, sheriffs, admirals, and
commissaries. If the debtor does not obey the will of
the letters of horning within the days of the charge,
the charger, after denouncing him rebel, and register-
ing the horning, may apply for letters of caption, which
contain a command not only to messengers, but to ma-
gistrates to apprehend and imprison the debtor.

35. Our law, from a consideration of compassion
allows insolvent debtors to apply for a release from
prison upon a cessio bonorum, i. e. upon their making
over to their creditors all their estate, real and personal.
This must be insisted for by way of action, to which
all the creditors of the prisoner ought to be made par-
ties. A fraudulent bankrupt is not allowed this privi-
lege.

36. Decrees are executed against the moveable estate
of the debtor by arrestment or poinding, and against
his heritable estate by inhibition or adjudication, of all
of which we have already spoken. Letters of poind-
ing as well as of horning, may be issued by warrant
of the court of session on the decrees of inferior judges.

BOOK IV.

Of Crimes.

1. By the law of Scotland no private party, except
the person injured, or his next of kin, can accuse crimi-
ningly: But the king’s advocate, who in this question
represents the community, has a right to prosecute all
crimes in vindicatum publicum, though the party injured
ought not to consent.

2. Those crimes that are in their consequences most
hurtful to society, are punished capital, or by death;
others escape with a less punishment, sometimes fixed
by statute, and sometimes arbitrary, i. e. left to the
discretion of the judge, who may exercise his jurisdic-
tion either by fine, imprisonment, or a corporal punish-
ment. Where the punishment is left by law to the dis-
ccretion of the judge, he can in no case extend it to
death; for where the law intends to punish capital,
it says so in express words, and leaves no liberty to
the judge to modify. But where in any of our ancient
laws the life of the offender is put in the mercy or will
of the king, it is probable that the judge, in place of
pronouncing sentence himself, left it to the sovereign,
who inflicted sometimes a capital, and sometimes a less
punishment on the person guilty, according to his
merit. The single escheat of the criminal falls on
conviction in all capital trials, though the letters of
transference should not express it; for if the bare non-appearance in a
criminal prosecution draws this forfeit after it, much
more ought the being convicted of a capital crime to
infer it.

3. Certain crimes are committed more immediately
against God himself; others against the state, and a third
against particular persons. The chief crime in the
first class, cognizable by temporal courts, is blasphemy,
under which may be included atheism. This crime
consists in the denying or viliifying the Deity by speech
or writing. Blasphemers were punished capital both
by the Jewish law, Lev. xxiv, 16, and by the Roman.
All who curse God, or any of the persons of the bless-
ed Trinity, are by our law, 1651, c. 21, to suffer death,
even for a single act; and those who deny him, if they
are convicts in their denial. This act is ratified by 1693, c.
11, which also makes the denial of a Providence, or of
the authority of the Holy Scriptures, criminal; and
punishable capital for the third offence.

4. Some crimes against the state are levied directly
against the supreme power, and strike at the constitu-
tion itself; others discover such a contempt of law as
 tends to baffle authority, or slacken the reins of govern-
ment. 

Treason, crimen majestatis, is that crime which
is aimed against the majesty of the state, and can be committed only by those who are subjects of that state either by birth or residence. It was high treason by the law of Scotland, to intend the king’s death, to lay any restraint upon his person, or to entice any foreign power to invade his dominions, 1662, c. 2, and to rise in arms, maintain forts, or make treaties with foreign states without his authority, 1661, c. 5. Certain facts, though not in their nature treasonable, were declared by statute to be punishable as treason, viz. theft by landed men, 1597, c. 50, murder under trust, ibid. c. 51, wilfully setting fire to coal-heughs, 1592, c. 146, or to houses or corns, 1528, c. 8, and assassination, 1601, c. 15. Treason was punished by death, and by forfeiture to the king of the traitor’s estate, both real and personal. But this forfeiture did not cut off the right of the creditors, tacksmen, superiors, vassals, heirs of entail, or widows of the forfeiting persons, 1690, c. 35. Treason might by our law have been tried after the death of the traitor, and sentence condemnatory upon such trial carried the estate to the crown, 1540, c. 69, which was indeed agreeable to the jus novum of the Romans, but contrary to the rules of law and the dictates of humanity.

5. Soon after the union of the two kingdoms in 1707, the laws of treason then in force in England, were made ours by 7 An. c. 21, both with regard to the facts constituting that crime, to the forms of trial, the corruption of blood, and all the penalties and forfeitures consequent on it. By this act, the facts that inferred statutory treason by our former law, are declared simply capital crimes.—For what this crime consists in, for the form of trial, &c. we refer to the preceding article on the Law of England, B. iv. sect. vi.

6. The crime of sedition consists in the raising combinations or disturbances in the state. It is either verbal or real. Verbal sedition, or leasing-making, is inferred from the uttering of words tending to create discord between the king and his people. It was formerly punished by death and the forfeiture of goods, but now either by imprisonment, fine, or banishment, at the discretion of the judge. Real sedition is generally committed by convoking together any considerable number of people without lawful authority, under the pretence of redressing some public grievance, to the disturbing of the public peace. Those who are convicted of this crime are punished by the confiscation of their goods; and their lives are to be at the king’s will. For preventing rebellious riots and tumults, it is enacted, 1 Geo. 1. st. 2. c. 5, that if any persons to the number of twelve shall assemble, and being required by a magistrate or constable to disperse, shall nevertheless continue together for an hour after such command, the persons disobeying shall suffer death, and the confiscation of moveables.

7. Judges who wilfully, or through corruption, use their authority as a cover to injustice or oppression, are punished with the loss of honour, fame, and dignity, 1540, c. 104. Under this head may be classed theftbote, from bote, compensation,) which is the taking a consideration in money or goods from a thief to exempt him from punishment, or connive at his escape from justice. A sheriff or other judge guilty of this crime, forfeits his life and goods, 1436, c. 137. And by a posterior statute, 1615, c. 2, even a private person who takes theftbote suffers as the principal thief. The buying of disputed claims, concerning which there is a pending process, by any judge or member either of the session or an inferior court, is punished by the loss of the delinquent’s office, and all the privileges thereto belonging, 1594, c. 216.

8. Defacement is the opposition given, or resistance made, to messengers or other officers while they are employed in executing the law, and is punishable with the confiscation of moveables. Defacement of the officers of the customs, by persons to the number of eight or upwards, was punished by transportation to America, for a term of years not exceeding seven, 6 Geo. 1. c. 21. 34. But now by 19. Geo. II. c. 34, armed persons to the number of three or more, assisting in the illegal running, landing, and exporting of prohibited or unlicensed goods, or any who shall resist, wound, or main any officer of the revenue in the execution of his office, shall suffer death, and the confiscation of moveables.

9. Breach of arrestment is a crime of the same nature with defacement, as it imports a contempt of the arrestment law and of the judges; and it is subjected to the pains inflicted on defacement, by 1581, c. 118, viz. an arbitrary corporal punishment, and the escheat of moveables, with a preference to the creditor for his debt, and for such further sum as shall be modified to him by the judge.—Under this head of crimes against good government and police, may be reckoned the forestalling of leg of mutton, as that, the buying of goods intended for kets, public market before they are brought thither, which, under the third criminal act, infers the escheat of moveables, offences 1592, c. 148; slaying salmon in forbidden time, 1503, against the c. 27; offences against the acts for preserving the game, planting, destroying plough-grain in time of tillage, and slaughtering, &c. or houghing horses or cows in time of harvest, 1857, c. 82; and destroying or spoiling growing timber, 1698, c. 10.—1 Geo. I. st. 2, c. 48.

10. Crimes against particular persons may be divided, either against life, limb, liberty, chastity, goods, or against particular persons; as against the life of a person’s without a necessary cause. The distinction which obtained in our ancient law between slaughter murder, premeditated, or upon forthought felonies, and that which was committed on a sudden, or chaud mella, indulging to the last the privilege of girth and sanctuary, st. Rob. II. c. 9—1555, c. 31, was taken off by 1661, c. 22, (copied after 1649, c. 19,) which supposes homicide to be a capital crime, without any such distinction. Casual homicide, where the actor is in some casual gone degree blameable, and homicide in self-defence, where micide, the just bounds of defence have been exceeded, are punishment, and in self-murder arbitrarily by this act; but the slaughter of night defence, thieves, house-breakers, assistants in masterful depredations, or rebels denounced for capital crimes, may be committed with impunity. The crime of demem- tion, or the cutting off of a member, is joined with that brutish murder, in 1491, c. 53; but in practice, its punishment has been restricted to the escheat of moveables, and an assaultment or indemnification to the party. Mutilation, or the disabling of a member, is punished at Mutillation, the discretion of the judge.

11. Self-murder is as highly criminal as the killing Self-murder of neighbour; and for this reason, our law has, con- duc, to the rule crimen morte extinguitur, allowed a proof of the crime after the offender’s death, that his single escheat might fall to the king or his donary. To this end an action must be brought, not before the justiciary, but the session, because it is only intended ad civilum effectum, for proving and declaring the self- murder; and the next of kin to the deceased must be made a party to it.

12. The punishment of parricide, or of the murder Parricide.
of a parent, is not confined by our law to the criminal himself. All his posterity in the right line are declared incapable of inheriting, and the succession devolves on the next collateral heir, 1594, c. 220. Even the cursing or beating of a parent infers death, if the person guilty be above sixteen years, and an arbitrary punishment if he be under it, 1661, c. 2. A presumpotive or statutory murder was constituted by 1690, c. 21, by which any woman who should conceal her pregnancy during its whole course, and should not call for or make use of help in the birth was reputed the murderer, if the child was found dead, or was missing. This act was intended to discourage the unnatural practice, which yet continues too frequent, of women making away with their children begotten in fornication, to avoid church censures. It is however now repealed by 40 Geo. Ill. c. 14, which enacts that the circumstances mentioned in the act 1690, shall, infire the punishment of imprisonment only, for a space not exceeding two years.

Dueling. 13. Duelling is the crime of fighting in single combat, on previous challenges given and received. The single combat was authorised by the Gothic polity, as a method of determining both criminal and civil questions; but fighting in a duel without licence from the king, is by 1600, c. 12. made punishable by death. This act is ratified by 1696, c. 35, which also enacts, that whatever person, principal or second, shall give a challenge to fight a duel, or shall accept a challenge, or otherwise engage therein, shall be punished by banishment and escheat of moveables, though no actual fighting should ensue.

Haimsocken. 14. Haimsocken (from haim, home, and socken, to seek or pursue,) is the assaulting or beating of a person in his own house. The punishment of this crime is nowhere defined, except in the books of the majesty, which make it the same as that of a rape; and it is like rape capital by our practice. The assault must be made in the proper house of the person assaulted, where he lies and rises daily and nightly; so that neither a public-house, nor even a private, where one is only transiently, falls within the law.

Battery pendente lite. 15. Any party to a law-suit who shall say, wound, or otherwise invade his adversary, at any period of time between executing the summons and the complete execution of the decree, or shall be accessory to such invasion, shall lose his cause, 1584, c. 138—1594, c. 219. As these acts direct, that proof shall be previously taken of the invasion, by the justice or other competent judge, the court of session sustain themselves judges, because they are truly competent to all causes where the conclusion is merely civil. The sentence pronounced on this trial against him who has committed the battery, is by the act declared not subject to reduction, either on the head of minority, or any other ground whatever. And if the person prosecuted for this crime shall be denounced for not appearing, his liberate as well as single escheat falls upon the denomination.

Wrongful imprisonment. 16. The crime of wrongful imprisonment is described, 1701, c. 6. It is inferred, by granting warrants of commitment in order to trial, proceeding on information not subscribed, or without expressing the cause of commitment; by receiving or detaining prisoners on such warrants; by refusing to a prisoner a copy of the warrant of commitment; by detaining him in close confinement above eight days after his commitment; by not releasing him on bail where the crime is bailable; and by transporting persons out of the kingdom, without either their own consent or a lawful sentence.

The persons guilty of wrongful imprisonment are punished by a pecuniary mulct, from £100 down to £1000, according to the rank of the person detained, and the judge or other person acting contrary to the directions of the act, is over and above subjected to pay to the person detained a certain sum per diem proportioned to his rank, and is declared incapable of public trust. All these penalties may be insisted for by a summary action before the session, and are subject to no modification. Private persons may be guilty of this crime, 14 Dec. 1736, Paterson.

17. Adultery is the crime by which the marriage bed is polluted. This crime could neither by the Roman law, l. 61, ad leg. Jul. de adul., nor by the Jewish, Lev. xx. 10. Dent. xxvi. 22, be committed, but where the guilty woman was the wife of another. By ours, it is adultery if either the man or woman be married. We distinguish between simple adultery, and that which is notorious or manifest. Open and manifest adulterers, who continue incorrigible notwithstanding the censure of the church, were punished 1551, c. 20, by the escheat of moveables; but soon thereafter, by 1563, c. 74, the punishment of notorious and manifest adultery was made capital. This crime is distinguished by one or other of the following characters. Where there is issue procreated between the two adulterers; or where they keep bed and company together notoriously; or where they give scandal to the church, and are, upon their obstinate refusing to listen to its admonitions, excommunicated, 1581, c. 105. The punishment of simple adultery, not being defined by statute, is left to the discretion of the judge; but custom has made the falling of the single escheat one of its penalties.

18. Bigamy is a person's entering into the engage-ment of a second marriage, in violation of a former marriage-vow still subsisting. Bigamy, on the part of the man, has been tolerated in many states before the establishment of Christianity, even by the Jews themselves; but it is prohibited by the precepts of the Gospel, and is punished by our law, whether on the part of the man or of the woman, with the pains of perjury, 1551, c. 19.

19. Incest is committed by persons who stand within incest, the degrees of kindred forbidden in Lev. xviii. and it is punished capital by 1567, c. 14. The same degrees are prohibited in affinity as in consanguinity, Lev. xviii. for, in questions of the law of nature, all children, whether lawful or natural, stand on an equal footing: Civils ratio civilia juris corumque potest, non vero natura. It is difficult, indeed, to bring a legal proof of a relation merely natural on the side of the father; but the mother may be certainly known without marriage.

20. There is no explicit statute making rape, or the ravishing of women capital; but it is plainly supposed in act 1612, c. 4, by which the ravisher is exempted from the pains of death, only in the case of the woman's subsequent consent, or her declaration that she went off with him of her own free will; and even then he is to suffer an arbitrary punishment, either by imprisonment; confiscation of goods, or a pecuniary fine.

21. Theft is defined a fraudulent meddling with the property of another, with a view of making gain. Neither the law of Moses nor of Rome punished theft capitally. By the first the thief was bound to restore,
in some cases, five times the value; in others less, Exod. xxii. 1. et seq.; and by the Roman, either the double or quadruple, according to the circumstances attending the crime. Our ancient law proportioned the punishment of the theft to the value of the goods stolen; heightening it gradually from a slight corporal punishment to a capital, if the value amounted to thirty-two pennies Scots, which in the reign of David I. was the price of two sheep. R. M. l. 4. c. 16. § 3. L. B. c. 121. § 6. In several later acts, it is taken for granted that this crime is capital, 1587, c. 82—1608, c. 5, &c. But where the thing stolen is of small value, we consider it, not as theft, but as pickery, which is punished either corporally or by banishment. The breaking of orchards, and the stealing of green wood, is punished by a fine, which rises as the crime is repeated, 1579, c. 84.

_22._ Theft may be _aggravated_ into a capital crime, though the value of the thing stolen be _trifling_, as theft twice repeated, L. B. c. 121. § 5, or committed in the night, arg. 1661, c. 22; or by landed men, or of things set apart for sacred uses. The receivers and concealers of stolen goods, knowing them to be such, suffer as thieves. Those who barely harbour the person of the criminal (receptatores) within forty-eight hours either before or after committing the crime, are punished as partakers of the theft. Such as sell goods belonging to thieves, or lawless persons, who dare not themselves come to market, are punished with banishment and the escheat of moveables.

_23._ Theft, attended with violence, is called _robbery_; and, in our old statutes, _rif_ , 1477, c. 78, or _stoutrif_; 1515, c. 2; under which class may be included _sorrowing_, or the taking of meat and drink by force, without paying for it. Stoutrif came at last to be committed so audaciously, by bands of men associated together, that it was thought necessary to vest all our freeholders with a power of holding courts upon sorrows and rieves, and condemning them to death, 1594, c. 227. Nay, all were capital punished, who, to secure their lands from depredation, paid to the rieves a yearly contribution, which got the name of _black-mail_. 1587, c. 21. 1587, c. 102. An act passed 1609, c. 18, commanding to banishment a band of sorrows, who were originally from Egypt, called _gypsies_, and adjudging to death all that should be reputed Egyptians, if found thereafter within the kingdom. Robbery committed on the seas is called _piracy_, and is punished capitally by the high admiral. Several of the facts which constitute this crime are set forth in a British statute, Geo. I. c. 24.

_24._ _Falsehood_, in a large sense, is the fraudulent imitation or suppression of truth to the damage of another. The lives and goods of persons convicted of using false weights or measures were, by our old law, in the king's mercy; and their heirs could not inherit but upon a remission, L. B. c. 152. The latest statute against this crime, 1609, c. 2, punishes it by confiscation of moveables. 121. § 6.

_25._ That particular species of falsehood which consists in the falsifying of writings, passes by the name of _forgery_, and was by the Roman law punished capitally when the atrocity of the fact required it. By our statute law, the punishment of this crime was at first the amputation of the hand; afterwards proscription, banishment, and dismembering of the hand and tongue, joined with the other pains inflicted by the common law; and at last it is declared, in general terms, to be he pains due to the committers of falsehood, 1621, c. 22. Our practice has now of a long time, agreeably to the Roman law, made the crime capital, unless the forgery be of executions, or other writings of smaller moment; in which case it is punished arbitrarily.

_26._ _Perjury_, which is the judicial affirmation of a _falsehood_ on oath, really constitutes the _crimen falsi_; for he who is guilty of it does, in the most solemn manner, substitute falsehood in the place of truth. To constitute this crime, the violation of truth must be deliberately intended by the swearer; and, therefore, reasonable allowances ought to be given to forgetfulness or misapprehension, according to his age, health, and other circumstances. The breach of a promissory oath does not infer this crime; for he who promises on oath, may sincerely intend performance when he swears, and so cannot be said to call on God to attest a falsehood. Though an oath, however false, if made upon reference in a civil question, concludes the cause, the person perjured is liable to a criminal trial; for the effect of the reference can no further than the private right of the parties. Notwithstanding the mischievous consequences of perjury to society, it is not punished capital only either by the Roman law or by ours. The special punishment of swearing falsely on an assise, was confiscation of moveables, imprisonment for a year, and infamy; which punishment came, in the course of time, to be transferred to perjury in general, with a small variation, 1555, 47.

_27._ The crime of _stellionate_, from _stellio_, Plin. Hist. 4, Stellio-Nat. l. 30, c. 10. Includes every fraud which is not distinguished by a special name, but is chiefly applied to conveyances of the same numerical right, granted by the proprietor to different dispositions. The punishment of stellionate must necessarily be arbitrary to adapt it to the various natures and different dispositions of the fraudulent acts. The persons guilty of that kind of it which consists in granting double conveyances, by our law declared infamous, and their lives and goods at the king's mercy, 1540, c. 105. The cognizance of _fraudulent bankruptcy_ is appropriated to the court of And, &c. session, who may inflict any punishment on the offender that appears proportioned to his guilt, death excepted, 1696, c. 5.

_28._ The crime of _usury_, before the Reformation, Usury, consisted in the taking of _interest_ for the use of money; and now in taking a higher rate than is authorised by law. The punishment of usury was by 1597, c. 247. declared to be the escheat of moveables, annulling the usurious contract, and a forfeiture of the principal sum lent, with the lawful interest due upon it, to the king or his donatory, with the burden of restoring to the private party, in case he should concur in the prosecution, the unlawful profits given by him to the creditor. But, by 12 An. stat. 2. c. 16, the usurious obligation is not only declared void, but the creditor, if he has received any unlawful profits, forfeits the treble value of the sums and goods lent. Usury, when it is to be pursued criminally, must be tried by the judiciary; but where the libel concludes only for the voiding of the debt or restitution, the session is the proper court.

_29._ _Injury_, in its proper acceptance, is the reproaching or affronting our neighbour. Injuries are either verbal libel; or real. A _verbal_ injury, when directed against a private person, consists in the uttering contumelious words, bal, which tend to expose our neighbour's character by making him little or ridiculous. Where these words are uttered in the heat of a dispute, and spoken to the person's face, the law does not presume any malicious intention in the utterer, whose resentment generally sub-
sides with his passion; and yet, even in that case, the truth of the injurious words seldom absolves entirely from punishment. It does not seem that the twitting one with natural defects, without any sarcastical reflections, though it be inhuman, falls under that description, as these imply no real reproach in the just opinion of mankind. Where the injurious expressions have a tendency to blacken one's moral character, or fix some particular guilt upon him, and are deliberately repeated in different companies, or handed about in whispers to confidants, it then grows up to the crime of slander, agreeably to the distinction of the Roman law, l. 15. § 12. De Inj. And where a person's moral character is thus attacked, the animus injuriandi is commonly inferred from the injurious words themselves, unless special circumstances be offered to take off the presumption; e.g. that the words were uttered in judgment in one's own defence, or by way of information to a magistrate, and had-some foundation in fact. The cognizance of slander was, and perhaps is to this day, proper to the commissaries, who, as the judicis Christianitatis, were the only judges of scandal; but, for some time past, bare verbal injuries, or hasty words uttered interpersonally, have been tried by other criminal judges, and even by the session. It is punished either by a fine, proportioned to the condition of the persons injured and injured, and the circumstances of time and place; or, if the injury import scandal, by publicly acknowledging the offence; and frequently the two are conjoined. The calling one a bankrupt is not, in strict speech, a verbal injury, as it does not affect the person's moral character; yet, as it may hurt his credit in the way of business, it founds him in an action of damages, which must be brought before the judge-ordinary. A real injury is inflicted by any fact by which a person's honour or dignity is affected; as striking one with a cane, or even aiming a blow without striking; spitting in one's face; assuming a cast of arms, or any other mark of distinction proper to another, &c. The composing and publishing defamatory libels may be reckoned of this kind. Real injuries are tried by the judge-ordinary, and punished either by fine or imprisonment, according to the des-merit of the offenders.

50. Anciokly, no person could be convicted of the smallest offence till he was found guilty by a jury of his countrymen; and though now, for more than a century past, inferior judges have tried lesser breaches of the peace de plano, yet to this day all prosecutions of a higher nature, whether before the supreme or inferior criminal courts, must proceed by jury; and no trial, even for a blood-wit, if pursued before the justiciary, can be carried on without a jury. In the trial of crimes competent to the court of session, the judges may well be considered in the character both of court and of jury.

31. Crimes cannot, like debts, be referred to the defender's oath; for no person is compellable to swear against himself, where his life, limb, liberty, or state is concerned; nor even in crimes which infer infamy, because one's good name is, in right estimation, as valuable as his life. The law is however forsworn, in the crime of usury, to depart from some of its common rules, that the crime may be brought to light. Where the usury is founded on a written obligation, in the hands of the defender, the pursuer may, by an exhibition, force him to produce it in evidence of the crime, contrary to the rule, Nemo tenetur edere instrumenta extra se; and where it is not founded upon writing, the crime may be proved by the usurer's own oath, notwithstanding the rule, Nemo tenetur jurare in suam tur. pitidinem, 1600, c. 7. Crimes therefore are, in the general case, proveable only by the defender's free confession, or by writing, or by witnesses. No extrajudicial confession, unless it is adhered to by the pannal in judgment, can be admitted as evidence; for the whole proof must be deduced in open court, in presence of the assize, or jury, as well as of the pannal. A judicial confession ought to be received with all the qualities that the pannal has thought fit to adjact to it; so that the prosecutor, who pleads upon one part of it, must admit the whole. Proof by writing is seldom used but in usury, forgery, and perjury. Though, in defor- mencement, the written execution of the messenger or officer is sufficient evidence of the violence in all civil questions concerning the validity of the diligence, till it be declared false; yet in a criminal trial moved against the deforcer, the messenger's execution, who is a party interested in the prosecution, is not regarded.

32. All objections relevant against a witness in civil cases, are also relevant in criminal. No witness is admitted who may gain or lose by the event of the trial. Hence, in the crime of usury, the testimony of him who has given the unlawful profits is rejected, because he becomes a gainer by the conviction of the deforcer, 1600, c. 7. In defor mencement, the persons employed by the messenger to attest the execution are in some sense parties, violence being commonly used against them as well as against the messenger; yet, as the proof of the crime would be frequently impracticable if their evidence were rejected, the law considers the messengers as the only party against whom the violence is intended, and therefore receives the testimony of the witnesses, though they should be beaten. Socii criminis, or associates in the same crime, are not admitted against another, except either in crimes against the state, as treason; in occult crimes, where other witnesses cannot be had, as forgery; or in thefts or depredations committed in the Highlands, 21 Geo. II. c. 34. 21. The testimony of the private party injured may be received against the pannal, where the king's advocate is the only prosecu
tor, if, from the nature of the crime, the pannal needs a par
y of witnesses, as in rape, robbery, &c.

33. Where a crime is to be proved by several circumstances connected together, every one of which makes a part of the same criminal act, a single witness to each circumstance is sufficient evidence. But it may be doubted, whether this ought to obtain in crimes reiter-
ated by different criminal acts; for if a single witness should be deemed sufficient in such case for proof of each separate act, it would destroy one of the strongest checks by which the testimony of false witnesses may be controlled. Formerly, the depositions of witnesses in all trials before the criminal court were reduced into writing; but that practice is abolished by 21 Geo. II. c. 19, unless where the libel concludes for death or de
nemination. Crimes which, by their nature, hardly admit proof by direct evidence, may be proved by presumptive evidence; presumptive evidence, founded by the conviction of the prosecution in criminal trials, to be so pregnant as necessarily to carry conviction along with them. But where a crime is to be tried only ad eidenti effectum, e.g. where a process of adultery is brought for obtaining a divorce, more slender presumptions will be received; so that the same proof that has been judged sufficient for procuring a divorce before the commissaries, may be cast if the crime should be afterwards tried criminally.
35. After all the witnesses have been examined in court, the assizes are shut up in a room by themselves, where they must continue excluded from all correspondence till their verdict or judgment be subscribed by the foreman (or chanceller) and clerk; but if they are unanimous, they may, by 54 Geo. III. c. 67, deliver their verdict at once by the mouth of their chancellor, without retiring from the box. According to this verdict, the court pronounces sentence, either absolving or condemning. It is not necessary, by the law of Scotland, that a jury should be unanimous in finding a person guilty; the narrowest majority is as sufficient against the pannal as for him. Juries cannot be punished on account of an erroneous verdict, either for or against the pannal; but they might, by our former law, for absolving him against clear evidence.

36. Though the proper business of a jury be to inquire into the truth of the facts found relevant by the court, for which reason they are sometimes called the inquest; yet, in many cases, they judge also in matters of law or relevancy. Thus, though an objection against a witness should be repelled by the court, the assizs are under no necessity to give more credit to his testimony than they think just; and in all trials of art and part, where special facts are not libelled, the jury, if they return a general verdict, are indeed judges, not only of the truth, but of the relevancy of the facts that are sworn to by the witnesses. A general verdict is that which finds, in general terms, that the pannal is guilty or not guilty, or that the libel or defences are proved or not proved. In a special verdict, the jury finds certain facts proved, the import of which is to be afterwards considered by the court.

37. By our old law, the sheriff was confined to a definite time, in pronouncing and executing sentence on certain criminals. When a murderer was taken red hand, i.e., apprehended in the criminal act, it behoved the sheriff not only to try him, but to execute the sentence within three suns; whereas, if he was apprehended ex intervallo, forty days were allowed for that purpose. It was afterwards provided, that in all cases where the sheriff was tied down to do justice in three suns, sentence might be executed at any time within nine days, provided it had been pronounced within three. But, by our present laws, criminal judges not only may, but must suspend for some time the execution of such sentences as affect life or limb, so that condemned criminals, whose cases deserve favour, might have access to apply to the king for mercy. No sentence of any court of judicature, south of the river Forth, importing either capital or corporal punishment, could be executed in less than thirty days; and if north of it in less than forty, after the date of the sentence by 11. Geo. I. c. 26. 10. This act, in so far as it concerns corporal punishments, less than death or dismembering, e.g., whipping, pillory, &c., is altered; so that judges may now inflict these eight days after sentence on this side Forth, and twelve days after sentence beyond it, Geo. II. c. 32.

38. Crimes are extinguished, 1. By the death of the criminal; both because a dead person can make no defence, so that his trial is truly a judging upon the hearing of one side; and because, though his guilt should be ever so notorious, he is, after death, carried beyond moral; the reach of human penalties, and consequently continues no longer an object of correction, which is one of the greatest purposes of punishment. Such trials, therefore, can have no effect, but to punish the innocent heir, contrary to that most equitable rule, Culpa tenei suos auctores. 2. Crimes may be extinguished by a remission from the sovereign. But a remission, though mission; it secures the delinquent from the public resentment, the exercise of which belongs to the crown, cannot cut off the party injured from his claim of damages, over which the crown has no prerogative. Agreeably to this distinction, no person was allowed to plead a remission, till he had given security to satisfy the private party; and in the case of slaughter, it behoved the wife, or the executors of the deceased, who were entitled to that satisfaction, or as it is called in the style of our statutes, assylum, to sign letters of statius, acknowledging that they had received satisfaction before any remission could be granted to the slayer. Whoever, therefore, founds on a remission, is liable for damages to the private prosecutor, in the same manner as if he had been tried and found guilty. Crimes are also extinguished by acts of indemnity, and by prescription. By the custom of Scotland, following in this respect the Roman law, the term of prescription is twenty years; but in certain crimes it is limited, by statute, to certain periods, according to the quality of the offence.

The following are the principal institutional works on the law of Scotland: Craig's jus Feudale, folio, 1722; Stair's Institutions of the Law of Scotland, folio, 1759, (of this work, which is of the highest authority among institutional treatises, a new edition, with notes illustrative of the law since 1759, is in the press.) Bankton's Institutes of the Laws of Scotland, 3 vols. folio, 1751-1755; Erskine's Principles of do. with Notes, 8vo. 1816; and Erskine's Institutes of do. with Notes, folio, 1812. To which may be added, on certain branches of the law, Ross's Lectures on the Practice of the Law of Scotland, 2 vols. 4to. 1792; Wight on Parliament and Elections in Scotland, with Supplement, 2 vols. 4to. 1806; Bell's Commentaries on the Law of Scotland, and on the Principles of Mercantile Jurisprudence, vol. 1st. 4to. 1816; and Kames' Principles of Equity, 8vo. 1800. For the Criminal Law of Scotland, see Hume's Commentaries on the Law of Scotland, respecting the Description, Punishment, and trial of Crimes, with Supplement, 5 vols. 4to. 1797-1800, Sup. 1814. (J. B.)
system of finance in all its branches, connections, and consequences. A natural predilection for these pursuits, laid the foundation of all his future greatness, and particularly of all the fame which he afterwards acquired as a political speculator.

Shortly after the death of his father, which happened in 1688, Mr. Law visited London. This step he was induced to take, from motives similar to those which stimulate most of our young adventurers, considering London as the theatre on which mental endowments and external graces may be displayed to most advantage; and borne up, no doubt, by a sense of his own superiority in these respects, he naturally conceived, that a residence in the capital of the British empire, would not only favour his progress in the pursuits to which he had the strongest attachment, but likewise gratify him, sooner or later, in all his hopes and wishes.

In London, Mr Law, remarkable as he always was for elegance of person, engaging convivial powers, and an extreme propensity to deep play, soon gained admission into the first circles of fashion. His company was courted particularly by the fair sex; and his conversation was prized by every votary of the beau monde.

While thus at the very outset of his career, a circumstance happened which, at first view, was likely to blast all his rising prospects. His fondness for affairs of gallantry involved him in a quarrel with one Mr. Wilson, a gentleman inferior only to himself in those endowments which attract the notice and ensure the attention of the gay. This quarrel, as commonly happens in similar cases, ended in a mutual challenge to the field. In the encounter Law came off victorious, having left his antagonist dead upon the spot where they fought. Having neglected for the moment his safety by flight, he was soon afterwards apprehended, and committed to the King's Bench Prison. Thinking it unadvisable to stand trial, he took the first opportunity of making his escape. He went to the continent, and, during the period of his exile, betook himself to his favourite pursuits. In these, which during his residence in London had been almost totally neglected, he soon made greater progress than ever. Indeed, it could not be otherwise, since his mind was formed with that inquisitive disposition which prompts to the pursuit of knowledge on all hands, and which no difficulties can discourage. The field of information also was now much enlarged. While in Britain, his attention was confined exclusively to the state of things around him. Now, however, his residence on the continent put it in his power to view things on a larger scale. He examined the state of manufactures and trade in the chief commercial cities of Europe. He visited the principal banking houses; and the office of secretary to the British resident in Holland, which he held for some time, put it in his power to gain an acquaintance with the operations of the mysterious bank of Amsterdam. It appears, however, that before the commencement of the 18th century, he returned to his native country, where, in December 1700, he published at Edinburgh the Introduction to his Proposals and Reasons for constituting a Council of Trade. His professed object in this work was, to suggest measures whereby the commercial interests of his country might be promoted. The attempt was laudable, and, which is not always the case, well-timed. A variety of unfortunate circumstances, and particularly the failure of the Darien expedition, had reduced the trade and manufactures of the country to a low ebb. In such a state of things, it might have been expected that the exertions, however feeble, of any public-spirited individual, in support of the interests of the country, would have met with general encouragement. This, however, was not the case with the publication of Mr. Law. His projects did not accord with the sentiments of the supreme judicature, and consequently met with no encouragement from that quarter. The proposal, also, which he made to Parliament in 1705, for the establishment of a paper currency, was rejected by the house, from an idea, that if carried into effect it would be prejudicial to the landed interests of the country. This repeated disappointment in his plans, the object of which was, at one and the same time, personal aggrandizement and public good, naturally alienated his mind from his native country. Accordingly he left Scotland soon after, and was at Genoa in 1708. For five or six years after he rambled about the continent, observing the manners of the different nations, and making his fortune by skill in games of hazard. It is said, that when he settled at Paris in 1714, he was possessed of a fortune, acquired in this way, of £110,000.

Prior to this period, he had visited the capital of France twice; but his plans there met with as little encouragement as they did in England. The natural jealousy of the Parisians, also, would no doubt be excited by the circumstance of his being a foreigner. Through the advice and under the patronage of his friend the King of Sardinia, however, he visited Paris a third time, in 1714. The death of Louis XIV. happened soon after; and he was patronised by the Duke of Orleans, regent during the minority of Louis XV.

By Law's advice and direction, certain improvements were made in the state of the finances, and measures adopted for establishing upon a firmer basis the sinking credit of the country. Commencing the residence of the advocate, William, then settled at London, he set up a private bank, under the firm of the "General Bank of Law & Co." So great was the public confidence placed in this institution, and so uncommon the success of which it was productive to the proprietors, that, about the close of the year 1718, the Duke of Orleans resolved to take it into his majesty's hands, as had at first been proposed. This measure was strenuously opposed by the proprietors; but all opposition to the will of the crown being vain, the "General Bank of Law & Co." was, on the 4th December, 1718, incorporated by royal charter into what was afterwards termed the "Royal Bank." It was perhaps this circumstance which led to the more speedy development of that stupendous scheme, which seems to have long occupied the mind of Law, generally known by the name of the Mississippi System.

The object of this scheme was to invest the whole of the national trade, with certain revenues arising from different sources, in the hands of one great company, who might thus be enabled to extend their commercial projects to an indefinite extent. By the suggestions of Law, such a company actually was instituted, under the name of the Company of the West. To this company was granted the whole province of Louisiana in North America, a country watered throughout by the Mississippi river; from which circumstance the scheme was generally known afterwards by the name of the Mississippi System. This vast project, which owed its birth entirely to Law, who was in consequence appointed director-general of the company, soon became the topic of general conversation. The minds of the lower orders were interested by the fair prospects which it held forth; while the novelty of the scheme attracted the notice not only of France, but of all the other European nations. Nothing was talked of in Pa-
Law, John, irs but the Mississippi; and nothing was sought after with such avidity as shares in the India Company. The reputation and the fame of Law extended far and wide. His house was crowded from morning till night with visitors from all quarters, most of whom were satisfied with a look or a smile from the illustrious foreigner. He was regarded by all ranks as the saviour of the kingdom; and the same honour was conferred upon him, as upon the king and regent themselves. Soon after, he was declared comptroller-general of the finances, or, in other words, prime minister of state. Honours were heaped upon him from all quarters. He was elected an honorary member of the Academy of Sciences; and the freedom of his native city was transmitted to him in a gold box of the value of £300. Thus was an obscure foreigner elevated at once to the second rank of authority and power in the most distant nation of Europe.

The system of which Law was the founder, continued to gain credit and influence for sometime. Its immediate effect was the exaltation of the lower orders in the society; there was daily a prodigious rise in the price of shares in the Company. In a month's time all ranks and influence were vanquished; a stranger, a visitor, a mediate or remote foreigner, had a share one day, found himself possessed of a fortune by selling it the next. The distinctions between master and servant was for a time abolished. High and low, rich and poor, were banded together. Paris was crowded with strangers from all quarters of Europe; and there was a prodigious influx of wealth into the French empire. Thinking men soon perceived that the necessary consequences of such a state of things would be, the destruction of all government, the stagnation of trade, and the dissolution of morals. The order of things in society is so wisely constituted, that changes such as that which took place upon the establishment of the Mississippi system, could not fail to produce the most baneful effects. The grand object, too, which the original projector of the scheme had in view, must have been frustrated at least for the present, by the confusion and disorder of which it was the immediate occasion. A scheme, such as that which we are now contemplating, requires, in a pre-eminent degree, caution and deliberation. Where these qualities are wanting, a scheme may promise fair, and it may be borne up for some time by popular favour. The springs of an organised body may be kept in motion by the mere energy of enthusiasm; but it requires not the spirit of prophecy to foresee, that a scheme, which has nothing more than novelty and enthusiasm to support it, will speedily be ruined. To the want of which, then, of cautious inquiry and cool philosophic deliberation, we may attribute the speedy downfall of the Mississippi system.

The Company speculated to a most enormous extent. The original proprietors forgot the purpose for which it was organised, and were intent solely on the acquisition of wealth for themselves and their friends. Hence in the midst of the general delirium, there was observed a constant drain of specie from the bank. So great was the desire manifested by the members of the Company to have their shares converted into gold and silver, that there was scarcely left enough of these articles for the purposes of ordinary circulation. From this and other causes, apprehensions of danger to the national interest arose. Accordingly, by certain edicts published from the crown, it was easy to perceive, that the downfall of the Mississippi system and of Law's grand scheme was all speedily to happen. In prospecting at events, personal pique and envy, no doubt, had a considerable share of influence. The greatness of a foreigner gave umbrage to the Parisian minis-
The prosperous career of Law was now terminated. The rage of the populace continually increased, and he saw no prospect either of favour or of safety, if he remained any longer at Paris. Accordingly he left France, and came once more to his native country. He went by the way of Holland, passing under the name of M. du Jardin. Wherever he was known, he was received by all ranks with kindness and respect. All were desirous to see the man who had extended his fame far and wide, and who, from an obscure and private station, had, by the exertion of his own abilities, risen to the highest civil rank which a commoner can attain. He passed through Brussels and Venice, and went to England by the way of Bohemia, Hanover, and Denmark. At Copenhagen, he found a British squadron, in which he was safely conveyed to London. There he took a splendid house, and was daily visited by the first ranks of people. Soon after his arrival, he heard of the confiscation of his property in France. Conscious, however, of the rectitude of his intentions, and of the fidelity with which he had conducted himself in the different stations which he was appointed to fill, he naturally expected, that, after the fullest investigation, the balance would be found considerably in his favour. In this, his expectations were frustrated. The regent, who had always been his friend, and who did not desert him in his sad reversal of his fortunes, died suddenly on the 2d December, 1723. With him perished the last hopes of Law. All prospect of recovering any part of his property became every day fainter and fainter. His official salary, which, through the regent's kindness, had hitherto been regularly transmitted to him, was discontinued. He soon became embarrassed. Suits against him were commenced both in England and in France, and he was threatened with imprisonment by his creditors. He made another attempt, through the Duke of Bourbon, prime minister of France, to recover his property; but this entirely failed. In the year 1725, he bid a final adieu to Britain, and fixed his residence at Venice. There he died in a state of comparative indigence, on the 21st of March, 1729, in the 58th year of his age. He was buried in one of the churches of the city, where a monument is erected to his memory. The following epitaph appeared soon after:

*C'est ici que se réunissent les éclairs,\ C'est ici que se concentrent les volcans.\ Que, par les régles de l'algèbre,\ A m'ia la France à l'hôpital.*

LAZARETTO. is the name of a public building for the reception of persons who are appointed to perform quarantine, in consequence of coming from places suspected of the plague. See Howard's *Account of the principal Lazarettos in Europe*, Warrington, 1789, and the article Quarantine.

LAZULI LAPIS. See Mineralogy.

METALLURGY AND MINERALOGY.

LEAF. See Botany, vol. IV. p. 39. and p. 58. sect. V.

LEAGUE. See Measures.

LEATHER, is a substance prepared from the skins of several sorts of animals, for various important purposes. It is used particularly by glovers, harnes-makers, coach makers, saddlers, breeches-makers, gilt-leather-makers, chairmakers, shoe-makers, and bookbinders. An account of the art of preparing leather will be found under Tannino.

LEBADEA, is a town in Turkey, situated between Delphi and Thebes. The streets of the town are narrow and ill paved; and in consequence of the numerous conduits and channels for supplying mills and reservoirs from the bed of the Hercyna, water is seen falling in all directions. Lebadea is celebrated for the Hieron of Trophonius, which is situated a few paces from the spot where the river Hercyna issues from beneath a rock. None of the Grecian antiquities are better authenticated than this. An uncertainty, however, exists respecting the *Adytum* or residence of the oracle, in consequence of the interior not having been explored in modern times. The narrow aperture, supposed to lead to the Adytum, is close to the ground, and is choked with stones and rubbish. Below the aperture, a fountain issues from several small pipes into a bath, paved with large hewn stones and pieces of marble, and which was used by those who came to consult the oracle.

The most sacred part of the Hieron, containing the entrance to the Adytum, and the niches for the *dona volvara*, is a perpendicular rock of black marble facing the east. The niches, which are 12 in number, are above the Adytum, and to the right and left of it, and have different shapes and magnitudes. The largest is an entire chamber of stone, containing a stone bench, which may have been the throne of Mnemosyne. This chamber is 5 feet 10 inches from the ground, and the whole of it is hewn from the solid rock. It is 12 feet 8 inches long, 11 feet 3 inches wide, and 8 feet 8 inches high. The stone bench is 8 feet 8 inches long, 14 inches wide, and 18 inches high.

The fountain which we have mentioned, serves to supply the town of Lebadea with its best water.

Dr. Clarke ascended the citadel on the summit of the rock above the cave, and found there the capital of a large Corinthian pillar, of a rare variety. It was made of the hard black marble of the rocks upon which the citadel stands. Within the fortress he observed a few fragments of antiquity; and in a mosque near it some inscriptions.

Lebadea has a considerable commerce in the produce of Attica, Boeotia, and Thessaly, and carries on a thriving export trade even to London, of corn, and cotton, and currant raisins, which it procures from Patras. The ancient Anticyra, now Aspropot, is the port of Lebadea. The wine of Orelionomenus is sold here, and is sometimes like the clearest spring water. The honey of Lebadea is sent to the Grand Signor's seraglio. Lebadea contains 1500 houses. A very full and interesting account of the cave of Trophonius, with a drawing of it, will be found in Dr. E. D. Clarke's *Travels*, vol. IV. p. 155—156.
LEBANON, or Libanus, is a celebrated mountain of Asia, on the borders of Palestine and Syria. It is part of a group in the form of a horse-shoe, which commences a little above Smyrna, about three or four leagues from the Mediterranean, and extending southwards towards Siden, takes an easterly direction towards Damascus, and thence winds northward. The name of Lebanon is given to the western ridge, and Antilebanon to the eastern, comprehending Calosyria between them.

Mount Lebanon is said to be composed of a hard calcarious stone of a whitish colour, sonorous like freestone, and arranged in strata of various inclinations. The celebrated traveller, M. Burckhardt, whose recent death is so deeply deplored, ascended this mountain in 1811, and has stated in a letter to Dr. E. D. Clarke, that it is composed of primitive limestone.

From a very vague calculation, Volney has estimated the height of Lebanon at 1500 or 1600 fathoms. It is about 100 leagues in compass, and consists of four ridges rising one above another. The first ridge produces grain and fruits in great abundance; the second, which is rocky and barren, produces nothing but thorns; the third is covered with fruitful gardens and orchards; and the last, which is uninhabitable from the extreme cold, is covered with deep snows, which remain almost all the year.

The rivers which flow from this mountain, are the Jordan, Recham, Nahar-Rosian, and Nahar-Cadica, and several smaller streams.

The wines of Lebanon have long been celebrated. The principal of these is the Vino d'Oro, or golden coloured wine, which is not boiled, but purifies itself by keeping. The vintage commences about the end of September.

Mount Lebanon is chiefly inhabited by the Maronites, and by the wild Arabs, of the sect of Kali. The convent occupied by the Maronite patriarch, consists of various grottos, of which the church is the largest, cut out of the rock. It lies in a deep bottom, to which there is a narrow and steep descent. See Volney's Travels in Syria, and Clarke's Travels, vol. ii. p. 146.

LEDbury, is an ancient borough and market town of England, in the county of Hereford. It stands about one mile west of the river Leddon, on a declivity within a small valley, formed by the well-watered eminence, called Dog Hill, and other eminences. It consists of two streets, crossing one another at right angles. The principal street extends north and south, and has a middle road near the old market-house, which is supported on strong oak pillars, and consists of timber and lath covered with plaster, the beams being painted black. Many of the old houses are built in this way with projecting stories; but the modern ones are of red brick, and look well. The church is a large building of Saxon architecture. It consists of a nave, side aisles, and chancel; a chapel dedicated to St. Catherine; and a detached tower, which rises to the height of sixty feet, terminating in a fine spire. There is a curious Saxon door-way on the west front; and the church contains many ancient and interesting sepulchral memorials. Ledbury has also an hospital, founded by Bishop Foliot in 1232; a free school, supported by grants issuing from disclaimed charity lands; a charity school; and several almshouses.

The principal articles manufactured here, are ropes, lines, and sacks for meal; the clothing trade, which was once very flourishing, having now declined. Great quantities of cider are manufactured in the neighbourhood.

In 1811, the parish contained,

LEECH. See VERMES and SURGERY.

LEEDS, a large manufacturing town of England, in the West Riding of Yorkshire, is situated on the north bank of the Aire, on an eminence, which rises gently from the river to the upper end of the town, and slopes to the west, east, and south. The suburbs on the south side of the river, are connected with the town by a freestone bridge, which forms an excellent entrance to the town. Leeds is about half a mile broad from north to south, and nearly a mile and a half long from east to west. Briggate, the principal street, is about 500 yards long and 30 broad, and divides the town nearly into two parts. In the middle of the town, both to the east and west of Briggate, are several good streets, and many large and elegant houses. The western part is however the most elegant, and is adorned with very handsome houses. In the old parts of the town the streets are narrow and crooked, and in some places not very clean; but in general the town is cleanly kept, and every street has a flagged pavement on each side.

The principal public buildings in Leeds, are the five churches, St. Peter's, St. John's, St. James', Trinity Church, and St. Paul's, the dissenting chapels, the general infirmary, the house of recovery, the free grammar school, the mixed cloth hall, the white cloth hall, the gaol and court-house, the king's mills, the water works, the charity school, the Leeds national school, and the circulating library. The church of St. Peter is a large and ancient building, 165 feet long and 97 broad. It is built in the form of a cross, with a tower or steepie 96 feet high, and underwent a thorough repair in 1811. This church contains many interesting monuments, one of which, designed and executed in marble by Flaxman, is peculiarly elegant, and was erected by the town of Leeds to the memory of Captains Samuel Walker and Richard Becket, who fell in 1809 at the battle of Talavera. St. John's church, begun in 1851, and consecrated in 1854, was founded and finished by John Harrison, Esq. It consists of two aisles only, with a single row of columns up the middle; and the tower is placed almost at one angle of the west end. St. James' church is built of stone, in the form of an octagon. It was first occupied by the Countess of Huntingdon's preachers; but was afterwards bought for the establishment. Trinity church is a handsome building in the Greek style, with a tower surmounted by a spire. It is ornamented externally with eight Doric pillars on each side; and the roof is sustained by a double row of Composite columns. The entire expense of the building was £5,653. St. Paul's church is an elegant stone building, which was erected through the exertions of the Rev. Miles Atkinson, at an expense of £10,000. It was consecrated in 1793. The architecture is Roman; and the end front consists of a pediment, supported by four Ionic pilasters. The spire was the plan. The dissenting meeting-houses, which are eight in number, are one Presbyterian, one Unitarian, three of Independents, one of Scotch Presbyterians, one of Baptists, and one of Quakers, besides two Methodist meeting-houses, and a Roman Catholic church.
The general infirmary is a large and handsome brick building of Roman architecture. It was founded in 1768, and was opened in 1771. It is 150 feet long, and 68 wide. The court is 186 feet by 30; and the back court, with the offices and garden, is 185 feet by 120. An attic story was added to the central part of the building in 1792. Mr. Howard, who visited Leeds in 1788, says, that this hospital is one of the best in the kingdom. The average number of in-patients annually during the three years preceding 1816, was 764, and the out-patients 1675. The house of recovery was founded in Vicar Lane in 1802, and opened in 1804, and is appropriated to the reception of poor persons afflicted with infectious fevers.

The free grammar school was erected by John Harrison, Esq. and in 1692 was enlarged by Mr. Lawson. In 1780, an excellent house was erected near the school for the use of the master.

The mixed or coloured cloth hall, built in 1758, is a quadrangular building, enclosing an open area of 1773 yards by 68. It is divided into six covered streets, each of which contains two rows of stands. Each stand is 22 inches in front, and has the name of the clothier painted upon it. The total number is 1800. The number of master manufacturers, however, does not exceed 1780, some of them having two stands. Each stand originally cost three guineas; but they are now worth from £8 to £15. The hall is so completely lighted, that the colours of the goods can be seen as distinctly as in the open air.

The white or undyed cloth hall, built in 1775, is a quadrangle 99 yards long and 70 broad, and is divided into five covered streets, each of which has a double row of stands, the total number of which is 1210. Each of these cost originally 30 shillings, but they now sell from £3 to £8. A small hall was erected some years ago in Albion street, for the use of those clothiers who had not received a regular apprenticeship, and who could not therefore be admitted into the other halls.

The market for coloured cloths is held every Monday and Saturday at nine in the morning, and that for white cloth on Tuesday at one o'clock. The market commences by the ringing of a bell. At the end of an hour a second bell rings; and at the end of a quarter of an hour a third bell announces that the market must be cleared. All the business is therefore completed in an hour and a quarter; and if any merchant remain in the hall after the last bell is finished, he is fined five shillings, and the same sum for every five minutes that he continues there. After the cloths have been properly fulled, and the uniformity of their fabric certified by a leaden ticket affixed by the inspector, they are brought to the market in the rough. The buyers purchase in a few words, and the cloths are taken to the warehouses to be examined. A part of the price is then paid, and six months credit given for the balance.

The new court-house and prison, at the bottom of Park-Roe, may be ranked among the first public buildings of the town. The first stone was laid on the 2d of September, 1811, and completed in 1813. The principal front is towards Park-Roe, and consists of a portico of four Corinthian columns, and two wings, which have pannels highly wrought in bas relief, containing the fasces, fleeces, wreaths, &c. The rotation-office, and the West Riding magistrates' room, are on each side of the vestibule, and communicate with the great room, which contains an elevated stage for the public, capable of containing 800 persons. There are also two galleries, one for the grand jury, and a corresponding one for ladies; a room for the counsel, and a retiring-room for the jury, which communicates with their box. The casement story, which is entirely arched with stone, consists of a open ground arcade, for the use of the military, behind which is a guard-room, and an engine-room, sufficiently large to contain the whole of the town and fire-offices engines.

There are also on this story, gallery apartments, which command the prison-court, in which are thirteen cells.

The king's mews are held by a grant from the crown by J. P. Neville, Esq. and all the inhabitants of Leeds are obliged to grind their corn there.

The water-works are near the bridge over the Aire, and supply the town with abundance of soft water. Adjoining to them are the vast warehouses belonging to the Aire and Calder Navigation.

The charity-school, in which 70 boys are taught reading, writing, and arithmetic, and 50 girls reading, writing, and knitting, was founded by Mr. Harrison. The children are admitted at seven, and remain till fourteen.

The Leeds national school is a convenient and handsome edifice for the instruction of 520 boys and 180 girls on Dr. Bell's system. It was begun in 1812, and opened in 1813.

A Lancastrian school was also erected in 1812, and is a large and commodious brick building.

A Wesley chapel, a very handsome and spacious building, was erected in Maiden-lane in 1816.

Leeds has an excellent circulating library, which was established in 1768 by the exertions of Dr. Priestley. It contains a large and excellent collection of books, and some valuable manuscripts, which are deposited in a splendid apartment, erected at an expense of £5000.

Magnificent assembly rooms have been built in Leeds, and dancing assemblies are held every fortnight during the winter. The theatre was built in 1771; but during four years previous to 1816 it was shut up.

Besides the institutions we have mentioned, there is a workhouse, built in 1736 by Mr. Sykes, several old almshouses, founded by John Harrison, Esq. and consisting of 20 dwellings, to which 12 more have been added, and 10 new almshouses, founded by Mrs. Potter, for the widows of deceased tradesmen.

The principal manufacture of Leeds and its vicinity is that of cloth. It consisted formerly of the coarser kinds, but the superfine cloths are now manufactured on a great scale. Swandown, toilenets, kerseymers, and various other fancy articles are also made here. Manufactures of sacking, canvas, linen, and thread, have also been carried on to a considerable extent. Two carpet manufactories have also been established, besides several cotton mills, manufactories for flat and green glass, and for fine and coarse pottery goods. There are also several founderies. On the banks of the Aire, and its tributary streams, are mills for grinding corn, dyers wood, rape-seed, for fulling cloth, and for driving the machinery for the carding and spinning of wool. There is likewise a large manufactury of steam engines carried on by Mr. Mathew Murray, which, we believe, is the largest in England excepting that of Messrs. Boulton and Watt.

Leeds is one of the principal mart of the woollen manufactures in the west riding of Yorkshire, and is a great part of the cloths pass through the hands of the Leeds merchants. The manufacturers of mixed cloths reside chiefly in the villages belonging to the parish of Leeds, westward of the town, and at Dewsbury and its vicinity, &c. The white cloth is made also at Dewsbury, and in a district six miles distant from Leeds.

The borough of Leeds, which includes the whole pa-
L E E 695' L E G

Lee is governed by a mayor, 12 aldermen, and 24

councillors.

The country round Leeds is pleasant and beau-

tiful. The vale of the Aire is highly interesting. The

soil is very fertile, and within three or four miles of

the town there is abundance of coal, which is very cheap.

Within a mile of the town are vast quarries of argilla-

ccous schistus, which supply Leeds, &c. with flag-stones.

The following is an abstract of the population of the

town and liberty of Leeds for the year 1811.

| Inhabited houses | - | 12,749 |
| Families         | - | 33,641 |
| Direct employ. in trade, &c. | - | 11,759 |
| Males            | - | 29,512 |
| Females          | - | 33,092 |
| Total population | - | 65,534 |

Leeds is situated in East Long. 0° 37' 26", and North

Lat. 53° 48' 0".

For farther information respecting this opulent town,

see the magnificent work of Thoresby, entitled Du-ecatius

Leodiensis, edited by Dr. Whitaker, and published at

Leeds in 1816; also Whitaker's Loides and Elmete,

Leeds, 1816, a work of equal splendour; and the Beaux-

LEETAKOU or LATTAKOU, is a large and populous

city of Africa, and the capital of the territory of the

Booshoona tribes. This town was visited in 1801 by Dr.

William Somerville and Mr. Truter, and is sixteen

days journey beyond the Orange river. The account

taken of the town by these travellers, will be found

in our article BOOSHODANAS.

Lectakou was visited in June 1813, by the Rev. Mr.

Campbell, minister of Kingsland Chapel, who has given

a very full account of the inhabitants. He describes

the city as lying in a valley between hills, and stretch-

ing about three or four miles from east to west. The

city is divided into about 50 districts, separated from

each other, having each a headman, or alderman, and a

place enclosed for public resort, where the men spend

the greater part of the day together, dressing skins, and

making knives, and various articles. Copper and iron

are obtained from some nation farther west; and it is

understood that there are copper mines in mountains

not very distant from Lectakou. From these metals

the people manufacture axes, adzes, knives, spears, and

hodkins, rings for the legs, arms, fingers, and ears. Their

cloaks are made and sewed as well as those of

Europeans. The women of Lectakou build the houses,

dig the fields, and sow and reap, while the men milk

the cows, make their clothes, and go to war. Even the

women dig the ground along with the other females:

They use a kind of pick-axe. They all sing when at

work, and strike the ground in time. In the house of

Salakoopou, the king's brother, Mr. Campbell saw paint-

ings, which were rude representations of the camelon

and rhinoceros, elephant, lion, tiger, and steinbuck.

They were drawn on the clay wall with white and black

paint by Salakoopou's wife. The water by which the

town is supplied, is obtained from holes at the end of

a hill about a mile to the westward. Each hole is one

foot in diameter, and two feet deep. From 50 to 100

women are to be found at these little wells from morn-

ing till evening. From the best calculation which Mr.

Campbell could make, he estimated the number of

houses at 1500, and the inhabitants at 7500. There

are, it is said, about a thousand places called outposts,

where there are people and cattle.

Mr. Campbell places Lectakoo in about 26° 12' of

South Lat. and 25° 14' East of Greenwich. See Bar-

row's Travels in the South of Africa; and Campbell's

Travels in the South of Africa, chap. 15, 16, 17, 18, 19,

20, Lond. 1815.

LEGACY. See Law, p. 624, § 27, and p. 680, § 3.

LEGEND. See Medals.

LEGHORN, or LIVORNO, anciently Liburni portus,

and Liburnum, is a flourishing city and sea-port town

of Italy, in the Grand Duchy of Tuscany. It is situ-

ated in the Mediterranean, in a marshy and unhealthy

country, opposite to the small island of Malora. The

town, which is well fortified, is of a square form, and

is about 12,750 feet in circumference. Its streets are

straight, regular, and wide, and most of the buildings

are tolerably handsome. The fine street, called the

Street of Ferdinand, traverses the town in a straight

line from the gate of Pisa to the Colonella gate. The

Place of Arms is a noble square.

Leghorn contains fourteen churches, two Greek chal-

chels, an Armenian chapel, and a magnificent syna-

agogue. Its principal church is collegiate; and the

constant residence of the canons fixes several men of

learning in the town. The free Turks and Turkish

slaves have a mosque; but, with the exception of the

English, who have a chaplain, the Protestants are

not permitted the free exercise of their religion. One

of the principal objects of interest at Leghorn is the

marble statue erected by Cosimo II. to his father Grand

Duke Ferdinand I., which is the work of Giovanni del

Opera. It stands in an open place before the harbour.

The gigantic figures of the Turkish slaves, chained

at the angles of the pedestal, are particularly admired.

The Campo Santo, or the Cemetery of the Catholics,

is planted with cypress, and has some fine chapels. The

cemetery of the English is still more magnificent, and

contains some superb mausoleums. The harbour is

divided into the outer and the inner. The inner harbour

serves merely for four or five galleys, which are em-

ployed against the Corsairs. The outer harbour is

formed by a mole, 600 common paces long; it is well

paved, with a partition in the middle for sheltering the

shipping from the wind on one side. From this mole,

which is a favourite promenade, are seen the punta Ca-

valeggieri, the lighthouse, which stands on a rock, and

has 30 lamps in one lantern, the islands of Gorgona,

Meloria, Capraia, and even Corsica. Large ships lie

beyond the mole, moored to pillars of large iron rings,

as there is not a sufficiency of water in the harbour.

There are at Leghorn three lazaretto's and an arsenal;

and the vessels perform quarantine at Molato. The

inhabitants of Leghorn carry on an extensive trade, which

is greatly promoted by the freedom of the port, as eve-

ry bale of goods, whatever be its size, pays only two

pastras, or scudi. Coral is the principal object of

manufacture at Leghorn. After it is obtained from the

fisheries, it is more reduced for the Indians. It is then

split into small grains (like those of beads) of dif-

ferent sizes, which is done by first cutting the coral

into small cubic pieces, then perforating them, and after-

wards grinding them on a revolving stone, till they re-

ceive the desired shape. They are next arranged into

sizes by passing them through sieves, and assorted ac-

cording to similarity of colour. The most lively colours

are the most prized in the Indies, and the palest are

most esteemed in Germany. The largest are sold at 60

franes per ounce. At the orphans' hospital there is a

manufacture of artificial flowers. The great part

of the trade of Leghorn is carried on by the Jews, who

live in a particular part of the city, and, though subject

to heavy exactions, they are still in a prosperous state.
Articles brought into Leghorn from the Continent pay heavy duties to government, and from that cause, as well as from the monopolies of brandy, tobacco, and salt, the necessaries of life are very dear.

Leghorn is famous for its great magazines of oils, which were constructed by the Medicis family. They are square vaults, from four to five feet high, built of brick, and covered inside with a sort of stucco, made of pounded bricks. These magazines are capable of holding no less than 24,000 barrels. Every merchant has his own reservoir, and keeps the key of it.

The bowling-green, called Gli Spariti, and the ramparts, are the favourite promenades. The convent of Monte Nevo, at a short distance from Leghorn, is highly celebrated. Leghorn contains no antiques. The water of Leghorn is so bad, that the opulent inhabitants supply themselves from Pisa.

The principal imports of Leghorn from Great Britain are: alum, Jesuits’ bars, cassia, fistula, and lignes, cinnamon, cloves, nutmeg, pepper, pimento, black and white ginger, Carraca, West India and Maranhau cacao, coffee, black and silver cochinile, Perambuco, Maranhau, Bahia, and Bengal cotton, cod and stockfish, Buenos Ayres and Brazil hides, East India, Caraca, and Guatimala indigo, lead in pigs, lead ore, litharge, mankeens in short pieces, Jamaica and Leeward Islands rum, raw and refined sugar, Hawthorne white and brown, Brazil dito, tin in plates 4d single, English and Scotch wheat, fustic, logwood, Brazil or Perambuco wood, Nicaragua in large logs, Manchester, Birmingham, and Nottingham manufactures.

The principal exports of Leghorn are: sweet and bitter almonds, anchovies, Bologna white, ared, Florence dito, red and white, Sicily barilla, juniper berries, Sicily rough brimstone, Tuscan dito in rolls, cantharides, Parmesan cheese, cream of tartar, Zante currants, essence of bergamot and lemon, Smyrna black galls, Aleppo black galls in sorts, gom arabic and tragacanth, Bologna hemp, Irios root, liquorice, paste, lemon juice, madder root of Cyprus and Smyrna, manna in flakes and in sorts, Lucaa oil in jars and in half chests, Gallipoli oil, orange peel and buds, quicksilver, Lipari and Smyrna raisins, Tuscan rags, sponges, safflower, soffron aquillas, Sicily sumac, senna, Tuscan lamb and kid skins, white and mottled sheep, valonea, &c.

The population of this town is variously stated. Some make it 60, and even 70,000; others from 40 to 50,000; and Eustace calls it only about 30,000. East Long. 10° 16' 45" and North Lat. 43° 33' 5". See Eustace's Travels, vol. ii. p. 295.

LEIBNITZ, Godfrey William, a celebrated philosopher and mathematician, was born at Leipsic in 1646, and was the son of Frederic Leibnitz, professor of moral philosophy, and secretary to the university in that city. He made a rapid progress in classical learning, and discovered, in his youth, a ready talent of versification. His academical studies were very extensive, but were particularly directed to the writings of the Greek philosophers, whose systems he attempted to reconcile with each other, and with that of Des Cartes. He devoted himself chiefly, however, to the study of the law, as a professional pursuit; and was admitted bachelor of that faculty at Jena in 1665, and doctor at Altorf in the year following. Upon a visit to the university of Nuremberg, he connected himself with a society of learned men, who were engaged in the pursuit of the philosophers stone, and to whom he acted for some time in the office of secretary; he having attracted the notice of Baron Bernheub, first minister of the Elector of Mentz, he repaired under his protection to Frankfort on the Main. In 1668, he wrote a treatise in support of the elector palatine’s pretensions to the crown of Poland, which had then become vacant, and was in consequence invited to the court of that prince; but his patron Boinheub prevented his acceptance of the invitation, by procuring him the office of counsellor of the chamber of review at Mentz, and afterwards engaged him to take charge of his son at Paris. He applied himself in that city to the study of mathematics, in which he had not previously made much progress, particularly to the writings of Pascal, St. Vincent, Huygens, &c.; and attracted so much notice by his invention of a new arithmetical machine, that he was offered a seat, as a pensionary member, in the Academy of Sciences. But his promotion in France would have required his desertion of the principles of Protestantism; and removing to England in 1678, he became acquainted with the learned members of the Royal Society, and especially with Mr. Collins, from whom he received some hints of the method of fluxions, which had been invented by Sir Isaac Newton in 1664 or 1665. Receiving advice of the death of the Elector of Mentz, by which he lost his office and salary, he returned to France, and was soon afterwards appointed by the Duke of Brunswick-Lunenburg one of his counsellors, but permitted to remain at Paris in order to complete his arithmetical machine. In 1676 he returned to England, and went from thence to Hanover, where he experienced the same favour from Ernest Augustus, Bishop of Osnaburg (afterwards Geo. I.), as from his predecessor, and at his request began to compile a history of the house of Brunswick. In 1700, he was a member of the Royal Academy of Sciences at Paris; and in the same year was appointed perpetual president of the Academy at Berlin, which the elector of Brandenburg (afterwards king of Prussia) had founded by his advice. To this institution he sent numerous dissertations on various subjects; and projected an academy of the same kind at Dresden, but which the troubles in Poland prevented from taking effect. About this time he applied himself to the construction of "a universal language," which had already occupied the attention of the learned, and which he proposed to accomplish by employing characters resembling as much as possible those of algebra. His fame spread rapidly over Europe, and attracted the patronage of several crowned heads. In 1711, he was made alicis counsellor to the emperors, from whom he received a pension of 2000 ducats, and who promised to double the sum, upon condition of his residing at Vienna. He was chosen as a privy counsellor also by the earl of Muscovy, with a pension of 1000 ducats; and it is said, that he was offered the place of keeper of the Vatican Library at Rome, by Cardinal Casanata. Upon the accession of his patron the elector of Hanover to the throne of Great Britain, Leibnitz again visited England in 1714, where he was treated with great distinction; and, soon after his arrival, he engaged in a controversy with Dr. Samuel Clarke, on the subjects of free-will, space, &c.; which terminated only with his death in 1716, at 70 years of age.

Leibnitz, as to his person, was of a middle stature and spare habit of body; near-sighted, of a studious air, and mild aspect. He was extremely temperate in his mode of living; taking his meals only when hunger impelled him, and using a plain though strong diet. His temper was naturally hot, but he was able to re-
strain it, after the first hasty emotions were over, and
was both affable and polite in conversation, as well as
greatly averse to disputation. He was indefatigable in
his application to study; and used to impress any sub-
ject indelibly on his memory by merely committing it
to paper. He was perpetually occupied with projects,
chiefly for the promotion of learning and science; but
one of his most romantic schemes was that of a general
government for Europe under one power, in which the
emperor of Germany was intended to direct the civil,
and the pope the ecclesiastical department. He was
seldom neglectful of his own interest, in the midst of
all his speculations, and was sufficiently solicitous to
secure the favour of princes, as well as to turn their pa-
troage to his own advantage. He was indeed consi-
dered as fond of accumulating money, of which he left
at his death about 60,000 crowns; and the greater
part of the sum was found in sacks, in various kinds of
specie. In his religious sentiments, he professed to be
a Lutheran, and wrote several treatises against hereti-
calistical tenets, but his scheme of setting the
pope at the head of the religion of Europe—his neglect
of all public worship—and the sentiments expressed in
several of his writings, have made it probable that he
had no very fixed opinions on the subject, and that he
conceived those which he really entertained. He was
never married, though he made some proposals with
that view, when he was about 50 years of age; but the
lady desiring time to consider, gave him an opportu-
nity to do the same; and led him to the conclusion
that "marriage was a good thing, but that a wise
man ought to consider of it all his life." He was un-
questionably a man of eminent genius and extensive
learning. His writings treat of a vast variety of
subjects, scientific, literary, political, and metaphysical,
and were published in different forms and places; but
were collected by M. Dutens, and printed at Ge-
neva in six large vols. 4to, in 1768. A very full ac-
count of the dispute between Leibnitz and Newton,
respecting the invention of Fluxions, will be found un-
der Fluxions, vol. ix. p. 383. See also Mathematics,
History of. (q)

LEICESTER, the county town of Leicestershire, is
situated in the hundred of Goscote. It is 98 miles to
the north of London. It stands on the river Soar.
The houses are principally ranged in three parallel
streets, intersected by several smaller ones. They are
in general, not so commodious as are principally found in
manufacturing towns. There are five parish churches,
the most celebrated of which is St. Margaret's; but St.
Nicholas' church is esteemed the most ancient. The
floors of all, or nearly all, the churches in this town, are
considerably lower than the level of the church-yards
and the streets, whence it is supposed, that the latter
must have gradually been raised since the building of
the former. The county jail, which was built in the
year 1791, is on the plan of Mr. Howard. The town
jail was built about the same period. At the southern
extremity of the town is the infographic, a square build-
ing with two wings, calculated to accommodate 54 pa-
tients, exclusive of the fever ward; near it is an asylum
for indigent lunatics. The exchange stands in the mid-
dle of the market-place. There is also a theatre in Le-
icester, and it is noted for the number and excellence of
its images. To the south-east of the town is the new
walk, 3 4ths of a mile long, and 20 feet wide; from it
there are many pleasing views of the town, meadows,
and surrounding country. Leicester has returned two
members to Parliament ever since the reign of Ed-
ward I. In the reign of Henry VIII. one was chosen
by the mayor and his brethren, and the other by the
inhabitants at large. This mode of election continued
till the time of Charles II. when the commons at large
returned both members. From this period, the right
of election has been vested in the freemen not receiving
alms, and in the inhabitants paying scot and lot. The
number of voters is supposed to be about 2000; but
persons living in the borough by certificate, not having
gained a settlement by renting £10 per annum, or ser-
viving in an annual office, are not entitled to vote. The
government of the town is vested in a mayor, recorder,
steward, bailiff, 24 aldermen, 48 common councillors,
town-clerk, &c. The chief trade of Leicester consists
in combing and spinning wool, and manufacturing
it into stockings. The goods are chiefly coarse; part
consumed in the county, and part exported. The
trade of Leicester was long stationary, but latterly it
has been much improved and extended. In the year
1680, there was only one stocking-maker in this town;
at present there are nearly 100, who employ about 4000
frames; and, when trade is good, between 15,000 and
20,000 dozen pairs of stockings are manufactured in a
week. Between 7000 and 8000 persons are directly or
indirectly in some branch of the hosiery business in this
town. In the year 1801, there were 3905 houses inhab-
ited by 3606 families; 85 houses uninhabited; 7921
males, and 9032 females; 499 persons chiefly employ-
ed in agriculture, and 11,320 in trade, manufactures,
&c. The following is the result of the population re-
ut in 1811:

| Houses inhabited, | 4609 |
| Families inhabiting them, | 4873 |
| Houses building, | 74 |
| — unemployed, | 74 |
| Families employed in agriculture, | 428 |
| — in manufactures, | 4090 |
| All others, | 335 |
| Males, | 10,901 |
| Females, | 12,345 |
| Increase, | 6198 |

In 1801, 16,933

See Beauties of England and Wales, vol. ix.; and Pitt's
Agricultural Survey of Leicestershire. (w. s.)

LEICESTERSHIRE is an inland county, situated
nearly in the centre of England: It is bounded on
the north by Nottinghamshire and Derbyshire, from
which it is divided, in some parts, by the rivers Trent and
Soar; on the west it is bounded by Derbyshire and
Warwickshire, from the latter of which it is divided
by the small rive Aukor and the Roman road called
Watling Street; on the south it is bounded by North-
amptonshire, from which it is divided by the rivers
Wellow and Avon; and on the east it is bounded by Rut-
landshire and Lincolnshire. With respect to its
shape, it has been compared to a "shoulder of mutton
with the shank cut off." Its greatest length is from
the south of Lutterworth to the northern part of the
vale of Belvoir; on this line it measures about 45
miles: its general breadth, from east to west, is rather
more than 40 miles; its mean diameter is about 30
miles; the circumference is about 150; and its super-
ficial contents have been variously estimated, as high
as 560,000 acres, and as low as 522,240. According to
the latter estimate, Leicestershire appears to be the
26th county in England with respect to size.
It is divided into six hundreds, viz. Framland, Gar-tree, Goscote East and West, Gtublaxon, and Sparkenho. There are eleven market towns, of which the principal are Leicester (the county town), Loughborough, Hinchenley, Lutterworth, Melton Mowbray, Market Harborough, Market Bosworth, and Ashley-de-la-Zouch. There are in this county 192 parishes; but the number of places which pay separate parochial rates is 328. It sends only four members to parliament; two for the county and two for Leicester. It is in the province of Canterbury, and diocese of Lincoln: The whole county is under one archdeacon, and it contains six deaneries.

With respect to surface and soil, Leicestershire is highly favoured by nature. Its surface is not so level as to render it unhealthy, or ill ventilated as to prevent the waters from flowing from it, so as to render it fit for all the purposes of agriculture; and, with a very few exceptions, it is not so broken or lofty as to render it cold, or of difficult and precarious cultivation. It is, in fact, in most parts raised to such a degree, as to afford at once beautiful scenery, and a fine field for the labours of the farmer. The highest ground in the county is some of the peaks in Charnwood forest, towards the north-west, and their elevation is not more than 800 or 900 feet above the level of the sea. There are also rough lands called Wolds on the southern side of the county. The soil of Leicestershire varies very little over its whole area. It may generally be described as a loam of different degrees of tenacity, depth, and fertility, according to its proportion of clay, and the substratum on which it lies. The best, or rather the driest and sharpest soil is commonly found on the hills; the strongest and wettest soil in the vallies. The red loam, which seems to stretch across England, from Rutlandshire to the very extremity of Devonshire, is prevalent in this county. It is a soil of great fertility; and, being easily worked at all seasons, of great value to the farmer.

The principal rivers in Leicestershire are the Soare, the Swift, the Welland, the Avon, the Wreke, and the Ankor; but they are all very small streams. The Soare rises in the south-west border of the county, whence it flows to Leicester. Soon afterwards it is joined by the Wreke from the north-east; its course then bends to Mount Sorrel and Loughborough, till it falls into the Trent. It is made navigable for barges from its junction with the Trent to several miles above Leicester, a distance of upwards of 20 miles. The Swift rises in this county, flows by Lutterworth, and then enters Warwickshire. The course of the Welland in this county is also for a short space; it rises in it near Harborough, and soon afterwards enters Northamptonshire. The Avon rises nearly in the same part of the county; but its course is directly opposite to that of the Welland, being through Warwickshire into the Severn. The course of the Wreke has been already mentioned. The Ankor rises near the source of the Soare, and, running in a north-west direction near the borders of Warwickshire, falls into the Avon. Hence it appears, that the Soare, and its tributary streams, the Wreke and the Welland, flow into the east sea, while the other rivers of this county flow into the west sea.

There are several artificial navigations in this county; that of the Soare, or the Leicester Navigation as it is called, has already been briefly noticed. Besides the main stream, or cut, on or near the line of the river Soare, down the Soare valley to the Trent, there is a collateral branch to Loughborough, which is continued over part of Charnwood forest by canal, or road-way, to the collieries and lime-works in that part of the county. By means of the Leicester and Melton-Mowbray canal, the rivers Wreke and Eye form a communication with the Soare; and the former rivers, by means of cuts, &c. are made navigable to Melton-Mowbray, where the Oakham canal commences. This canal runs a course of 15 miles, about half of which is in Leicestershire, the rest in Rutlandshire; in the first 83 miles it has a rise of 126 feet, afterwards it is level. The Grantham canal merely skirts the east side of the county, on the borders of Nottinghamshire, running through the vale of Belvoir, to which it is of great advantage, the roads being there almost impassable during winter. The Union canal begins at and joins the Soare navigation at Leicester. Its course for three miles is nearly parallel to that river; it then passes towards Wigston, &c. and on to Northampton, into the river New Navigation and Grand Junction canal. Its whole course, from Leicester to Northampton, is 45 miles, with 407 feet 6 inches lockage; the rise is 110 feet, and the fall 197 feet 6 inches. It passes through 4 tunnels. There is a cut to Market Harborough. In its course it crosses the river Welland. The Ashley-de-la-Zouch canal joins the Coventry canal near Nuneaton. It soon afterwards enters Leicestershire near Hinchenley, and passing Market Bosworth, proceeds to Ashley-de-la-Zouch. It is 50 miles long, with 250 lockage. It was intended to have been continued to the navigable part of the Trent, below Burton. There are several rail-ways, as appendages to this canal, to the collieries and lime-works in this part of the county.

The climate of Leicestershire is, on the whole, mild, healthy, and very salubrious; and the harvest, especially in the western parts of the county, at least ten days earlier than it is in the counties on the east coast of England. The average annual fall of rain is supposed to be about 30 inches.

This county is not distinguished for its minerals. Its coal and limestone, however, are valuable, and in some parts abundant; and there are also lead, iron-stone, coal-slate, and freestone. The coal mines are situated in the north-west of the county, not far from the borders of Derbyshire. Those at Cole-Orton and Lount have been long worked; but those on Ashley Wolds have been lately established by the Marquis of Hastings. The seam is nearly three yards deep; but as it lies 200 yards below the surface, it is raised at considerable expense; the quality of this coal is good. The most celebrated lime-works in this county are those of Breton and Bardon-upon-Soare. Breton lies in the hundred of West Goscote, near the borders of Derbyshire. It is situated at the base of a high limestone rock, of a conical form, with the top seemingly cut off; the strata which compose the central parts of it (and which are found nearly horizontal in the plain) are raised almost perpendicularly, and placed upon their edges, while those on each side decline like the surface of the hill. According to Dr. Darwin, the Breton limestone contains two parts magnesian earth, and three calcareous. The kilns, in which it is burnt, are in the form of an inverted cone. Alternate layers of coal and limestone are placed at the top, and the burnt lime is drawn out at the bottom. This lime, in consequence of the quantity of magnesia which it contains, is reckoned prejudicial to the land, unless it is laid on with great caution and judgment. The limestone at Bardon-upon-Soare is of a different quality from that of Breton. It consists of a hard blue stone, which lies in thin strata. The first under the surface is tinged with yellow, the rest...
the under strata are six inches thick, and two feet asunder. This limestone strongly resembles in appearance, composition, and qualities, the clay-stone of Gloucestershire, which, when burnt, produces the strong lime of that district. The lime of Barrow is used not only as a manure, and for the common purposes of building, but also for water-works; as, under water, it forms a strong and durable cement; for the latter purpose it is exported to Holland, &c. When the pier of Ramsgate was built, Dutch torras was first used; but not being found to answer, Barrow lime was advantageously substituted. In the quarries of this limestone some curious minerals are found, such as fossil fish, plants, &c. The most singular is a plain and bold representation of a flat fish, but what particular fish is not known. It is not less than a foot long, and of a proportionable depth; the scales, fins, and gills projecting from the surface. In the vale of Belvoir, is a limestone similar to that of Barrow. At Stanton-Harold is also limestone of a good quality, in the fissures of which rich lead ore is found, which is smelted into metal. On Ashley Wolds, iron stone is met with. It lies at the depth of 600 yards, and is mixed with clay marl; but does not pay for smelting. On the east side of Charnwood forest, a thick heavy slate is raised, which is used for covering buildings, and some of the thickest blocks for grave-stones. There are few parts of the county which do not contain free-stone and brick-clay. The hill at Mount Sorrel is formed of a rock of reddish granite. This is so hard, especially after being exposed to the air for some time, as to resist all tools. Many houses are built with them, and make a very singular appearance. They are often imperfect cones; and being too hard to be cut or broken, the smoothest face is laid outermost, in beds of the excellent lime of Barrow. These stones, from their uncommon hardness, are coveted for painters' millets."

Leicestershire is one of the few counties in England which is equally celebrated for its agriculture and its manufactures. Some of the estates in it are very large, particularly that of the duke of Rutland. The tenures are principally freehold. There is little copyhold, and still less holding church tenure. In the grazing districts of this county, there are many substantial yeomen who farm their own estates: In those districts the farms are large; in the other parts they seldom exceed 200 acres. The graziers have long been justly celebrated for their skill, experience, intelligence, capital, and success; and there are many of them by no means inferior, in most of these respects, to the well-known Bakewell.

Leicestershire is much more distinguished as a grazing than as an arable county; and the tillage land is much less, in proportion, than that of most other counties. In the south, east, and middle of the county, are many farms without any tillage land whatever. In the north and west a proportion of each farm is generally kept in tillage. According to Mr. Pitt, in his Agricultural Survey, one-half of the strong clay loam (the whole of which he estimates at 160,000 acres) is in occasional tillage: the whole of the more friable loam, which he also estimates at 160,000 acres, is in occasional tillage. According to this estimate, there are 240,000 acres in occasional tillage, or under the convertible husbandry: Of these, he reckons the 570,000 acres under wheat; 40,000 under barley; 80,000 under oats; 12,000 under beans, peas, and vetches; 40,000 under turnips, cabbages, &c.; 80,000 under clover; and 5000 clean fallow. In the mode of cultivating these crops there are few things requiring particular notice.
They are large, heavy, and full of wool; but large boned, their wool coarse, and they take a long time to fatten. This breed, however, is gradually approaching to the second kind, or the new Leicester. For this latter, the county, as has been remarked, is indebted to Mr. Bakewell. "Their offals are small, and their profitable points are large; their backs are broad and straight; their breasts are full, bellies tucked up, heads small, necks short, legs thin, pelt light, and wool fine of its kind; they are quiet in temper and disposition, and capable of being fattened in a short time, on a small proportion of food, and to a great weight, in proportion to their apparent size." Mr. Bakewell has fattened mutton to six inches thick of fat upon the ribs. Fat weather will weigh about 25 lb. a quarter; the average fleece about 7 lb. The weight of the bones is proportionally very trifling: On a shoulder of 19 lb. the bones frequendy will not weigh more than six ounces. The forest sheep are principally confined to Charmwood: they are white or grey-faced, with legs of the same colour as the face; generally without horns, and with coarse wool.

Mr. Bakewell paid attention to the improvement of the breed of horses, as well as of cattle and sheep; but long before his time, Leicestershire was famous for a useful and beautiful breed of strong black horses. It is still a horse-breeding county, not only for the plough, waggons, &c. but also for the race-course and the chase. The fleets of Ashley, Loughborough, Harborough, Burton-on-Trent, Rugby, Ashburn, Stafford, &c. are principally supplied with Leicestershire horses, which are here bought up for the drays of London, &c. Mules have long been used in this county, both for draught and the saddle; they have also been used in the plough. The swine of Leicestershire, having partaken of the improvement of Mr. Bakewell, are of a better breed than are to be met with in most other counties.

The principal manufactures of Leicestershire are intimately connected with its great product of wool. They consist of wool-combing, woollen yarn, worsted, and stockings principally or wholly of worsted. The chief seat of these branches is Leicester and its neighbourhood, and Hinckley; the chief country villages also partake in them. At Ashley are considerable cottonworks. Harborough is the seat of a considerable manufactory of tammies. At Hinckley and Ashley, a good many hats are manufactured. Latterly, patent netlace has become an object of great attention in Castle Donnington and its neighbourhood. The principal exports of the county, chiefly by means of the Trent, are worsted stockings, hats, cottons, lace, wool, and cheese.

The sheep are sent to Birmingham, London, &c. These two towns, and the populous parts of Staffordshire, take off a large quantity of the cattle of this county.

The poor-rates in Leicestershire, in the year 1776, amounted to the sum of £26,360; in the year 1809, they had advanced to £107,586: the increase, therefore, is 10 to 40. In the same period, the poor-rates of the whole kingdom had advanced from £1,679,585 to £5,161,813, or from 10 to 21 nearly: hence it appears, that they had increased in this county in rather a greater ratio than in the whole kingdom. The number of persons relieved in and out of workhouses, in the year 1808, was 19,154, besides those that were not parishioners. Each person relieved out of any workhouse at the rate of £3, 18s. 8d. per annum; each person relieved in the workhouses cost at the rate of £11, 14s. 6d. per annum. Taking both classes together, the expense per individual amounted to £4, 7s. 3d. The resident population, in 1801, amounted to 130,081; so that the number of parishioners relieved from the poor-rates appears to be 14.5 in 100 over the resident population. The amount of the total money raised by parochial rates was 16s. 6d. per head on the population. The amount of the whole expenditure on account of the poor averaged 12s. 10d. on the population. The number of persons belonging to friendly societies appears, in 1806, to have been 8 in the 100 of the resident population. One hundred of these societies had been enrolled according to act of Parliament. In the year ending 25th of March, 1815, the amount of money raised by parochial rates in this county, amounted to rather more than £140,150.

When the Romans invaded Britain, Leicestershire was inhabited by a tribe called the Corani. On their conquest, it was included within the province of Flavia Caesariensis, and had military stations established in different parts of it, which were connected, as usual, by military ways, the most celebrated of which were the Watling-street and Fossway. When the Romans left the island, Leicestershire formed part of the kingdom of Mercia, and Leicester was constituted a bishop's see much about the time that England was divided into counties. Before this period, the kingdom of Mercia was subdivided into two parts, distinguished by the names of Southern and Northern. The inhabitants of Leicestershire were then called Middle Angles. Although this county lies, it may be said, in the centre of the kingdom, it was much subject to the ravages of the Danes, who constituted and regarded Leicester as one of their five chief cities in the island. After the Norman conquest, it was entirely parcelled out by William among his relatives and favourites, who, on their part, regranted various allotments to their followers and dependents. At this period, Leicestershire contained as great a number of strong castles as perhaps any district in the kingdom, most of which, however, were utterly demolished in the reigns of Henry II., John, and Henry III. When Domesday Book was compiled, there were only four wapentakes, or hundreds.

The whole county, at the time of the compilation of Domesday, is said to have contained 34,000 inhabitants; in the year 1700, the number was 80,000; in 1750, the number was 95,000.

According to the population returns of 1801, there were at that time 25,992 houses, inhabited by 27,997 families; 63,943 males, and 66,138 females; employed in agriculture, 38,823; in trade, &c. 42,036. The number of inhabitants on a square mile were 139, the average of England and Wales at that time being 152. Some returns of baptisms and burials in the middle of the 16th century, compared with returns from the same parishes in the middle of the 18th century, it appears that, at the former period, the baptisms were 276, and the burials 216; and, at the latter period, the baptisms were 276, and the burials 216; so that the population in these parts of the county, in that space of time, seems, judging from the burials, to have increased only as 5 to 9; whereas, by the births, it seems to have increased only as 5 to 8. The increase of population is supposed to have been chiefly among the manufacturing classes. From the account we have given of its modern agriculture, it is evident that it cannot grow wheat sufficient to support its inhabitants; whereas, formerly, a much larger proportion of its land was arable, under wheat and beans principally.
The following is the result of the population returns in the year 1811:

Baptism in 36, Burial in 57, Marriage in 130.

LEIGHTON, Robert, was the eldest son of Alexander Leighton, a native of Scotland, but a minister in England, whose publications in support of the puritanical tenets, drew upon him the vengeance of Bishop Land, and subjected him (besides the indignity of having his ears cut, and his nose slit,) to a cruel imprisonment for the space of eleven years. His son Robert was, from his youth, distinguished by the most humble piety, and at the same time by the most promising talents. He was sent to complete his education in Scotland, where he made considerable progress in the learned languages; and afterwards spent some years on the continent, where he acquired a ready use of the French tongue. Upon his return to Scotland, he was ordained minister of Newbattle, in the neighbourhood of Edinburgh, where he devoted himself to his clerical studies and pastoral duties, without taking much concern in the political and theological contentions which subsisted prevalent in those days. In 1648, he declared his appollation of the measures in favour of the king, but was protected by the Earl of Lothian from the violence of the opposite party: and, when censured at the meetings of synod for neglecting to preach the duties of the times, is said to have replied, "If all the brethren have preached to the times, may not one poor brother be suffered to preach about eternity?"

Finding it impossible, with all his moderation, to avoid sharing in the disputes of that period, he resigned his charge, and withdrew to a private station; but was soon after called from his retirement to preside over the college of Edinburgh, an office which he discharged, for the space of ten years, with great fidelity and approbation. During the terms of vacation, he made frequent excursions to London, where he had opportunities of observing all the eminent men of Cromwell's court; and occasionally also visited the Netherlands, where he seems to have found among the Jansenists a greater congeniality of views on his favourite idea, of reviving the purity and simplicity of the primitive ages of the Christian church. He seems to have considered the form of church government as a matter of comparative indifference, and as not very strictly defined in sacred scripture; but may be supposed to have been impressed by his father's sufferings with a feeling of aversion, rather than of attachment, to the constitution of the English hierarchy; and, when the measure of introducing Episcopacy into Scotland was adopted, he certainly showed great reluctance to accept the promotion which was pressed upon him. Having at length consented, (chiefly, it is said, through the persuasion of his brother, Sir Elisha Leighton,) he was made choice of Durham; a single instance of a poor deacon, to which, however, the deanery of the chapel-royal was annexed. He appears from the beginning, to have augured little good from the measure in which he concurred; and remarked upon the feasting and jollity, which attended the consecration of himself and his associates, "that it had not such an appearance of seriousness and piety, as became the new modelling of a church." He was soon after discouraged, by finding no support in his conciliatory plans with the Presbyterians, or in his Christian views of promoting sober piety and true worship among all denominations, which he regarded as more important than the mere form of government. His colleagues discovered no disposition to co-operate in his schemes, or to propose any other scheme of their own but compulsion; and "before they reached Edinburgh, they were (as he said to Bishop Burnet) as weary of him as he was of them." He left them at Morpeth, and refused to join in the pompous entrance which they made into the metropolis. He declined also taking his seat in the first session of parliament which followed their arrival; and indeed never appeared in that assembly, except when some measure came before them relative to religion or the church. He particularly exerted himself to procure liberty for the Presbyterian ministers, to take the oath of allegiance with the explication which they tendered; and when he found that he could not concur in the oppressive measures which were pursued, he repaired to court in 1665, when he laid his sentiments on the matter before the king, and requested leave to resign his bishopric. This proposal of resignation was refused; but Charles promised to direct a change of measures; and is said to have been more friendly to Leighton's views than any of his counsellors. The good bishop in the mean time devoted himself to the business of his own diocese, in which he gave an example of personal piety and professional duty, which all parties might have done well to imitate. He regularly went round his district every year, preaching and catechizing from parish to parish, and labouring to raise his clergy to a higher sense of spiritual matters. He lived in a very private manner, and gave all his income to the poor, except what was requisite for his personal expenses. In the hope of bringing about a general accommodation, and in consequence of promises of assistance from the court, he was persuaded, in 1670, to become Archbishop of Glasgow, where he exerted himself to the utmost to reconcile the contending parties. But at length perceiving that he gained nothing upon the Presbyterians except their esteem, and that he was suspected, and even hated by the Episcopal leaders, he resigned his charge in 1675, and retired to a private residence in Sussex. But, though he resigned his preferment, he did not relax his professional labours; but divided his time between studious retirement, and the clerical offices of preaching or reading prayers in the adjoining parishes. He retained to the last an appearance of greater youthfulness and strength, both of mind and body, than is usual in advanced years. At the age of 70 his hair was still black, and his motions lively; and his quickness of thought, power of memory, and spirit of devotion, in no respect impaired. But on a visit to London in 1684, he was suddenly seized with a pleursy, of which he died in a few hours, at the Bell inn, in Warwick Lane. "He was accounted a saint," says Bishop Burnet, "from his youth up. He had a great quickness of parts, a lively apprehension, with a charming vivacity of thought and expression. He had the greatest command of the purest Latin that ever I knew in any man. He was a master both of Greek and Hebrew, and of the whole compass of theological learning, chiefly in the study of the Scriptures. But that which excelled all the rest was, he was
possessed with the highest and noblest sense of divine things that ever I saw in any man. He had no regard to his person, unless it was to mortify it by a constant low diet, that was like a perpetual fast. He had a contempt both of wealth and reputation. He seemed to have the lowest thoughts of himself possible, and to desire that all other persons should think as meanly of him as he did himself. He bore all sorts of ill usage and reproach like a man that took pleasure in it. He had so fixed the natural bent of his temper, that in a great variety of accidents, and in a course of twenty-two years intimate conversation with him, I never observed the least sign of passion but upon one single occasion. He brought himself into so composed a gravity, that I never saw him laugh, and but seldom smile. And he kept himself in such a constant recollection, that I do not remember that ever I heard him say one idle word. There was a visible tendency in all he said to raise his own mind, and those he conversed with, to serious reflections; he seemed to be in a perpetual meditation. And, though the whole course of his life was strict and ascetical, yet he had nothing of the sordidness of temper that generally possesses men of that sort. His thoughts were lively; oft out of the way and surprising, yet just and genuine. And he had laid together in his memory the greatest treasure of the best and wisest of all the ancient sayings of the heathens as well as Christians, that I have ever known any man master of; and he used them in the aptest manner possible." His sermons are full of sublime and Christian sentiments; his style combines, in a wonderful manner, a majestic force with a beautiful simplicity; and his pronunciation as a preacher is said to have been at once grave and graceful. His extreme modesty rendered him inexorable to all the intrigues of his friends to publish any of his writings during his life; but he was very careful in the preparation of his discourses; and many of his works have been recovered since his death. The chief of those which have been published are, a volume of sermons, with an exposition of the Creed, Lord's Prayer, and Decalogue; an exposition of the first psalms of Peter; meditations on certain psalms, originally in Latin; theological reflections in the same language; a few lectures and letters. See Bishop Burnet's History of his own Times; life of Leighton prefixed to his volume of Sermons; and preface to his Exposition of Peter, by Dr. Doddridge.

LEIGHTON Buzzard, or Beaudesert, is a considerable market-town of England, in the county of Bedford. It is situated on the river Lysel, or Ouzel, and consists of one large street, crossed at right angles by two smaller ones. The principal piece of antiquity in the town, is its beautiful pentangular cross. It is 38 feet high, and consists of two stories. It is built of stone, and situated in an open area in the market-place, and is supposed to have been erected about the beginning of the fourteenth century. The church is a large structure, and has a square tower surmounted with a spire 193 feet high. The Grand Junction Canal passes on the west side of it, and within a furlong of the town, and is capable of carrying vessels of 80 tons. About half a mile from the town are the remains of a Roman encampment. The population of the parish, in 1811, was 408 houses, 509 families, 187 families employed in trade and manufactures, and 2114 inhabitants. See Britton's Architectural Antiquities of Great Britain, vol. i.; Lyson's Magna Britannia, vol. i.; and Beauties of England and Wales, vol. i. p. 36.

LEINSTER. See IRELAND, Vol. XII. p. 266, &c.

LEIPSICK, or Leipzig, is a city of Misnia, in Upper Saxony, and situated on the Pleisse, in the fertile plain between the rivers Saale and Mulda. The town is neat and regularly built, and is about 8934 places in circumference. The suburbs are extensive, and consist of good buildings and gardens, and is separated from the town by a fine walk of lime trees, which runs round the town. The Grand Place is large, and contains many excellent houses. The citadel, called Pleissenburg, from its being situated on the Pleisse, is a place of great strength. It is erected after the model of the ci-devant citadel of Milan. It contains a moat, finished in 1752; and in its Roman Catholic chapel there is a monument to Jablonowski; and on one of its towers is the observatory. Leipsick contains eight parish churches for Lutherans, and one for Calvinists. The church of St. Thomas has a fine organ, and its tower is 200 feet high. The exchange is a good building, and the roof of its hall is well finished. The other remarkable buildings and objects of curiosity at Leipsick, are the Maison Du-four, which is one of the finest edifices in Leipsick; the theatre; the manage; the Hotel de Ville, built in 1636; the house and the court of Auerbuch, built by the physician Strohmer; the auditory of M. Plattner; the concert room at the old assembly; the church of St. Nicholas; the college of princes; the Paulinum, a vast and ancient edifice, in the garden of which is a monument to Gellert; the hospital of St. George; the Laze-retta, and the clinical institution; the esplanade, with a statue of the reigning king; the monument of Gellert at the church of St. John, and his tomb in the public cemetery.

The principal literary and useful establishments in Leipsick, are the university, which was founded in 1409, and has always maintained its celebrity as a place of learning, and which has six handsome colleges belonging to it; the two public schools; the Academy of Painting and Design; the Economical Society; the Society of the Sciences of Belles Lettres, founded by Prince Jablonowski; the Collegium Philo bibliothecarum; the Institution for the Dumb and Deaf; the Intelligenz Compilator, with its numerous collections of machines and models; the Museum of Beggargang, an excellent institution, which deserves the notice of travellers.

The chief collections and cabinets, are the libraries of the city, the university, and the churches and schools of St. Nicholas and St. Thomas; the cabinets of painting of M. M. Richter and Stieglitz; the cabinet of natural history of Link; the physical cabinet of M. Tauer, and the mineralogical cabinet of M. Hansen and M. Geissler.

Leipsick is a place of considerable trade, and possesses some important mercantile privileges. Three great fairs are held annually; at the beginning of the year, Easter, and Michaelmas, which continue during a fortnight each, and are frequented by foreigners from all parts of Europe, and even from Asia. The Bohemians bring all kinds of glass ware, linens, &c.; the Silesians bring linens; the Poles leather, wax, and wool; the Prussians and Pomeranians, woollen and silken stuffs; the Nurembergers toys; the Swabians linens, and gold and silver articles; the Austrians and Hungarians leather, wines and dye stuffs; the Swiss, woollen, silken, and linen stuffs; the Russians, leather, hemp, and flax; the Italians silk; the French lace and millinery; and the English, Dutch, and Hamburgers, colonial produce and British manufactured goods.

The general amount of the trade carried on at these fairs, has been estimated at twenty millions of rix-dollars per annum. The almanac of Leipsick contains the names and addresses of more than 800 foreign mer-
chances, who frequent these fairs, exclusive of from 260 to 290 booksellers. The amount of books sold annually, has been calculated at 500,000 rix-dollars; and, for the accommodation of this trade, the booksellers have recently established an exchange for the sale of books. Its principal manufactures are silk, gold, and silver stuffs, linen and cotton printing, velvet, leather, carpets, hats, tobacco, paper, playing cards, Prussian blue, &c.

Leipsick is a depot both for foreign and Saxon merchandise, and the export of linens, silks, velvets, and velvet cloths, made in the neighbourhood of the town, is very considerable. These, along with leather and smuts, which are also exported, are shipped at Hamburg, from which Leipsick procures its supplies of colonial and other foreign produce.

There are many promenades and public gardens around the town, which are deserving of notice. About three-fourths of a league from Leipsick, between the great road of Magdeburg and Dessau, is the field of battle of Breitenfeld, celebrated by the defeat of Tilly. The field of battle of Lutzen is also near the town; and the spot where the French army under Bonaparte was totally defeated by the combined forces of the allies in 1813. Population of Leipsick 33,000. East Long. 12° 21' 45", North Lat. 51° 20' 16". See Nordensch's Euro-ean Commerce, Lond. 18-8 and France, vol. ix. p. 657.

LEITH, is a sea-port town, and burgh of barony of Scotland, situated on the Firth of Forth, in the county of Midlothian. It stands upon the Water of Leith, which divides it into two parishes, called North and South Leith, and is about two miles distant from Edinburgh. These two parishes communicate by two drawbridges. By far the greater part of the town is situated on the south side of the river; but both in North and South Leith, the streets of the old part are narrow and irregular, and they contain many excellent and commodious houses. The principal street is called the Kirkgate, and is as it were a continuation of Leith Walk. The parts of the town, however, which have been erected during the last 20 or 30 years, such as St. John's Place, St. James's Street, Castlfield Place, and the new streets in North Leith, to the east of the battery, and near the new church, contain most elegant houses, which are inhabited by the principal merchants, &c., and are not surpassed by the finest buildings in Edinburgh.

The principal public buildings in Leith, are the old church of South Leith, the new church of North Leith, the chapel of ease, the Episcopal chapel, the Trinity house, the exchange buildings, the bank of Leith, the custom-house, the new school, and Seafield baths.

The old church of South Leith is a large Gothic building of no beauty, with a tower surmounted by a small spire. The new church of North Leith is an elegant building, completed, in 1816, from a design by Mr. Burns. The body of the church has a sort of polygonal form, and the portico, from which rises a very elegant spire, consists of four handsome fluted Ionic columns supporting a pediment. Besides the chapel of ease to the church of South Leith, which is a plain and neat building, there is an Episcopal chapel, built in 1813, a Burgher meeting-house, an Abingtoner meeting-house, and a new Burgher meeting-house at present building.

The Trinity house of Leith was erected in 1655; but it was taken down in 1817, and a very handsome new building of freestone has been erected in its room, and is just finished.

The exchange buildings, which were begun some years ago in Constitution street, are on a very large scale, and have been designed with much taste. They form the principal public building in Leith; and contain the assembly room, coffee-room, sale rooms, subscription library, reading room. These buildings are three stories high; and the central part is ornamented with five fine Ionic columns. They cost £16,000.

The bank of Leith, situated in Bernard street, is a Bank near small building, erected in 1806, and adorned with Ionic columns and pilasters.

The custom-house, which contains also the excise office, is a very large and handsome building, erected on the north side of the harbour in the years 1811 and 1812. From the necessity, perhaps, of its accommodating both the excise and the custom-house, the architect has placed the two entrances as two small wings to the building; and it has ornamented the central part of the front with two large fluted columns, which terminate several feet from the ground, and rest on a sort of wall. These two solitary columns, without any pilasters to flank them, have a very extraordinary appearance. The expense of this building was about £12,617.

The high school of Leith is a very neat building of brick, freestone, erected by subscription in 1805, on the southwest side of Leith Links. It consists of two stories, disfigured with a parley dome, for which we trust the subscribers will see the necessity of substituting a pediment, or some other ornament.

The baths of Seafield form a very elegant building, Seafield consisting as it were of two similar buildings placed at right angles to each other, and joined by nearly a quadrant of a cylindrical tower. One of the fronts is to the east, and the other to the north; and each is ornamented with a handsome porch. The lower floor is devoted to the baths; the entrance to those appropriated to the ladies being by the west porch, and the entrance to those of the gentlemen being by the east. These baths were erected some years ago, by subscription, on the property of Dr. George Wood, by whose exertions this undertaking was in a great measure carried into effect. They are situated immediately to the east of Leith Links, close upon the sea, and are generally allowed to be amongst the most elegant and commodious in the kingdom. The expense of the building exceeded £8000, raised in shares of 50 guineas each; the proprietors, or one member of their families, having a right to use any of the baths. It consists of 17 baths—hot, tepid, cold, pump, and shower baths, besides a very large plunge bath, well fitted for swimming; and to these is attached a capital hotel. The charges are very moderate. The price of the hot bath is 3s.; of the tepid bath, 5s.; of the cold bath, 1s. 6d.; of the shower bath, 1s. 6d.; and of the plunge or swimming bath, 1s. The whole establishment is in a most flourishing condition, attracting company from every quarter of the country; as a proof of which, from 70 to 80 baths have been given in one day. A considerable part of this property is already fenced by the remainder; and the house is admirably adapted for that purpose; as the salubrity of the air, the beauty of the views, the excellent opportunities for every kind of exercise, and the vicinity of the best markets, added to the very great advantages of hot and cold sea-bathing, in a medical point of view, must render Seafield in all respects a most desirable and healthy residence. The grounds in the neighbourhood, part of the same property as the site of the baths, are to be fenced, upon a plan combining elegance and comfort. The streets have been so arranged as to prevent the buildings immediately upon the sea from interfering with the view of those more removed. As yet, only two houses of a small size have
been erected; but as the demand for lodgings far exceeds the supply, it is probable that the feuars will now proceed with rapidity.

The town of Leith is extending itself rapidly in every direction. The plan of a new town has been laid down on the west of Leith, on the grounds of Hillhousefield and Bonningston. This plan, which is partly carried into effect, will extend from Newhaven road on the west, to a line parallel with Leith Fort on the east, being bounded on the south by the Water of Leith. Several excellent houses are already built in Jamaica Street, which forms part of the road from Queensferry to Leith. Some good houses are also built in South Fort Street, which will communicate with Leith Walk by a handsome bridge across the river; and Bonnington Place, extending along the road from Newhaven to Edinburgh, is very far advanced.

The formation of another new town, on the grounds belonging chiefly to Heriot's and Trinity Hospitals, lying on the south-east side of Leith Walk, will be immediately commenced. Various plans have been submitted to public inspection; and a very able report upon these plans, by the late distinguished architect Mr. Stark, has recently been published. Since the death of Mr. Stark, Mr. William Playfair has been employed to furnish a design for laying out a new town in the most elegant manner, and we understand that this design is in considerable progress. When this extensive plan has been carried into effect, comprehending a magnificent crescent on the north, and a terrace on the south declivity of the Calton Hill, and numerous streets and squares upon the grounds between that hill and the town of Leith, the towns of Leith and Edinburgh will be united into one great city, which, whether we consider its general architecture, its public buildings, its picturesque situation, its splendid and varied prospects, its charitable establishments, its literary and scientific character, and the general intelligence of its inhabitants, will form the finest city in the world.

Leith contains several charitable establishments, the most important of which are the Female Society for relieving indigent and sick women; an Auxiliary Society for promoting Christianity among the Jews, and for aiding the British and Foreign Bible Society in London; a Society for the Relief of the Destitute Sick; a Sympathetic Society; a Female School of Industry; and a Boys Charity School.

In consequence of Leith having been pillaged and burnt by the English soldiers, when the Earl of Harcourt invaded Scotland in 1541, Leith was re-built and fortified. The fortifications, however, were subsequently demolished, to prevent any invasion of the liberties of the country from the introduction of foreign troops. New fortifications were again erected by Oliver Cromwell, who built the citadel, the remains of which still exist. It consisted, at that time, of five porticos, two of which were demolished at the Restoration, and the sale of the whole granted to the Duke of Lauderdale, then prime minister for Scotland, and from him the magistrates of Edinburgh purchased it for the sum of £6000. The remains of the fortification are still visible between the Yard-heads and the Water of Leith, and also on the links of Leith.

Leith is defended by a fort, situated immediately to the westward of the town. The battery, which is a semi-circular one en barbette, is mounted with nine heavy pieces of cannon. It was erected during the American war, for the protection of the harbour and shipping, in consequence of the alarm excited by the appearance of Paul Jones' squadron in the Frith of Forth; since which period the boundaries of the fort have been greatly extended, and surrounded by a high wall. It is now the head-quarters of the royal artillery in North Britain, there being two companies of that corps stationed there, under the command of a field-officer. The barracks are capable of containing 350 men, and there are stables for 150 horses. There is also a large powder magazine and extensive warehouses erected within the fort, in which are deposited a large train of field artillery, with a suitable proportion of ammunition and stores. The harbour of Leith is defended by a fine martello tower, rising from the sea, at the distance of about a quarter of a mile from the pier. It was built during the late war, at a very great expense.

Whether we consider the port of Leith, in connection with some of the most interesting and eventful periods in the earlier history of Scotland, or as a modern port, in regard to the extent of its harbour works, and the number of its ships, we shall find it equally deserving our attention. In Leith, the extension of the quays have kept pace pretty nearly with the trade of the port; and even in the extent of birthage may be said to have preceded the demand of the shipping, probably from the command of the necessary funds arising from its powerful connection with the metropolis of Edinburgh.

In the former state of the foreign trade and commerce of the Firth of Forth, it was much divided with numerous towns on the coast of Fife, but this now seems to be confined to the ports of Leith, Grangemouth, Dundee, and Aberdeen. It is, accordingly, curious to trace the progressive advancement of the quays and piers of the harbour of Leith, from small beginnings, to works of the present magnitude. In early times, when the vessels employed in trade were of a much smaller class, there were no quays at Leith; and the vessels lay at the mouth and on the banks of the small river, or stream, which runs through the harbour. A breast wall, or quay, was first built by the city of Edinburgh, some time after the purchase of Leith, with the adjoining lands, from Logan of Restalrig, which seems to have extended no farther toward the north than St. Bernard Street, but the work was afterwards continued to the signal tower, or ferry-boat-stairs. In this state it remained for a long period, when it was prolonged to the northward, somewhat in the form of a crescent, by the extension of the wooden and stone piers. Perhaps the immediate inducement for the latter works was very much with a view to provide against the ravages which the sea was making upon the shore between Leith and Newhaven, which was endangering the safety of the citadel, and had already taken away a great piece of land on which a rope-work had been established.

About the latter end of the eighteenth century, however, the trade of this port had so much increased, that the merchants of Leith required further accommodation for their shipping; and an act having been obtained for increasing the shore piers, in the session of Parliament of 1800, a design having also been furnished by John Rennie, Esq. civil engineer, for a magnificent suite of wet docks, which has since been partly executed in the most substantial style of workmanship, under the inspection of Mr. John Paterson. The first of these beautiful basins, occupying an area of nearly four acres, commenced in the year 1801, during the provostship of Sir William Pettig, Bart., which was opened for the use of shipping in the year 1806. A second dock was afterwards begun in 1810, and com-
and in the greatest quantities, imported into Leith:-
Ashes, pot and pearl; cheese, butter, flax, hemp, wood, iron; bark, oak and birch; hides, horse, cow, and ox; skins, calf, sheep, &c. quills, seeds of all sorts, honey, spirits, wines, coffee, sugars, fruits, horns, rags, cork, wood, oils, blubber, whale, fins, dye stuffs, feathers, drugs, tallow, pitch, tar, bristles; linens, German and Russian; and marble.

Note of the quantities of the several Articles undermentioned Imported from Foreign Countries into the Port of Leith, in the three Years ending 5th January 1818, distinguishing each Year.

Manufactures.

Leith possesses several manufactures of considerable extent and importance. There are six or seven glass houses, where bottles and flint glass are manufactured in great quantities. The soap works of Mr. T. Jameson of Sherriff Brae, and of Messrs. Morison & Co., at Bonnington, are on a scale of great magnitude. The manufacture of soft soap was begun in 1750, and of tallow and candles in 1770, and that of hard soap in the same year. Soda is made to a considerable extent, by Mr. Lawrence Jameson; cards for combing wool, by Mr. Steid; leather by Messrs. Sommervail and Son; vinegar by Messrs. Alison and Stewart; and ploughs, cart wheels, and other implements of husbandry, by Mr. Morton, who has enriched agriculture by several new inventions and improvements. The iron work of Mr. Anderson, and that of Mr. Gutzmer, are upon a scale of considerable magnitude.

Ship-building is carried on to a considerable extent; and there are manufactories of sail cloth and cordage. Several saw mills, some of which were constructed by the celebrated engineer Mr. Brunel, have been erected upon the Water of Leith. There is an extensive distillery at Bonnington, belonging to the Messrs. Haigs, and two houses for the refining of sugar. Leith has long been celebrated for its ale. There are many breweries here; but we believe that of Mr. Gilles is the most extensive.

Leith is governed by a baron bailie, appointed by the magistrates of Edinburgh. He sustains the character of admiral, and chuses two resident bailies, who act as his deputies.
The population of the parishes of North and South Leitrim in 1811, was

The meridian of the observatory of Edinburgh passes through Leith Fort.

LEITRIM. LEICHH. See Leiba.

Leitrim, is a maritime county of Ireland, in the province of Connaught, bounded on the north by the counties of Donegal and Fermanagh; on the east by Cavan; on the south by those of Cavan, Longford, and Roscommon; and on the west by Sligo. It is about 32 miles long. Its greatest breadth is 16 miles, and its least is miles; and it contains 4,760 English acres.

This county is almost entirely covered with groups of mountains, which are not wholly barren, but afford sufficient herbage for the breeding of cattle. Towards the sea the mountains are wild and lofty, and are separated by deep vallies. The principal of these are the Sliegh-an-ear and the Dartry, the last of which rises to an immense height. The huge mountain of Sliegh-an-Erin, which is near the middle of the county, separates the mountains from the level barriers, which form the southern part of the county.

There is a great diversity of soil in this county. A rich dark soil on a limestone bottom; a ferruginous loam on the mountains, and an argillaceous stratum, are the principal varieties. There are great quantities of bog and moor land, and a considerable part of the land is in pasture. The farms are small, and are generally occupied in common by a number of tenantry.

This cause agriculture is in a very backward state; and few attempts have been made to improve the land by draining, or by the cultivation of the bog and waste lands. Potatoes, barley, rye, and wheat, are raised in small quantities, and oats in abundance for home consumption. Butter is produced in great quantities throughout the mountainous part of the county, and is sent to Sligo for sale. The cattle of Leitrim are small. The sheep are very much of the native Irish kind, but they are few in number.

The following were the prices of labour and articles of provision in 1811. Wages of a man per year £ 9, 2s. Ditto of a woman £ 2, 10s. Grazing a cow per year £ 3. Grazing a horse per year £ 4. Lime per bushel 1s. 1d. Hay per ton £ 1, 10s. Beef, and mutton, and pork per lb. 6d. Eggs per dozen 10d. Potatoes per stone 2½d.

The river Shannon is said to have its origin in this county at Lough Clean, though this, however, is claimed by a spot near Florence Court, in the county of Fermoy. Mr. Wakefield believes, that both these opinions are true, and that the Shannon is derived from two rivulets, which afterwards unite. From Lough Clean, which is a small lake, the Shannon flows into Lough Allen, a lake about 30 miles round, and 7 miles long, which lies in the centre of the county. There are several other lakes and small streams, which abound in trout, pickerel, perch, and bream.

The minerals of this county are numerous and valuable. Iron ore occurs in great quantities in the high grounds, and it is also found in deep and rich beds in the low grounds. Copper and lead, a variety of clays, and plenty of limestone, are also found. Rich veins of coal have been wrought at Arigna. The seam is in a mountain near Lough Allen, the summit of which is a bog. These collieries belonged originally to a company of the O'Reillys, upon whose failure it fell by mortgage into the hands of the Latouches. The coal is not of a good quality, and has been employed principally in foundries.

The manufactures of Leitrim, particularly that of linen, are improving rapidly. There are several bleaching greens in the county, and numerous potteries near Leitrim and Dromahare.

About a century ago, Leitrim was a continued forest; and immense heaps of charcoal timber are still seen at Dromshoob. A great deal of wood has lately been planted.

The principal town of the county is Carrick, which Town only contains above 100 houses. Leitrim, about three miles north-east of Carrick, is not considerable enough to be a great town.

Dr. Beaumont estimates the number of houses in this county at 10,926, and the population at 50,000. Dr. McParlan, who took the number of families in each parish from the books of each individual parish clergyman, found that they amounted to 15,326, which he multiplied by 5, and obtained the population of 76,630. The majority of the inhabitants are Catholics. Mr. Wakefield estimates the proportion to be as 30 to 1; the same as in the county of Sligo. There are 17 parishes in the county. See McParlan's Survey of Leitrim; Beaumont's Memoir of a Map of Ireland; Robertson's Traveller's Guide; and Wakefield's Statistical Account of Ireland, passim.

LEMNISCATE, is the name of a curve which resembles the figure 8. The equation of the curve is 

$$y^2 = a^2 x^2 - x^4$$

LEMNOS, now Stalimene, is an island in the Greek Archipelago, belonging to Turkey. It is about 15 miles long and 11 broad, and abounds with mountains and valleys. The whole of its eastern coast is inaccessible, on account of a shoal which stretches four leagues into the offing. On the west coast, there are a few places of shelter for vessels against northerly winds. There is a large road on the north of the island; but on the south there are two real harbours, Port Cadias, and Port Sant Antonio, which are not very far from each other. The island of Lemnos is hilly, but very fertile. Its products are corn, cotton, oil, and silk, which is used in the manufacture of a few light stuffs. Somnini observed here a spring of hot water, and another of aluminaux water. The species of bole, called Lemnbrian earth, is still obtained from a hill on the island. This earth was formerly dug up with many religious ceremonies. The principal Turkish and Christian inhabitants met on the 6th of August at a chapel called Sotera, half way between the village of Cochino and the mountain where the earth is found, and thence they went in procession to the top of the mountain, where Greek priests read the liturgy. Certain persons appointed on purpose then began to dig, and as soon as they discovered a vein of the desired earth, they announced it to the priests, who put it into small hair bags, which they delivered to the Turkish governor and other officers. The excavations are then filled up, and the procession returns back as before. Some of the hair bags are sent to the Turkish emperors, and the rest, marked with his seal, or with the words 'Tres invicti', or sealed earth, is sold by the sangiak, or his deputies, to the inhabitants, or to foreign merchants. The sangiak accounts annually to the Grand Signior for his sale of the earth; and the inhabitants are capital punished, if they in any shape export or trade in that earth without the permission of the sangiak. The two chief places in the island, are Cochino, formerly Hesperias, and Lemnos or Stalimene, formerly Merina.
LEO.

LENA. See RUSSIA.

LENS. See Optics.

LEO X. Pope, the second son of Lorenzo di Medici, was born at Florence in the month of December, 1475, and was baptized by the name of John. Having been destined by his father for the church, he received the tonsure at the age of seven years; and being then declared capable of ecclesiastical preferment, he obtained, at a very early period, through the interest of his family, no less than twenty-nine benefices. In 1498, during the pontificate of Innocent VIII, he was created to the rank of cardinal, when only thirteen years of age. His early education was entrusted to that eminent scholar, Angelo Poliziano, assisted by other learned men, who frequented the Medici palace; and the success of their instructions was greatly promoted by the uncommon gravity and solidity of his disposition. In 1492, he was formally invested with the purple, and immediately went to reside at Rome, as a member of the sacred college. In consequence of his opposition to the election of Pope Alexander VI. he found it prudent to withdraw to Florence, in which place he acquired much personal respect; but on the invasion of Italy by Charles VIII. of France, he was involved in the expulsion of his family, and obliged to take refuge at Bologna.

In 1499, the cardinal, accompanied by his cousin Giulio di Medici, and a small party of friends, made a tour through the states of Venice, Germany, and France; and returning by Genoa, he soon afterwards went to Rome, where he fixed his residence, and in consequence of his prudent behaviour, was enabled to live safe and respected during the remainder of Alexander's pontificate. During the earlier part of that of his successor, Julius II. he continued to reside at Rome, cultivating polite literature, enjoying the pleasures of polite society, and indulging his taste for the fine arts. To the exercise of the chase he was passionately addicted.

In 1505, when he had attained his thirtieth year, he began to take an active part in public affairs; Julius, on his seizure of Perugia, having appointed him to his government. Adhering with firmness to the interest of the Pope, he acquired the confidence of his holiness to such a degree, as to be entrusted, with the supreme direction of the papal army in the holy league against the French, in 1511, with the title of legate of Bologna. At the bloody battle of Ravenna, in 1512, he was taken prisoner, and conveyed to Milan, where the dignity of his sacred office procured for him a respectable treatment. He contrived, however, to effect his escape, and returning to Bologna, he assumed the government of the district, in the capacity of the Pope's legate.

On the death of Julius II. the Cardinal di Medici was elected to the pontificate in the month of March, 1513, being then in the thirty-eighth year of his age. He assumed the name of Leo X. and ascended the papal throne with greater demonstrations of good will, both from Italians and foreigners, than the greater number of his predecessors. His love of literature was displayed, by the appointment of two of the most elegant scholars of the age, Bembo and Sadoleti, to the office of papal secretaries.

The first object to which the efforts of the new Pope were directed, was the liberation of Italy from the dominion of foreign powers. With this view, he took into pay a large body of Swiss troops, by whose valour and discipline the bloody victory of Novara was gained over the French, who were in consequence forced to abandon Italy. The king of France, Louis XII. who had incurred ecclesiastical censure, made a formal submission, and received absolution. Having thus, in the first year of his pontificate, secured internal tranquillity, the attention of Leo was next turned to the encouragement of literature, and the patronage of men of genius. His first care was to restore to its former splendour the Roman gymnasium, or university, by means of new grants of its revenues and privileges, and by filling the professorships with distinguished characters from all quarters. Under the direction of Janus Lascaris, a college of noble Grecian youths was founded at Rome, for the purpose of editing Greek authors; and a Greek press, under the superintendence of Lascaris, was established in that city. Public notices were given throughout Europe, that all persons who should bring ancient manuscripts to the Pope would be liberally rewarded, besides having them printed at the expense of the holy see. Leo also endeavoured to promote the study of oriental literature, by founding the first professorship in Italy of the Syriac and Chaldaic languages, in the university of Bologna.

On the death of Louis XII. and the accession of Francis I. to the throne of France, it soon became apparent that the flame of war would be rekindled in the north of Italy. After some ineffectual attempts to preserve a neutrality, Leo at length found himself under the necessity of joining in a league with the emperor, the king of Arragon, the states of Florence and Milan, and the Swiss cantons, against the French king and the state of Venice. This league, however, was soon broken by the rapid success of the French arms, and the defeat of the Swiss in the battle of Marignano; after which the Pope found it expedient to detach his cause from that of his allies, and to form an union with Francis, the terms of which were arranged at an interview between the two sovereigns, which took place at Bologna towards the close of the year 1515.

In the year 1516, Leo found a pretext to gratify his passion for aggrandizing his family, by excommunicating the Duke of Urbino, and seizing his whole territory, which, together with the ducal title, he conferred upon his own nephew Lorenzo. In 1517, the expelled duke collected an army, and by rapid movements completely recovered his capital and dominions. Chagrined at this event, the Pope endeavoured to engage all the Christian princes in a crusade against him; and having raised an army under the command of his nephew, by a profuse application of the treasures of the church, the duke was at length compelled to resign his dominions upon honourable terms. In the same year, the life of the pontiff was endangered, and his moments embittered, by a conspiracy which was formed against him in his own court. Cardinal Petrucci, the principal author of this conspiracy, had formed a plan of destroying Leo by poison; but having failed in this attempt, he withdrew from Rome, still however maintaining a correspondence with his secretary. Some of his letters having been intercepted, he was decoyed to Rome by a safe conduct from the Pope; but on his arrival he was arrested, committed to prison, and finally strangled. His agents and accomplices in the plot were put to death with horrid tortures; and some of the other cardinals were degraded, and subjected to heavy fines. In order to secure himself against any future disaffection, Leo created thirty-one new cardinals in one day, many of them consisting of his own relations and friends, and some whose talents and virtues rendered them worthy of such dignity.

Under the pontificate of Leo, the severest wound was inflicted upon the church of Rome, by the rise of the
The boundless profusion of the Pope having completely exhausted his treasury, he resolved to replenish his coffers by the profits arising from the sale of indulgences. The efficacy of these wares was extolled in such scandalous and extravagant terms, as could hardly fail of giving offence to pious and thinking men. Leo warmly protested against this abuse, calling in question the authority of the pope to remit sins, and making some severe strictures on this method of raising money. Leo seems to have treated the matter at first very lightly; and when his interference became necessary, he showed a disposition to adopt lenient measures. All attempts, however, to effect a reconciliation proved fruitless; the breach became daily wider; and in the month of November, 1518, Leo published a bull, asserting the pope's authority to grant indulgences, which will avail both the living and the dead in purgatory. The works of Luther were burnt in different places by Leo's command; and Luther, upon his part, made a solemn and public conflagration of the papal decrees and constitutions, and even of the bull itself. But the circumstances connected with the rise and progress of the Reformation, will be more properly related in another place. It was this pontiff who rewarded the controversial talents of Henry VIII. of England, by conferring upon him the title of Defender of the Faith.

The state of tranquillity which Italy enjoyed, at this period, permitted the Pope to indulge his taste for magnificence in shows and spectacles, and in the employment of those great artists who have reflected so much lustre on his reign. His private hours were chiefly devoted to solitude, or to amusements, some of which are said to have been of a trivial nature, and little suited to the dignity of his station. He was not, however, so much engrossed by these pleasures, as to neglect any opportunity of aggrandizing his family or his see. By the death of his nephew, Lorenzo, the duchy of Urbino, with its dependencies, became annexed to the Roman see; and other acquisitions were made by less justifiable means. Baglioni, chief of Perugia, was decapitated by the Pope, tortured, and put to death; and his territories incorporated with the papal dominions. The city of Fermo was seized by a body of papal troops, and Frederic, the commander of the town, killed by them in attempting to make his escape. Leo even made an attempt to get possession of the city and territory of Ferrara, which, however, proved unsuccessful. In the year 1521, he entered into a treaty with the emperor, for the establishment of the family of Sforza, in the duchy of Milan. For this purpose, he hired a large body of Swiss troops, which were suffered to march through the Milanese into Romagna. This army, in conjunction with the Spanish and German auxiliaries, took possession of Parma, which, together with Placentia, was to be united to the domain of the church. The allies then crossed the Adige, and were received, without opposition, into Milan; the Swiss in the service of France having been prevailed upon to desert. They next entered the territory of the duke of Ferrara, against whom the Pope had already launched the thunders of the church. Several of his strong places were taken, and the siege of his capital was impending, when Leo, who had repaired to Rome, to be present at the public rejoicings for these successes, was attacked by an indisposition, apparently trivial, but so rapid in its progress, that after a week's illness, he expired, on the 1st of December, 1521, in the forty-sixth year of his age, and the ninth of his pontificate. His death was by some ascribed to poison, but of this there is no evidence.

Different opinions have been entertained with regard to the character of this celebrated pontiff, which, however, will be best estimated from the narrative have given of the principal transactions of his life. Without giving credit to many of those enormities with which he has been charged upon insufficient evidence, it will appear that Leo was far from exhibiting a pattern of integrity in his moral and political conduct. Self-interest seems to have been his ruling motive of action; and he shewed himself by no means scrupulous with regard to the means he employed for attaining his ends. His patronage of literature and the fine arts has been held out as the finest trait in his character, and as a sufficient atonement for all his faults. The age of Leo X. indeed, is generally referred to, as one of the most flourishing periods of art and literature in the annals of mankind. But, without derogating from that just share of merit which may be allowed to belong to Leo on this account, we may be permitted to observe, that many of the subjects of this celebrated age must be sought for beyond the sphere of his protection and influence; and that the patronage he bestowed may be ascribed, perhaps, more to his vanity, than to any real love of what is valuable in literature, or any genuine admiration of what is excellent in the arts. See Roscoe's Life and Pontificate of Leo X. (2)

LEOMINSTER, or LEMSTER, is a burgh and market town of England, in the county of Hereford. It is situated in a rich and fertile vale, abounding with orchards, hop-yards, fine meadows, and arable lands. The river Lugg runs on the north and east sides of the town. Two smaller streams flow through the town, and other three considerable rivulets pass within half a mile of it. Leominster is about a mile long from north to south, and about half a mile from east to west. There are many good modern houses built of brick; but, in general, the houses consist of timber and plaster, painted white and black, and adorned with curious grotesque carvings. The streets in the centre of the town are narrow, and the suburbs ill built. The church of Leominster is a large building, and irregular both in its form and architecture. The interior length is 125 feet, and its width 124. The church of Leominster was partly destroyed by fire on the 18th March, 1700, and was rebuilt at the expense of nearly £18,000. Besides the church, there are four places of worship, viz., for the Baptists, Presbyterians, Moravians, and Quakers. The meeting-house of the Baptists is a neat building. The town-hall, or butter close, is a singular building of timber and plaster, erected in 1683. It stands on 12 oaken pillars. A new gall was built here in 1730; and in 1809, a neat market-house was erected by the corporation for the sale of grain. It is a small building of the Tuscan order, with pediments and a capital.

The town is governed by a bailiff, chief steward, recorder, 24 capital burgesses, a chamberlain, two sergents at mace, and some inferior officers. It sends two members to parliament, and the number of voters is about 500.

Cloth is the principal article of manufacture at Leominster. The manufacture of hats and gloves, and the tanning and dressing of leather, are carried on to a great extent. From the fertility of the surrounding country, Leominster has always been considered as one of the best markets for wool, wheat, and eyerly. There is a free school here, two charity schools, an alms-
The population of the burgh and parish, in 1811, was 750 houses, 889 families, 484 of whom were employed in trade and manufactures, and 3295 inhabitants. See The Beauties of England and Wales, vol. vi. p. 562—574.

LEON, a province of Spain, situated towards the north-west, is bounded on the east by Old Castile, on the south by Estremadura, on the west by Portugal and Galicia, and on the north by the Asturias. Its form is that of a long rectangular figure, about 52 leagues from north to south, and 30 at its mean breadth from east to west, lying between 40° and 43° north latitude, and between 4° 10' and 5° 25' west longitude. It was anciently the country of the Vetones, mentioned by Strabo, and, for a long period, formed a separate kingdom. After the defeat of Roderic, the Gothic king, at Xeres de la Frontera, its capital city Leon was taken from the Moors, in 717, by Prince Pelagius, who had collected the dispersed Christians; and in 915, one of the successors of that prince took the title of King of Leon. In 1090, it passed to Ferdinand, surnamed the Great, then king of Castile, and was finally united with that kingdom in 1069.

This province is mountainous, but less so than many of those immediately adjoining. Its mountains are covered with trees, particularly oaks; and it contains many beautiful fields, luxuriant pasture grounds, and extensive valleys. The more remarkable mountains are those which form part of the Sierras of Pico and Oca (formerly Mount Idubeda,) in the south-east part of the province. The principal rivers are the Douro, which enters the province from Arragon, and divides it into two nearly equal parts; the Carrion, which flows from Old Castile, and falls into the Douro at Simancas; the Eresma, which enters Leon at Macheda, and afterwards unites with the Douro; the Tormes, which rises near the southern extremity of the province, runs northwards to Salamanca, and thenee north-west to the Douro, opposite Bemposta, on the frontiers of Portugal. Besides these, there are the Sil, the Buria, the Sabor, the Baza, the Arago, the Xero, the Pisuerga, and nearly as many more, which chiefly rise in the province or on its confines. There are several bridges over these rivers, particularly over the Douro. There is one below Benavento over the Ezia, consisting of nineteen arches; one of eighteen arches over the Poma, near Villa Rente; and another over the Tormes, at Alva de Tormes, of twenty-six arches, supposed to have been built by the Romans. There is a lake near Astorga, called Sanabria, about three miles long and half as much in breadth, through which the river Tuoeru rushes with such force as to excite waves equal to those of the sea; and a rock rises in the middle of the lake, on which stands a fine old castle belonging to the Counts of Benavento.

Minerals. In the mountains are found iron and copper mines, and a number of mineral streams. Four of these are cold springs, namely, at Amusco, Buron, Bavela Fuente, and Astudillo. There are also four warm fountains, namely, one near Almeida, of a sulphurous appearance; one at Ledesma, where there is a public bath of a moderate heat, which is found useful in cutaneous diseases; one at Bonar, issuing from a rock, and of a lukewarm temperature; and one at Barnos, near the frontiers of Estremadura, serviceable in rheumatic and nervous complaints. Near Zamora, turquoises are found in the hills, and were formerly so abundant, that the Moors called it "the town of turquoises." A great number of excellent mules are reared in the province, and considerable flocks of sheep and goats; and various kinds of fish are found in the rivers, particularly eels, barbel, and trout.

There are many fertile valleys in the province, partly agriculturally those of Mediano and Bateeas, and the soil is very productive in many districts, especially on the east point towards Portugal. The lower grounds are also free of trees, and agriculture might form the province, were more attention paid to the irrigation of the land by its numerous rivers. The principal crops are wheat, oats, maize, flax, olives; and in some places, extensive vineyards, particularly around Baronos, where 25,000 arobas of wine are produced yearly. But cultivation, in general, is in a languid state; and many districts, capable of being rendered sufficiently fertile, are left in a state of nature. It is only in some of the richer tracts that fruit trees are found, particularly from Casas del Puerto to Villa Toro.

Formerly, very flourishing manufactories existed in several towns of Leon, especially in Ciudad Roderigo, where fine tapestries, embroidery, and laces were made, and where the best leather in Europe was prepared. But all these have greatly decayed. There are some cloth manufactories in a few of the towns, particularly at Crvas; one for hats at Zamora; for serges at Rio Seco; and some of hosiery and leather at Leon. The commerce of this province, therefore, consists chiefly in importation. Some wines, especially those produced in the south-east of the country, are exported; but those of the northern districts are so inferior, as neither to bear carriage, nor answer any market. A considerable portion of the coarser manufactures are sent into Galicia; and the madder produced in the vicinity of Ciudad Roderigo and Medina del Campo is conveyed through Portugal to the English merchants.

This province contains six bishoprics, viz. Leon, Salamanca, Palencia, Zamora, Astorga, Ciudad Roderigo; 2460 parishes, 196 convents, 23 hospitals, five asylums, two military governments, four-intendancies of provinces, one university, four superior colleges, 25 colleges of all classes, six cities, 559 towns or boroughs, 2005 villages or settlements, of which 76, formerly inhabited, are now deserted. The principal towns are Leon, Astorga, Zamora, Toro, Palencia, Medina-del-Rio-Seco, Torielasillas, Villa Pando, Duenas, Marsilla, Villa Franca, Bemevente, on the north of the Douro; and on the south of that river, Salamanca, Ciudad Roderigo, Alva de Tormes, Pena-Aranda, Penafiel, Carpio, Medina-del-Campo, and Ledesma. But many of the towns are not half inhabited; and the population has been recently much diminished. The present amount is estimated at 665,000 persons; of whom 5598 are secular priests, 2064 monks, 1576 nuns, 31,540 nobles, 25,218 servants, and the remainder of the other professions. The inhabitants of this province are distinguished by their gravity and taciturnity, and greatly resemble those of Old Castile. Among the mountains near Astorga are a race called Mauregatos, who preserve the remains of the ancient costume, in their pyramidal hats, neck-ruffs, short jackets, wide breeches, and spatterdashes. Their women wear large ear-rings, a kind of white turban widened like a hat, a chemise closed over the chest, a brown corset buttoning tight, with large sleeves, opening behind, brown veils and petticoats, and over all immense coral necklaces, passed several times round the neck and shoul-
Leon. The capital city of the last mentioned province, is situated between the two sources of the Exal. south from the mountains of Asturias, and is one of the most ancient towns in Spain. It was founded before the reign of Galba, and received its name from the circumstance of the Legio Septima Germanica having been stationed there. It was known at a very early period also as an episcopal see; and, in the time of the Gothic kings, possessed the privilege of appealing immediately to Rome. It was the first town of any importance recovered from the Moors; and was for three centuries after that period the residence of the first Catholic kings in Spain. It contains 13 parish churches, one collegiate church, four convents of monks, five of nuns, and a number of hospitals and hermitages. There are also the royal houses of San-Isidoro, and San-Marcos, of the order of St. James; and a chapter of noble canonesses, not cloistered, but who take the vows. But little now remains of its ancient splendour and population; and the exterior magnificence of its public buildings forms its principal boast and attraction. A great part of its walls is constructed of green marble; and, at the bottom one of the gates, which was formerly a famous prison, is a statue of King Pelagius. The ancient palace of its sovereigns, which stands close to the wall on the western side, is now in a decayed state, and has been converted into a cloth manufactury. The edifices most worthy of notice, and still in a good state of repair, are the monastery of the regular canons of St. Augustin, and the royal convent of St. Mark, which are both of tolerable architecture; the hotel of the Counts of Luna, which is a large and handsome building; the palace of the Guzmans, remarkable for its strong walls and superb portal; the town-house, which has a tolerably regular front, and good appearance. The Place Mayor, opposite to the town-house, contains several beautiful and uniform buildings; and there are several squares and handsome fountains. But the great boast of the place is the cathedral church, which is esteemed one of the finest in Spain, and furnishes a beautiful specimen of Gothic architecture, distinguished for its height and boldness, just proportions, and admirable lightness of structure. It contains the tombs of one emperor, and 37 kings; and the shrines of several saints, particularly of St. Isidore and St. Vincent. There are a few manufactories of woollens, linens, stockings, and leather gloves; but the town is chiefly supported by the expenditure of the churchmen. The streets are covered with filth, and full of beggars, who are fed at the convents. The adjoining country is very beautiful, and ornamented with numerous avenues of noble trees; but little is done in the way of cultivation; and the produce consists more of vegetables, fruits, and pastures, than of grain. The population of the town is estimated at 6000. (q) LEOX (Isla de), a town and insulated district in the vicinity of Cadiz, which has recently increased in population and wealth; and forms a singular instance of a new and growing town in Spain. The island is formed by a canal which surrounds it, and which at high water is so deep (about 24 feet) as to admit the largest ships. This insulated portion is still farther separated from the continent by a marshy tract, through which a causeway is constructed; and the whole adjoining country is filled with salt pits, in which the heat of the sun makes the lay-salt, which is so import-

ant an article in the commerce of Cadiz. This northern extremity of the isle is remarkably strong both by nature and art; and may be considered as one of the principal defences of Cadiz. The road, which leads through the marsh, (which is impassable in any other way,) enters Leon by the bridge of Zuazo, which is flanked with batteries, and defended by gun-boats. This bridge has evident marks of a Roman origin; but its modern structure is ascribed to a Dr. Sanchez Zuazo, who died in Segovia in 1437. This island was so entirely deserted in the 17th century, that there was not a single house upon it; but at present the principal street of the town is two miles in length, with shops of every kind on each side of it; and the number of inhabitants above 40,000. Its extent is so considerable, that, including the suburb of St. Carlos on the north, it is supposed capable of containing double that number. The streets are wide, and the houses large; but, like other Spanish towns, it displays a strange mixture of grandeur and poverty. The hotel de ville, in the great square, is a handsome building; and the house of the Marquis d'Urena is provided with a well-chosen library, a philosophical apparatus, and a fine collection of paintings. The principal church equals most of the religious edifices of Spain in point of decorations; but one of the most striking objects in the place is the repository of the deceased ecclesiastics, called the Pantheon. This is an open court, of an oval form, with a corridor built on arches, and supported by pillars. In the walls, which are of competent thickness, are receptacles for the remains of the clergy, resembling the mouths of ovens, which after interment are closed with bricks, and of which Mr. Jacob reckoned five hundred. The town is much occupied by naval and military officers and establishments; and presents a busy animated scene. See Laborde's View of Spain; Burgon's Travels in Spain; and Jacobi's Travels in Spain. (q) LEONIDAS, one of the kings of Sparta, who was appointed to check the progress of the Persian army at the pass of Thermopylae, and who bravely devoted his life to the cause of his country. Coolly contemplating the desperate nature of the service assigned them, he and his little band, before leaving Lacedaemon, celebrated their own funeral rites, and took a final farewell of their relatives and friends. The general facts of his determined and reasonable resistance to the overwhelming force of the invaders, are sufficiently established to warrant the eulogies which all succeeding ages have bestowed upon his magnificent conduct; but a variety of circumstances, resting rather on the authority of tradition than of history, have been detailed by his partial countrymen, in illustration of the daring and deliberate courage by which he and his heroic band were animadverted in this patriotic enterprise. When reconnoitred by a Persian horseman, at their fatal post, they were observed exercising themselves in martial sports, and decorating their flowing hair, according to the custom of their country. When haughtily required by the Persian monarch to lay down their arms, Leonidas returned the laconic reply, "Come and take them." When promised a kingdom from the invader, upon condition of surrendering at discretion, he gallantly replied, that "the Spartans were accustomed to acquire kingdoms by valour, and not by treachery." When informed that the Persians were so numerous that their darts would darken the sun, the answer was briefly given, "then we shall fight in the shade." When surrounded on the third day of the contest, and determined with his three
hundred Spartans, and a few Thespian auxiliaries, to obey the law of his country, which prohibited retreat before an enemy, however superior in strength, "Come," he said to his fellow-soldiers, "let us die cheerfully in this place, for to-night we shall sup with Pluto." When the last onec was made, Leonidas fell early in the fight, under a shower of javelins; and his undaunted followers, surrounding his dead body, died to a man on the spot. A monument was afterwards erected on the field of battle, with the following inscription by Simonides: "Tell, O stranger, the inhabitants of Lacedemon, that we died here in obedience to her sacred laws;" and, for many years, it was the custom of the Spartans to pronounce funeral orations, and celebrate public games, on the anniversary of this battle, in honour of their heroic countrymen. LEPROSY. See Medicine.

LERIDA, anciently Ilerda, is a town of Spain, in the province of Catalonia. It is situated on the declivity of a hill, on the west bank of the river Segre. The town is long, narrow, nearly triangular, and close and ill built. The streets are narrow, crooked, uneven, and paved with pointed stones unequally driven in. It has only one tolerable street, about one-fourth of a league long, which would have been handsome had it been wider. The quarter of the town towards the river is well situated, though gloomy within. A fine quay, extending the whole length of the town, has been lately built, and unites the double advantage of restraining the waters of the Segre, and of furnishing the means of amusement to the inhabitants. If planted with trees it would form a handsome promenade.

The principal edifice in Lerida is the cathedral, which has been lately built, but unfortunately stands in a narrow street. It is ascended by a double flight of twenty steps, which leads to a terrace, on which the gates of the church open. The front, which is of white-stone, has six fluted pilasters of the Corinthian order, between which there are three large doors, with iron gates of handsome workmanship. It has two square towers, terminating in round pavilions. At the top of the hill are the remains of a palace which the kings of Arragon had inhabited. There was formerly a university at Lerida; but it has now only a college, which is maintained by the bishop, and where sixty young clerks are instructed gratuitously.

A trade in salt fish was formerly carried on here, but it has now failed. Lerida now exports the productions of the adjacent territory, such as fruits and pot-herbs, to Urgel and Arragon. Silk worms are bred here, but to no great extent. The surrounding country, which is rich and productive, is intersected with canals, and is well watered. Population 18,000. See Laborde's View of Spain, vol. i. p. 82.

LESBOS. See Metelin.

LESSER INTERVALS, in Music, are such as are lessened either S or $; or, Lesser or Minor Intervals, are such as are less than the Major Intervals of the same name, by the intervals S or $, and even by S and $; also in the discordant nomenclature, followed by different writers, on Musical Intervals. (q) 

LESSING, GOTTFRIED EPHRAIM, a celebrated German author, was born at Kamenz, a town of Upper Lusatia, on the 23d of January, 1729. The first rudiments of instruction he received from his father, John Gottfrey, the Protestant clergyman of Kamenz, a man of excellent character, who acquired some reputation from his theological writings. Having spent some time under the tuition of a private instructor, and at the public school of his native place, he was sent, in his twelfth year, to the free school at Meissen, where he remained five years, and acquired, by diligent study, an intimate acquaintance with the Greek and Latin languages. Some translations from Anacreon, which he executed while at this school, were afterwards published among his poems. He also applied with great zeal to the study of the mathematics; translated for his own use the second, third, and fourth books of Euclid; and wrote an history of the mathematics.

From Meissen he repaired to the university of Leipzig. It was the wish of his father that he should study theology, with the view of taking orders; but this Lessing declined, conceiving that he did not possess the requisite qualifications. Hitherto he had been a diligent student; but finding that he had addicted himself too exclusively to books, to the neglect of bodily exercises, and the improvement of his mind by social conversation, he laid aside for a time all serious reading, and endeavoured to acquire those ornamental accomplishments, which might enable him to make a better figure in society. Poetry, and the belles lettres in general, particularly the drama, were now his favourite studies. He was a constant attendant at the Leipzig theatre, then under the direction of Madame Neuberin, with whom he contracted an intimate acquaintance; and made some attempts in dramatic composition. In the mean time, his father, who had been informed of his course of studies, and had hitherto with difficulty supplied his expences, strongly urged him either to take orders, or a medical degree; but Lessing declined to do either, and was now led to provide a subsistence for himself by the exercise of his talents. In a periodical work, published at Hamburgh by one M. Agricola, he gave the first specimens of his abilities as an author. He also made translations of French plays along with Weisse, and furnished poems for a periodical publication edited by his friend Mylius. The former of the pieces which he published with his name was a comedy, entitled, Der junge Gelehrte, which was performed with success by the company at Leipzig. From Leipzig he was induced to remove to Berlin, in the hope of finding a better field for his literary exertions.

Here, in conjunction with Mylius, he commenced a periodical work on the history and state of the stage, which, although written in a new and instructive manner, was discontinued after the fourth number. He next occupied himself with the publication of his poems, which appeared anonymously, under the title of Trifles. Soon after he repaired to Wittenberg, where he continued to prosecute his studies for about a year, and took the degree of Master of Arts. During this period he was employed in various literary occupations, in which he had an opportunity of displaying the force and the versatility of his genius.

Having become weary of his residence at Wittenberg, he returned to Berlin, where he renewed his acquaintance with the eminent men of that city, and contributed the literary article to a newspaper, which had
previously been written by his friend Mylius. In 1753 and 1754, he published an edition of his miscellaneous writings in 4 vols. 12mo, which were well received, and contributed to extend his reputation. Berlin was at this period the residence of a considerable number of those men, to whose talents the literature of Germany has been most eminently indebted. Of this number were Moses Mendelssohn, the celebrated Jewish philosopher, Nicolai, the printer, Rambler, the poet, Salzer, the philosopher and critic, Süssmilch, the statistical writer, and several others of distinguished reputation. From the charms of this literary society, Lessing retired for a while to Potsdam, with the view of completing his tragedy, entitled, *Miss Sarah Sampson*. This was the first specimen of the tragedi bourgeois which had appeared in Germany. It was received with great applause when first acted at Frankfort on the Oder, and was afterwards performed with the same success, on various other theatres. It was also translated into the Italian, French, and Danish languages.

In 1755, he went to Leipsic. Here he was introduced to M. Winkler, a young man of fortune, who engaged him as the companion of his travels. Their journey, however, extended no farther than Amsterdam; for M. Winkler having received intelligence of the irruption of the Prussians into Saxony, thought proper to return home. Lessing now occupied himself, for some time, in translating several works from the English; and in composing a volume of original fables, in the manner of *Aesop*. In 1757, he became associated with Moses Mendelssohn and Nicolai, in the publication of a periodical work, entitled, *The Library of the Belles Lettres*, containing a review of works in polite literature, with original correspondence. He now returned once more to Berlin, and published his tragedy, *Philotas*. One of the most remarkable fruits of the intimacy that subsisted between Lessing, Mendelssohn, and Nicolai, was the joint production of the *Letters on Literature*; a work which acquired great celebrity, and which contributed perhaps more than any other publication to form the taste and style of the German writers. About the same time, Lessing published three books of fables in prose, to which he prefixed a treatise on the theory of the fable. In 1760, he was elected an honorary member of the Berlin Academy of Sciences.

Lessing now entered upon a new scene. Without giving the slightest notice, even to the most intimate of his friends, he set out for Breslau, as secretary to the Prussian General von Tanezien. This appointment, which he had been induced to accept on account of his health, gave him an opportunity of acquiring more knowledge of the world. He became acquainted with almost all the officers of the Prussian army; but, unfortunately, his military associates gave him a taste for gaming, which impeded the progress of his literary pursuits. In the year 1765, he returned to Berlin, and resumed his former mode of life. He now published his *Laocoon*, a treatise on the limits of poetry and painting, for which he had collected the materials during his residence at Breslau. In 1766, he received an invitation from a society of lovers of the drama at Hamburg, which made him advantageous proposals for his assistance in endeavouring to improve the theatre in that city. This invitation he accepted, and accordingly repaired to Hamburg in 1767. Here he commenced his *Hamburgh Dramaturgy*, a weekly paper, which was afterwards published in two volumes, 8vo. forming a mass of valuable dramatic criticism.

Lessing's circumstances, however, were still very limited, and his prospects so little encouraging, that he had resolved to sell all his effects, and go to reside in Italy; where he fortunately met with a patron in Leopold, the hereditary Prince of Brunswick, through whose influence he was appointed librarian at Wolfenbüttel, and received the title of Aulic Councillor. Here he found ample materials for the gratification of his literary curiosity. A few days after he had begun to discharge the duties of his new office, he discovered an important MS., the existence of which had been doubted, viz. the work of Berengarius of Tours, in which he refutes Lanfranc's book on transubstantiation. This work he intended to have published, had he met with encouragement. In 1771, he commenced an improved edition of his miscellaneous writings; of which, however, only the first volume appeared in his own lifetime. In 1775, his popular tragedy, entitled *Emilia Galotti*, was performed for the first time at Brunswick, and soon afterwards upon all the other German theatres. In the exercise of his functions, as librarian, he commenced a periodical work, under the title of *Contributions to History and Literature, from the treasures of the ducal library at Wolfenbüttel*, of which the first number appeared in 1773.

The state of his health, at this period, induced him to undertake a journey to Berlin and Vienna; where he was received with very flattering attention. At Vienna, he became acquainted with a lady of great intellectual accomplishments, the widow of a merchant, with whom he united himself by marriage. Having accompanied the hereditary prince of Brunswick in a journey to Italy, he returned, after an absence of eight months, from this period he devoted himself chiefly to polite divinity, and published the *Fragmenta* of an *Anonymous Writer, discovered in the Library at Wolfenbüttel*; which involved him in a controversy with some of the German theologians, and ultimately occasioned the suppression of the *Contributions*, by the interference of the Consistory. His next publication was that singular drama, *Nathan the Wise*, a piece which has been sometimes represented on the stage, but which is more calculated for the closet. The last effort of his pen consisted of a treatise *On the Education of the Human Race*. His health had been for some time in a declining state; and his constitution being at length completely exhausted, he expired on the 15th of February, 1781, in the 39th year of his age.

Lessing is generally considered as one of the most able and original writers whom Germany has produced. In his youth he had been an indefatigable student, which supplied him with a large stock of acquired knowledge. He possessed strong natural abilities, and his mind was ever actively engaged in literary and philosophical inquiries. As a poet, he is more remarkable for correctness than brilliancy of fancy. His dramatic pieces were by his own confession, the offspring of laborious effort, combined with critical knowledge, rather than of any original talent for that species of writing. It is in his prose writings that the vigour of his genius is most conspicuous. These abound in able disquisition, profound and original remarks, and criticism at once judicious and acute. In this last respect, indeed, he deserves to be placed high in the ranks of literature, as one of the most eminent critics.
of modern times. An edition of his works has been published at Berlin, in thirty volumes 8vo. See Lec-

Denzon deichter De Christen, by Jörden; and

LECTRA, now LEFTRA, or LEFC, the name of a
town of Greece, celebrated by the battle fought there
tween the Thebans and the Spartans. Dr. Clarke
informs us, that the traces yet remaining of its an-
cient monuments are like those of a considerable ci-
ty. The ground is covered for a considerable space
with huge fragments of marble and stone, among
which the inhabitants have long laboured to introduce
the plough. "We saw them employed," says Dr.
Clarke, "in breaking a huge bas-relief, and labouring
hard to remove the foundations of ancient edifices; but
the remains of the trophies, temples, and walls of Leuc-
tra, will resist their utmost unremitted efforts for a
long time to come. See Clarke's Travels, vol. iv.
p. 89, 90.; see GREECE, vol. x. p. 471.

LEUWENHOEK, ANTHONY VAN, a Dutch phi-
losopher, who has been universally celebrated for the
number and importance of his microscopical obser-
vations and discoveries. He was born at Delft in Hol-
land, in the year 1632, and does not seem to have had
the benefit of a learned education. Leuwenhoek was
first recommended to the Royal Society by Dr. De
Graaf, as a person who had made several microsco-
pi
cal discoveries by means of glasses contrived by him-
self, and surpassing even those of the celebrated Eu-
chstio Divini. His first communication was sent to
the Royal Society by Dr. De Graaf, in 1673, and is en-
titled, Some Observations made by a Microscope contri-
yed by M. Leuwenhoek in Holland. His communications
to the Royal Society became frequent and important,
and amounted altogether to about 112 papers. He pub-
lished also about 26 papers in the Memoirs of the Aca-
demy of Sciences. These papers were all collected into
two quarto volumes, and published at Leyden in 1722,
under the title of Antonii a Leuvenhoek Opera omnis seu
Arcana Naturae ope exactissimorum Microscopiorum de-
lecta, experimentis variis consignata.

Leuwenhoek was elected a fellow of the Royal So-
ciety of London in the year 1680. He was made a
corresponding member of the Academy of Sciences at
Paris in 1697, and received similar honours from
almost all the learned academies in Europe.

When Queen Mary was in Holland, she paid a visit
to Leuwenhoek, and was much delighted with his curi-
siosities. He presented her with two of his microscopes,
in testimony of his esteem. The success which attend-
ed Leuwenhoek's observations, seem to have arisen
wholly from his having paid the most minute attention
to the grinding and polishing of single lenses, which
he always used in preference to the compound micro-
scope.

M. Leuwenhoek died at Delft in 1723, and bequeath-
ed to the Royal Society a small Indian cabinet, in
the drawers of which were thirteen little boxes, or cases,
each containing two microscopes handsomely fitted up
in silver; of which, not only the lenses, but all the appar-
atus, were made with his own hands. Each micro-
scope had an object placed before it; and the whole
was accompanied with a description of the objects, in
his own hand-writing. A fuller account of these will be
found in the Philosophical Transactions for 1723, vol.
xxxiii. p. 446.

LEVEL and LEVELLING. See Navigation In-

land, but particularly Surveying.

LEVEL, Loch. See Kinross-shire.

LEVEN, a village in the parish of Scoonie, and
county of Fife, lies on the western extremity of Largo
bay, at the junction of the river Leven with the frith
of Forth, about nine miles north-east from Kirkaldy.
It consists of two streets running parallel to each other,
and several bye-lanes, which, owing to their being nar-
row and badly paved, are in general very dirty. In
the neighbourhood, particularly on the estate of Durye, are
several rich seams of coal, which, however, are not at
present wrought. These formerly employed a consid-
erable number of ships in conveying their contents to
Holland; but this trade has for many years been dis-
continued, and the shipping belonging to this place
has, in consequence, been greatly reduced. There are
at present only two small and several sloops. The
harbour, which is entirely a natural one, and formed
by the mouth of the Leven, is capable of admitting
vessels of about 200 tons, and of affording secure shelter
to a considerable fleet; but it is rather difficult to take,
especially when the river Leven runs from the east end of the loch of the same name,
and runs a rapid course of nearly fourteen miles. The
fall in that distance is above 300 feet, and it is thus
peculiarly adapted for public works. In 1818, there
were on this river ten spinning mills, two paper mills,
two iron founderies, seven bleachfields, and twenty-eight
corn and other mills, giving employment to about 6000
persons, and whose buildings and machinery were esti-
mated at £176,250.—The salmon-fishery here, which
was formerly of some importance, is now very unpro-
ductive, owing, it is said, to the deleterious ingredients
brought down by the river from the bleachfields, &c.—
The fairs held at this place were formerly frequented
by merchants from distant parts of the country; and
linen cloth, to a very considerable amount, was annu-
ally brought here for sale from all quarters of the
country. These fairs, however, have now dwindled into
petty markets for toys and sweetmeats. Adjoining the
town are a mill for spinning flax, an iron-foundery, a
brick and tile work, and an adhesive for coal and
charcoal.

The population of Leven amounts to 1132; and
its inhabitants are chiefly employed in the manufacture
of coarse linen and sail cloth. (p)

LEVER. See Mechanics.

LEWES-CHASE ISLANDS. See Leo-Citroo Islands.

LEWES is a burgh and market town of England, in
the county of Sussex. It is beautifully situated on a
declivity, washed by the Ouse, and surrounded on eve-
ry side, but the west, with an amphitheatre of high
hills which form part of the South Downs. The town
is remarkably clean, and the streets, which are dispo-
sed irregularly, are in general spacious and well light-
ed. Lewes had formerly twelve parish churches, which
are now reduced to six; namely, St. Peter's and St.
Mary Westout, formerly two parishes, but now gene-
 rally called St. Anne's; St. Michael in Foro, St. John
sub Castro. All Saints, St. John Baptist South-over,
and St. Thomas in the Cliffe. The most remarkable
of these is St. John sub Castro, which is situated in the
middle of the oval camp, and contains some curious in-
scriptions and monuments. St. John's South-over is a
large church, close to the gate of the priory. St.
Anne's, at the top of the High Street, is a new brick
dicile, with stone rustic quoins, built on the site of
the old church, which was taken down in 1805. St.
Michael in Foro was rebuilt in 1755, and has a neat
The shire hall, erected in the High Street, is a new building, both elegant and commodious. The house of correction was built in 1793, on a plan recommended by Howard. It has thirty-two cells, a chapel, &c. The free grammar school was originally established in 1512. The theatre, which is a neat building, has lately been enlarged and improved. A library society was established here in 1786, and now possesses an excellent collection of books. The Sussex Agricultural Society, instituted in 1796, holds its meetings at Lewes: its premiums are awarded about the beginning of August.

On a hill, about a mile from the town, is a race course, reckoned one of the best in England. The races are generally held in the first week of August, and continue three days. The only manufacture of importance is at the iron-works, above the bridge, where cannon, shells, balls, &c. are cast. The river Ouse, which runs through the town below a handsome bridge, is navigable for barges six miles up the county, and enables the town to carry on a great trade in corn of all kinds and malt; and all the articles consumed in the adjoining county are imported at Newhaven, and sent up the Ouse to Lewes for sale. In consequence of the increase of its trade, two respectable banks have been established. The river Ouse was formerly navigable for small barges only from Newhaven bridge to Lewis, but since the passing of the act in 1791, it has been widened, deepened, and embanked, so as to be navigable for barges of a larger burden. The remains of the castle of Lewes are still in existence; and there is reason to think, that Lewes is the site of the Roman station called Montantiowis.

The population of the borough of Lewes, in 1811, was

LEWIS is the name of the most northern, and the largest of the Hebrides, or the Western Islands of Scotland. It is connected with the Island of Harris, by a narrow isthmus on its southern side, which is entirely dry at low water, and not wholly covered at high water, so that the two may be considered as one island, although the Lewis part of it is politically connected with Ross-shire, while Harris belongs to Inverness-shire.

The whole island, including Harris, is 82 miles long, from the Butt of Lewis to the Sound of Berners, extending north-west and south-east; and though it does not possess such numerous arms and indentations as the Island of Skye, yet it furnishes some of the best harbours in Great Britain. The average breadth of the island is 11 miles, and its area 451,000 Scots acres. Only about 46,000 acres are under regular meadow or corn land, the rest consisting of mountains, moors, marshes, and other wastes. The circumference of Lewis and Harris, following the sea-mark, is 850 miles. The valued rent of the whole is £7789, 6s. 6d. Scots, and the real annual rent, valuing kelp at £10 per ton, is about £10,000 Sterling per annum.

The island of Lewis is formed into four parishes, which compose the presbytery of Lewis, the parish of Harris belonging to the presbytery of Uist. These parishes are Barra, Lochs, Stornoway, and Uig.

The parish of Barra occupies the northern extremity of the island, and is about 36 miles long, and 13 broad. Barra has about 45 miles of sea coast, which is bold and rugged, but contains no harbours for vessels, and only a few creeks where ships can enter in calm weather. The ground is level, but the soil is poor, moorish, and ill cultivated. Attached to this parish is the island of Rona, which is said to be the most north-western point of Europe, being situated 10 leagues to the N. W. of the Butt of Lewis. It is about a mile in length, and half a mile in breadth.

The parish of Lochs, so called from the number of Parishes of its lochs or lakes, is about 19 miles long, and 9 miles broad at an average. Its line of coast, from its numerous inlets, amounts to 90 miles. The coast is bold and rocky. The soil is moorly and unfit for culture, although by the industry of the inhabitants, and the use of sea-weed, some parts near the coasts have been cultivated. The inhabitants are principally employed in the fisheries, and in the manufacture of kelp, of which 60 tons used to be made annually. The Shiant or Holy Isles, belong to this parish, and lie in the channel which separates Lewis and Skye. One of these is called Huann Mootar, or St. Mary's Island, and has a chapel dedicated to the Virgin Mary. They are celebrated for pasturing sheep and black cattle.

The parish of Stornoway is very extensive; but the inhabited parts have the form of an isosceles triangle, Stornoway, two sides of which are 10 miles, and the other 7. The extent of sea-coast is 35 miles. The chief bays are Broad bay, South bay, Loch Stornoway, and Loch Grimsadder, all of which afford excellent anchorage for the fishing vessels. In Loch Stornoway there is sufficient water for ships of any burden, and no heavy sea can come into it.

At the head of this bay, upon a projecting point, is Town of built the town of Stornoway, which, by the exertions of the late Lord Seaforth, has, from being a paltry hamlet of a dozen of thatched houses, become the first town in the northern Hebrides.

The streets of this town are straight, and the houses neat and well built, and covered with slate. It has a commodious custom-house, a town-house, an assembly-room, and two convenient school houses, in which there were educated, in 1808, no fewer than 219 scholars of both sexes. Stornoway is a thriving town, possessing a brisk trade fishery. During the five years, ending July 1808, 17,430 barrels of cured herrings, and 719 tons of ling and cod fish had been exported from the place, which had brought into the town at least £52,000. The quantity of oil exported during the same period amounted to about £6,000. In 1808 there were about 44 registered vessels, of from 16 to 127 tons burden, belonging to the port and district, which were navigated by 126 men and boys, and of which the tonnage amounted to 1612 tons. In addition to those which were regularly employed in fishing and in trade, there were 104 small boats, navigated by 592 men, and occasionally engaged in the herring, ling, and cod fishery. These boats did not all belong to Stornoway, but they had their residence there for part of the year, and contributed to enrich the place. The following was the population of Stornoway in 1808:
Married persons, 1012
Children, 1008
Male servants and apprentices, 59
Female servants, 166
Absent mariners, 60
Total population, 2305

Seaforth Lodge, the residence of the late Lord Seaforth, stands in an elevated situation, near the town.

Seaforth, 1 mile west, which is the residence of the present Lord Seaforth, stands in a situation, near the town.

Small islands, attached to Harris, may be divided into the north and south islands. The northern islands, there are three inhabited: Taransay, is high and rocky; four miles long, and one mile broad. Scalpay, lying in the entrance to East Loch Tarbert, is low, heathy, round, and about three miles wide; but is much intersected by arms of the sea. It has a light-house on it, and at the western extremity, two of the best natural harbours in the Hebrides. Scarp, situated in the mouth of Loch Resort, is one entire mountain of rock, about three miles in diameter. The uninhabited islands belonging to this division, are numerous; the largest are, Skotsivay, about a mile long; Issay, long and flat; the two Soays; Fladday; and a large green island called Galshier, frequented by geese. Of the southern islands of Harris, four are inhabited, Berneray, Pabbay, Calligray, and Easay. Berneray, lying about a mile north of Uist, is four miles long, and one and a half broad, and very fertile; but its north-west side is

This population of 13,661 inhabitants occupying 454,000 acres, gives 33 acres nearly to each individual.

The art of cultivation is very far back in these islands. Agricultural ploughs are rarely used, and where used, the imple-ment is the common Scotch one, with a feathered sock, drawn by four miserable horses. The soil near the shore is in general sandy, being covered by the particles (chiefly of finely ground shells,) drifted from the beaches by high winds. Towards the rising grounds, the soil is a mixture of black earth and sand, formed from the decomposition of granite; both these produce rich crops of Scotch barley, or bear, when manured. The greater part of the soil is moss upon clay and gravel. Sea-weeds in great quantities are drifted upon the sheltered parts of the coast, and constitute 4-5ths of the manure used by the natives. The remainder is produced by an indescribable species of domestic economy. The chief crops are oats, barley, flax, and potatoes. There was no hemp grown in 1808. From the sharpness of the soil, and the heat of the summer months, the harvest is generally very early. It is not uncommon to cut barley the first week of August, and within nine weeks after the seed has been sown. The quan-
Agriculture.

Some difficulty grain raised is sufficient for the consumption of the islands, in spite of distillation and mismanagement. Where there is land, there is not want of beds formed, and the surface being thickly laid over with seaweed, generally carried to the place on the farmer's back, is closely covered with sod, cut with a particular species of spade: the bed is then left until late in the spring, when the clods are pulverized with a heavy kind of hoe, and the ground sown with barley, or planted with potatoes, the whole being afterwards harrowed with a hand-rake, having six timber teeth, and a handle two feet long. The women and children assist in these operations. When the barley is ripe, it is generally plucked up by the roots, and tied into sheaves; and the stubble is so valuable as thatch, that it is afterwards cut off with a sickle, and the barley built up in stacks. On every farm there is a kiln for drying the corn; the principal tenants have also each a mill of a simple construction; but in general the meal is made by means of the quern, an instrument in use formerly all over Scotland. This is formed by a couple of stones, the lower one hollow, and the upper made to fit easily into the cavity, so as to be turned by a staff or handle fixed in it. The home grown meal is generally consumed before the month of June; and those who cannot afford to buy imported meal, subsist on the milk of their sheep or cows, or upon fish, or on the root of the potanilla anemone, until the potato crop is ready for use. Mr. Macdonald considers these islands as the most backward in agriculture, and in the general state of the inhabitants, of all the Western Isles.

Cattle and kelp are the chief saleable articles of produce. The kelp manufacture has been lately prosecuted with ardour. About 140 tons of a superior quality are annually made from Loch Roag, and about 50 tons in the parish of Lochs. The cows are much poorer and smaller than those of the island of Skyre; but they make very delicate beef, when exported and fed on good pasture. The parish of Lochs contained in 1795, 2488 cattle, 4000 sheep, and 348 horses. The parish of Stornoway contained 2440 cattle, 2576 sheep, and 556 horses; and the parish of Uig contained 3562 cattle, 5044 sheep, 682 horses, and 304 goats. Harris and its islands contain about 900 milk cows; and about 200 head of cattle are generally sold annually to drovers. The whole stock of cattle in Harris and its islets may be about 2500. The sheep in Harris are of a diminutive size, of a thin lank shape, with straight horns, the face and legs white, tail short, and wool sometimes bluish-grey, sometimes black, brown, russet, or blotched of various colours; their number is about 1100. On Harris a considerable tract of ground has been stocked with Tweeddale or black faced sheep, by Mr. Mackinnon of Corry, and other gentlemen. In some of the mountainous islands, they are said to have sometimes four, and sometimes even six horns. The number of goats is trifling. There are not less than 1000 horses in Harris, of very small size, but remarkably stout and hardy. Some of the gentlemen have larger horses on their farms, and a few asses have been introduced. Fowls and fish of every kind are abundant.

Antiquities.

There are many Druidical circles in these islands, and numerous Danish signal forts; and most of the proper names of the islands, &c. are of Danish origin. Near the small village of Colarnish in Uig, there is an entire Druidical circle, consisting of 12 stones, each about 7 feet high, and 6 feet distant. In the centre is an obelisk of larger size, 13 feet above the ground. Three obelisks stand directly south from the circles, running out in a line, another due west, and another east; towards the north there are two straight ranges of obelisks, reaching by way of avenue to an opening between two of the stones of the circle. Each of these rows consist of 6 stones regularly placed. At Melish in Uig are the remains of a nunnery, called "the house of the old black women." There is a Danish fort, or Dun of Callaway, which is probably the most entire in Scotland. The form is perfectly circular, and it has a double wall of dry stone 30 feet high.

Harris is a parish in the presbytery of Uist. There Religion, are seven stated places for public worship according to the church of Scotland, in the parish of Harris; two of these are no less than thirty-six miles asunder; the clergyman has a missionary assistant. There are two churches of stone, with slated roofs.

The climate is, as may be naturally supposed, variable and moist. The springs are very cold, the summers warm, the autumn attended with heavy rains, and the winters are stormy and cold, but without long or severe frosts, or heavy falls of snow. These islands, however, are differently constructed from the continent of Great Britain; the high ridges running throughout their length, being close to the east coast, and the west coast being comparatively flat.

Of the mineralogy of Harris, we believe, little is as yet known. There seems, however, to be neither limestone nor freestone in the country; and from all accounts, granite appears to be the common rock. There are some appearances of copper and iron, and there is a number of chalybeate springs.

The deer (Cervus elephas) in the forest amount to perhaps 800 head. Some of the uninhabited islands abound with rabbits (Lepus cuniculus). Of wild birds, there are grouse, (Tetrao urogallus), ptarmigan, (Tetrao lagopus), woodcocks, (Scolopax rusticola), snipe, (Scolopax gallinago), and plovers, (tringa), of various kinds; also eagles and hawks, (falco, &c.) crows, Corvus corone, &c.) teals, (Anas crecca), curlews, (Scolopacea arquata), bernicles, (Anas bernicla), wild geese, (Anas anser), gannets, (Pelicanus bassanus), cormorants, (Pelicanus carbo), and scarts, (Pelicanus gracchus), with innumerable other sea-fowls. The numerous fresh water lakes and streams abound with excellent black trouts, (Salmo fario,) and a few salmon, (Salmo salar,) frequent the mouths of the rivulets in the spawning season. The basking shark, or sail fish, (Squalus maximus,) is frequently killed in May and June; they are from 25 to 40 feet in length, and the liver of a large one produces eight barrels of oil. Seals (Phoca barbata et vitulina) are very numerous at all seasons. The sea-fish most plentiful are the herring, (Clupea harengus,) dagfish, (Squalus canicula,) cod, (Gadus morhua,) ling, (Gadus morcar,) skate, (Raia batis,) mackerel, (Scophim scomber,) cobby, (?) and sandeel, (Ammodtes tolusina,) There are also abundance of shell-fish, and the dredging for oysters, (odrea,) and the taking of lobsters, (Cancer gammarus,) might be a valuable increase of revenue to the inhabitants; but they are ignorant of the secret of catching them, and this natural advantage is carried off from them by expert fishermen, who come to load their little vessels for the London market.

Lewis and Harris were certainly once covered over with trees, if we may judge from the remains found in mosses; but there is now no such thing in the whole island; and even the bushes and shrubs, which gentlemen have attempted to plant in their gardens, die, as soon as they rise higher than the wall. The list of cryptogamous plants, particularly of Fuci and Alge,
would undoubtedly be found to be extensive, if the shores were accurately examined; but, in other respects, the flora of Harris is very meagre. See Martin’s Description of the Western Islands of Scotland; Buchanan’s Travels in the Western Islands; but particularly M. Donald’s Agricultural Survey of the Hebrides.

LEXELL, Andrew, John, an eminent mathematician and astronomer, was born at Abo in Finland, on the 24th December, 1740. He went through his early studies in that town, and applied himself eagerly to the abstract sciences. In 1760, he took his degree of doctor in philosophy, and published an inaugural dissertation, entitled, Aphorismi Mathematico-Physici, after having disputed under the presidency of M. J. Gadolinia, professor of natural philosophy.

In 1763, M. Lexell repaired to Upsal, where he distinguished himself by a dissertation, entitled, De Methodo inveniendi lineas curvas ex datis radiorum osculi proprietatibus, which obtained for him the situation of lecturer in mathematics; and such was his reputation, that, in 1766, he was appointed professor to the corps of marine cadets.

In consequence of the arrival of Leonard Euler at St. Petersburgh, and the preparations which were making, in 1769, to observe the transit of Venus in eight different parts of the Russian empire, M. Lexell became anxious to reside in a capital containing such attractions for men of science, and where genius and industry never failed to meet with their reward. With this view, he had sent to the academy, in 1768, a memoir on the integral calculus, entitled, Methodus integrandi nonnullis aequationum exempli illustrata. Euler was charged with the examination of this memoir, and gave a very favourable report upon it. The Count Wolfdimer, Gotberg, however, who was then director of the academy, stated his suspicion that it might be the work of some able geometer, who wished to favour Lexell by his assistance; to which Euler replied, that, if this were the case, it must have been written either by D’Alembert or himself, and that Lexell was unknown to both.

The Count, satisfied with this high eulogium on the merits of Lexell, did not hesitate a moment in sending to him an appointment of adjunct in the Academy for the Mathematical Sciences. Lexell eagerly accepted of the situation; and on the 17th October, 1768, he obtained the consent of the Swedish government, and set off without delay for St. Petersburgh. Upon his arrival in that capital, he began to make himself familiar with the use of astronomical instruments, in order that he might be able to observe with success the transit of Venus; a duty which he performed to the satisfaction of the academy, along with Father Meyer, who had been appointed, along with him, to attend the observatory during the absence of the astronomers. M. Lexell became very intimate with Euler, who employed him in writing out all the calculations and memoirs with which he was occupied. Lexell had also a considerable share in the new theory of the moon, and in the determination of the sun’s parallax, as deduced from the observations of the transit of Venus, which are published in the 14th volume of the New Commentaries of St. Petersburgh.

The reputation of M. Lexell now increased every day. In 1771, he was received among the number of ordinary academicians, and Count Orloff gave him the place of one of the astronomers. The academies of Stockholm and Upsal elected him a member of their body, in 1773 and 1774; and the Royal Academy of Sciences of Paris sent him the diploma of correspond-
Prince of Orange; but it has no building of importance, as the professors live in private houses, and the students in lodgings. The library is open only once a week, and contains about 40,000 volumes. The salaries of the professors, exclusive of fees, is about £200 per annum. There is also in the university a physical cabinet and a museum of natural history. There is a literary society at Leyden, and also a poetical society.

Leyden possesses some good private collections and cabinets, &c. The principal of these are, M. Doeven's cabinet of antiquities and collection of minerals; the cabinet of natural history of M. François Berkley; the botanic garden; the anatomical collections of Doeven, Rau, and Albinus; the cabinet of paintings of M. Sellos; the collection of prints of M. de Leyde, which was reckoned the best in Holland; M. Tak's collection of Dutch paintings; and M. Dibbel's cabinet of designs and medals.

Leyden has eight gates, and its ramparts, which form an excellent promenade, are formed of earth, partly covered with turf, and partly faced with brick, and crossed by several bastions.

Leyden has long been celebrated for its manufacture of cloth, and there is a staple hall erected for the use of the manufacturers and merchants. There are also manufactories of soap and indigo. The fair of Leyden is still much frequented. Its booths, arranged under trees, and along the banks of the canals, occupy about one-fourth part of the town. East Long. 4° 29' 13" N. Lat. 52° 30'. Population 30,935.

LEYDEN, JOHN, an eminent poet and oriental scholar, was born on the 5th September, 1775, at Denholm, a village of Scotland between Jedburgh and Hawick, in the county of Roxburgh. Although our author was nearly ten years of age before he had an opportunity of attending even the reading school, and received the whole of his early education under very unfavourable circumstances, yet he made rapid progress in his studies; and overcame, by his own persevering exertions, difficulties which would have discouraged a less ardent and ambitious character. His parents having determined to educate him for the Scottish church, he was instructed in the Latin language by Mr. Duncan, a Cameronian minister at Denholm, and was reckoned fit to enter the college of Edinburgh in the year 1790. Here he was so soon distinguished by a profound knowledge of the Greek and Latin languages; and while he attended to the various sciences which a candidate for the church is compelled to study, his leisure hours were employed in acquiring a knowledge of the French, Italian, Spanish, and German languages, to which he joined a familiar acquaintance with the ancient Oriental, the Hebrew, the Arabic, and the Persian.

In the year 1798, he attended two young gentlemen who were studying at the college of St. Andrew's; a circumstance which secured him the acquaintance of Professor Hunter, an excellent classical scholar and philologist, to whose instructions Leyden acknowledged himself deeply indebted. About this time, the expedition of Mungo Park, who had been the early friend and college companion of Leyden, had excited universal notice, and naturally turned the attention of Leyden to the history of Africa; a subject which he studied with much attention. His researches were published in 1799, in a small volume, entitled, A Historical and Philosophical Sketch of the Discoveries and Se
was suggested, that they might be advantageously employed in investigating the languages and literature of India. Mr. Dundas entered eagerly into this plan; but the only appointment at his disposal was that of surgeon assistant, which could be held only by a person who had received a surgical diploma, and could pass an examination before the medical board at the India House. Leyden eagerly accepted of the appointment, with the understanding, that he was to be employed only in literary researches when he arrived in India; and he actually succeeded in qualifying himself for it in the space of five or six months. He received a diploma from the College of Surgeons of Edinburgh, and obtained a degree of M. D. from the university of St. Andrew's. About the middle of December 1802, he left Edinburgh, to join the fleet which was on the eve of sailing for India. On his journey to London he was seized with the cramp in his stomach, in consequence of his excessive exertions in Scotland; and when he arrived at the native of Madras, the influence of this disorder, he was told that he must either proceed to the Downs, or vacate his appointment. The clerks made out his appointment, and orders to sail in the Hindostan, as if he had been in perfect health; and had it not been for the kind interference of Mr. George Ellis, the author of the Specimens of Ancient English Poetry, he would have been drowned in the Hindostan, which was actually wrecked in going down the river. By Mr. Ellis's influence, he got permission to go in the Hugh Inglis to Madras,—a circumstance which allowed him to reside in London till the beginning of April 1803. The Hugh Inglis set sail on the beginning of April, and after a voyage distinguished principally by a mutiny in the vessel, in which Leyden evinced great intrepidity, he arrived at Madras, where he was nominated surgeon to the commissioners appointed to survey the ceded districts; and was at the same time directed to carry on inquiries concerning the natural history of the country, and the manners and languages of the natives of Mysore. His health, however, was unable to resist the effects of the climate, and his unwaried exertions to acquire the languages of the Mysore; and, as appears from his "Address to an Indian gold coin," his health and his spirits were so much injured, that he was obliged to leave the presidency of Madras, and repair to Prince of Wales's Island. Previous to his leaving Madras, he succeeded in translating the famous Jewish tablets of brass, preserved in the synagogue of Cochin, and which had puzzled all preceding orientalists. He had studied the Arabic, Persian, Hindustani, Mahratta, Tamil, Telinga, Canara, Sanscrit, Malayalam, Malay, and Armenian languages; and he had deciphered the inscriptions of Mavalipo- rani, written in an ancient Canara character, and also several Lada Lippi inscriptions, which is an ancient Tamul dialect and character.

During his voyage from Travancore to Pulo-Penang, or Prince of Wales's Island, which was performed in a Mappilla brig, it was chased by a French privateer which led Dr. Leyden to compose an Ode to a Malay Cry, or dagger, the only weapon which the state of his health permitted him to use. In this island Dr. Leyden found many friends, and enjoyed the confidence of Philip Dundas, Esq. who was governor of the island. During his residence in that place, he visited Achi and some other places on the coast of Sumatra, and the Malay peninsula; and he collected the curious information respecting the language, literature, and descent of the Indi-Chinese tribes, which is given in the valuable dis-

The wheat is superior to that from the Russian ports, and is commonly kiln-dried. The other grains are sent chiefly to Holland, Spain, and Portugal. Flax, which is of an inferior quality, comes principally from Lithuania. The hemp is like the pass-hemp of Riga. Hides and skins are both cheap and good at Libau. The merchants store it in vaults till it is purchased by the country people, who bring supplies of Russian produce.

The annual exports of Libau are,

- Rye: 10,000 lasts
- Wheat: 2,000 ditto
- Barley &c.: 4,000 ditto
- Oats: 2,000 ditto
- Flax: 15,000oods
- Hemp: 17,000 ditto
- Crushing linseed: 1,000 barrels
- Sowing linseed: 10,000 ditto
- Hides and skins: 18,000 decker.

In the year 1800, there arrived at Libau 117 vessels, and there set out 111. The value of the exports had been 1,065,699 rubles, and that of the exports, 620,327. North Lat. 56° 31' 36" and East Long. 20° 55' 20". See Catteau de Calleville's Tableau de la Mer Baltique, tom. ii. p. 305. Paris 1812; and Rondan's European Commerce.

LIBRARY. The obvious advantage of preserving written language, led to the formation of books, any considerable assemblage of which constitutes a library. At the period of the Spanish invasion, emblems or pictures were employed by the South American nations instead of writing; for they were unacquainted with letters; but in Yucatan and Honduras, there were books made of the leaves of trees; and "in the province of Mexico they had a library, histories, and calendars, wherein they painted such things as had proper figures, in their natural representations, and such as had none, with other characters, and thus they represented whatever they pleased." Herrera, Decau ii. Book ix. ch. 4. This must be considered as a library in its earliest stage; for all which are described to have belonged to the ancients, were composed of books, or rolls, resembling those of the moderns.

"Annexed to the edifice forming the sepulchre of Osyramdous, one of the ancient kings of Egypt, was a library, inscribed with these words, "Food for the mind," and sculptures on the walls, represented "a judge, with the image of truth hanging from his neck, and many books lying before him." Diodorus Siculus, lib. i. cap. ii. One of the most celebrated libraries in the world was founded at Alexandria, 283 years anterior to this Christian era, by Ptolemy Philadephus, who obtained for it the books belonging to Aristotle, first bequeathed by that philosopher to Theophrastus: and here also the version of the Septuagint was preserved. No expense was spared on the collection, which at length amounted to 500,000 volumes according to Josephus, or 700,000, according to Aulus Gellius and Ammianus Marcellinus; but after subsisting 244 years, it was burnt accidentally during the expedition of Caesar to Egypt, though the ancients disagree as to the precise cause of the conflagration. Seneca affirms that the Alexandrian library was rather to be considered a pompous spectacle for the public than a place for the studies of the learned: De tranquillitate animi, cap. 9. Another library was collected at Alexandria, which was partly extant in the time of Tertullian, and one of great extent is said to have been burnt by the Mahometans in the year 414 or 650, by the Caliph Omar.

A library is supposed to have been kept in the temple of Jerusalem; and the Jewish authors speak of "the multitude of books."

In scripture, it is written, that a search was made Persian "in the house of the rolls, where the treasures were laid up in Babylon," for a decree by Cyrus to build a temple at Jerusalem; but it was found at Achmetha in Media: Ezra, ch. v. 17. vi. 1, 2. It does not appear to us as to some authors, that the house of the rolls was a library belonging to the Persians, or any thing else than the archives of the kingdom.

Pisistratus founded a public library in Athens, which Greeks was carried to Persia by Xerxes, and brought back by Seleucus Nicanor, plundered by Sulla, and restored by Hadrian. Eumenes the son of Attalus collected a library of 200,000 volumes at Pergamus, according to Strabo and Plutarch, which the latter says, Calvisius, a retainer of Caesar's, accused Mark Antony of having given to Cleopatra: In Vit. Anton.

Many authors have written concerning the libraries of Greece, and various conjectures have been formed where the remains of the ancient historians may be expected still to exist: The subject has been renewed lately by the Rev. Mr. Walpole, in the following observations published in Dr. Clarke's Travels:

"As many manuscripts had been collected, at vast expense, in Greece for the library at Buda, (destroyed by the Turks in 1256,) we ought not to omit mentioning it. Alexander Brassinianus had seen in it the whole of Hyerides with Scholia, the works of many of the Greek fathers, and of the classical writers. From this library issued parts of Polybius and Diodorus Siculus. A manuscript of Heliodorus, from which was taken the first edition of the Ethnics, was found by a soldier, and brought to Vincentius Obsopanus: it belonged to this library. Neatsper thus speaks of the collection: 'Ex mediis Graecia inamstandis sumptibus ematur Matthias Corvinus rex.' Epist. p. 70.

"There is no doubt that Constantinople and Athens have contributed the greatest number of the manuscripts we possess in different parts of Europe.' There were monasteries full of learned men at Byzantium, to a late period; and every monastery had its library. The Turks, on their conquest, did not occasion that indiscriminate destruction which idle declamation has sometimes impugned to them. Mahomet the Second secured the library of the Greek Emperor, which was preserved by his successors, until it was destroyed by Amurat IV. At Byzantium, Constantine Lascaris transcribed many of those works which were afterwards placed in the Madrid Library. In this city were procured those manuscripts which were left to the Escorial Library by Hurtado de Mendoza; and which had been presented to him by Soliman the Second.
vin has given partial catalogues of some of the libraries at Constantinople; and a traveller, in 1597, mentions a valuable collection which he had seen in that city.

With respect to Athos, we find that two hundred manuscripts are deposited in one library alone, brought from the monasteries on the mountain; and a great part of those at Moscow had been collected by the monk Arsenius, in Athos, at the suggestion of the Patriarch Nicon.

"We must add Thessaly, Chios, Corfu, Crete, Cyprus, Chalce, (the island in the Propontis,) Ithodes, and Epidauria, as places which have supplied some manuscripts. We should have had much valuable intelligence concerning the libraries in the monasteries of Thessaly, if the life of Professor Biornstahl had been prolonged. He had visited all of them, and had resides many days at Triecula, for the express purpose of copying a Greek manuscript belonging to a monastery. Biornstahl was attacked by a fever at the foot of Mount Olympus; here he was obliged to continue ten days, without medical assistance, and was then taken to Salonic, where he died, in July 1779.

"Notwithstanding our acquisitions are already great, we should not intermit our researches in the Levant. Many manuscripts may be saved by them from destruction. 'I myself,' says Dr. Covell, 'have seen vast heaps of manuscripts (for I never found them on shelves, or in good order) of the Fathers and other learned authors, in the monasteries at Mount Athos, and elsewhere, all covered over with dust and dirt, and many of them rotted and spoiled.' An inquiry should be made into the truth of what was stated to Hemsterhusius by some Greeks, that part of the Comedies of Menander was still in existence. Application might be made to the Greek nobles of the Phanar, many of whom are versed in ancient Greek, and who are probably the possessors of some valuable manuscripts. Parts of the first book of the Demonstration Evangelica of Ensebius were printed by Fabricius from a manuscript belonging to Prince Mavrocordato; and a copy of the Greek Orators, now in England, was the property of a Greek noble.

"It may be reasonably supposed, that many manuscripts in Greece have experienced the treatment which works of the same sort have met with in other countries. Poggios, we are told, found, while he was at the Council of Constance, a manuscript of Quintilian, on the table of a pickling shop. Masson met with one of Agobardus in the hands of a bookbinder, who was about to use it for the back of a book; and one of Ascobius was about to be employed for the same purpose. Musculus found, in the roof of a Benedictine monastery, some of the works of Cicero, and the whole of Ovid. Numbers of manuscripts in Greece are irrecoverably lost to us, either by design or accident; and of those, which we may hereafter meet with, we cannot suppose all will prove to be of equal value:

Παλαι τοι παθητηροι παρεις δι' τι βασκει.

Yet if we meet with only few of which we shall be able to say, as Casambon once said to J. Scaliger, that they are 'πανυπερεται, et vero χρυσον αρτηρια,' the trouble of research will be well required.

"A list of theological manuscripts in the Library of Patmos, has been given by Possenn; their number accounting, according to his statement, only to fifty-five. The present catalogue, containing the titles of ninety-two manuscripts, and about four hundred printed volumes, and of which an account is here subjoined, by no means precludes the necessity of further examination. The Greek compiler of it has not stated any circumstance relating to the manuscripts, by which we can form an estimate of their value: it gives no information respecting the form of the letters or that of the spirits, or any of those subjects which would lead us to a knowledge of their respective dates.

"There is one manuscript mentioned in it, concerning which it is impossible not to feel more than common curiosity: it is one of Diodorus Siculus. By an accurate inspection of it, we should learn whether the hopes, which have been more than once entertained, of the existence of the lost books of that historian, are in this instance also to be disappointed. H. Stephanius had heard that the forty books of Diodorus were in Sicily. This report arose, probably, from Constantine Lancaris having said, in Sicily, that he had seen all these books in the Imperial Library of Constantinople. Lancaris fled from this city at the capture of it by the Turks. In the turbulence and confusion of that period, the entire copy to which he referred might have been lost. 'Deum immortalem,' says Scaliger, 'quam cuncta habere possint his annis et saeculis, est maxima potentia.'"

Mr. Walpole has given a list of the books in the Library of Patmos, as copied by the Marquis of Sligo.

Notwithstanding the sanguine expectations of the admirers of ancient literature, very few valuable MSS. have been discovered of late years; and it must be admitted, that even those accidentally rescued from destruction, were in general of comparatively modern date, or of little consequence. Neither the inquiries which have extended to the African states, nor the researches at Herculaneum, have recovered the lost historians, or any works of importance. It was common to make written copies of the Classics after the introduction of printing, and the earlier editors seem to have been very unskilful judges of the antiquity of MSS.

Many of the Romans had libraries. Lucullus instituted one which was enlarged by Sylla from the plunder of Greece, and destined for public use by Julius Caesar. Cicero observes, that he studied in it. Libraries were established by several of the emperors, as Augustus, Tiberius, Vespasian, Trajan, and others. Even Domitian sent to foreign countries, for the purpose of storing his library, which was consumed by lightning in the reign of Commodus, and restored at great expence by the emperor Gordian, who added to it 62,000 volumes, which had been bequeathed to him by his preceptor Quintus Serenus Samonicus. The most magnificent of all was the Ulpian library, founded for the benefit of the public by Trajan, where the books carried from the conquered cities were deposited. In the time of Constantine, there were 30 public libraries in Rome. This emperor formed a library of 120,000 volumes at Constantinople, which was greatly enlarged by his successors, but destroyed by fire; and was afterwards renewed by Leo Isaurus, who himself ordered it to be burnt. Zonaras says, that there was a manuscript of the Iliad and Odyssey here, on the skin of a dragon, 120 feet long: Annales, tom. ii.

Little is recorded of the libraries of the middle ages between the destruction and revival of literature in the middle ages.
Europe. But every era has produced learned and inquisitive men, by whom books were prized. Cassiodorus, minister of Theodore king of the Goths, retired to a monastery which he had built, and founded a library there for the use of the monks, about the year 550. Some time later, Charlemagne founded a library near Lyons, which historians affirm contained books bound in a magnificent manner. After this monasteries almost exclusively possessed libraries; and such collections, formed by the accessions of centuries, are still to be seen on the continent.

Our observations shall be confined chiefly to a few of the more celebrated modern European libraries, for a full account of them all would lead us into very copious details. Louis Jacob, a Carmelite, who wrote on this subject in the middle of the seventeenth century, enumerates above 1100 libraries, ancient and modern. Traité des plus belles Bibliothèques. Many of these, however, were contained in monasteries, now suppressed.

Among the libraries in Italy, a country always the seat of literature and the arts, the Vatican at Rome is preeminent. Certain zealous authors have written, that St. Peter the Apostle first established a library, belonging to the Roman Church, which, after augmentation by some of the Popes, was carried to Avignon, and then brought back to the Vatican, their ordinary abode. But authentic history proves, that Nicholas IV. who was elected to the papal chair in 1477, laid the foundation of this library, and supplied it with many MSS. from Greece, and that Sixtus V. spared no pains on its embellishment; nor was it neglected by any of the others down to Pope Pius VI. Some of its most valuable acquisitions came from the collection of the Elector Palatine, which was taken in 1622 by the Duke of Bavaria, who presented it to Urban VIII. Queen Christina of Sweden also had collected 1500 manuscripts, which, on her decease, descended to the chief of the Ottoboni family, afterwards Pope Alexander VIII, who deposited them in the Vatican. The exact number of books found here is not known, as there is no published catalogue of the library: but there are 10,000 volumes of manuscripts, and, having consisted of manuscripts originally, the printed books are said not to be in equal proportion. Nevertheless they are very numerous; and the whole library is chiefly contained in an immense gallery, 214 feet long, and 48 broad, and in other apartments superbly decorated by the hands of eminent painters. A particular chamber is called the Papyrus Room, from the quantity of writings it contains on the Papyrus of the Egyptians. Among the MSS. are preserved one of Virgil, written in capitals, on 901 folio pages of vellum, supposed to be of the seventh century; One of Terence, in 92 folio pages, also on vellum, with figures, as old as the tenth century. Both these celebrated MSS. have been published, but the reader must beware of considering the printing of the former a fac-simile, such as we are accustomed to publish in this country, though generally believed to be such, for there are only approximations to it. In the Vatican are preserved a parchment roll, 217 feet long, and 33 inches broad, containing the Pentateuch, in Hebrew, written in the ninth century; an Arabic MSS. of the ninth century, of two of the evangelists, on cotton paper; a Coptic MS. on 279 folio pages of vellum, of the Pentateuch, written in the tenth century; a MS. of the laws of the Visigoths, of the eighth century; a copy of some of the works of Gregory of Tours, of the ninth; and many other MSS. of equal value and curiosity, such as Caesar's Commentaries, of the twelfth century; the Acts of the Apostles, written in gold letters, presented by a Queen of Cyprus to Pope Alexander VI., and the like. Pope Pius VI. added a superb collection of engravings to the library, which also possesses numerous curiosities, accumulated by purchase and donation, Misse Catalogue Indicatif. During the progress of the late usurpations of the French, they demanded 500 valuable MSS. from the library of the Vatican, along with early printed works, and 5000 or 6000 medals, which were delivered to their commissioners at Rome, in July 1797: Biblioteca Vaticana, p. 136, 146. This library is divided into three portions; one is public, whether all may rest on two days of the week; another is of more difficult access, and the third is reserved for the reception of only very few persons. There are besides several extensive libraries in Rome, as the Barberini, containing about 50,000 printed books, and some thousands of manuscripts. The Colonna library, distinguished by about 400 volumes of books and engravings of the fifteenth century; and the library of the Roman College, wherein is contained the library and museum of the celebrated Kircher, Vasi Itineraria, p. 559. The remaining libraries in Italy are numerous; as at Bologna, Florence, Milan, Mantua, Pisa, Venice, and elsewhere. The Medicean library at Florence is deposited in a spacious edifice, designed by Michael Angelo. It consists of above 90,000 printed volumes, and 3000 valuable manuscripts. The latter have been described in a catalogue of eleven folio volumes, by Assemani, Biscioni, and Bandini: and 3000 volumes, printed in the fifteenth century, are also described in two folio volumes by one of these authors: Cambio’s Guida, p. 47, 164. In the library of St. Mark at Venice, there is a copy of the evangelist of that name, which is affirmed to have been written by himself. Pope Julius III. is said to have ordered 12,000 Hebrew manuscripts to be destroyed at Cremona, because that language was written by a people hostile to Christianity. Gallois, Bibliothèques de l’Europe, p. 23.

The literature of Spain is exceedingly restricted, and Libraries in the whole nation can boast of very few libraries truly valuable; for the importance and extent of a collection are to be separately appreciated. The library of the Escorial, however, contains about 130,000 volumes, of which 4300 are manuscripts, said to constitute its more interesting part. A fortress belonging to the Emperor of Morocco had been taken, wherein 4000 Arabic MSS. were found, and carried to Paris for sale, but not being prized there, they were transported to Madrid, and about 3000 selected by the command of Philip II. Most of the library was destroyed by fire in 1671, when a large proportion of the Arabic MSS. perished. In 1760 and 1770, Michael Castri, a learned ecclesiastic, published a catalogue, in two folio volumes, of 1805 that had escaped, to which he added as many as make 1851 in whole: Bibliotheca Arabico-Hispanica Escorialensis. Besides these which are extremely curious, there are MSS. in various other languages: as one of the four evangelists, written in gold letters, on 160 leaves, supposed to be 700 or 800 years old—a treatise by St. Augustine, de baptismo parvularum: said to be in his own hand—the original works of St. Theress—and a parchment roll, containing an original Greek MSS. of St. Basil. The library of the Escorial was founded by Charles V. There are three public libraries in Madrid, besides those in the Royal Library, that of San Isidro, and the library of the Duke de Medina Sidonia. The first consists of about 200,000 volumes, according to the librarian, but judging by the space they occupy, this number is
thought to be exaggerated. Almost the whole books published in Spain, as well as the best foreign works, are purchased for the library. A porter is stationed at the door to see that the injunctions respecting the dress of its visitors are observed: Fischer's Travels, p. 193.

In some of the Spanish libraries the books are arranged with the front, or edge, presented to view, instead of the back as with us.

Although there are many extensive and valuable libraries in France, those of Paris are the most distinguished, particularly the National Library, which is unrivalled in the world. This immense depot of literature, formerly called the King's Library, is of obscure origin. It appears that Charles V. had a library of 910 volumes, in the fourteenth century, which is said to have contained originals, or translations, of the Greek and Roman Classics: but it was entirely dissipated. Another collection, founded by Louis XI. was enlarged by Francis I., who had a decided predilection for Greek literature, and under a directing his ambassadors to the various European courts were procured Greek MSS. in the course of their respective missions, he sent three travellers to the Levant for that special purpose, who brought home 400 volumes. The celebrated Budæus was appointed librarian by that sovereign; which office he held until he died, in 1540.

In 1661, the library consisted of 16,746 printed and manuscript treaties. The acquisitions of the National Library have been numerous, from the accession of other entire libraries, and of late they have been very numerous, both by purchase and plunder. It is entitled to two copies of every work published in the kingdom. In the year 1785, it contained 200,000 printed volumes, 60,000 manuscripts, 5000 volumes of prints, and 2000 engravings; since which period it has been much increased. Its contents are at present computed to be 350,000 printed books; between 70,000 and 80,000 manuscripts, and, it is computed, 50,000 portraits. There is no complete catalogue of this vast collection. A catalogue of the manuscripts in ten folio volumes, under a systematic arrangement, was published during the reign of Louis XVI. Recourse must be had to the library itself, or its catalogues, to form any correct opinion of its contents, which, in general, may be said to consist of all that is interesting, rare, and precious, in literature. The MSS. embrace every different branch of learning of all ages. A written roll of papyrus, taken from the hand of a mummy in Egypt, was presented to it by Buonaparte, after he left that country in 1801. A manuscript, containing the works of Prudentius, who was born in the year 348, in rustic capitals, is supposed to be contemporary with that author. The National Library is rich in early printed works, and those on vellum; and all the arts and sciences are copiously treated of, together with history, in the modern part of the collection. By good fortune, it has constantly been committed to the charge of learned individuals; and it is now divided into two departments, each under skilful superintendence. It is conducted on the most liberal principles; open five hours daily, and so completely accessible to the public, that it is supposed about 200 persons are constantly engaged here during summer, and about 50 during winter. Not more than 10 or 12 antiquaries are usually occupied with the manuscripts. Known literary characters are allowed the use of books at their own residence, which is seldom productive of inconvenience to others, from there being frequently several copies of a work; and losses to the library are very rare: Essai Historique sur la Bibliothèque du Roi; Pinkerton's Recollections, vol. ii. Above 10 other public libraries are open in Paris; and before the Revolution there were 32 of celebrity.

The collection next in extent and value to the National Library of France, is the Imperial Library of Vienna, contained in an edifice 242 feet long, of fine architecture, and decorated with columns and pilasters. It was founded by the Emperor Maximilian, in 1480, and enriched by subsequent accessions, among which is the entire collection of Prince Eugene. The contents of the Imperial Library, above twenty years ago, were computed at 300,000 printed books, and from 18,000 to 15,000 manuscripts, all arranged according to size. Besides these there are 700 large volumes of prints, 200 of which are occupied by portraits, from every country, and of all periods. In this superb assemblage of literature, there are above 7000 volumes printed in the fifteenth century, many of them of excessive rarity, and almost unique at the present day. One of the rarest works is the Christianismæ Restitutio, by Servetus, printed in 1553, in octavo, of which it is said only another copy is known to exist in the library of M. Gaignat, at Paris, where it was purchased for £200. The one in the Imperial Library was presented by a noblemen to Joseph II., who bestowed on him a diamond, worth 10,000 crowns, in return. Here are preserved a celebrated manuscript of Livy, conjectured to belong to the fifth century; a fragment of St. Mark and St. Luke, in gold and silver characters; and a Mexican manuscript, in coloured figures, executed on a human skin, deemed unique in its kind. An extraordinary specimen of chirography, by a Jew, is seen on a single page, eight inches long, by rather more than six broad, wherein are written, without contractions, and very legible by the naked eye, the Pentateuch and Book of Ruth in German; Ecclesiastes in Hebrew; the Canticles in Latin; Esther in Syriac; and Deuteronomy in French. The last line consists of 305 letters. This library is open daily, and is much frequented: Voyage de deux Francais, tom. v.

The library at Dresden is kept in a handsome edifice, which forms a hollow quadrangle, on the east square, with seventeen windows on two of the exterior sides, and fifteen on the other two; and on the internal side are eleven windows by seven. The ground floor is reserved for antiques, and the books are lodged in the first and second storey. Two very spacious galleries and ten chambers occupy the first; the second consists of one gallery and nine apartments. In this library are above 150,000 printed volumes, and 5000 manuscripts. One of the latter is in Mexican characters, on the human skin, which Thevenot has explained to be a calendar, and some fragments of the history of the Incas. There are also a fine copy of the Koran, which belonged to Bajazet II. and was taken from a Turk by a Saxon officer at the last siege of Vienna; and the original MS. of the Revelations of Marshal Saxe, bearing to have been written by him in thirteen nights, and concluded in December, 1733, while labouring under a fever. Among the printed books are 600 of the Aldine editions, and many on vellum. A copious collection of antiques is preserved in fourteen apartments below the library, which are eighteen vaulted cellars, stored with a vast quantity of valuable porcelain, of foreign, and likewise home manufacture, for which the city is so famous.

The library of the University of Gottingen is said to Gottingen. exceed 150,000 volumes: That of Munich amounts to Munich. 100,000, including a valuable collection of manuscripts. At Stutgard, the late King of Wirtemberg commenced Stutgard.
the formation of a library, which, in 1791, amounted to 100,000 volumes, contained in an edifice constructed of wood. There were then 9000 Bibles, of all editions, and in all languages; and the royal owner still required 3000 copies, which we believe he afterwards acquired, to render his collection complete. The university of Prague has a library consisting of 130,000 printed volumes, and 8000 manuscripts, deposited in a quadrangular building, nearly 250 feet in length by 150 in width. It contains a complete collection of Polyglot Bibles; and among the manuscripts are a copy of Justin, on volumes, of the 15th century, in good preservation; one of Pliny, also on vellum, written by order of the magistrates of the city in 1350, beautifully executed, and well preserved; and a table of logarithms, in the handwriting of Tycho Brahe.

There are few celebrated libraries in Poland, as may be expected from the political distractions of that country. What is called the King's Library, at Warsaw, does not exceed 20,000 volumes, most of which are modern. A manuscript, in three folio volumes, with 172 fine drawings, describes the antiquities dug up at Velleia, between 1760 and 1765. The university of Cracow has a library, in which are 4000 manuscripts; and among them is seen a Latin Encyclopaedia, in a large folio volume, written by Paul of Prague, in 1459. A more valuable and extensive collection, called the Zaluski Library, or Library of the Republic, was formed, and devoted to the public by two brothers of that name in 1745. But no funds were appropriated, either for its enlargement or suitable preservation. Originally the Zaluski library consisted of 300,000 volumes, comprising 52,000 duplicates. By the sale of these, and from other circumstances, the collection was supposed, in 1791, not to exceed 200,000 volumes, while its value was not proportioned to its size. But it suffered many depredations, and at length was sent by General Suwarrow to St. Petersburg in 1795, where it was deposited in three elegant apartments, and opened for the use of the public in 1812. It was formerly divided into five general classes of literature; but, according to the recent work of Müller, half its contents are theology; and the portion embracing jurisprudence is distinguished according to languages. The same author observes, that this is the only public library in the capital of the Russian empire, and that of their notable library. The library of the Academy of Sciences, which some time ago exceeded 40,000 volumes, was founded with 2500 taken by Peter at the siege of Mittau. It contains numerous diplomatic papers of the reign of that prince, and the most extensive collection of Chinese works in Europe, amounting to 2800 different treatises, of which there is an exact catalogue; some Japanese manuscripts, and several of the Mongols and Thibet. The original MS. instructions, in the handwriting of the late empress, to prepare a new code of laws for her vast empire, is preserved in a fine bronze vase, which is always placed on the table during the sittings of the academy: Müller Tableau: Bacmoister Essay.

Previous to the late siege of Copenhagen, the royal library exceeded 130,000 printed volumes, and 3000 manuscripts, all contained in a gallery 352 feet long, and other apartments. Among the manuscripts is an imperfect copy of Livy, ascribed to the sixth century; about 250 treatises collected by Niebuhr during his interesting travels in the East; and four large volumes of paintings of plants, on vellum, from nature, by the celebrated, Madame Merian. A large portion of the duplicates of this library, particularly those relative to natural history, were purchased, some years ago, by an intelligent Scotch bookseller, and carried to Edinburgh.

—Copenhagen had also to boast of one of the most extensive private libraries of modern times, in the collection of Mr. Suhm, well known by his taste in northern antiquities. It consisted of 60,000 printed volumes, besides manuscripts procured at great cost.

The king's library in Stockholm is said not to exceed 20,000 volumes and 500 manuscripts. A copy of the Evangelists, written on purple vellum, and supposed to belong to the ninth century, is commonly called the codex auritus, from the quantity of letters in gold.

—The library of the university of Upsal, containing 50,000 volumes, is possessed of a manuscript of still greater celebrity, also a copy of the Evangelists, written in gold and silver letters, on 187 leaves of vellum, but wanting the beginning and end. The manuscript is ascribed to Ulphilas, bishop of the Goths, who flourished under the Emperor Valens, about the year 370. Junius, and also Ihre, have published dissertations regarding it.

The principal libraries in Great Britain, are the Royal British Library, those of the British Museum, Oxford, Cambridge, and the Advocates' Library in Edinburgh. It is calculated that the royal library amounts to 80,000 volumes, which have been acquired chiefly by his present Majesty. The library of the British Museum, British museum, which is now considered the national deposit of literature, has been composed of various others, successively obtained, and is chiefly valuable for its numerous manuscripts. These are principally formed of the collections made by Sir Robert Cotton, who was born in the year 1570, and by the Earl of Oxford, who died in 1741. The library of the former was put under sequestration in the reign of James, owing to the appearance of a political pamphlet falsely ascribed to the owner, because a copy, under another name, was discovered among its contents. It was purchased for the use of the public in 1701, and annexed by statute to the British Museum in 1753. This library originally consisted of 938 volumes of manuscripts, which were reduced to 861 by fire in 1731. A complete catalogue, lately published by order of government, in one volume folio, embraces 26,000 articles, which, in general, relate to British history. The Harleian MSS. amount to nearly 8000 volumes at the death of their noble owner. Now there are 10,000 volumes, besides above 40,000 original rolls, letters patent, signs manual, &c. for the most part relating to great Britain and Ireland. It is difficult to form a correct idea of this copious collection without actual examination. There are numerous ancient MSS. of the classical authors: such as a fragment of the Æneid, and a copy of Quintilian, of the ninth century; two copies of Terence, and one of Homer and Ovid, of the tenth; and a copy of Sallust of the eleventh. Here are about 300 manuscript Bibles and biblical books, in Hebrew, Chaldee, Greek, Arabic, and Latin; nearly 200 volumes of writings of fathers of the church; numerous missals, breviaries, and liturgies; an extensive collection relative to the topography and antiquities of Great Britain; many volumes of original letters from celebrated natives of the island, and foreigners; works on the arts and sciences—among which is a tract on the steam engine, with plans, diagrams, and calculations, by Sir Samuel Morland, who styles himself master in mechanics to Charles II. A catalogue of the Harleian MSS. has been recently published by order of government, in four volumes folio; one in an abbreviated form, of the printed books in the

Sweden.
British Museum, is just about being concluded, in several octavo volumes. These libraries are open daily, and, on a suitable recommendation, any person is introduced to study in the reading room; but no manuscript may be copied without special permission. There are several other libraries in London belonging to public bodies: That of Sion College, an institution for education of the clergy, is entitled to a copy of every book published in the kingdom.

The different colleges of the universities of Oxford and Cambridge have libraries of various extent, of which the Bodleian collection is said to be the most ample in Britain. This was instituted towards the close of the reign of Queen Elizabeth, by Sir Thomas Bodley, who collected 1294 rare manuscripts, which were afterwards increased to 6818, independent of 1898 in the Ashmolean museum. A catalogue of part of those relating to oriental history, was executed by J. Uri, a Hungarian, and published in a folio volume in 1787. The printed works are numerous and valuable.

The library of Trinity College, Cambridge, is extensive, and contained in a large apartment, floored with black and white marble. Here, among other literary curiosities, are some of Milton's poems, in his own writing. A valuable collection of manuscripts, by Parker, Archbishop of Canterbury, is deposited in the library of Corpus Christi college, several of which are attached to the double folios, published in some, engraved figures constitute the principal part, to which is annexed a small proportion of text, and only one side of the leaf is employed. Such is the Ars memorandi notabilia per figuras, supposed to have been thrown off previous to the year 1430, which consists of a number of rude cuts of the principal events recorded in the Gospels, with text on the opposite page; Ars moriendi, of which the subject is a sick man in bed, surrounded by grotesque and hideous figures of devils and angels. Something monstrous or absurd was the fashion of the time, as we see in sculptures of various kinds; and, in the former work, St. Luke is represented by a bull standing on his hind legs, while St. Mark is introduced as a rampant lion; Historia Veteris et Novi Testamenti, seu Biblia pauperum, is previous to the year 1450, but which some have considered the earliest specimen of block printing. Besides these and others denoting the infancy of the art, the Spencerian library contains a fine collection of early printed and scarce Bibles; as the Mazarine Bible, printed between 1450 and 1455; one, supposed the work of Albert Pfister, anterior to 1460; Fust and Schoeffer's Bible, 1462; that by Swey-heim and Pannartz, 1471; a Dutch Bible, 1475; Prince Radziwill's Bible in Polish, and those in the different European languages. Here are seen the Latin Psalter of Fust and Schoeffer of 1457, being the first printed book to which a date is affixed; and another of nearly equal rarity, of 1459. Many of the earliest editions of the classics, beautiful copies on vellum, and the works of all the celebrated printers of the 15th century, add to the value of the collection. An accurate opinion of the nature, value, and importance of these, to persons who consider science as secondary to the medium of imparting it, may be formed from the laborious catalogue of Mr. Dibdin, in four royal octavo volumes, which at once carries the reader back to the earliest ages of the typographic art in every variety.

The library of the university of Edinburgh consists of about 50,000 printed volumes, and a few manuscripts. An abbreviated catalogue of the medical books, including some on natural history, together forming the most complete part of the collection, is published in an octavo volume. The library is under good management, and the respective demands of the numerous readers are expeditiously supplied. The advocate's library in Edinburgh, was founded in 1680, by the exertions of Sir George Mackenzie, and now consists of about 80,000 volumes, of which 50,000 are manuscripts. Its most copious subjects are the national history, Greek and Roman antiquities, and jurisprudence in general. Among the manuscripts, there is a fine copy of Mar.tial's Epigrams, in perfect preservation, which has been ascribed to the ninth century; the most ancient, in so far as we are aware, that is known to exist. This work is written in double columns, on 108 leaves of a peculiar kind of vellum, such as is not in use at present, in the small Roman character, with the titles of the epigrams in rustic capitals. Instead of the uniform division of syllables, the words frequently run into, and are united with each other, as in the most ancient manuscripts, or being irregularly divided, the first syllable is annexed to the word preceding, while the last is prefixed to that which is subsequent. The ancient mode of punctuation is particularly exhibited among the capitals. Here are, besides, a fine copy of Valerius Maximus on ennium, dated 1636, which merits collection; and fragments of several other classics, as Juv.enal, Persius, and Ovid, of considerable antiquity. In the advocates' library are preserved thirteen of the chartularies, or volumes of records of the different religious houses of Scotland, which escaped the general destruction in which the edifices themselves were involved, in promoting the reformation of religion; a folio volume of musici for the service of the cathedral of Scone, written in the sixteenth century; several papal bulls and original charters. The records of the religious houses are particularly valuable, from ascertaining the ancient owners of property, which is often important in legal proceedings, illustrating the antiquities of the country, and from presenting a greater number of writings of the twelfth and thirteenth century, than are elsewhere collected together. Law, and subjects of national history, occupy the great bulk of the manuscripts, which are of very unequal value. There are a few works of old English history, numerous letters of distinguished individuals, including one in the handwriting of Queen Mary, and several of foreigners.

The printed books in the advocate's library embrace every department of science and literature, except theology and medicine, of which there are only some leading...
treatises. It contains several first and early editions, and many scarce and curious works; as the Mazarine Bible, as entire as when it came from the press; a breviary of 1478, in folio, printed on fine vellum; three volumes of Rudbeck’s Atlantis, &c. A catalogue, in three folio volumes, enumerates the contents of the library down to 1807. The funds for its support are ample, and its annual acquisitions are considerable. It is conducted on liberal principles, and access to it has proved beneficial to the authors of various literary works, published both in England and Scotland. This library is at present kept in eight apartments, some of which are absolutely subterraneous. Part of it, however, is about to be removed to a spacious gallery, wherein the most essential requisites for convenience and accommodation are overlooked; the consequence of inconsiderately substituting a picture, from some imaginary point of view, for a simple and unostentatious plan, suitable to the purpose for which it was intended. The attorneys or writers to the signet of Edinburgh have a library, computed at about 15,000 or 20,000 volumes; of which there is a systematic catalogue in a quarto volume.

The library of the university of St. Andrews contains about 38,000 volumes; that of Glasgow is smaller; and about 14,000 are in the library of King’s college, Aberdeen. Among the manuscripts belonging to the last are, a splendid copy of the Koran, said to be the identical manuscript used by the late Tipppo Sahib; a work on Hindoo theology, written on fine vellum, and rolled on a piece of ivory, after the fashion of the volumes of the ancients; and a copy of the Shaster, in Sanscrit, on the leaves of trees.

The library of Trinity College, Dublin, consists of above 40,000 printed volumes, and 1100 manuscripts, in different languages, all contained in a fine gallery, 210 feet long, 41 broad, and 40 high. Among the manuscripts there is preserved the Gospel of St. Matthew, along with other fragments of Scripture, written in Greek capitals, ascribed by Mr. Barret to the sixth century. The subjects of the remaining manuscripts are much diversified. Many relate to Irish history, particularly the troubles of 1641, concerning which there are numerous original papers. Some are written in the Latin language, which Irish characters are employed to express.

According to a subsisting law, which is about to undergo some modification, eleven libraries are entitled to a copy of every publication in the united kingdom. These are, the royal library, British museum, Sion college, the universities of Oxford and Cambridge, Edinburgh, St. Andrew’s, Glasgow, Aberdeen; the advocates’ library in Edinburgh, and that of Trinity college, Dublin.

In respect to eastern libraries, we shall briefly remark, that they are, for the most part, very limited. There are 13 public libraries in Constantinople, none, except perhaps the Turkish emperor’s, exceeding 2000 volumes, of which a catalogue was obtained, with great difficulty, by the Abbe Toderini. Inspection of it as printed by that author, will demonstrate of what Turkish literature consists. The libraries have several attendants with fixed salaries; and in some of them are seen translations of British and continental publications into the Turkish language. Until its publication, with which we are not aware that Mr. Walpole is acquainted, several of the lost classics were supposed to be deposited here. Toderini Letteratura Turcaeha, tom. ii. p. 53. At Seringapatam, the library of Tipppo was taken, consisting nearly of 2000 volumes, many of which are highly decorated. Stewart’s Catalogue. There are considerable libraries in China and Japan, and also in the capital of the kingdom of Ava.

The Emperor Leopold and the Elector of Bavaria commenced a library of music in the seventeenth century, which Dr. Burney suggests should be done on a regular plan; and gives a sketch of the arrangement to be preserved. But the reader will find a more comprehensive and useful system in a German work, published last year, 1817, at Leipzig, entitled Musical Literature, which is divided into 88 different branches, containing a complete catalogue of all music, the number and species of instruments for which it is composed, the price, and place of publication. In 1794, a musical library was instituted at Paris, but principally with a view to instruction in the art.

It is not enough that a vast assemblage of books should be collected together, they must be deposited in suitable receptacles, and rendered useful and accessible from a proper arrangement of their names in a catalogue. Some libraries are contained in one large apartment; others as extensive in several of smaller size, which seems preferable. As books consist of perishable materials, air and heat are essential to their preservation. Where a library is already completed, its contents may be deposited in different compartments according to their subjects; but this does not appear a convenient distribution for one in a state of progressive enlargement. There it will be more beneficially effected merely according to size, while the contents are explained in catalogues, framed under a systematic form. But although the utility of such catalogues be indispensable, as without them it is impossible to repress exuberances in certain branches, or to supply deficiencies in others, the learned are not agreed on the best and most comprehensive system; whence the catalogues of the greater number of libraries are prepared simply according to the names of the authors of the various works. The great difficulty seems to consist in fixing on leading heads. Some of these are obvious, but some frequently adopted are obscure: however, it is evident, that any division separating printed treatises from those in manuscript, or classifying books according to language, must be defective. Bacon, Diderot, and other learned men have maintained, that all human knowledge rests on three fundamental principles, memory, reason, and imagination, by which latter we presume invention is also to be understood; that memory is the source of history, reason of philosophy, and imagination of poetry. It has been proposed to classify the catalogue of a library according to these and their subordinate branches. By some authors, they have been farther interpreted thus: 1. Memory, or history; 2. Reason, philosophy or science; 3. Imagination, poetry, liberal arts, mechanical arts. It has been also proposed, to arrange a catalogue under the five branches, theology, jurisprudence, history, philosophy, and belles lettres, and such was the plan principally followed of late in the national library at Paris. But in Britain, the word philosophy is now of very doubtful interpretation; and belles lettres is so exceedingly vague and indefinite, that miscellanies perhaps would be equally explicit. A system less defective, though also in five parts, is proposed by Deburc, in theology, jurisprudence, sciences and arts, belles lettres, history. This removes the great difficulty of the plan of Bacon and Diderot, which places works on sculpture and architecture along with those of fable and romance; an arrangement quite repulsive
5. and 7. engravings, comprising, by which theology is subdivided into, 1. Bibles, interpreters, critics, commentators; 2. Councils, liturgies, fathers; 3. Theologians. Jurisprudence into, 1. Canon law; 2. Civil law. Sciences and arts into, 1. Philosophy; 2. Physics; 3. Natural history; 4. Medicine; 5. Mathematics; 6. Arts. Belles lettres into, 1. Grammar; 2. Rhetoric; 3. Poetry; 4. Philology; 5. Polygraphy. History into, 1. Historical prolegomena; 2. Geography; 3. Chronology; 4. Ecclesiastical history; 5. Prose history of ancient monarchies; 6. Modern European and foreign history; 7. Historical parallelipodia; 8. Antiquities; 9. Literary, academic, and bibliographical history; 10. Biography; 11. Historical extracts. This system is founded, almost exclusively, on that of Gabriel Martin, who divides literature into five primitive classes adopted by Debur, and who, by the arrangement of no less than 148 catalogues, had an opportunity of reducing his theory to practice. These systems have been followed, in many instances, with very little alteration, though probably from being more generally known. Denis, the imperial librarian at Vienna, proposes an arrangement under seven different heads, which probably could be adopted with considerable convenience; theology, jurisprudence, philosophy, medicine, mathematics, history, philology. He considers that theology is connected with jurisprudence by the ecclesiastical councils; jurisprudence with philosophy by the law of nature; philosophy with medicine by natural history; medicine with mathematics by anatomy; mathematics with history by chronology; history with philology by heroic fables; and that philology is connected with theology by mythology. Another system, rather more explicit, was offered at Jena, which divides literary works into sixteen different classes: 1. The knowledge of books; 2. Philology; 3. Theology; 4. Jurisprudence; 5. Medicine; 6. Philosophy; 7. Pedagogy; 8. Science of the statesman; 9. Science of the soldier; 10. Knowledge of nature; 11. Knowledge of arts and trades; 12. Mathematics; 13. Geography and history; 14. Fine arts; 15. Literary history; 16. Miscellanies. We shall say nothing of the system proposed by M. Thiebault; for it does not seem applicable to practice. A system in very copious detail is suggested by M. Peignot, the author of several works on what is now called bibliography, a subject which as yet has not been reduced to any fixed principles. This is chiefly founded on the three great sources of knowledge, according to the philosophers before named, memory, reason, and imagination, preceded by the article bibliography. M. Peignot enumerates about 250 different heads, under which the books may be arranged; but we cannot see on what sound principle natural history is ranked under history; and the science of nature, comprehending some of its most essential parts, under philosophy. Neither can we reconcile the position of the military art, which stands between engraving and music, with the principles of analogy. What is now said, sufficiently evinces the difficulty of classifying the catalogue of a great library according to any unobjectionable system; yet it is not absolutely essential that such arrangement should proceed on the most refined principles; for a few general heads, each branch-
LICHEN.

Lichen is the name for an extensive natural order of plants, in the lower scale of the vegetable creation. They appear generally in the form of crusts, covering rocks and the bark of trees. In English, they are known under the comprehensive denominations of rock-moss and tree-moss; but few of the species are distinguished by particular names. The dye-stuffs called orcal and cudbear, are kinds of lichen; and so are the oak-lungs and ground-liverwort, which at different times have been in estimation as medicines, the former in pulmonary complaints, and the latter for the bite of a mad dog.

By the older botanical writers, the lichens were classed along with the frondose musci. Our countryman, Morrison of Aberdeen, Professor of Botany at Oxford, towards the end of the 17th century, was the first who separated them. He formed them into a genus, under the title of Musco-fungus, their leathery substance leading him to consider them as allied to the fungi. Tournefort, in the Institutiones Rei Herbariae, 1700, first applied the term which is the general term Lichen; but he made a separate genus of those having a coralline shape, describing them along with certain fungous plants, such as clavariar, under the title of Coralloides. Micheli laboured indefatigably in illustrating the lichens. In his Nova Plantarum Genera, 1729, they are divided into fewer than 38 sections, and nearly 300 species are described, and not a few of them delineated. Dillenius, in his Historia Muscorum, 1741, arranged them under the names of Usnea, Coralloides, and Lichenoides, leaving the simple word lichen to signify the official liverwort. The filamentous species were associated with the conifer, under the first-mentioned title of Usnea; the former being Usnea arborea, and the latter Usnea aquatica.

The justly celebrated Linneus employed himself chiefly in investigating phænogamous plants, by means of which he was best able to establish his Sexual System. In the Algae, he did little more than range and adapt to his own views the plants described by Micheli, Dillenius, and others. He greatly reduced the number of species of lichens, on account, it is presumed, of the vagueness of the descriptions given by preceding writers, which did not enable him to construct regularly the compendious, but luminous specific characters in which he delighted. He comprehended the whole under one great and heterogeneous genus, Lichen; but he divided it into eight sections, distinguished by the general habit and appearance of the plants: 1. Crustaceous with tubercles; 2. crustaceous with shields; 3. tilled; 4. foliaceous; 5. leathery; 6. bearing cups; 7. shrub-like; and 8. filamentous.

Since the time of Linneus, great progress has been made in the investigation of the lichens. The distinguished Hefwig, and the still more accurate Gaertner, examined with care the mode of propagation of this tribe of plants, a subject which had hitherto been little attended to. But the author who principally extended our botanical knowledge of the lichens, was Dr. Hoffman of Göttingen. Between 1784 and 1792, this laborious author published descriptions and figures of all the known species, under the title of Enumeratio Lichenum. He, at the same time, attempted their division into natural genera, founded, like the sections of Linneus, on the general habit of the plants. He was succeeded in this department of botany by Dr. Erich Acharius, whose works, it is remarked by Sir James Edward Smith, "form a new era in cryptogamic botany, and will most likely prove the foundation of all that can in future be done on the subject." If, therefore, the illustrious Linneus was deficient in his acquaintance with the alga, it was reserved for another eminent Swede to elucidate this difficult branch of the science.

After some account of the structure of lichens, and of the mode of fructification, or of propagation, in this obscure tribe of plants, the reader shall be presented with a detailed view of the Acharian system. Several new terms must unavoidably be used; but they shall be as sparingly employed as possible, and their meaning carefully explained. A short account of the uses of the lichens, in domestic or rural economy, in medicine, and in the arts, will be subjoined.

Lichens are produced on the hardest and most barren rocks, and at great elevations; on old walls; on the trunks and branches of trees, whether the bark be smooth or rugged; and on the surface of the earth, particularly in moorish soils. They are found in all climates, and at all times of the year, being naturally fitted to resist, not only heat and cold, but dryness and wetness. They suffer more, however, from drought than from humidity; and in this country, like the musci, they appear to greatest advantage at the moist seasons of the year.—A few notices regarding their habitats, will be more intelligible after the Acharian arrangement has been explained.

Structure of Lichens.

These plants have no distinct and regular roots. Some species, such as the common ground-liverwort, have small fibres issuing from the edge and under-surface of the frond: others are immediately attached to their place of growth, for example, to stones, as if by a sort of cement. They are equally destitute of stems, and also of leaves, properly so called. The part most analogous to a leaf, and which constitutes the principal body of the plant, is frequently termed the frond: by Thallus, or Acharius, it is denominated the thallus. This thallus is often merely a thin flat crustaceous expansion; sometimes, however, it is foliaceous and lobed; again, it is branched, and like a shrub in miniature; in some cases it seems to be only a pulpy or gelatinous mass; and in others, little else than a sort of powdery matter.

In the leaf-like, and in the branched lichens, the thallus is distinctly composed of two parts. (1.) The exterior is commonly hard, cartilaginous, or crustaceous, homogeneous, with scarcely any signs of organization in its texture, but abounding everywhere with very minute granular bodies, the nature of which will be afterwards explained. This is called the cortical substance. It forms both the upper and under stratum of the thallus, in most of the foliaceous lichens, being wanting below however in some of these, and also in the uniform crustaceous species; in those which are shrub-like, it surrounds the branches and ramified. In the humid state, the parenchyma of this cortical substance is somewhat gelatinous; and in many species it consists, to the extent of half its weight, of mucilage,
and gelatine. (2.) The other constituent part of the thallus, inclosed by the cortical, is called the medullary substance. It is generally soft, cottony, or fibrous, and apparently vascular.

No spiral vessels are observable, nor have any particular kind of circulating vessels been traced in lichens. Seldom, indeed, can the structure be shewn to be either distinctly vascular or cellular.

Lichens, so simple in general structure, possess in a strong degree that quality of the living principle, which tends to the formation of new parts, or to the supply of such as may have been injured. If a part of the cuticle of a coriaceous lichen be destroyed, so as to expose the internal white substance, this white part soon acquires a greenish colour, which Ramond traced to the extravasation of a peculiar juice. The different parts of lichens often grow together, or become conjoined, and the plants thus assume very various forms. Indeed, the more simple the organization, the greater seems the tendency to irregular spraying; and the greater, of course, the dissimilarity between individuals of the same species.

Lichens are not only perennial plants, but they possess the curious faculty of continuing for years, without undergoing any perceptible change. Dr. Withering mentions one case, in which the parts of fructification of an individual lichen remained, without visible alteration, for the long period of ten years! In such kind of fructification we may confidently expect something very different, in nature and properties, from the flowers and seeds of phenoogamous plants; and it will soon appear that we do meet with something very different.

Fructification of Lichens.

The fructification of lichens, or the mode in which they are propagated, has long been a botanical problem, which has exercised the talents, and divided the opinions of the most acute cryptogamists. Before stating the doctrine of Acharius, therefore, it may be proper to advert to what was taught by Hedwig, and by Gaertner, as the two most distinguished writers on the subject.

Hedwig. It is well known, bestowed much pains in examining the fructification, not only of the frondose mosses, but of lichens; and, till of late, his authority was pretty generally assented to by botanists. On the fronds of many lichens, numerous small mealy tubercles, or wart-like excrescences appear, commonly of the same colour and texture as the frond. On dividing, by a vertical section, some of these tubercles in an early stage of their growth, Hedwig found them to consist of a congeries of cells, each of them containing a granulous mass. The granules he regarded as particles of pollen. When the tubercle acquires a deep brown colour, it is at maturity; the pollen then escapes, and the tuberbe become black. Here, therefore, we have something like a male flower, especially in the eyes of one bent on extending the sexual hypothesis to plants of every tribe. On a different part of the same plant, or on a different plant of the same species, appear a number of cup-shaped or target-shaped bodies, either sessile, or supported on short pedicles, commonly of a greenish colour, but gradually becoming dark as they ripen. When the ripe cups and shields are divided by a vertical section, they are found to contain, immediately under the dark crust at the top, a number of small egg-shaped bodies, arranged in perpendicular layers. These Hedwig considered to be the spores, or seeds; and the cups or shields were of course the female flowers.

The diligent and sagacious Gaertner took a different view. His observations led him to conclude, that the powdery matter, and minute oblong bodies, contained within the tubercles, shields, or saucers, consist not of pollen or of seeds, but of a peculiar sort of gem or buds. This kind of bud he denominates the propago, and describes as being a simple gem, without leaves or regular shape, in some cases naked, and in others covered with an envelope. When at maturity, these gems separate from the parent plant; they are dispersed in the same way as seeds, and a new progeny springs up. They are so far analogous to seeds; but, considered physiologically, they are more strictly allied to buds.

It may here be remarked, that several of the more perfect plants are bulbiferous; as may be seen in the true Lilium bulbiferum of Linnaeus, and the tiger-spotted lily of China, L. tigrinum; and in not a few of the alliaceous tribe, such as Allium carinum, and arenarium, which are both natives of Britain: viviparous grasses are common on our upland pastures, as Aira cespitosa vivipara, Festuca vivipara, and Poa flexuosa and alpina; and many plants can be propagated by tubers, as the common potatoe, and the Jerusalem artichoke. All such plants, it will be observed, might, in favourable situations, produce seeds; and if it be true, that nature has provided these resources in order that the species might with more certainty be continued in intractable regions, or on sterile soils, we might naturally expect that lichens would, in that respect, be adapted to the contingencies to which they are exposed, of being successively scorched, drenched, and frozen on the same barren rocks. It may be added, that the very simple organization of the lichens might lead us a priori to expect, that they would be inerced by means less complicated than are observed in phenoogamous plants. It is justly remarked by Sprengel, that the propagation by galls, in the less perfect plants, prevails more and more as the organization is lower. It begins to occur in the ferns, is more general in the mosses, still more so in the hepaticae, and most prevalent of all in the lichens and conifer.

The opinion of Gaertner has been established by the labours of Acharius; and lichens (and probably also Fuci, or sea-weeds) are henceforth to be considered as gemmiparous plants, propagated only by bud-knots, or gongyli.

It is remarked by Acharius, that the frond, which constitutes the body of the lichen, performs the functions of a universal receptacle, and may be regarded in that light. The numerous processes already alluded to as generally observable on the surface of the thallus, and which, according to their shape and appearance, have been called saucers, shields, and targets, are considered as part of receptacles, and are by him denominated Apothecia. They are either regular or accessory. Apothecia. When they occur of similar structure in various species or shields of lichens, and constitute a generic character, they are said to be regular or true; when they are variable or irregular, and afford only specific distinctions, they are said to be accessory. From the thallus, in many species, rises a kind of little stalk, called podetium, supporting the apothecium. When the stalk is very small and short, it is styled podulilla. The propriety of employing such new terms is obvious; a poecidium, for example, (the parallel term employed in speaking of phenoogamous plants) sustains the flower and fruit, and springs from the stem; while the apothecia of lichens present

Cephalodia.

neither flowers nor fruit, and the stalks upon which these apothecia are elevated arise from a common receptacle.

In order distinctly to see the structure of an apothecium, and the parts of which it is composed, it is necessary to make a perpendicular section; and, for this purpose, it is right to prepare the specimen by moistening it gradually for some hours. The employment of a pocket lens, or small microscope, is likewise indispensable.

The apothecia of some lichens are observed at first to be covered with an extremely fine membrane, somewhat analogous to the involucrum or volva of the agarici. But this membrane is not very generally found; and Acharius considers it as not otherwise useful than in protecting the apothecium when tender. The apothecia, or partial receptacles, therefore, may be regarded merely as modifications of the thallus itself, and as composed externally of the same substance, though frequently of a different colour. Upon making the section, certain vessels, disposed in vertical rows, are displayed. These constitute the lamina proligeri, or gemmiparous plate, (the seminal layer of Sprengel). They are compact, firm, smooth, and pelliculid. Within these, numerous small bodies are observed, which are the gongyli or bud-knots already alluded to, and which are minute opaque bodies. The gelatinous substance of the gemmiparous plate being brought into a state of solution by continued moisture during autumn and winter, the gongyli probably then escape and germinate. In some lichens, the gongyli are not produced in gemmiparous plates, but in gemmiparous nuclei; and each nucleus is invested with a membrane called peritheciwm, which is horny when dry, and pelliculid and gelatinous when wet. Both the plates and the nuclei are divided into cells, and often also into vesicles. Cells (the theca of Hedwig) are mere oblong vessels or cavities. If these only occur, the parenchyma of the apothecium is said to be of simple texture (simulare). The cells, however, are frequently compound, or contain within themselves smaller cells: these smaller cells were erroneously considered as the naked seeds by Hedwig; but they have been ascertained to contain gongyli like the simple cells; and are by Acharius distinguished by the name of vesicles. The cells of both kinds are often found quite empty, though outwardly perfect; yet gongyli abound in other parts of the substance of the same apothecium. Gongyli are universally to be found in lichens; cells and vesicles, however, are frequently wanting. These vessels are apt to disappear through age. They dry up, too, like other parts of the lichen, during hot weather; and on the return of the moist and cool season of the year, they again expand;—characters, it may be noticed in passing, which are quite applicable to seeds.

If the apothecia were to be considered as the fruit of lichens, then one and the same species of plant must be held as presenting often two, or even three different kinds of fructification; for some lichens, besides regular apothecia, contain tubercles, warts, or pores, all of which furnish the supposed seeds. These, indeed, are the parts which Hedwig regarded as the male organs, affording pollen; they do not, however, fade and disappear, after a short time, like the antherse and staminua of flowers, but endure as long as the true apothecia. They are termed cephalodia by Acharius; and he mentions, that from the powder taken from some of them, the lichen has been observed to be propagated. In one great division of lichens, the apothecia may be said to be fruit-shaped, and this might appear to strengthen somewhat the argument drawn from analogy; but in two other great divisions, these organs are nowise fruit-shaped, but are of the nature and habit of the thallus itself. Even where no regular apothecia, or even no powdery excrencences are to be seen, the gongyli or bud-knots are not wanting; for these are also distributed through the frond or general substance of the lichen. Some species of lichen, it is well known, very rarely produce their shields or apothecia; insomuch that a specimen containing them is prized by botanists as an invaluable treasure. This is the case, for example, with Lichen nivalis and L. glaucus, (Cetraria); L. postulatus, (Gyrophora); L. jubatus, (Alectoria); L. pubescens, (Corticaria); L. perlatus and L. physodes, (Parmelia); and with L. palmatus, (Collema)—perfect specimens of which form what Acharius would call the "gaze of a lichenologist." It has often excited surprise, that plants which so seldom presented their parts of fructification, should yet be abundantly spread over our rocks and trees. This difficulty, however, is now satisfactorily explained. These lichens, although incomplete in the eyes of the botanical collector, are really perfect plants of their kind, being enabled to reproduce the species by means of the gems dispersed in the substance of their fronds.

It may here deserve notice, that, in this tribe of plants, reproduction by gems must be held as being as complete and permanent as that by means of seeds. It follows, that Mr. Knight's doctrine, "That the only genuine reproduction in vegetable nature must be effected by seeds," cannot be considered as of universal application, but will fail to be limited, at all events, to phanenomalous plants. Perhaps it may be found to be more particularly adapted to the arboreous plants with which this ingenious writer is most conversant, and to which it seems in every respect applicable.

Lichens, therefore, according to the views of Acharius, may be described as forming a new peculiar Natural Order, distinct from the other cryptoaphia; and as consisting of plants—in which the whole body, whether frond or crust, performs the functions of a universal receptacle, or thallus,—of various shapes,—without a distinct root, or stem,—perennial,—furnished with vegetative corpuscles or gongyli, (analogous to, but something intermediate between seeds and buds, though most nearly allied to the latter), by which the species is continued,—these gongyli abounding in every part of the substance of the thallus, both externally and internally, either scattered, or collected in small nests,—and at the same time existing, inclosed in separate or proper organs, which are sometimes fruit-shaped, and generally coloured, called apothecia or partial receptacles.

No account, it is believed, of the Acharian genera, has hitherto appeared in any English publication. It seems proper, therefore, not only to enumerate the generic names, but to detail the essential characters; and the subject may probably be somewhat facilitated and relieved, by mentioning a few of the more remarkable British lichens, as illustrative of the respective genera of Acharius, under which they now fall to be arranged. It may be noticed, that some years after the publication of his Prodromus Lichenographiae Sueciae, and of his Methodus Lichenenum, Acharius gave to the world, in 1810, an enlarged and improved work, entitled, Lichenographia Universalis, to the arrangement and denomination of which we shall adhere. It might perhaps be possible to dispense altogether with the terms thallus and apothecium, and merely to denominate the former universal, and the latter partial receptacle; unless
the occurrence of intermediate verrucose receptacles, in some genera, should seem to present an obstacle. In the mean time we shall adopt the language, and plan of description, of the work last mentioned; not convinced, however, that it would not be better, in laying down the generic characters, to notice in the first place the Thallus, which forms the bulk of the lichen, and then the Apothecia, which are small and subordinate parts, although they afford convenient distinctive characters.

Acharian divides lichens into three great classes. 1. Idiothalami, in which the apothecia are different in substance and colour from the thallus; 2. Cerithalami, in which they are partly formed of the thallus; and 3. Homothalami, in which they seem to consist wholly of a production of the cortical and medullary substance of the thallus. These three classes embrace forty-two genera, the author having considerably increased the number subsequently to the publication of his Methodus Lichenum. By way of appendix, a class of Athalami is added, in which no apothecia appear, or have hitherto been detected: This includes only one genus.

**System of Acharian.**

**CLASS I. IDIOthalami.**

**A. Homogenei.**

1. **Sporoma.** Apothecia varying in shape, and coloured; swollen or tumid, without a membranaceous border, being composed of naked gonfylla heaped together. Thallus crustaceous, uniform or of one shape, somewhat membranaceous, and scaly or powdery.

This and the next genus are not so distinctly marked as most of the others. The species of Sporoma are found on the bark of trees, or on decayed wood, having usually the appearance of a scattered dark-coloured powder.

2. **Arctonia.** Apothecia generally inclining to round-shaped; flattish, without a membranaceous margin; covered with a thin black membrane; internally, somewhat gelatinous, and of simple texture. Thallus crustaceous, uniform, or membranaceous, and sometimes approaching to cartilaginous.

Lichen lyceneus, described and figured in Sowerby's *English Botany*, t. 809, affords an example of this genus.

3. **Solorina.** Apothecia roundish, sessile, without a border; covered with a coloured membrane; within, subgelatinous, and containing vesicles. Thallus leathery, leaf-like; beneath, veined or marked with fibrils.

This genus includes merely two species, the Lichen croceus and saccatus of Linnaeus and of *English Botany*, which were formerly ranked under Peltidea by Acharian in his *Methodus*. Solorina croceus occurs on some of the Scottish mountains, where it was first observed by Dr. Stuart of Luss; it is at once distinguished by the fine saffron colour of the under-side of the frond. In S. saccata, the apothecia or shields frequently appear sunk in sockets; but this is only when the plant is past its prime.

4. **Gyalecta.** Apothecia circular; concave, immersed in the thallus, but with raised edges formed by the gemmiparous plates; urceolated (or resembling a short tube with a wide mouth), and covered with a thin coloured membrane; within, somewhat gelatinous, and of simple texture. Thallus crustaceous, uniform.

The generic name is derived from the Greek γυαλετ. concave, in allusion to the shape of the apothecia. This genus includes only four or five species; one of which is the remarkable Lichen excavatus observed by Thunberg on the rocks at the Cape of Good Hope.

5. **Lecidea.** Apothecia circular, sessile, covered with Lecidea a coloured membrane; bordered by a regularly equal disk; within, of simple texture. Thallus varying; crustaceous, either uniform or figured; rarely foliaceous, and cloth-like or cottony.

This is an important genus, containing more than a hundred species, and embracing many of the small crustaceous lichens which ornament the hardest rocks, and which first begin to operate their disintegration. The genus is divided into three sections: 1. *Cetaria*, with the thallus crustaceous and uniform; 2. *Lepidoma*, with the thallus crustaceous, figured, and somewhat leaf-like; and 3. *Croceia*, with the thallus figured, and cloth-like or cottony. In the first section occur Lichen immersus, which is found sunk on the surface of our limestone rocks, and of the chalk-cliffs of England; the well-known and beautiful variety of Lichen atrovirens, called L. geographicus, from its resemblance to a coloured map,—a plant which is found at the highest elevations, and which terminates the vegetation on Chimboraico; L. Dicksonii, named in honour of Mr. Dickson of Covent Garden, and found by him on the Scottish mountains; and L. sanguinarius, remarkable for the bright red which the apothecia present when cut with a knife, or which they ultimately acquire when they spontaneously open. As examples of the second section, may be mentioned L. canescens, luridus, and leucocephus of British authors. Of the third section, the only species is L. gossypinus of Swartz, found on the Blue Mountains of Jamaica.

6. **Gyrophora.** Apothecia circular, sessile, spirally Gyrophora plaited; with a border; covered with a coloured membrane (black); within, of simple texture. Thallus leaf-like, membranaceous, peltate, or supported by a central stalk.

Lichen polyphylus, proboscidies, and punctatus, of Linnaeus and of English authors, afford examples of this genus.

7. **Calycium.** Apothecia cup-shaped, with a stalk (rarely sub-sessile), and surrounded by a border; filled with a powdery mass, which forms at first a flattish and afterwards a somewhat globular disk. Thallus crustaceous, uniform.

This genus is divided into three sections: 1. With sub-sessile cups, *Acolum*; 2. Cups stipitate or supported on stalks, and furnished with a border, *Placeolum*; and 3. Cups stipitate, the disk sub-globular, almost inclosing the border, *Strongyliaum*. In most of the species the crust is extremely thin, and in some it is scarcely perceptible. Several of those with stipitate cups have, by different authors, been referred to the genera *Mucor* and *Trichia*; for instance, Calycium aciculare of Acharius is the Trichia fulva of Withering.

8. **Opogona.** Apothecia of an oblong shape, sessile, covered with a coloured membrane (black); with a straitened disk, inclosed by a border; within, of
simple texture. \textit{Thalli} crustaceous, membranaceous, rough, or granulated, uniform.

The generic name implies a similarity to written characters. There are two sections: \textit{Hymenina}, having oval or elliptical apothecia; and \textit{Algozina}, having them of a linear shape. The former may be illustrated by a reference to the Lichen simplex of the Rev. Hugh Davies, in \textit{Lin. Trans.} vol. ii. Of the latter, a new species, named \textit{O. tridens}, has been observed by Mr. Turner of Yarmouth.

\section*{B. Heterogeniel.}

Graphis. \textit{Graphis. Apothecia} linear, immersed, or surrounded by a spurious border of the thallus; the perithecia forming an interior border, within which a naked disk is seen, being the upper part of an elongated nucleus, which is cellularly striated within. \textit{Thalli} crustaceous, membranaceous, or rough and granulated; uniform.

The species of this genus have perhaps a still more striking resemblance to written characters. One of them is the Lichen scriptus of Linnaeus, which is common on the smooth bark of many of our trees, particularly oaks, elms, and birches. A variety of this species is remarkable for having the apothecia so arranged, as to represent not unaptly many letters of the Hebrew alphabet.

Bistrora. \textit{Bistrora. Apothecia} circular, immersed, presenting a concave naked disk, encircled by the perithecia, which forms a margin; nucleus compressed, of nearly uniform texture within, and very slightly marked with cellular divisions. \textit{Thalli} crustaceous, uniform.

Of this genus there is only a single species hitherto known, \textit{B. turgida}, which inhabits rocks in the elevated woods of Switzerland. It has much the habit of a Lecidea; but is distinguished by possessing a peritheium and nucleus. The name is derived from the Greek word \textit{bistros}, signifying a small jug or bowl.

\section*{Verrucaria.}

\textit{Verrucaria. Apothecia} subglobular, partly immersed in the thallus; covered by a double perithecium, the exterior one cartilaginous (black,) set with papillae, which at maturity exhibit small perforations; nucleus subglobular, cellular, the cells including vesicles of a concentric form. \textit{Thalli} crustaceous, membranaceous, somewhat granulated or powdery; uniform.

Nearly fifty species of Verrucaria are described by Acharius. They are divided into five sections, distinguished by the nature of the thallus: 1. \textit{Lejophloea}, with the thallus cartilaginous and smooth; 2. \textit{Blennorina}, subgelatinous; 3. \textit{Lithopina}, crustaceous; 4. \textit{Cuninaea}, crustaceous and powdery; and, 5. \textit{Inoderma}, with the thallus somewhat sponge-like. Few of the species which fall under this genus have been described by British authors. Two, however, may be mentioned, \textit{Lichen tessellatus} of \textit{Eng. Bot.} t. 533, and \textit{L. fuscellus} of Turner, in \textit{Lin. Trans.} vii. p. 90. Of the 5th section, it may be added, \textit{Sphaeria} byssacea of Withering, affords an example.

\section*{Endocarpon.}

\textit{Endocarpon. Apothecia} globular, included in the thallus, each covered with a membranaceous, diaphanous, simple perithecium, with a small (blackish) perforation, marked by an indistinct border, and projecting from the surface of the thallus; nucleus glo-
smaller receptacles, covered with a very delicate transparent perithecium, punctured above with small perforations; nuclei subglobular, furnished with cells and vesicles. Thallus cartilagino-membranaceous, and somewhat crustaceous; uniform.

Of this genus, Lichen pertusus of British authors is an example.

17. Thelotrema. Apothecia wart-like, formed of the thallus, hollowed, with a border; each including a single thallinium, or smaller receptacle, encircled by a membranaceous perithecium, ultimately bursting above; nucleus compressed; within, of simple texture, and acquiring somewhat of a striated appearance from the regular disposition of the goniyli. Thallus cartilagino-membranaceous, and somewhat crustaceous; uniform.

For illustration of this genus, Lichen inclusus, and L. exanthemeus, of English Botany, may be referred to.

18. Pyrenula. Apothecia wart-like, formed of the thallus, including a single subordinate receptacle or thallinium, covered with a thick (black) cartilaginos perithecium, which is prominent, and terminates in a papilla; nucleus globular, and furnished with cells. Thallus crustaceous, or cartilagino-membranaceous; uniform.

This genus contains very few species, and is nearly allied to Verrucaria and Porina. Lichen pertusus of Thunberg is a Pyrenula; but the pertusus of other authors is a Porina.

19. Variolaria. Apothecia wart-like, formed of the thallus, (every where rough or scab-like;) with an indistinct border, including and concealing a compressed gemmiparous plate, divided into cells, but destitute of a perithecium. Thallus cartilagino- membranaceous, or crustaceous; uniform.

Lichen fagineus of Linnaeus, which is pretty common on the bark of our beech and hornbeam trees, is a variety of Variolaria communis of Acharius. Lichen lacteus, Lin. is likewise a Variolaria.

20. Sagedia. Apothecia wart-like, formed of the thallus, covered above with a coloured membrane; marked with a disk-shaped depression, and concealing a gemmiparous plate, which is shaped like a nucleus, immersed in the substance of the thallus, and of simple texture within. Thallus crustaceous, uniform.

Only six or seven species of this genus are known; they are small, and peculiar to hard rocks. One species, S. rufescens, has been observed only on the sandstone rocks of England, where it was detected by Mr. Turner. The name is derived from saxn, a shield, the apothecium greatly resembling small shields,—which might be said of several other genera.

B. DISCOIDEI.

21. Urecolia. Apothecia circular, with a border formed by the thallus; the gemmiparous plate coloured, forming a disk of the apothecium, having a proper border, or being elevated on the circumference, somewhat urceolate, and immersed in the substance of the thallus; within, of a striated appearance, and furnished with cells. Thallus crustaceous and uniform; sometimes granulated or powdery.

This genus is divided into two sections. 1. Aspistaria, in which the disk has no distinct border. To this section belong Lichen lacerius of Withering; and L. cinereus, Lin. a minute but common species, which often gives bare hard rocks a greyish appearance. 2. Amphidonia, in which the border both of the apothecium and the disk is distinctly raised. Of this division, Lichen scaposus, of Eng. Bot. and L. caeleatus, Lin. (L. cinereus of Withering,) are examples.

22. Lecanora. Apothecia circular, thick, sessile, formed of the thallus; gemmiparous plates coloured, forming plano-convex disks of the apothecium; encircled by, but not in immediate connection with, elevated unequal borders of the thallus; within, striated, and furnished with cells. Thallus crustaceous, tartar-like; uniform, or somewhat lobed.

This extensive genus, of which Acharius describes above 150 species, is divided into three sections. 1. Rinodina, with a uniform crustaceous thallus; as in Lichen aster, L. coarctatus, and L. Turneri, of Eng. Bot. L. quadricolor and cocinea of Dickson, L. ventosus, Lin.; and the well-known dye lichen, L. parietus, from which litmus is prepared; and L. tartareus, which affords the cudbear of the west of Scotland. 2. Poromma, with a figured thallus, which is imbricated or squamous. Of this section, the beautiful Lichen decipiens may be mentioned as an example; and likewise L. crassus of Hudson, and L. candelarius of Linnaeus, with the shielded form of which "golden candles" are, in some countries, made for high festivals. 3. Placodium, with a flat crustaceous thallus, stellated or lobed on the circumference; as in Lichen gelidus, or L. Hecla of Flora Danica, L. flavicans of Withering, and the small but elegant L. fulvus of Dickson.

23. Roccella. Apothecia circular, closely and wholly Roccella attached to the thallus; gemmiparous plates forming plano-convex disks to the apothecium, encircled with sessile borders formed by the thallus; covering globular but compressed masses, consisting of two layers, the upper transparent and rather gelatinous, the under blackish and compact, including nests of naked goniyli. Thallus cartilaginous, and somewhat leathery; round or thread-shaped, also flat and shrub-like.

To this genus belongs the celebrated dye lichen, L. Plate roccella, Lin. (Roccella tinctoria, Ach.) It grows on LXXXV. the sea rocks of Portland island, but is rare in England. Fig. 4. a. The only other species of this limited genus hitherto described, are the Lichen fusiformis, Lin. and L. fusoides of Dickson, which occur on maritime rocks in the south of England, and in the Channel islands.

24. Evernia. Apothecia circular, sessile, edges raised, Evernia, and slightly bent inwards; gemmiparous plates forming concave disks, surrounded by a border of the thallus, which rises beyond them; within, of simple texture. Thallus branched or laciniate, cottony, or woolly; angular, sometimes compressed or flat.

This genus includes the well-known Lichen prunastri, Lin. which grows abundantly on our trees; and also L. vulpinus, Lin. which is considered as poisonous, and occurs sparingly on trees in this country. The generic
name is taken from the Greek nTeen, branched, in allusion to the ramifications of the thallus.

25. Sticta. Apothecia circular, thickish, adhering closely to the thallus, to which they are attached by the centre, while they are otherwise free; gemmiparous plates flat, forming disks, encircled by borders of the thallus, which project beyond them. Thallus somewhat leathery and cartilaginous, foliaceous, forming large lobes; beneath, villous or woolly, and generally marked with pits or pores (cyphellae), and mealy warts (soredia).

This genus takes in the Lichen pulmonarius, or lung-wart moss, which is common on the trunks of old trees in this country; but neither the cyphella nor soredia are seen in that species. Lichen scrobiculatus, (verrucosus of Hudson,) and L. fuliginosus of Dickson, afford, therefore, better examples of Sticta. It may be noticed, that both the Sticta pulmonacea and S. scrobiculata are promiscuously denominated aikrom (oak-rag) by the peasantry. In the lowlands of Scotland. Several spreading species, which cover the huge stems of tropical trees, also belong to this genus.

26. Parmelia. Apothecia circular, somewhat urceolate, membranaceous, fixed to the thallus by the centre, and free beneath; gemmiparous plate covering the whole of the apothecium, and almost concealing it, bent inward at the circumference; within, in some species of simple texture, in others cellulous and striated. Thallus membranaceous or inclined to leathery, foliaceous and often stellated, lobed and laciniate; generally with fibrils on the under side.

This genus contains about sixty species, and includes some of the largest and most beautiful of the lichen tribe, and several of those which are employed by the Scottish Highlanders to tinge the woollen-stuffs which they manufacture. It is divided into three sections. 1. Lobaria, with a circular leathery frond, divided into broad flat lobes. Of this, Lichen glomuliferus of Flora Scotiae may be mentioned as an example, while at the same time it may be referred to as an instance of the excellent talent for description possessed by Lightfoot. Lichen caperatus, sometimes used for dyeing wool of a yellow colour, likewise falls under this section; and to it may be added, L. perlatus; letteviensis or herbaceus of Hudson; olivaceus; and the common yellow lichen of walls, L. paretinus. 2. Circinaria, with the thallus of a membranaceous substance and stellated form. To this division belong Lichen omphalodes and L. saxatilis, which are very abundant in the Highlands of Scotland and Wales, and are much used as dye-stuffs; likewise L. membranaceous of Dickson; L. plumbeus of Lightfoot; L. fabiunensis and stygius, which are found on the mountains of Scotland; the very common L. stellaris; and L. centrifugus of British writers, (Parmelia conspersa, Ach.) 3. Physcia, with the thallus somewhat membranaceous, and of a stellated form, but the extremities of the segments appearing as if inflated. Lichen physodes, Lin. aptly exemplifies this section.

27. Borrera. Apothecia circular, shaped like small cups or pedicles; gemmiparous plates forming disks, surrounded and embraced by an elevated border of the thallus, which is bent inwards; within, furnished with vesicles, or sometimes of simple texture. Thallus cartilaginous, branched, and laciniate, the laciniae generally naked and channelled below, often eli-iiated.

This genus, named in honour of a distinguished English botanist, Mr. Borrer of Sussex, (who, it is understood, has been long engaged in preparing, conjointly with another eminent cryptogamist, Mr. Dawson Turner of Yarmouth, a Lichenographia Britannica,) is well characterized by the beautifully fringed species L. ciliaris and L. tenellus of British authors.

28. Cetraria. Apothecia roundish, plano-concave, at the thallus, with the margin of the thallus, and therefore loose beneath, elevated and bent inward at the circumference; gemmiparous plate surrounded by a projecting border formed by the thallus; within, of simple texture, or slightly cellulous. Thallus membranaceous, and somewhat cartilaginous, foliaceous, irregularly laciniate, smooth below.

The well-known Lichen Islandicus affords an example of this genus. To it also belongs L. nivalis, which grows on the summit of Ben Lawers in Scotland, but which has not there been found in full fruition; from Acharius we learn, that the targets or apothecia are flesh coloured, with a finely scolloped border, formed by the thallus. L. juniperinus and glaucus of Linnaeus are likewise Cetraria: The latter species, with the apothecia in a perfect state, (in which condition it is rarely found,) has been detected near Inverary, by a distinguished Scottish cryptogamist botanist, Mr. Robert Maughan, senior.

29. Peltidea. Apothecia circular, flat; gemmiparous Peltidea plates wholly above the thallus, and situated on appropriate small lobes, attached somewhat obliquely; surrounded by elevated borders formed by the thallus; within, of simple texture, or cellulous. Thallus leathery or membranaceous, leaf-like; beneath, veined and woolly, with partial lobules bearing the apothecia.

This genus is well marked by the numerous small lobes of the frond, but is named from the proportionally large peltae or targets (apothecia) with which these lobules are ornamented. The far-famed Lichen caninus, or ash-coloured ground liverwort, affords an example; and L. venosus, scutatus, horizontalis, and aphthosus Linnaeus, likewise belong to it.

30. Nepiroma. Apothecia kidney-shaped, flat; attach-Nepiroma ed to the under side of the frond, and on proper lobes; embraced by a raised thallus-border, except at the interior side or base of the lobe; within, of simple texture, and striated. Thallus leathery and membranaceous, leaf-like; beneath, smooth, or only slightly villous, with partial lobules producing the apothecia.

This genus is nearly allied to the preceding, being distinguished chiefly by the reniform appearance of the apothecium; or rather of the gemmiparous plate. It includes L. arcticus and antarcticus of Linnaeus; and may be exemplified in L. resupinatus of our own country, the trivial name of which is taken from the circumstance of the apothecia facing downwards.

31. Dufourca. Apothecia circular, terminal, supported Dufourea, each by a tubular branch of the thallus, which forms a border to it; fixed by the circumference, beneath free; gemmiparous plates forming plano-convex disks, within of simple texture. Thallus membranaceous and soft, branched, roundish, within fistular and cotto-

ty.
these are natives of rocks and trees in Africa. It is named in honour of M. Dufour, the most distinguished lichenologist of France, and who intends to publish a Lichenographia Gallica, including the species found on the Italian Alps, and on the Pyrenees.

C. CEPHALOIDEI.

32. CENOMYCE. Apothecia roundish, convex, like the capitula of mosses, without a border fixed at the circumference, beneath free, hollow within, covered; gemmiparous plate covering the whole surface of the apothecium, reflexed at the edges, within of simple texture. Thallus cartilaginous and somewhat crustaceous, leaf-like and laciniated, rarely uniform, producing fistular cup-like processes (podetia), bearing the apothecia on their tips.

This is an extensive genus; and it is difficult accurately to discriminate the species, owing to the great variableness both of the thallus or frond, and of the podetia or tubes. The very common Lichen pyxidatus, and L. cocciferus of Linneus may illustrate it; and these and some others readily attract the eye by the bright red of the tubercles. Many of the species inhabit sterile marshy grounds; of these, the well-known reindeer lichen, (L. rangiferinus, Lin.) is the most important. In different species the frond is divided so as to resemble the branching of the antlers of various kinds of deer. Lightfoot describes an alcicornis, and Acharius has added both a damacornis and a cervicornis. Other species of Cenomyce, which occur pretty frequently in this country, are, L. uncialis and cornutus of Linneus; L. furcatus of Hudson; and L. vermicularis of Dickson. The genus is divided into four sections. 1. Phylloclara, with the frond foliaceous, lobed and tilled, and very short and indistinct podetia. 2. Cladonia, with the frond foliaceous and laciniated, and the podetia cup-shaped. 3. Helopodia, frond laciniated and imbricated, podetia cylindrical and fistular, terminated by apothecia resembling minute fungi. 4. Pycnothelia, with the thallus crustaceous and uniform.

33. BEOMYCES. Apothecia circular, convex, shaped like capitula, without borders, solid, sessile; clothed with the gemmiparous plate, which is reflexed at the circumference, and of simple texture within. Thallus crustaceous, uniform, with short, soft, solid podetia, supporting the apothecia.

There are only three or four species of this genus. The generic name alludes to the circumstance of the tubercles resembling small fungi, or lycopodions; being derived from βαίος, small, and πυκνός, a mushroom. Lichen ericitum and L. fungiformis of Withering may be noticed as examples: the former is Beomyces rossus, and the latter B. rupestris of Acharius.

34. ISIDIUM. Apothecia circular, in a great measure formed of the gemmiparous plate; at first almost included within the apex of the podetium, and bordered by it; afterwards becoming prominent, thick, hemispherical; beneath, flat, and sessile; within, of simple texture. Thallus crustaceous or tartar-like, uniform, furnished with solid short podetia, (papillae of some authors), some barren, others bearing a gemmiparous plate, or constituting apothecia.

The name of this genus has been bestowed, on account of its general resemblance to the coral called isis by Linnaeus; and Lichen corallinus may be mentioned as an example. Only eight species are described by Acharius; and one of these, L. ocellatus (Isidium ocellatum, Achar.) he received from our countryman Dickson, nor does it appear to have been found elsewhere than on the rocks of Scotland.

35. SCLEROCOLON. Apothecia solid, sessile, with a border; at first turban-shaped, but backwards acquiring a hemispherical or almost globular form, covered above; the gemmiparous plate ultimately dilated, and extending over the border, reflexed; within, of simple texture, somewhat striated. Thallus shrubwise-branched, cylindrical or roundish; within, rather of a woody texture, solid; with a crustaceous bark, set, with small granulations.

The solid stem (στερημα καύλης) gives name to this genus. It may be exemplified in Lichen paschalis of Linneus, which grows on the rocks of the Highland districts of this country.

36. SPHEROPHORON. Apothecia somewhat globose, spherical on the branches of the thallus, of which they are formed; at length bursting on one side, when they are seen to include a mass or ball (of a dark colour), which soon falls into powder. Thallus shrub-like, branched, cotyloid within, rather solid, covered with a cartilaginous bark.

This is a very well-marked genus, distinguished by its spherical parts of fructification (σφηρικά φρούτα). Only three species are described by Acharius. Lichen fragilis, Lin. (Spherothoron compressum, Achar.) which is not uncommon on our upland heaths, and which much resembles a small coraline, and L. globiferus, Lin. are two of these.

37. RHIZOMORPH. Apothecia rather globose, terminal, or on the points of the branchlets, filled with a morpha somewhat gelatinous mass; of simple texture. Thallus branched, filiform, prostrate or creeping, cottony within, clothed with a cartilaginous bark.

This root-shaped genus includes several plants which have commonly been referred to the genus Clavaria by English writers, and which particularly have been considered as varieties of Clavaria hypoxylon.

CLASS III. HOMOTHALALAMII.

38. ALECTORIA. Apothecia circular, thickish, sessile, Alectoria with a border; afterwards becoming convex, and the border nearly disappearing; wholly formed of the thallus. Thallus branched, with filiform branchlets (lorula), pendulous or prostrate; within, fibrous, and of cottony substance, with a cartilaginous bark.

The well-known Lichen jubatus of Linneus, or horse-tail lichen, affords an example of Alectoria, a name which is taken from the Greek word for hair.

39. RAMALINA. Apothecia circular, thickish, somewhat Ramalina peltate or supported on central pedicles, flat, with a border; wholly formed of the thallus. Thallus branched and laciniated, in tufts; within, rather solid, but composed of cottony substance, with a cartilaginous bark.

This genus includes the well-known and common Lichen fraxineus, fastigiatus, and farinaceus of Linneus, which are abundant not only on the oak, the ash, and other forest trees, but often infest orchards. Lichen ca-
licaris, Lin. (Ramalina scopulorum, Ach.), which clothes
many of our rocks near the sea, likewise belongs to it.
The generic name is derived from the Latin rhamnus, a
dead twig, the plants having been considered as resem-
bling, or perhaps as decaying, decayed branches.

40. CORNULICARIA. Apothecia circular, obliquely pel-
tate; at first, with scarcely a perceptible border, but
afterwards becoming dentate and reflexed; wholly
formed of the thallus. Thallus branched, shrub-like,
slender; within, somewhat solid, of cotty substance,
with a hard cartilaginous bark, rendering the
plant rigid and rather fragile.

Lichen corniculatus of Flora Scotia (Cornulicaria
tristis, Ach.), and L. hispidus (C. spadacea, Ach.),
which are found on rocks in the Highland districts, as well as
L. ochroleucus, which grows on the highest mountains
of Scotland, afford examples of this genus.

41. USNEA. Apothecia circular, peltate, very broad,
flat, without a border, but on the circumference some-
what ciliated, or set with hair-like fibrils, (rarely
almost naked;) wholly formed of the thallus, and of
cotty substance within. Thallus branched, fili-
form, with a tough thread-like fasciculus of little
ducts running along the centre, covered with a car-
tilagino-crustaceous bark, rather brittle when dry.

Lichen plicatus, floridus, and barbatus of Linnaeus,
are examples. These grow generally on old trees, and
in thick shady woods; Lichen plicatus, indeed, is often
particularly distinguished by the name of Tree-moss.

42. COLLEMA. Apothecia circular, immersed, sessile,
(rarely with a sort of pedicle), bordered, urceolate,
flat, entirely formed of the thallus. Thallus varying
in shape, wholly of the same gelatinous kind of sub-
class; when dry, becoming hard and cartilagi-
nous.

The generic name is derived from κόλλημα, gliten.
The species are pretty numerous; they vary greatly in
aspect, and are therefore distributed into no fewer than
seven sections. 1. Phlyctis, with a crust-like thal-
lus, as in Lichen niger, Lin. 2. Echlymus, with the
thallus imbricated, composed of small lobes, and round-
ish, as in L. cristatus, Lin. (Collema pulposum var.
Ach.) and in L. fascicularis. 5. Septinum, thallus fo-
laceous, somewhat tilled, the lobes distinct, thick, tur-
gid; as in L. palmatus of Hudson. 4. Mallotum, fo-
laceous, with the lobes rounded, and fibrils on the un-
der side; as in L. saturninus of Dickson, and L. Bur-
gessii of Lightfoot. 5. Lathagrium, foliaceous, with the
lobes membranaceous, broad, loose, of a blackish-
green colour; as in L. nigrescens, Lin. (L. vespertilio
of Lightfoot). 6. Leptogium, foliaceous, with the lobes
of a very delicate diaphanous substance, generally glau-
cous; as in L. tremella of English authors, (Collema
lacerum, Ach.) 7. Polyedrium, with the thallus very
finely branched and laciniate; as in the minute and
elegant Lichen tenuissimus of Dickson, and also in L.
musciola of the same author.

(APPENDIX.) ATHALAMI.

43. LEPRARIA. No apothecia. The gongyls (if such
they be) naked, loose, collected in little heaps. Thal-
lus crustaceous, powdery or leprous-like, uniform;
in general, composed almost entirely of gongyl or
propagula.

Byssus candelaris of Linnaeus, or Lichen flavus of
English authors, may exemplify this doubtful genus.

Such is the arrangement adopted in the Lichen-
ographia Universalis of Acharius, with the additions
suggested by the author in the 12th volume of the
Linnaeus Transactions. The greatest pains have evi-
dently been bestowed on the execution of the work.
As a proof of this, it may be noticed, that the generic
characters are all minutely and accurately illustrated
by figures, in as far as at least these characters depend
on the apothecia or shields. These figures are usually
magnified, and represent perpendicular, and sometimes
also horizontal sections, so as to afford the clearest pos-
sible explanation of the descriptions. But the generic
characters depend not only on the situation, shape, and
structure of the shields, but on the general habit and
form of the lichen. It has been objected, we believe,
that some of the characters of the genera are not sufficient-
ly obvious; that, so far from being so, unpractised
eyes might find difficulty in detecting specific dif-
ferences where they ought to look for generic. To
those, however, who are somewhat accustomed to mi-
nute discrimination, this difficulty in a great measure
vanishes; and from a single perfect specimen of any
species, the genus may generally without hesita-
tion be determined, while the similarity in external
habit very commonly leads to the association of the
same species of the same genus. In point of fact, too,
the principal generic characters of Acharius are taken
from the external parts of the plant, which are pretty
the easily distinguished, although it necessarily happens
that these are often small, and must be examined with
a magnifying glass. The difficulty attending the mul-
tiplication of genera, it may be remarked, consists more
in appearance than in reality. Genera, it must be re-
membered, are necessarily artificial divisions, species
only being natural. The forty-three genera of Acha-
rius, may be considered as equivalent to as many sec-
tions of the overgrown genus Lichen of Linnaeus; and
thus the principal objection will resolve into the ad-
tional tax on the memory of the botanist, who must
therefore up so many more generic names, some of them
not perhaps uncoined. When Acharius has increased the
number of genera, however, he has greatly reduced the
number of species described by preceding writers. This
was to be expected, as the necessary result of a pain-
fully careful examination of the different appearance of
the same plants in their early and advanced stages, and
of the same species taken from different habitats,—from
a rock or from a tree, from a shady or an exposed situa-
tion. Colour, it is well known, is peculiarly liable to
variation, so that it cannot alone be depended on as a
character in describing natural bodies. But colours are
less liable to change in cryptogamic than in phanoge-
nous plants, and they are therefore with propriety oc-
casionally noticed by Acharius; still, however, when
colour is mentioned as a character by this cautious in-
vestigator, it is always in a subsidiary way, as indicated
by printing within parentheses. In the Lichenographia
Universalis, the synonymy is not nearly so ample as in the
Methodus Lichenium; but the name bestowed by the
discoverer, or by the author who first-described the
species, is commonly given; and where species have
been represented in engravings, the best figures are re-
ferred to.

Dr. Wahlenberg of Stockholm, in his Flora Lappo-
Wahlena, 1812, has also divided lichens into three classes: berg.
1. Athalamae, containing two genera, Lepraria and Va-

5 A.
LICHENS.

Habitats of Lichens.

Rocks.

The general distribution of lichens has already been slightly touched on. It may here be observed, that certain species show an attachment for particular kinds of rocks, in the same way as the more perfect plants evince a predilection for different varieties of soils. The hardest masses of granite and gneiss on the Scottish mountains are the favourite residence of Lecanora gelida, Lecidea petrea, silacea, laplicida, sulphurea, and atrovirens, Parmelia fahniiensis, Verrucaria glauca, Opegrapha petrea, and Gyrophora proboscidea. Lecanora fusco-atra var. dendrictica has been observed on pure rock-crystal. The porphyry rocks are preferred by Lecidea postulata and confusae, Parmelia ciliaris and furfuracea, and Gyrophora deserta. The mica-slate rocks seem to be the choice of Cornicularia tristis and exilis, Gyrophora polyphyllea, and of the var. frigida of Lecanora tartarea, which often appears branched, from its twisting about mosses and remains of jungermannia: the clay-slate, of Lecidea Dicksoni and cupularis, Lecanora decipiens, and Baromyces rupestris. The clay-slate porphyries and different varieties of trap-rocks are the favourite habitats of numerous species, such as Lecidea fusco-ater, Urectoria scruposa and cinerea, Lecanora tartarea, Parmelia saxatilis and caperata. Sandstone, especially if near the sea, is generally selected by Ramalina scopolorum: Lecanora parea and atra are likewise very commonly found upon it. Lime-stone is preferred by Lecidea immersa, Colloma nigra, Verrucaria muralis, Urectoria calcarea, and Thelotrema exanthematica. All of the lichens now mentioned, however, are occasionally to be found on rocks of very different geognostic and mineralogical characters, their growth being much influenced by the circumstances of elevation and exposure.

Trees.

In like manner, it may be remarked, certain species seem attached to particular kinds of trees; but the same species grow on various sorts of trees, assuming a somewhat different habit on each kind, and to a certain extent acquiring different qualities. Thus, of the Variolaria communis of Acharius, we have four varieties, indicated by the trivial names fraginea, alnea, pirea, and abietina, from their growing on the beech, the alder, the pine, and the spruce.

The most naked heaths form the favourite habitation of numerous species of Cenomyce. Coarse moist clay is preferred by some of the Peltidea, as P. venosa and horizontalis. The more gelatinous lichens often support themselves by means of decaying mosses, around which they form incrustations, as may be seen in Collema pulposum, texum, and tremeloides, and Lecidea muscorum. Some lichens grow on stones under water, as Collema fluviatricum, and C. flaccidum var. a. Several species of Rhizomorpha inhabit the galleries of deep mines, such as those of Leadhills, particularly R. spinosa (Clavaria hypoxylon of most English authors), and R. dichotoma and subterranea. A few small species take up their abode, parasitically, on the musci hepatici, and even on other lichens; thus, var. b of Lecidea cinereo-fusca has been observed on jungermannia, and Calcium stigonellum (Lichen gelatinus) on the crust of Porina pertusa.

Uses of Lichens.

It now remains only to give some account of the uses of lichens. Here no assistance is to be derived from lichens, the labours of Acharius, his writings being purely botanical. Linnæus, Hoffman, Georgi, Lightfoot, Withering, and others, make amends; and the essays on this subject by Watson, by Amoreux the younger, by Willemet, Westring, and Proust, might afford materials for a longer dissertation than would be suitable for this place. In the course of treating of their uses, we shall notice the few observations which appear to have been made by chemists on the constituent parts of lichens.

Lichens are of great utility in the general economy. In the eco-

rimaria. II. Heterothallus, containing four genera, Lichen, Peltidea, Baeomyces, and Endocarpon. III. Heterothallus, containing six genera, Verrucaria, Opegrapha, Lecidea, Gyromon, Calicium, and Spherophor-

port themselves by means of decaying mosses, around which they form incrustations, as may be seen in Collema pulposum, texum, and tremeloides, and in Lecidea muscorum. Some lichens grow on stones under water, as Collema fluviatricum, and C. flaccidum var. a. Several species of Rhizomorpha inhabit the galleries of deep mines, such as those of Leadhills, particularly R. spinosa (Clavaria hypoxylon of most English authors), and R. dichotoma and subterranea. A few small species take up their abode, parasitically, on the musci hepatici, and even on other lichens; thus, var. b of Lecidea cinereo-fusca has been observed on jungermannia, and Calcium stigonellum (Lichen gelatinus) on the crust of Porina pertusa.

Uses of Lichens.

It now remains only to give some account of the uses of lichens. Here no assistance is to be derived from lichens, the labours of Acharius, his writings being purely botanical. Linnæus, Hoffman, Georgi, Lightfoot, Withering, and others, make amends; and the essays on this subject by Watson, by Amoreux the younger, by Willemet, Westring, and Proust, might afford materials for a longer dissertation than would be suitable for this place. In the course of treating of their uses, we shall notice the few observations which appear to have been made by chemists on the constituent parts of lichens.

Lichens are of great utility in the general economy. In the eco-

of lichens. Here no assistance is to be derived from lichens, the labours of Acharius, his writings being purely botanical. Linnæus, Hoffman, Georgi, Lightfoot, Withering, and others, make amends; and the essays on this subject by Watson, by Amoreux the younger, by Willemet, Westring, and Proust, might afford materials for a longer dissertation than would be suitable for this place. In the course of treating of their uses, we shall notice the few observations which appear to have been made by chemists on the constituent parts of lichens.

Lichens are of great utility in the general economy. In the eco-

nomic nature, although their operation is slow and almost imperceptible. The largest oaks of the forest, and most ancient pear-trees of the orchard—trees which endure for centuries—at length become "mosed with age," and more frequently owe their destruction to the silent attacks of parasitical lichens, especially of the larger branched kinds, than to the ravages of storms. But it is not merely on the "monarchs of the wood" that lichens exert their influence. Many species, as we have just seen, vegetate upon the barest and hardest rocks: these, by their decay, prepare a suitable nidi for the smaller frowndose mosses. The mosses, in their turn, afford sufficient soil for rock plants of a larger size, such as stone-crop, or sheep's-fescue; and thus the rocks at length become covered with herbage, or even with shrubby and arborescent plants. In this way, we may distinctly trace to the vegetation of the humble crustaceous lichen, the commencement of one means of that gradual but never-ceasing disintegration or decay, which is wearing down the densest and loftiest pinnacles of the earth. Meantime, lichens tend to even and varigate rock scenery, by "bestowing tints of a delicate pea-green and primrose, which (to use the words of Ann Radcliffe) it is not necessary to be a botanist to admire."

Food to Animals.—In the extreme northern countries of Europe, the branched coralline lichen (Cenomyce economy, rangiferina) is highly important in rural economy, reindeer as affording the principal food of the reindeer—animals in which consist the whole riches of the inhabitants. In Lapland, as we learn from Linnæus, plains of several miles in extent are often completely covered with this lichen; and in places where no other plant will even take root, this thrives and becomes luxuriant. These dreary wastes—these "terra damnatae," as a naturalist of a lower latitude has styled them—are the Lapland fields and fertile pastures. On these the reindeer feed during winter. By a kind provision of nature, it happens that at this pinching season, when no other vegetable is to be had, the lichen, buried under
the snow, is found in its most flourishing state. The rein-deer, tossing aside the icy surface-covering with their antlers, and scraping off the loose snow with their fore-feet, devour the lichen greedily, and even become fat upon it. When the proper lichen is deficient, some other species are resorted to by the deer, particularly Stereocaulon paschale, and the common rock-lichen, Alectoria jubata. In this country the rein-deer lichen is seldom found more than three or four inches high; in Lapland, however, it flourishes exceedingly, and is frequently from six to ten inches in height. In some districts of the north of Europe, it is collected like hay, and stored as provender for black cattle. In the mountainous districts of Upper Carniola, Cetraria Islandica is collected in quantities, and used for fattening cattle. Even in the southern States of America, particularly in Virginia, a species of lichen is gathered for winter food both for sheep and cows. This is the neckless-moss, Lichen articularus, (which is L. barbatus in an advanced stage of growth, or Usnea barbata of Acharius.) Many species of lichen are eaten by goats, and evidently afford a grateful food to them.

Only two or three species of lichen have hitherto been employed by man as articles of food. Several species have, at different times, acquired celebrity in the cure of diseases. The most important and valuable use of lichens, however, is in the arts, particularly in dyeing.

Food to Man.—The principal species which affords food to mankind is the Lichen Islandicus, or Eryngio-leaved Liverwort, (Cetraria Islandica, Ach.) This, as implied in the trivial name, is abundant in Iceland, where no kind of grain can be ripened. It is collected in the summer, and, when dry, ground into meal or flour, of which bread and gruel, or pottage, are made. It is sometimes also put whole into broth, or boiled in whey, till it be converted into a jelly. In general, it is either previously steeped for some hours in warm water, or the water of the first boiling is rejected, in order to remove a part of the bitter extractive matter, which, if left, produces a disagreeable taste, and is apt to prove purgative. It has often been recommended as a light and delicate article of food for persons of a phthisical habit, or subject to catarrhal complaints; and for this purpose it is yearly imported in small quantities into England. In the Journal de Physique, M. Proust particularly mentions its properties as an esculent substance. One pound weight of the dry lichen in powder, weighed, when boiled for a quarter of an hour, and well drained, about three pounds; and the same quantity of the dry lichen was found sufficient for making no less than eight pounds of soup; and this soup was so rich, that, on cooking, it turned to a tremulous jelly. The lichen, simply boiled, possesses a sort of membranous elasticity; on account of its containing a considerable proportion of insoluble starchy matter.

One hundred parts of dried lichen afforded to M. Proust, of

The soluble matter, he remarks, is nearly allied to starch, and, like it, is precipitated by infusion of gall: it differs from it, however, in not being glutinous, and in the solid matter of the jelly contracting and separating from the fluid, as curd does from whey. The insoluble matter, on the other hand, has much analogy with gluten.

To this account of M. Proust, it may be proper to subjoin the result of an analysis performed by Berzelius, as detailed in the 90th volume of the Annales de Chimie, especially as this analysis is probably the most rigorous and accurate which has hitherto been made of any species of lichen. From 100 parts he obtained the following constituents:

<table>
<thead>
<tr>
<th>Syrup</th>
<th>Bitartrate of potass, with a little tartrate and phosphate of lime</th>
<th>Bitter principle</th>
<th>Green wax</th>
<th>Gum</th>
<th>Extractive colouring matter</th>
<th>Starch</th>
<th>Insoluble starchy matter</th>

A substance containing 80 parts in the 100 of starch, or starchy matter, and small portions of syrup and gum, must be highly nutritious; and Proust remarks, that nature can scarcely furnish a more excellent article of food. In general it retains a slightly bitterish taste, resembling the flavour of weak sugar water; but if seasoned with sugar and lemon-peel, and eaten with butter or oil, it is said to form a very palatable dish. Sir George Mackenzie, in his Travels in Iceland, mentions that this lichen was mixed with chocolate made for breakfast, at the house of Dr. Clog, a physician near Reikjavik, but that he could not, from the taste of the beverage, have detected the presence of the lichen. Proust recommends it as a very convenient antiscorbutic vegetable on long sea voyages, and as a home article of diet in times of scarcity. Lifeblad, it may be added, has published a separate tract, strongly recommending its use in Sweden, when visited with unfavourable seasons and bad harvests.

The Iceland-moss has scarcely any perceptible flavour: indeed very few of the lichen tribe affect either the sense of taste or of smell. A small species (Lecidea aromatica, Ach.) first described by Mr. Turner of Yarmouth, is said to possess a slightly aromatic taste; and Variolaria amara and Borrerum furfuracea are remarkable for their bitter qualities. From Mr. Hooker's work on Iceland, we learn, that Gyrophora hirsuta of Acharius, is considered by M. Paulsen as forming an article of food greatly superior in quality to the Cetraria Islandica. It is produced only on the crags; and whether it can be collected in considerable quantities is not mentioned. It is, however, a pretty common species on the gneiss rocks of Sweden. On the same authority, it may be added, that Gyrophora cylindrica is used as food in Iceland in times of scarcity: this species, we may notice, was observed on the mountain of Gautafeld in Arran, by Mr. Lightfoot; and by him described under the name of Lichen crinitus.

A lichen is noticed by Professor Pallas, in his earlier Travels, as growing on the calcareous mountains of the Great Desert of Tartary, the thick coriaceous crust of which is eaten by the wandering tribes: it is described by Acharius under the name of Urceolaria esculenta.

Gmelin informs us, that, in Siberia, the lungwort lichen, Sticta pulmonacea, is used, in the making of ale, as a substitute for hops; and Georgi notices it as an edible species, along with Parmelia physodes, Usnea pilcata var. hirta, and Ramalina farinacea. These lichens, when boiled, yield a yellow mucilage, nearly insipid; and, when eaten with salt, are said to form a tolerable food. They all give out a portion of resin to
alcohol; but the taste of this, is not discernible in the water in which they are boiled. Some others of the branched and filamentous lichens, such as Ramalina fraxinea and fastigiata, and Usnea barbata, have been examined chemically by Berzelius, and found to be characterized by the presence of a species of starch possessing several peculiar properties. Probably these also might be employed as food.

Medicine.—Several of the lichens were formerly celebrated as specifics in the cure of diseases. The common cup-moss (Lichen pyxidatus, or Cenomyce pyxidata, Ach.) was long regarded as an infallible nostrum for the hooping-cough. The common ground liversor (Lichen caninus, or Petelidea canina, Ach.) received its trivial name on account of the fame it had acquired as a specific for the bite of a mad dog. Even the celebrated Dr. Mead, in his History of Poisons, eulogized this medicine, and declared that it had never failed, during thirty years experience, in averting the terrible consequences which result from the bite of this animal when in a rabid state; but at the same time he mentioned, that copious bleeding was to be conjoined. The lungwort or oak-lung (Lichen pulmonarius, or Sticta pulmonaria, Ach.) was prescribed in former times, for relieving pulmonary complaints. In those days, nothing was more common among practitioners who trusted in simples for the cure of diseases, than endeavouring to find a plant possessed of some fancied resemblance to the part of the body affected: the wrinkled and reticulated frond of this lichen having some similarity to the surface of the human lungs, there remained no question of the propriety of administering it for disorders of these organs. It is scarcely necessary to add, that it has now completely lost its fame as a specific. From the experiments of Georgi and Amoreux, however, it appears, that this species possesses a portion, equal to one-eighth of its substance, of a reddish gum, having a slightly bitter taste: it is one of those, therefore, which may deserve the attention of the pharmacologist. The Iceland moss, as already hinted, has been recommended in incipient consumptive cases in this country, and a Decactum Lichenis Islandici has a place in the Edinburgh Pharmacopoeia. It is generally considered, however, as scarcely otherwise useful, than for affording a light nourishing diet. In Iceland and in Sweden it is much employed as an evacuant in the spring season. Dr. Withering tells us, that the country people in England make an infusion of Lichen aphthodes (Peltidea aphthodes, Ach.) in milk, and give it to children affected with the thrush, (aphtha in the mouth,) and that, in large doses, it destroys worms, by exciting purging and vomiting. Linnæus informs us, that the Laplanders apply a bandage composed of tree-moss, (Usnea plicata, Ach.) to their feet, when excoriated with travelling, and that they find great benefit from this kind of cataplasm, arising probably from the styptic quality of the plant. According to Pontoppidan, the yellow filamentous lichen, (Evernia vulpina,) is so poisonous, that it is employed for killing wolves, a carcass of some animal, smeared and stuffed with the powder of it, mixed with pounded glass, being set as a bait. It may be remarked, that a lichen, said to possess the active and powerful properties of a poison, might deserve further examination, as more likely to prove useful, when skillfully regulated by the physician, than such species as have not attracted notice by exerting any remarkable energy.

Perfumery.—Lichens have for a long time been employed in perfumery. It is now impossible, perhaps, to determine with certainty what the usnea of the ancients was, or whether it even belonged to the family of lichens. According to Dillenius and Ray, it was a filiform lichen, found on trees in the East Indies, and which, when moistened, exhaled an odour of musk or of ambergris. It is enrolled by Acharius under the name of Alectoria Arabum, but it must be regarded as merely a conjectural species. In the seventeenth century, some of the filamentous lichens were undoubtedly kept in shops, under the name of Usnea; and they formed the basis of a noted perfume called corps de Cypre gris, or putis Cyprius. Their employment for this purpose, however, did not probably depend on any remarkable inherent scent, but on their aptitude for imbibing and retaining odours. Lichen prunasti (Evernia prunastri, Ach.) is, in fact, as well adapted for this purpose, though nowise fragrant; and to this day this species forms the basis of several perfumed powders.

Dyeing.—Various species of lichen have long been used by the common people in the northern countries of Europe for communicating different tints to cloths of home manufacture. These are generally of coarse wool, and the process of dyeing them is proportionately rude. Several species, however, have likewise been employed by the artist, and from these the colour has been extracted with the care and skill of the practical chemist.—See article DYEING.

The orach, or archil, (Roccella tinctoria) is the Orach, most valuable lichen as a dye-stuff. If we may trust to Tournefort, the properties of this species were familiar to the ancients; it was collected in the islands of the Archipelago, and, from one of these, acquired the name of Purple of Amorgus. In modern times, according to Berthollet, it was first prepared as an article of commerce at Florence, the fine violet colour which resulted from mixing it with urine having been accidentally observed by a Florentine merchant, about the year 1750, while visiting the Levant. The lichen, reduced to powder, is put into a vat with urine and quicklime, and frequently stirred, additional portions of these substances being added, till the mixture have acquired the desired tint. Orach, thus prepared, yields a purple or purplish-red colour, which is not however easily fixed, the alcohol in some specimens is usually tinged with orach, and will afford to the reader an idea of the tint commonly produced. It is sometimes employed, and with great success, for brightening other colours. The lichen grows very abundantly on the sea rocks of the Cape Verde, and also of the Canary Islands, and from both clusters it is exported in considerable quantities. About the year 1750, not less than 100 tons were annually collected in these islands. In the English market, it is at present (1818,) worth about £200 per ton, the price varying, to the extent perhaps of £40 a ton, according to the quality of the need, as the merchants call it. The plant occurs, but sparingly, on the sea-rocks of the south of England. In France it is called orseille, and is used to a considerable extent, in the southern provinces, for dyeing silks, being collected on the rocky shores of the Mediterranean. By the Dutch it is manufactured into a paste called by them Lacmus or Littius. This is sold in square masses about an inch in length, and half an inch in breadth and thickness, hard and brittle, having the appearance of a violet-coloured earth, with white spots. It may here be remarked, that another species of Roccella, R. ficiiformis, is reported to vie in richness of colouring matter with the common orach, while the plant attains to a much larger size.
LICHEN.

This species, like the former, occurs sparingly on the sea-rocks of the South of England; but it is said to abound in the East Indies, especially on the shores of Sumatra, and might deserve the notice of some of our enterprising countrymen.

The names of Orachal and Orcscle are bestowed also on Lecanora tartarea, which has to a considerable extent been employed as a substitute for the other. This species has long been noted for its property of yielding copiously a red, or brownish red colour, equally beautiful, it is thought, but less durable, than the colour yielded by the true orachal. Its use was early known in West Gothland; and, to this day, it is collected in Sweden and Norway, and brought in whole cargoes to Britain.

At Glasgow it is called cudbear—a denomination which it has acquired from a corrupt pronunciation of the Christian name of the chemist who first employed it on the great scale (Dr. Guthbert Gordon); at least it is the principal species used in the cudbear manufacture, for Urceolaria calcaria, and some other kinds, are commonly intermixed, being gathered promiscuously by the people employed. The true cudbear lichen might easily be distinguished by its yellow saucers, while U. calcaria might as readily be discriminated by its black tubercles. It is not uncommon on the rocks of this country. In the rocky districts of Westmoreland and Cumberland, it is gathered by the peasantry for dyers, who pay them at the rate of 1d. a pound; and it is likewise collected in various parts of Scotland, where it often covers the different kinds of trap and clay-stone rocks. Considerable quantities of the dye-stuff are sold to manufacturers engaged in the woollen and silk trade, generally at the rate of about £1 per cwt.; and the makers of the article, themselves, employ a part of it in dyeing cottons of a Turkey-red colour. The cotton pullicate handkerchiefs of Glasgow are dyed with this preparation; and the fixedness of the colour is well known.

Dillenius first took notice of a species of lichen, which he observed to be in use among the natives of Caernarvonshire for dyeing scarlet, and which they preferred even to orachal. He describes it: "tartareaum, tinctoria, candidum, tuberculatus atris." From thence it has been considered as the Lichen calcarius of Linnaeus, or Urceolaria calcaria, Ach. which has just been mentioned as usually intermixed with cudbear lichen. Dillenius supposed that this is the species mentioned by Martin, in his History of the Western Islands of Scotland, under the name of corkir, and with which the inhabitants produce a reddish colour. This lichen does occur in these islands; but it is not common, the great body of rocks not being calcareous, or of the kind to which this species is almost peculiar. The cudbear lichen, Lecanora tartarea, is the true corceur of the Scottish Highlanders, and which, as mentioned by Lightfoot, they employ for dyeing a claret or pompadour colour. It is usually prepared by pounding the lichen, and mixing it with stale chamber-ley, to which a little salt or kelp is added; this mixture is kept in a state of maceration for several weeks; being then brought to the consistency of coarse paste, it is made up into balls, with a little lime or burnt shells, and is kept ready for use. When used, it is coarsely powdered, and a small portion of alum is generally added. The other lichens employed by the country people as dye-stuffs are prepared much in the same way.

The perelle or Orcelle d'Auvergne, prepared from Lecanora parela, was long a favourite material among the teinturiers of France, before the lichen was collected for economical purposes in this country. It is now, according to Withering, gathered in considerable quantities on the rocks in the north of England, and sent to London in casks. From this species the finest Limus is prepared; slips of unsized paper stained with which, are well known to chemists as delicate tests for ascertaining the presence of minute portions of uncombined acids. It may be noticed, that M. de Coeq, in a memoir in the Annales de Chimie, has created some doubt as to the species of lichen from which the perelle or orachal of Auvergne is procured: It is possible that the dye-stuff sold under those names may, in a great measure, be manufactured from the common Roccella; but in the Flore Francaise of Lamark and Decandolle, the Peltaria (Lecanora) parela is, without hesitation, referred to as the genuine source. Dr. Westring mentions Lichen parela as the only one which yielded to him a real blue; this it did merely by infusion; but he adds, that the colour is fugitive, nor could he discover any mordant capable of fixing it.

The Parmelia saxatilis, is still used in some parts of Scotland for dyeing woollen yarns, and is known to the peasantry by the name of stanec-ram. It is also common-ly employed in Sweden, and other northern countries, for the same purpose. Dr. Withering mentions, that, in these countries, it gives a purple colour; but, as managed in Scotland, it yields only a dirty orange. Parmelia omphalodes is much used by the Scottish Highlanders, under the name of crotal, for dyeing a reddish-brown. According to Rutty, Parmelia caderata is used in the north of Ireland and in the Isle of Man for dyeing wool of an orange colour, and is often called meel. The Sticta pulmonacea, already repeatedly mentioned, is sometimes resorted to by the same class of people for ting ing their yarn of a brown colour. In the north and west of Scotland these lichens are sometimes promiscuously called crotles: in England, it is believed, they often get the name of rags or hazel-rags, and in the south of Scotland hazel-ram. Although several species of lichen very different in habit and qualities, are thus used by the common people of this country, so very defective are the means employed, that they procure scarcely more than one colour.—Linneas mentions that a beautiful red colour may be prepared from Lichen postulatus (Gyrophora postulata, Ach.); and Dr. Withering states that this green also yields us, and that it is the finest of all black paint. A lichen allied to this, and which has already been mentioned as an edible species, Gyrophora cylindrica, is used by the Icelanders for dyeing woollen stuffs of a brownish-green colour. In Sweden, especially in Smoland, and also in Norway, Evernia vulpinus, (the poisonous property of which has before been noticed,) is used for dyeing woollen stuffs yellow. The Cetraria Islandica, which has already been spoken of, both as an article of food and as a medicine, is used in Iceland for dyeing brown. The colour resides in the extractive matter, which is separated by slight boiling or by merely steeping in warm water.—We have the authority of Bartram, the traveller, for stating, that Lichen barbatus (Usna barbata, Ach.) is colored in quantities from the trees in Pennsylvania, and employed by the people for communicating an orange hue to yarn.

The species which have been mentioned are remarkable for abounding in colouring matter, and for the facility with which they communicate it to woollen, cotton, or silk en fabrics. Many other species, however, afford colour, and some minute lichens give the finest tints. The writer of this article, many years ago, made
experiments, on a small scale, on some of the lichens which are found on the rocks in the neighbourhood of Edinburgh. Merely by drying and pounding, and then throwing the powder into a phial containing a little liquid ammonia or lime-water, or sometimes a mixture of both, and fitting the phial with a cork, some beautiful colours were procured, not however till after the lapse of several days. Slips of white paper were the only substances stained: the paper ought to be unsized, in which state it may be procured from the manufacturer; for India paper, probably merely on account of its being destitute of any glutinous ingredient, received the delicate tints more freely and equally than that of English manufacture. Treated in this way, Lecanora ventosa, which is plentiful on some parts of the rocks of Arthur Seat hills, gave a beautiful violet tint, superior to what was procured, by the same process, from Lecanora parella. Ramalina scopularum, from sea-rocks at Carolina Park, afforded little or no colour when young plants were used, and a dull orange when old stems or fronds were employed. Parmelia conspersa yielded a very fine gamboge yellow; and Parmelia pareticina a yellow scarcely inferior in beauty, but approaching to orange: this last species, as intimated in the trival note, abounds on old walls, and might easily be scraped off and collected on considerable quantity: Both in it, and in P. conspersa, (Lichen centrifugus, Linn.) the central parts of the thallus often decay, and the plants then appear to grow in circles. Lepraria chlorina, which grows along with P. pareticina, and in general appearance resembles it, having a fine lemon-yellow crust, afforded no yellow colour at all, but rather a peach-blossom tint, which was not permanent. Lecidea sanguinaria, from rocks in the King's Park, instead of yielding a scarlet, as was expected from the red colour of the tubercles when cut, gave only a dull lead-grey. Neither the external nor internal colour of the lichen, therefore, afforded any indication of the tint which might result from the powder treated with the ammonia and lime-water. By such simple means, however, it may in general be ascertained whether any particular species of lichen is likely to yield colour at all: and it may here be remarked, that if it yields colour readily and copiously, these are the principal and most desirable qualities; for brown, purple, or orange, though at first they consist dull and diffused, in general, the improved tint is increased in intensity and brilliancy, by varying the processes, or enlarging the quantities employed; and it not infrequently happens, that the colour which first shows itself, is, after a few days, or in consequence of some slight change of management, replaced by one more agreeable to the eye, and which would prove more valuable in the arts. It may be added, that where the same species of lichen grows both on rocks and on trees, which is not an uncommon occurrence, the specimens taken from the rocks will be found evidently more productive of colour than those picked from the trees. The particular nature of the colouring matter in lichens does not appear to have been yet subjected to accurate examination by chemists.

This part of the subject has been excellently illustrated by the labours of Dr. Westring of Nordkoping, physician to the king of Sweden, who has given ample details of judiciously varied experiments made by him upon most species of lichen indigenous to Sweden, and upon a considerably extended scale, with the view of ascertaining their effect in dyeing woollen-stuffs and silks. It may be proper here to detail the general rules laid down by this assiduous experimenter, (translated from the Stockholm Transactions into the Annales de Chémie for 1793): these rules may easily be followed by any person inclined to pursue the investigation.—and the subject is by no means exhausted.

The lichens should be gathered after some days of rain, when they can most easily be detached from the rocks. They are to be well washed; then thoroughly dried, and reduced to a powder; the finer the better. Pure river water is to be used; the water of wells generally containing some earthly or saline ingredient, which is apt to alter the hue. Twenty-five parts of water are to be added to one of powdered lichen. When quicklime is employed, it should be quite fresh; and one part of quicklime is enough to ten parts of powdered lichen. To ten pounds of the lichen, half a pound of sal ammoniac (muriate of ammonia) is sufficient. Before plunging the thread or stuffs to be coloured, into the dye, they should be dipped in pure cold water, in order that the colouring matter may act more equally: and they should be immersed in the same way when taken out. When lime and sal ammoniac are used together, the vessel containing the mixture should be closely covered for the first two or three days. Sometimes the addition of a little common salt (muriate of soda,) or of salt-petre (nitrates of potass,) will be found to give a greater lustre to the colours. Dr. Westring did not, in general, employ these ingredients; indeed any acidity in the water might not fail rather to destroy the gummy part of the lichens, which probably serves to fix their colours. From several species, the Doctor procured colours naturally so permanent that they resisted both acids and alkalis, and were not affected even by exposure for a considerable time to the sun's rays. In some instances, however, he employed different species of lycopodium as mordants, and with considerable success.

He praises, in particular, Lycopodium annotinum, a species which is found on some of the Scottish mountains. Some lichens yielded a good colour when macerated in a cold liquid, and the same species in a hot liquid gave a different and inferior line; but the fact was in other instances reversed.

Dr. Westring made trial of many of the Lichenes leprosi of Limnea, especially species belonging to the genera Lecanora and Ucellaria of Acharius, but including also some species of Parmia, Lecidea, and Isidium. The coralline-like species of this last genus were found to be extremely rich in colouring matter; and Lichen corallinus of Limnea (Isidium corridorum, Ach.), and especially L. pseudo-corallinus of Swartz (now appropriately named by Acharius, Isidium Westringii,) deserve the particular attention of those who practise, and who wish to improve, the art of dyeing. I. corallinus is found abundantly on the Swedish mountains, and Westring gives it as his opinion, that it may probably become a lucrative object of commerce. It is not uncommon on the rocks in some parts of Scotland. Worstend thread, kept for about three days in the simple infusion of the lichen, acquired a pistachio-green colour. When a little common salt was added to the infusion, it communicated to the thread a citron-yellow. From the lichen digested in spirit of wine for four-and-twenty hours, a wax yellow was procured; and when the digestion was continued for three days, a deep chestnut-brown resulted. But, what is more interesting, when the lichen was digested in simple water for the space of four days, a dark and very beautiful chestnut-brown was procured, of so fixed a nature, that it was not destroyed when the thread was dipped in dilute aquafortis. A shred of silk steep-
of the experiences more divided. 741. W. C.

The residuum of the boiling may be put into a hair-cloth bag, and squeezed in a press similar to that used by tallow-chandlers. The first boiling, however, by no means extracts the whole of the gum. The lichen is boiled a second or even a third time, repeating the process above described, and diminishing each time the quantity of water and of alkali added. When three boilings are employed, the gummy extract of the last may with propriety be reserved for the first boiling of a fresh batch of lichen. The extract proceeding from the first and second boilings is mixed together, and evaporated to the consistence necessary for block or press printing. The evaporating vessels are of tin or thin lead, placed over a range of stoves, and moderately heated, which is best done by steam. The mucilage thus procured is more or less coloured; but Lord Dundonald remarked, that, by continuing the digestion longer, with a low degree of heat, and abstaining from the use of any alkali, it might be produced nearly free of colour. It appears, indeed, from the experiments of M. Georgi, professor of chemistry at St. Petersburgh, that several of the lichens which have already been mentioned, (particularly Ramalina farinacea and Parmelia ph) sods, form with water a mucilage which yields, when evaporated, a gum as transparent as gum arabic, and in the proportion of about an eighth of the weight of the lichen. M. Amoreux repeated and extended the experiments of Georgi, and obtained considerable portions of pure gum from many of the broad-leaved lichens, such as Peltidea canina, Ramalina fraxines, and Parmelia caperata. All the lichens now mentioned are common in this country; and the two species of Ramalina, in particular, might be collected from trees in many woods and orchards, in great plenty and in great purity.

See Philosophical Transactions for 1758, (Watson); Memoirs of the Academy of Sciences of Lyons, for 1786, (Willenec); Amoreux Recherches et Expériences sur divers Lichens; Memoirs of the Stockholm Academy, from 1792 to 1799; Croll's Annales, 1796, 1797, and 1798; and Annales de Germaine, 1798, vol. viii. (Westphal) Journal de Physique, vol. lxxii. (Binos.) Philosophical Magazine, vol. x. (Dundonald.) (p. 5.)

Lichfield, or Litchfield, is an ancient city of England, in Staffordshire, and, united with Coventry, is the see of a bishop. It is situated on a small river running into the Trent, almost in the centre of England, in a healthy and agreeable valley, surrounded by hills of moderate height. The town is divided by a large and fine sheet of water into two parts, the city and the close; and consists of three or four good streets, with several smaller ones. The principal streets are Bridge street, vulgarly Bird street, Beacon or Bacon street, and St. John street, running off from this last in a southern direction. The high road from Birmingham to Newcastle-under-Lyne passes through the principal street. Many of the houses in Lichfield are elegant and well built; but several of them are constructed in the ancient style.

The principal public building in Lichfield is the cathedral, situated in the Close, and beside the sheet of water already mentioned. It is supposed to have been built about the year 667, during the bishopric of Juranman. It was rebuilt in 700 by bishop Heada, who dedicated it to St. Chad, and removed his bones to...
Lichfield. Roger de Clinton erected a great part of the present building. Walter de Langton built the portion of it which is called St. Mary's Chapel, as well as the cloisters; and at an expense of £2000, he raised a shrine to the memory of St. Chad. The cathedral received great injury from the sieges of the town during the civil wars. Bishop Hacket had the honour of repairing the damage which it then sustained; and, in the year 1788, it underwent a complete repair by private subscription, and under the superintendence of Mr. James Wyatt of London.

The extent of the whole cathedral from east to west is 611 feet in length, and 67 feet in breadth from north to south. It is adorned with three elegant steeples, one 258 feet high, in the centre of the building, and the other two 183 feet high, at its west end. The western front was formerly enriched with the finest sculpture, from subjects of scripture history; but several of these were removed, in 1749, by order of the dean and chapter, and the rest have been much injured by the gradual influence of time. On the summit of the roof between the two spires, is a statue of Charles II. who had contributed timber towards the repair of the church. It was the work of Sir William Wilson, and is supposed to occupy the place of a more ancient one of Adam, or our Saviour. The portico of the cathedral is not excelled by any in Great Britain, and contains the richest and the lightest sculpture. Within the porch, are placed the four evangelists holding the gospels in their hands. On the two sides are Moses and Aaron; and in the centre between the great doors, is the Virgin Mary with the infant Jesus. These were formerly richly painted and gilt. The south and north entrances to the cathedral are very fine, particularly the north door, which is rich in the most beautiful sculptured moulding. The roof of the cathedral was once covered with lead, but slates were afterwards substituted.

The body of the cathedral is lofty and spacious, supported by pillars, formed by a variety of slender columns with neat foliated capitals. The length of the body from the great west door to the choir is 213 feet, its breadth 153 feet, the breadth of the side aisles 60 feet, and the height of the nave 60 feet. The upper rows of windows are triangular, including three circles in each. Over the great west door is a magnificent circular window, formed at the expense of James Duke of York, in the reign of Charles II. The painted glass was the gift of Dean Addenbrooke, in 1776. There are many interesting monuments in this church. The principal are, one to Launcelot Addison, the father of the great Addison; one to Lady Mary Wortley Montague, representing the goddess of beauty weeping over an urn; one against the wall to Dr. Samuel Johnson, with a bust of him upon the pedestal; one to the celebrated Garrick, erected by his widow; and one to Mrs. Grove, wife of Dr. William Grove of Lichfield.

The choir, and St. Mary's chapel, were formerly separated by an elegant architectural screen, but during the latter alterations the two were thrown into one. St. Mary's chapel is uncommonly beautiful and magnificent. It contains nine windows, three on each side, and three at the end. The slender east windows are filled with painted glass, which Sir Brooke Boothby purchased from the dissolved abbey of Herkenrode, in the bishopric of Liège. Sir Brooke transferred his purchase to the dean and chapter. It consisted of 340 pieces, each about 22 inches square, and amounted to £1100, including expenses of carriage, and of fitting up the window to receive it. The centre, window on the same side exhibits the resurrection, executed by Mr. Eginton, from a design of Sir Joshua Reynolds. The organ, which has the stone screen formerly mentioned for its western enclosure, has twenty-five different stops, and is esteemed a very fine instrument. Both sides of the choir are adorned with twenty-five stalls.

The library, founded by dean Heywood, contains several valuable books and MSS. One of these MSS. is an ancient copy of the Valor of Pope Nicholas in the time of Edward I.; another is the Textus St. Cedre, or the Gospels of St. Chad, written in Saxon characters, and supposed to be about 1000 years old. There is here also a Koran, which was taken from the Turks at the siege of Buda. To the north of St. Mary's chapel there is a smaller chapel, in which the remains of two of the Mercian kings were interred.

The chapter, besides the bishop, consists of a dean, precentor, chancellor, treasurer, 4 archdeaconers, 27 prebendaries, 5 priest vicars, 7 lay clerks, 8 choristers, and other subordinate officers.

The bishop's palace stands at the north-east corner of the Close. It is a spacious stone edifice, bearing the date 1587, and the arms of the bishopric. As the bishops now reside at Eccleshall castle, this palace is generally occupied by tenants, and was long the residence of the family of the Seward. The deanery house stands to the west of the palace. The houses of the prebends are situated in different parts of the Close. The vicarage consists of two small quadrangles of low built houses. A new house, belonging to the registrar of the diocese, was built in 1796, on the site of the ancient prebendal house in which Bishop Hacket lived and died. There is attached to this house a large hall, containing an extensive and valuable museum, established by Mr. Wright, a surgeon in Lichfield. The elegant building, faced with stone, which stands at the entrance of the Close, was built at the expense of Andrew Newton, Esq. for the reception of twenty aged and necessitous widows, or unmarried daughters of clergymen, and has been since liberally endowed for their support.

The city of Lichfield is divided into three parishes, St. Mary's, St. Chad's, and St. Michael's. St. Mary's is in the centre of the town; and the church, supposed to have been originally founded in 855, stands on the south side of the market-place. The old building was taken down in 1717, and the present one substituted in its place. In its external appearance, it is tolerably neat, and is fitted up with oaken pews. The altar-place is handsome, and on the north side of it is the burial place of the Dyott family.

The market-house is a light brick building near the church. It consists of eight arches, surmounted by carved rails or bannisters, on the top of which were statues of eight of the apostles.

The guildhall in Bore Street is a neat stone edifice, adorned with the city arms, &c. The front hall is spacious, and underneath is a gaol. The theatre, situated in the same street, is a small building, with a stucco front, erected in 1790. At the south-west corner of the street is an English school, founded and endowed by Thomas Minors, Esq. in 1670, for the purpose of teaching 50 boys of the city to read the Psalter and Bible in English.

In St. John's Street stands the free grammar school, founded by King Edward VI. At this school were educated, Addison, Wollaston, Ashmole, Garrick, and...

The town was formerly divided into the old or high town, and into the new or low town. The last of these divisions comprehends two parts, viz. the Isle, and the quarter of the Meuse. The high town is built on the declivity of a hill, and stretches, in a southern direction, to the arm of the Meuse which separates it from the old or low town called the Isle; and towards the east it touches the great Meuse, which separates it from the quarter beyond the Meuse. The quarter called the Isle is formed by two arms of the Meuse, which rejoin at the lower end of this quarter. The quarter beyond the Meuse, which is nearly a peninsula, is situated, as well as the faubourg of Ameuce, between the Meuse and Mount Corruler. There is a communication between the different parts of the town by bridges.

The town is well fortified; but the citadel, which was upon the mountain St. Walburg, has been razed. At the foot of this mountain stood the episcopal palace, which was a very large building. The court of the palace was encircled with a peristyle formed by demi-gotic columns. The Hotel de Ville, which looks into the principal square, is a large, but not a handsome building. It contains a public library. The town is in general ill built, and is filled with a multitude of small streets and lanes, which have not that clearness and neatness which mark the other towns in Holland.

Before the French revolution, Liege contained, besides its cathedral, seven collegiate churches, 50 parish churches, five abbey for men, five for women, and 36 convents for both sexes; but it has since suffered greatly, both from the miseries of war, and from the barbarism of the revolutionists.

The cathedral church of St. Lambert is a very large building, but the Gothic style in which it is built is very bad. It was founded in 712 by St. Hubert. The fountains of Liege are very fine; and that which rises near the centre of the great square deserves particular attention.

The trade and manufactures of Liege were at one period very considerable and important. The principal natural productions of the surrounding territory are, mines of coal and alum. Great quantities of the alum, which is of an excellent quality, are sent to France. The tobacco is prepared in all its various forms; but the greatest part of it is received from Germany in leaves. Liege is celebrated for its manufactures of iron, which are not surpassed by those in France, and which still preserve their former reputation. Clock-work is made very extensively; but the manufacture of hats has employed from 12,000 to 14,000 workmen. Great quantities of them are sent to Holland, both for its own consumption, and for the East and West India trade. They are also exported in great quantities to France, for the Levant and the coast of Africa. The cloths of Liege are of a very superior quality. The tanneries are in great reputation, and peculiar methods of preparing the leather are said to be practised in them. Great numbers of cannon, stores, &c. are furnished by the iron founders. The iron is excellent for smelting, and takes a good polish. The other manufactures are those of writing and printing paper, fine china, and black lace, which is preferred by many merchants even to that of Brussels and Mechlin. Population 50,000. East Long. 5° 31' 42'' N. North Lat. 50° 39' 22''. See Rossbach's European Commerce.

LIEGNITZ, or LIGNITZ, Lignitum in Latin, is one of the best and most ancient towns of Silesia. It is the
Liegnitz, capital of a principality of the same name, and is situated upon the Katzbach. The palace within the town is surrounded with a moat and high wall. There is here a superb stone edifice, in which the states of the province hold their meetings. The Catholics possess the collegiate church of St. John, which was taken from the Lutherans in 1606; the church and the convent of the Benedictines; the church of St. John Nepomucenus, and the church and the convent of the Franciscans, and its gardens. The Lutherans have two parish churches. The church of St. Peter, and its library; and the pictures of the church of the Holy Cross; the Hotel de Ville; the Magazine of Cloths; and the manufactury of vegetable silk of M. Schnieber, are worthy of being visited. There is also here a college, an hospital, a royal and municipal school of the Confession of Augsburg; and a large academy founded by the Emperor Joseph, erected for the instruction of young men of both religions in military exercises. Liegnitz has many fine promenades. There is a fine view from the height of Goldberg; and at Wahlstadt, a village two leagues from Liegnitz, there is a convent of the order of St. Benedict, which possesses very fine pictures. This convent is built on the spot where a bloody battle was fought against the Tartars in 1241, when the Duke of Liegnitz perished. The kitchen gardens of Liegnitz are very famous, and from them are exported annually vegetables to the amount of 100,000 florins. There is a well frequented bath at Grunstadt, or Warmbrunnen. Liegnitz carries on a considerable trade in cloth and madder. Population 7000.
